During a gynaecological initial examination, an informative discussion is initially conducted with the patients to inform them about the procedure. Subsequently, the actual examination takes place. Patients are requested to undress from the waist down, which is often feasible in a cubicle or a designated area for this purpose. Following this, patients take a seat on the gynaecological chair, an adjustable chair equipped with footrests to elevate the feet. In this position, the physician explains the procedure of the examination. The speculum is announced and inserted. In some practices, the speculum is stored in a pre-warmed drawer and subsequently lubricated to facilitate insertion and increase comfort. The speculum is inserted in its closed state and then opened within the vagina. During a routine examination, the instrument is utilized to provide a view of the cervix as well as the vaginal walls. The tip of the speculum can be used to stabilize the cervix portio for conducting a cell smear. For this purpose, a swab or brush is guided through the speculum. Following the smear, the vaginal walls are examined to check for any changes. Subsequently, the speculum is carefully removed from the vagina. It's important to mention here that most physicians don't close the speculum inside the vagina completely due to pinching the tissue if they do. Additional palpation examinations may be conducted if necessary, for which the speculum is no longer required. Typically, throughout the entire examination, the patient, the physician, and a medical professional are present in the room (Barad, 2021).

2.3 Historical Development of the Speculum up to the Present Day (2024)

Bioethics, medical ethics and archaeology have developed different perspectives on the speculum. Accordingly, the speculum is presented as the most important invention of the time, which had a positive effect on the role of women in society. In other sources, however, nothing good is said about the development of the speculum, especially when it comes to its ethical justifiability (Sardesai, 2023). Depending on whether the first specula, i.e. the finds from Pompeii (Baker, 1999) are analyzed, or the use and significance of the specula in the 19th century, when the speculum was invented for the “second time” (Heinsohn, Steiger, 1987), the assessments vary. There are some records from the 19th century on the use of the speculum in Great Britain (Kennan, 2019) and on the development of new fields with the instrument in the United States of America (Ojanuga, 1993). The analyses are often related to fields beyond medicine, such as the social sciences, shedding light on the historical context and critically examining it for the reader.

Figure 2. Shows a Vaginal speculum, bronze, said to be from Pompeii, Roman, 199BC-79AD, possibly 20th century copy (https://collection.sciencemuseumgroup.org.uk/objects/co88417/vaginal-speculum-vaginal-speculum).

Figure 3. Shows a variation of vaginal specula from around the 14th, 15th and 16th century. Source: https://theconversation.com/speculum-the-creepy-history-of-this-ancient-gynaecological-device-and-why-its-still-feared-today-196977.

Figure 4. Shows a wooden speculum, which could have been used as a template, to model metal specula, but also could have been used as a speculum itself. The exact usage is unknown. Source: https://collection.sciencemuseumgroup.org.uk/objects/co88417/vaginal-speculum-vaginal-speculum.

Figure 5. Shows Sims speculum from around 1860- 1890. Source: https://collections.countway.harvard.edu/onview/files/original/a3e1e0d16c537860278047fe44428357.jpg.

At the beginning of the development and shaping of the speculum at the end of the 19th century, pronounced role models and gender stereotypes prevailed. Men had almost the sole privilege of higher education (Heinsohn, 2000). In Germany at this time, women were taught the naturalness of the role of mother and the unnaturalness of girls' education:

> "In general, however, it cannot be emphasized strongly enough that nature itself has prescribed to woman her profession as mother and housewife, and that natural laws cannot be ignored under any circumstances without serious damage, which in the present case would be particularly evident in the offspring." (Kirchhoff 1897, 257, quoted from Heinsohn, 2000, p. 62; translated from German)

> "And if the same demands were to be made on girls, in whom female sexual development is added at the age of about 15, they would be brought up as cripples who would be ruined for life. In my opinion, the establishment of female grammar schools should be banned once and for all for health reasons." (Kirchhoff 1897, 274, quoted from Heinsohn, 2000, p. 55-62; translated from German)

Higher education and the associated opportunities to rethink, develop and invent products were male dominated. The focus was on innovation and convenience for the treating physician. The needs and feelings of the people being treated, especially women, were ignored.

The first clinical specula, developed by Dr. J. Marion Sims in the United States at the end of the 19th century, served diagnostic, treatment, and research purposes (Ojanuga, 1993). It should be noted that Sims was not the only one to "rediscover" the speculum. During the period of witch-hunts, all knowledge about female care by midwives (referred to as "witches") was lost and had to be discovered a second time (Heinsohn, Steiger, 1987).

This work primarily focuses on the redesign and development initiated by Sims. This further or new development of the speculum was experimentally introduced and tested under reprehensible conditions (Sardesai, 2023). Accordingly, the ethical justifiability of Sims' further development must be criticized. Sims used his speculum to perform experimental operations on enslaved African women, without their consent and anaesthesia (Ojanuga, 1993). While many subsequent revisions of the instrument have been made, they often retained the material and basic shape of the original speculum (see Illustration).

The most obvious change over time is the range of applications. Not much is known about the initial use of the speculum, but the design of the form suggests that the female anatomy was explored and there is even evidence that the comfort of the subjects examined played a role (Baker, 1999). Between 1864 and 1869, the speculum came into widespread use in the United Kingdom. There was a surge in syphilis cases at the time, and the speculum was used to screen sex workers - or women who appeared to fit the profile- for venereal disease. Legislation for control purposes was enacted, mandating examination for those who fell within the criteria (Kennan, 2019).

During this period, and likely earlier, the only other patients that got treated with the speculum been among the wealthy classes to monitor pregnancy and childbirth, based on the few archaeological findings. Unlike sex workers, patients in the wealthier classes had the possibility to deny the exam (Baker, 1999). Today, the main field of application of the specula is diagnostics during gynaecological examinations (Schollmeyer, Schollmeyer, n.d.) and is, therefore, part of every check-up. The shape has been revised in certain areas. The design has been refined, with rounded edges and various sizes available to accommodate individual anatomical variations. Medical practices may conduct differing numbers of examinations depending on their size, with the majority of patients visiting for preventive measures, including cervical cancer screenings performed with the speculum (Speculum, n.d.). Depending on the handling, metal or plastic specula are used. Disposable plastic specula are discarded after use, while metal ones may be cleaned on-site or by external providers. In any case, sufficient instruments must be available to prevent bottlenecks (Interview, 28.10.2022). However, hospitals often lack the resources to reprocess all instruments, leading to a shift towards disposable plastic specula (Interview, 28.10.2022).

The time required for reprocessing is eliminated with plastic specula, but so is the longevity, which was once a key feature. It is debatable which is more practical for use. In some cases, it is argued (A better speculum, a better practice, a better world., n.d.) that plastic specula are more comfortable to insert because plastic is warmer than steel at room temperature.

The changes that have taken place in the design (pictures of various specula over the course of time, see above) and use of the speculum have arisen out of necessity, due to medical laws and overall development in the medical field and not out of an orientation towards the needs of the person being treated:

The speculum has rounded edges to avoid bruising the tissue (Palsgaard et al., 2022). In addition, the speculum was developed in different sizes to minimize any discomfort for the person being examined and to adapt to different individual circumstances (see also Chapter 3.1.1). In addition, it is now possible to use disposable specula, which rationalize procedures, especially in everyday clinical practice. These are the most important changes that have taken place historically. These are changes that had to take place in order for the instrument to comply with today's medical guidelines and be used in everyday medical practice. The emphasis on this is important at this point because the changes are so marginal, but there is so much potential for improvement in the design and enhancement. The lack of attention to such a sensitive area over a prolonged period (150-200 years) will be further explored in subsequent chapters (Pardes, 2017).

3. Gender-Specific Perception Regarding the Design of the Speculum

The design of medical instruments plays a crucial role in everyday treatment processes, as improvements in efficiency and comfort positively impact care (Bouquet et al., 2023). Specialist areas such as gynaecology in particular benefit from sensitive design. Sensitive design makes the person being examined feel more comfortable, which simplifies the examination for the person providing treatment. However, sensitive design also has effects beyond the actual examination. If the person being treated feels comfortable, they are less reluctant to attend regular appointments and potential illnesses can be detected at an early stage, which reduces the burden on the healthcare system (Bouquet et al., 2023). In addition to the formal aspects of speculum which were highlighted in the previous chapter, other factors such as cultural circumstances, social structures and gender-specific characteristics and traits also play a role.

Considering the social and cultural conditions at the time of its inception (as discussed in Chapter 2.2), it can be inferred that the design of the gynaecological speculum was heavily influenced by male perceptions. In addition to the historically predominantly male power of definition in the medical field of gynaecology (see subchapter 2.3), the parallels between the design and the role models prevalent at the time of development and the associated different perceptions of the sexes must be explained with methodological recourse to gender studies.

3.1 Social Gender and Gender-Specific Perception of Pain

Social gender is part of the sex-gender model. This model states that biological sex and gender identity are to be considered separately. Biological sex is defined by certain anatomical characteristics (Gildemeister, 1992) (Butler, 1991), whereas gender identity is not predetermined but develops through social interactions and is influenced by upbringing and cultural factors (Gildemeister, 1992). According to Butler, no gender identity can be automatically assigned to a biological sex (Butler, 1991).

According to the gender studies explanatory model, the tendency for biologically male individuals to identify as “men” and biologically female individuals as “women” is attributed to societal gender roles imposed from an early age (Blackstone, 2003). Biologically female children are often exposed to caregiving roles, through books or toys while biologically male children are discouraged from certain behaviours deemed unmasculine. Such statements and behavioural patterns shape gender roles and identity formation (Pauli, Hornberg, 2008).

These roles, which are shaped by the social environment, influence individual perception. By favouring or suppressing emotions, the perception of certain feelings, such as pain, can be retrained or expressed less clearly. (Pauli, Hornberg, 2008) The expression of pain has traditionally been stigmatized as stereotypically

female (Pauli, Hornberg, 2008). Gender-specific stigmatization, especially of female socialized persons with vaginas, tends to decrease nowadays.

Sims' first speculum, which was inspired by a tin spoon, was an example of the neglect of the needs of people with vaginas. With this instrument, the gynaecologist performed the first experimental operations on enslaved African women, without anaesthesia (Ojanuga, 1993). The existing disproportionate social power imbalance made it impossible to make room for women's needs.

Studies have shown that empathy for pain is most effective when the other person has experienced the same pain and can empathize by putting themselves in the position of the affected individual Jackson et al., 2005). In the case of the speculum, the anatomical characteristics of men make this direct empathy impossible. With regard to male-dominated gynaecology (see Chapter 2.2), one could speak of unfortunate factors that have not necessarily had a positive influence on the design and further development of the speculum.

However, as more interest in patients and their comfort in this area has developed over time, research has been and continues to be conducted into ways of making the examination more comfortable for those undergoing treatment and reducing pain (Seehusen et al., 2006).

3.2 Impact on the Development of the Specula

The discussion here regarding the impact on development is an interpretation of the preceding analysis of temporal conditions and circumstances.

The one-sided perspective, tied to the stereotypical notion of women, both female and male socialized persons and their roles, are reflected in the form and function of the instrument. Sims did not incorporate the needs of women into his development process of the speculum, and since then, the needs of patients with vagina have not been truly integrated into the product's further development process.

Another point that may have affected the design was the lack of sensitivity to the female gender. As alluded to earlier, this was probably less malicious intent than ignorance and the circumstances that prevailed at the time. Questions that might arise at this point are: “Didn't all instruments originate in such experimental forms? Why is there such an emphasis on the fact that the speculum was designed by men? Does perception have anything at all to do with the design?”.

These questions are justified and can now be summarized once again. Most products have an experimental origin. However, it is important to pay attention to the context of these products. Most products are developed either for men as well as women, or only for men. Here, the focus was on the needs of male practitioners, which was difficult to achieve when developing the speculum, or led to an unpleasant design for women.

The emphasis on male design is important because women were strongly underrepresented in decisive and co-determining positions at the end of the 19th century. This does not mean that the needs of women were not seen, but that male needs and perceptions were considered decisive.

It is important to draw a connection between design and perception, as these stereotypes and social circumstances has strongly influenced the priorities and decisions of developers. If women are not valued, or less valued, in society, it is very likely that their needs will not be considered in the development process either.

But hasn't our society moved a long way away from this and developed further? Yes, it has, at least that's what one might think. But if one looks at how the speculum developed until today, one cannot be quite so sure.

The factors that play a role in the fact that nothing has really changed regarding the further development of the instrument are analysed and discussed below.

4. The Speculum as a Symbol

The previous chapter showed how the social dynamics of the time affected the design of the speculum. These gender-related dynamics continue to shape society and culture to this day. The following chapter addresses the associated issues of stigmatization of the female body and shame. However, it also demonstrates how social upheavals and movements toward a more equal society can open up new paths.

4.1 Social Stigmatization of the Female Body and the Resulting Shame

Stigmatization occurs when cultural factors, stereotypes, and prejudices in a society lead to biologically female individuals being associated negatively or inferiorly compared to biologically male individuals, resulting in shame for their biological conditions (Reasons for Stigmatization, n.d.). We find the stigmatization of the female body in everyday situations that have become established and normalized in our society through centuries of tabooing and judging. This normalization implies that the evaluation is accepted and, furthermore, that many individuals socialized as females orient themselves toward and adapt to the lived and demonstrated norms.

The symbolization of the speculum helps to illustrate the complex social dynamics and how these can be perceived in an instrument such as the speculum. The speculum is not only a product of medicine, but also a symbol of the prevailing power structures and gender dynamics, both then and now. The fact that the design of the speculum is almost the same as it was at the time of its development is underpinned by the following readings of the speculum as a symbol.

The power imbalance between the sexes and control over the female body: Because the speculum is inserted into the vagina by a second person, the speculum symbolically becomes an instrument of loss of control, or the relinquishment of control, as the person being examined must completely trust the second person. The person being examined takes on a passive role here - also physically - a role that is reminiscent of social dynamics and power imbalances from the development of the speculum.

The right over one's own body: In many cultures and countries, the development and role of biologically female individuals are determined at birth. Being a woman often means being a mother, staying at home, and caring for children. The right to decide over one's own body, such as whether or not to use contraception, historically falls under the responsibility of men and has long been a taboo subject.
The speculum, developed by men to monitor bodily functions, thus symbolizes the ongoing control over the female body and its functions and rights, especially considering the history of the instrument's origins.

4.2 Social Upheavals and Enlightenment

The metaphors of the speculum considered in the previous chapter carry a negative connotation. How might the instrument be perceived if designed with feminist approaches and contextualized differently? The speculum could then metaphorically stand for values such as self-determination, enlightenment, inclusion and democratization.

By taking into account the needs of people undergoing treatment in the design process, the self-determination of the people being examined can be improved. The safety and autonomy that such an enlightened and sensitive scenario could foster would lead to an improvement in the examination experience and signify the disruption of historic dynamics.

A redesign can likewise stand for education and enlightenment in the area of gender stigmatization. The redesigned speculum would symbolize and reinforce the growing awareness of the needs and rights of biologically female individuals.

Diversity and inclusion could also be conveyed through the redesign of the instrument. The perception and consideration of diverse groups of people, regardless of age, sexuality and other identity characteristics, can be reflected in the design of the speculum.

Rethinking and redesigning the speculum can also stand for an upheaval and a redefinition of the power relations and dynamics of our society. Old hierarchical structures are broken up and people with vaginas can influence and shape the design themselves.

The following chapter will analyse what such a redefinition of the speculum could entail and explore the realistic possibilities.

5. The Speculum from a Design Perspective and in Comparison

During the research on the speculum, one fact stood out: problems in the use of the instrument and their possible origins have been identified. There are studies investigating how the use of the speculum can be improved and how the pain - which a large proportion of women experience - can be minimized (Seehusen et al., 2006). Furthermore, as already discussed in Chapter 2, some studies critically analyse the context of the second invention of the speculum and question its ethical justifiability (Sardesai, 2003).

This reveals the urgency of the redesign, which is discussed in this chapter from a design perspective. This is followed by market analyses, surveys and interviews. It is discussed how realistically a redesign of the speculum would be received and maintained in today's market, with the help of a comparison from another medical field.

5.1 Positive and Negative Characteristics of the Speculum in its Current Form

The characteristics of the speculum are better or worse, depending on the perspective from which they are viewed. The perspective that is still in focus today is that of the treating persons. Since this work deals with the perspective of the person being examined, particular attention will be paid to this in the following section.

Positive characteristics in the design are expressed above all in the handling of the specialist staff, as confirmed in the interview conducted with a gynaecologist (Interview, 28.10.2022). The material used, which in many cases is stainless steel, has little to no wear if it is properly cared for. Due to its longevity and the fact that it does not require the installation of special technology, the speculum as it is used today is a cost-effective product, even if it has to be cleaned and sterilised after each use. The handiness of the instrument has improved insofar as the two-bladed speculum, the “duckbill” is used for most examinations. This allows the practitioner to use both hands freely during the examination. There are also some improvements for the person being examined with regard to the perception of the product and the associated pain sensation. These are manifested by rounded edges and improvements to the spreading mechanism. Unfortunately, these upgrades are minimal and are mostly expressed by sensitized staff and less by improvements to the instrument itself (Interview, 28.10.2022).

A clear pattern emerged through discussions with people who have also had the speculum examination experience, as well as an anonymized survey on the topic of the speculum examination with regard to well-being.

Due to the fact that steel was used for the speculum, the temperature of the instrument is always colder than the body temperature of the person being examined, despite prior warming. Little can be done about this, as rapid thermal conductivity is a fixed property of the material. The survey showed that 26 of the 32 people questioned found this property very uncomfortable and tended to cramp up as a result). Before the speculum is inserted for the examination and smear test, the first uncomfortable feeling for some people undergoing

treatment arises as soon as they see the instrument or just think about it .For most people, the instrument does not look like what it is intended for. The feel qualities are described as tool-like, rough and hard. The survey and paper show that there is potential for improvement, particularly in the shape and material.

5.2 Realistic Possibilities and Challenges of Redesigning the Speculum

The survey of patients showed that for almost all respondents, adapting the material would significantly improve the examination experience. Accordingly, there is a lot of potential in aredesign.

What was not asked in the survey was whether the current instrument could be used in a different way to create a more pleasant experience. People have already dealt explicitly with these questions before and conducted studies. The result was that the comfort of the person being examined can be increased by offering them the opportunity to insert the speculum themselves. The improvement in the examination experience increased significantly (Wright et al., 2004). That study has shown that it's not just the insertion itself that impacts the overall examination experience; the way the examination is explained is decisive for many patients. For instance, one participant mentioned:

> “Everything was explained very well to me... so I understood. I was more involved in the process; it took the mystery out of it for me.” (Wright et al., 2004)

Regarding self-insertion, participants were informed about how the instrument should be inserted, after which they were given a moment to do it themselves. According to Table 9 of the study, 95% (126 out of 132 individuals) of the participants successfully inserted the speculum on their own. Additionally, 54% of them positioned the speculum in such a way that the doctor didn't need to make any adjustments. This aspect is significant as efficient time management is often crucial in medical settings. Concerns from some practices regarding the potential for self-insertion to prolong the examination were alleviated by the evaluation of the collected data post-study (Wright et al., 2004).

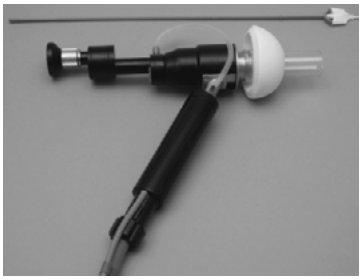
Another study examined in detail what constitutes sensitive language in the examination environment. Statements such as “watch out, it might hurt soon” or “it might pinch a little” are familiar to most people during examinations with the speculum. This study investigated what this response and “forewarning” does to the people examined. The conclusion was that the announcement exacerbates the perception and is therefore counterproductive (Carugno et al., 2020). The possibilities for redesigning the speculum seem obvious, but what challenges might be hidden here? The need for more sensitive instruments must be seen by the “right” people, i.e. doctors and the industry. This will only happen if there is an awareness of this issue and it is addressed.

Not only the instrument is supposed to be redesigned, but there also has to be a rethinking and listening process in the specialist areas concerned. Without rethinking and recognizing the need, it will seem unnecessary to many to replace an instrument that works “so well” (for the treating specialist staff).

Factors that also influence a redesign are the cost, the reprocessing of the instrument and the handling for the practitioners, as the current speculum is very efficient in this aspect. In addition, there are strict requirements that must be adhered to and provide a very strong framework for the design.

In order to get an overview of what instruments are currently available and on what is worked on, what competing factors need to be included and what the market has and has not accepted, the following section analyses the market and shows three directions of the market's state of the art.

Some deal with a redesign and reinterpretation of the experience for the person being treated, like Yona Care. They experiment with silicone to cover the metal surface (see table below). In addition to the redesign, Yona Care sets their focus on communication and education. Yona Care, as a comprehensive concept, seeks to enhance the examination experience for both patients and doctors. An accompanying



app facilitates preparation for the examination and enables the recording of essential information required beforehand. This data is then transmitted to the attending practice, allowing to increase interpersonal interaction during the examination.

The primary focus lies in adequately preparing patients to ensure their experience is as comfortable as possible. It's worth noting that Yona Care is still in its early stages of development and is not yet available on the market.

Some other speculums are made entirely of plastic. The plastic version is intended as a disposable product, which means lower costs for clinics and large practices, this is what the Orchid Speculum is made for (see table below).

However, these variants are still strongly oriented towards the shape of the speculum. The only new design, by Veda Scope is highly technologized, so the product is still in its infancy, as it is very cost-intensive to manufacture and purchase (see table below).

Table 1. Market Analysis of three different Approaches for a Redesign.

Product	Design/ Look/Source	Improvement (compared to the recently used tool)
Bridea Medical Orchid Speculum	 (https://www.brideamedical.com) (10.01.2024)	Disposable, which leads to cost efficiency compared to the metal speculum, plastic is less cold than metal (more comfortable for patients), rounding edges to not pinch the tissue
Yona Care	 (https://yonacare.com/) (10.01.2024)	Metal covered with silicone to make it less cold, this product deals more with the education and preparation before the exam happens, an App is available that guides through the exam
Veda Scope	 (https://doi.org/10.1111/j.1479-828X.2004.00180.x) (https://www.vedascope.com.au/) (10.01.2024)	Completely different look, it's supposed to be inflated inside the vagina which makes the spreading mechanism more comfortable, it's made from plastics so it's less cold, it's very cost- intensive, due to the technology

To put the development of the speculum in perspective, we compare its development with that of a medical instrument from another field. The compared instrument originates from dentistry and orthodontics and is used to take imprints of teeth. This instrument was chosen for the comparison because the basic design of the instrument is similarly simple to that of the speculum. A steel splint and alginate impression compound (dough-like mass) are used for the imprint. This method is inexpensive to use and prepare and is also durable and efficient due to the material, similar to the speculum. In contrast to the speculum, this splint is used neutrally for all people; there is no gender-specific design. This neutrality of the instrument and the field of dentistry, in general, means that it is a much less intimate and stigmatized environment in which the instrument is used. Another point of differentiation is that the speculum is used on everyone with a vagina as it is part of the check-up. In contrast, the splint is only used in dentistry when necessary and is not part of the regular examination equipment. The development that has taken place here over the last 10 years is the biggest difference. The instrument has been completely renewed in its design and equipped with new technology to optimize the examination experience for patients. The new instrument, the "3D intraoral scanner," makes it possible to take images of the teeth directly in the oral cavity and assemble them three-dimensionally on a screen in real time.

A discussion with an orthodontist revealed that the introduction of this scanner was initially associated with some challenges - such as learning how to use it and transfer the images to the corresponding program, as well as the frequent need for replacement parts. Despite this, the feedback was largely positive. The greater complexity and higher acquisition costs compared to the traditional method were justified by the increased comfort for the people examined.

This comparison should make us think. If innovative solutions can be used successfully in other areas, such as dentistry, why are there not similar advances in gynaecology? This question led to a critical reflection on the differences between medical specialties and the underlying social dynamics. The stigmatization and taboo of gynaecological examination were identified as potential barriers to innovation in this field. However, the comparison also encouraged breaking the stigma and developing new solutions that could not only improve comfort but also help to overcome outdated ways of thinking. Given these findings, the aim of this work was more clearly defined: The need to promote innovative solutions in gynaecology that not only improve comfort but could also help to overcome stigma and promote a more sensitive approach to the topic. This could help people with vaginas feel better understood and heard in the healthcare system.

6. Conclusion

6.1 Summary of the Results

The analysis showed that a redesign of the speculum should be characterized by the need to improve the examination experience, which was elaborated in chapter 5.2 with the help of studies. On the other hand, the design should be characterized by the destigmatization of the female body. This can happen at the level of the examination itself, through sensitization of the staff, but should also be achieved through a new and improved design. This frees itself from its ethically difficult background and thus demonstrates an openness and awareness of the needs of the persons to be treated.

6.2 Possible Implications for the Design and Application of the Speculum

These findings should be reflected in some way in the redefinition of the instrument. The form of the speculum should be designed inclusively, drawing inspiration from outside design fields where comfort and people's needs are more central to the design process. In order to improve the comfort of the investigation and to satisfy any autonomy needs, the study: "Speculum 'self-insertion': a pilot study" on the self-insertion of the speculum can be taken into account and elements from it incorporated into the redesign. The redesign should take place as a co-creation and be based heavily on user feedback to meet the needs of the people who will ultimately be affected.

New methods can be devised to eliminate the need for the opening of the instrument. Various technical options, such as cameras, can be included at this point. The materiality of the product should also be reconsidered and, at best, be replaced. There are many aspects that should be emphasized in the design process, but above all, there is still a lot that needs to be researched in this area of the healthcare sector.

6.3 Outlook

In the subsequent practical part of the work, a concept will be developed that meets many of the identified needs. There will be further surveys and own studies in which the first prototypes of a new instrument will be tested. The feasibility and regulations for products in the healthcare sector will be addressed and the design of the product will be finalized on this basis. In addition to the tool, a guide to gender-sensitive and gender-specific design will be developed to raise awareness on this topic. This guide is intended to help identify insensitive design more quickly and adapt it efficiently.

KEYWORDS | URBAN RENEWAL, OLD NEIGHBORHOODS, PARK CITY, LIFE SCENE PLANNING, SUSTAINABLE DEVELOP-MENT

ABSTRACT | With the continuous advancement of global urbanization, the problems presented by old communities have gradually become a major obstacle to urban development, and the gap in the living environment has become a symbol of the status of the rich and the poor. The main contradiction in China is the contradic-tion between the people's growing need for a better life and unbalanced and inadequate development, so the renewal design of old communities has become an important focus of urban development. In response to such problems, China has proposed the concept of a park city, which optimizes and integrates the spa-tial structure of the city and improves the quality of old communities by introducing the concept of parks. This paper discusses the design principles and strategies of the spatial, functional, and cultural relation-ships between parks and communities, answers the question of how to balance the development of park cities and old communities, and expounds on the importance of introducing the renewal mode of old urban communities into parks. It aims to seek a new urban development model, a new perspective of urban re-newal, which can not only meet the functions and efficiency of the city but also protect and restore the ecology and culture of the city, realize the high-quality development of the city and the people's better life, and provide a practical example for sustainable urban development.

1. Park City: Park in the City or City in the Park?

Park City is a composite system that organically integrates the form of the park with the urban space and is a new model of urban construction in the new era. The park city is not an image symbol. It is not a park built in the city, nor is it a simple sense of "park + city, " but the city and the park are integrated. Under the premise of following the historical evolution of the city, the transformation from the traditional city to the park city is to break the independent "island" model based on the past city park and integrate the leisure, entertainment, and tourism of citizens.

The essence of the park city is the home, so to meet the needs of the people as the priority. "People-oriented" is the starting point and foothold of the construction of the park city, but ecological protection and restoration is the basic premise, with the city's high-quality and resilient, healthy and sustainable development and social and economical green and efficient development as the guarantee, and finally to achieve a beautiful ecology, production development, and a happy life.

Therefore, in the process of urban renewal, how to effectively integrate parks and old communities to create a more humanistic and ecologically sustainable future life scene has become an important task in contemporary urban planning. Parks are intertwined with old communities, and ecological resources such as urban green space systems and park systems, which are most closely related to residents' lives, are regarded as the basic configuration elements of urban construction and residents' lives (Zhang & Li, 2021, pp. 1292-1301), to find a Chinese model of future communities, to build and create a new scene of future life under urban renewal, and to realize the park city expectation proposed by General Secretary Xi Jinping that "the whole city is a big park, and people go out as if they walked from home to their garden."

Figure 1. Chengdu Yulin Road old community into the park city concept renewal design project (image credit: www.archdaily.cn).

2. Renewal of Old Neighborhoods in Park City: The Link Between Urban History and Ecological Future

The construction of park cities is not only to beautify the urban environment but also to improve the quality of life of urban residents, and the transformation and development of old communities, as an important component of urban functional areas, is of great significance to improve the overall image of the city and the living standards of residents. At present, there is a certain contradiction between the construction of park cities and the development of old communities in China.

2.1 Unbalanced Resource Allocation

In the process of urban renewal and development, the construction of park cities often becomes the focus of urban planners and social capital because of its green ecological characteristics and leisure and entertainment functions, attracting more resources and investment. However, the development of old

communities is often neglected, and there is a lack of sufficient resources and attention, resulting in the uneven allocation of resources, the gradual deterioration of the infrastructure, environment, and living conditions of the communities, and the roads, drainage systems and power supply facilities of the old communities are inadequate and gradually aging due to disrepair; green space is scarce, public activity space is insufficient, environmental problems are becoming more and more obvious, and the community style and the quality of life of residents is seriously affected. This unbalanced development trend not only leads to the unfair allocation of social resources but also aggravates the uncoordinated internal structure of the city.

2.2 Land Use Conflicts

The growth of cities often comes with a large demand for land resources, especially in the process of creating park cities, which can mean that some existing land must be expropriated. At the same time, historic neighborhoods are often located in the heart of the city or in easily accessible locations where the value of land speaks for itself. Therefore, how to ensure that there is no conflict between the construction of park cities and the development of old communities while making efficient use of land resources has become an urgent problem to be solved. This requires not only the foresight of urban planners to balance the two with innovative perspectives but also to find a delicate balance between preserving the historical context and promoting urban regeneration. Only in this way will we be able to modernize our cities while preserving the communities that carry our historical memories and cultures and allowing them to coexist in harmony with the modern urban landscape.

2.3 Cultural Inheritance and Urban Renewal

The old town is often a place where the history and culture of the city are accumulated, where every brick, tile, street, and alley bears the stories of the past and the imprint of the times. However, in the process of rapid urban development, these old communities full of charm have unfortunately been marginalized and even faced the fate of abandonment or destruction. Such a situation not only results in the loss of many precious cultural heritages but also threatens to cut off historical continuity and weaken the diversity and richness of urban culture. Therefore, in urban planning and construction, we should pay more attention to the protection and rational use of old communities so that the historical context can be continued and the soul of the city can be inherited.

Therefore, how to balance the development of park cities and old communities and realize the rational allocation and utilization of resources is an important issue that every city must face and solve in the process of pursuing modernization. In the park city, the "park" is no longer a public green space dotted with urban and community spaces in the traditional sense, but a global, continuous, and accessible blue-green space system is established as the basis for the construction of the park city, forming a networked group layout of urban and green space integration (Dai, 2020). This means strengthening the greening, beautification, and purification of the community, paying attention to the fine design of the street space, and promoting the overall landscape construction of the community so that community residents can feel the existence of natural beauty everywhere in their lives. The construction of park cities and the renewal design of old communities should coordinate and cooperate to form a planning and construction model of park communities, realize the full coverage and sharing of park cities, and build a better living space that people yearn for.

3. Case Studies: Integration and Renewal of Park Cities and Old Communities

A good community park can meet the diverse needs of residents, and it will bring something to the residents spiritually. It may be about natural ecology, or it may be about regional culture, which requires us to explore and create (Table 1).

Table 1. Comparative analysis of design cases related to the integration and renewal of parks and old communities in China.

Case Name	Xinhua Road pocket park	Meifeng Community Park	Caoyang Centennial Park	Micro-landscape design of Xiaobao Village, Songzhuang Town
Case location	Shanghai	Shenzhen, Guangdong	Shanghai	Beijing
Design concept	Through the power of space, people can be separated from busy urban life and immersed in a quiet natural garden where they can stroll, sit, watch exhibitions, and enjoy flowers.	Based on the principles of "openness, ecology, and diversity," the site and surrounding areas are systematically sorted out place.	A multi-level, complex pedestrian experience community park, introducing the concept of a "3K" gallery to integrate art into daily life.	Serve the community, integrate art, and face the future.
Design method	1)Mirror stainless steel system. 2)weathering steel entrance. 3)plant system.	1) "Open" – removing walls opens up the boundaries of the park and establishes accessibility to city streets and neighborhoods. 2) "Ecology" - destroy the existing reinforced concrete floors, let the land breathe again, and establish an ecological landscape base. 3)"Diversification" - improve the park road network and basic service facilities, consider the surrounding users to set up children's play venues, terraced squares, Cultural exhibition corridors and jogging trails, and other diverse leisure and entertainment facilities (Zizu Studio, 2021, pp. 62-67).	1)excavating the site context. 2)constructing spatial scenes. 3)reshaping the street green network.	1)The main element of the design is a perforated gray brick wall with concentrated seating in designated areas, alternating with perforated weathering steel. 2)To the rear is a green area filled with pine trees and shrubbery, which form a natural buffer into the car park and can be accessed through various hidden passages.
Design highlights	The mirror system is rotatable; it is full of natural wildness; the weathering steel material is historic; through the reflection of the mirror, it forms a	Use low-cost landscape; design rich vertical aspects to create diverse activity spaces.	Reuse of remaining space; three-dimensional extension of the narrow site; random combination of ten sets of scenes.	There is a "living room" node every 100 steps to create a space for people to stay. Each node has a theme, and pedestrian trails connect the nodes to form a pleasant

	certain reminder to avoid becoming an urban crime space.			walking experience.
Comparison diagram				
	Before updating design			
	 	 	 	 
	After updating the design			

The above pictures are all from www.archdaily.cn.

Based on the above case analysis, it can be seen that China's old communities currently have clear boundaries between parks and communities, which are separated from the urban environment; functional supporting facilities are incomplete and lack maintenance; environmental problems ignore the connotation of ecological nature; cultural loss and lack of "place spirit," the residents' participation level is low, and their enthusiasm for participation is not high. In the context of population aging, there is an insufficient supply of age-appropriate services, and the renewal of age-appropriate services has just started. But at the same time, China has begun to adopt diversified practices in urban community renewal design, such as introducing mass participation, protecting historical features, paying attention to biodiversity, etc., aiming to create a more harmonious and livable urban space.

In terms of audience, community parks mainly serve community residents, the elderly, and children. At the same time, it can also attract residents of other age groups, such as young and middle-aged people, families, etc., who can relax and enhance relationships by engaging in sports, picnics, photography, and other entertainment activities in the community park.

In terms of spatial layout, most of the existing cases have chosen to remove the walls, thereby opening up the boundaries of the park and establishing accessibility between the park and urban streets and communities. The spatial layout within the park agrees that functional zoning and landscape effects need to be considered, and various activity venues, leisure facilities, green vegetation, etc., need to be reasonably arranged to meet the needs and preferences of residents of different ages and hobbies, and to reflect the principles of humanization and aesthetics, creating a comfortable and beautiful public space.

In terms of functional zoning, according to the needs of the audience, it is divided into quiet rest areas, recreational activity areas, sports and fitness areas, recreation areas for the elderly and children, etc. The setting of functional zoning needs to fully consider the diverse and individual needs of residents, making the park a comprehensive space that satisfies different functions and emotions.

In terms of landscape design, eco-friendly, green, sustainable, site-memory materials or unique local geological landscapes are used as the entry point, and measures are adapted to local conditions. For example, local rocks, rivers, lakes, vegetation, etc., are used to create a natural and harmonious landscape, which not only retains the regional characteristics but also increases the beauty of the park and improves the ecological value of the park. The selection of materials should be consistent with the theme and function of the park, reflect the park's innovation and responsibility, and create a green and sustainable public space.

In terms of ecological construction, technologies such as sponge cities, rain gardens, and bioretention are used to collect, purify, and utilize rainwater in the park, reduce runoff and pollution in the park, and improve the water circulation capacity of the park, pay attention to the seasonal changes and plant configuration of the park, create a rich level and change of the landscape effect, enhance the park's ornamental value and interest.

In terms of social culture, different combinations of urban space and entertainment and leisure facilities will form unique urban "scenes," and these different urban scenes contain specific value orientations (Silver, Clark, & Navarro Yanez, 2010, pp. 2293-2324). This value orientation attracts different urban groups to participate in activities and consumption practices, thereby injecting new vitality into the place and promoting regional development. Therefore, scenes are not only consumption, practice, and activity symbols of cultural value in urban space but also an important part of urban space (Deng & Liu,2021, pp.452-467). It fully explores and displays the park's historical culture and community characteristics, enhances the park's cultural connotation and place spirit, and enhances the park's sense of identity and belonging (Zheng, 2023, pp. 286-287). For example, combining the functions and landscape of the park, and setting up some cultural elements that can educate, inspire, and inherit, such as historical and cultural displays, folk activities, etc., make the park a platform for disseminating culture and knowledge. This will increase the participation of community residents, the vitality and interaction of the park, and make the park a platform that promotes community harmony and development.

4. Evolving Design Thinking: Integrating and Updating Park Cities and Old Communities

Integrating and updating the park city and the old community is to introduce the concepts and methods of the park city based on retaining the history, culture, and community characteristics of the old community and carrying out all-around space, function, landscape, ecology, and social development. Through transformation and other aspects, we can realize the transformation and upgrading of old communities and improve the quality of life and happiness of community residents (Figure 2).

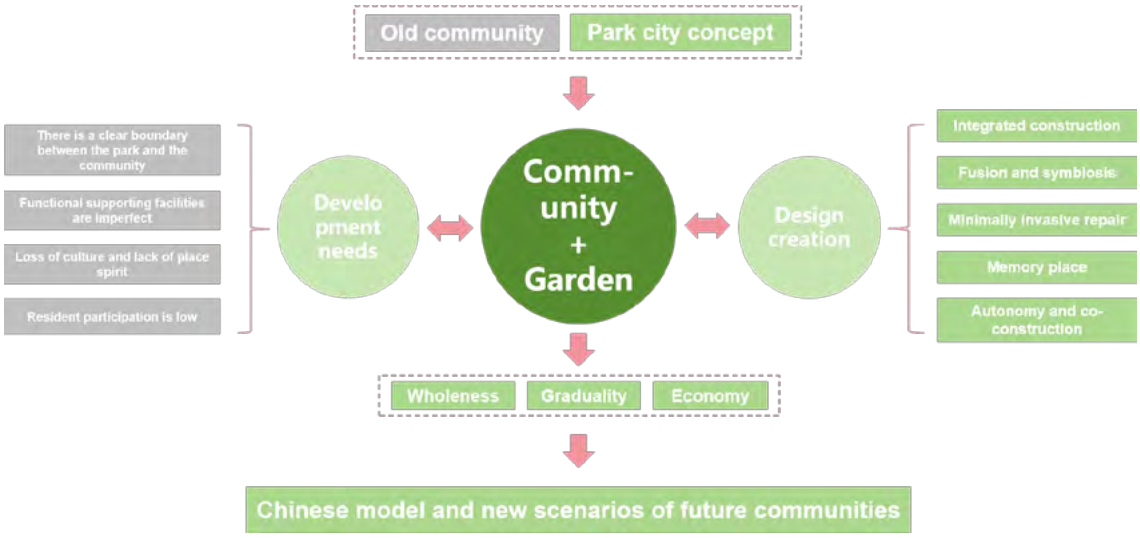

Figure 2. “Park + Community” design thinking (drawn by the author).

With the old community as the core, multi-level and multi-type community parks are organically connected, and around the spatial layout of park green space, community public service facilities, and community centers, an innovative "park +" spatial layout model is constructed, following the principles of integrity, progressiveness, and Economic design principles promote the organic integration of park form and community space, break the rigid functional separation of the community, innovatively use park green space to sew and penetrate the functional space of the community, amplify the landscape effect of the park community, and actively create urban green and An organic blend of landscapes for community spaces.

5. Design Strategies and Experiences: Integrating and Renewing Park Cities and Old Communities

Old communities are important witnesses of urban historical development and one of the main manifestations of urban historical context. Its spatial structure, street texture, history and culture, and other aspects of the form are all products of the development of the times (Zhu, 2023, pp. 102-104).
The foundation of the old community renewal strategy is to follow the concept of "people-oriented," which means returning to humanistic participatory and temperature governance. In the renewal of old urban communities, the subjective initiative of residents, the subject of renewal, must be given full play. Based on this, an operating mechanism of "co-construction, co-governance, and sharing" was established (Zhang, Wu, Yang, & Yan, 2023, pp. 95-103). Therefore, the renewal design of old communities requires the cooperation of governments, planners, residents, and other parties. All parties need to use a careful attitude to preserve the historical context of the old community as much as possible. At the same time, the occupied public spaces and abandoned spaces are designed through consultation to eliminate potential safety hazards, increase available landscape space, and create a good living environment for community residents.

5.1 Integrated Construction

1) Expand the area of green space by demolishing illegal buildings, using gaps to plant greenery, and opening fences. According to the provisions of the Property Law of the People's Republic of China, the public green space of the residential community belongs to the owners of the common ownership. Private encroachment on green space destroys the sharing of public green space and affects the quality of public space in the community. Therefore, legal demolition measures should be taken to restore the original green space. In addition, small green belts and miniature landscapes can be set up in the fragmented gray space at the corners of the community to transform and upgrade the inefficient and negative hard landscape.

2) Construction of roof gardens and the addition of vertical greening (Tan & Ma, 2021, pp. 360-369). Low-rise community buildings or roofs that can be roofs of people, retain the original function, improve the efficiency of roof space utilization, implant drying areas, supplement living facilities, implant activity areas and rest areas, and provide public communication spaces. Flexible reserve activity space to meet the diverse needs of residents, guide residents' activity space to the roof of the building, guide community residents to build a rooftop environment, give vitality to the space, and refresh the city's "air appearance." At the same time, by planting climbing plants, hanging flower pots, setting up green walls, etc., the three-dimensional greening effect of the city is increased, the urban landscape is beautified, the urban climate is regulated, the noise Is Isolated, the dust is”abso’bed, the quality of life of urban residents is improved, and a healthier and more comfortable living environment is created for residents.

3) The global COVID-19 epidemic that broke out in early 2020 caused community residents to pay renewed attention to environmental issues in public spaces. After experiencing a long period of isolation, people are more eager to get closer to nature and socialize with others. Therefore, in the design of park space, the alternative medicine system constructed by Japanese researchers can be combined to integrate exercise therapy, horticulture therapy, and forest bathing therapy (Harper, Fernee, & Gabrielsen, 2021), etc., with community park green spaces to achieve a certain healing effect. On the one hand, park green spaces can cool down and humidify, provide negative oxygen ions, and have the function of purifying air, water, and

soil, which is conducive to enhancing individual immunity, thereby reducing the spread of diseases. On the other hand, park green spaces can shorten the distance between people and nature and between people, calm the mind, and help promote the healthy development of individuals' physical and mental health.

5.2 Integration and Symbiosis

We shall give full consideration to the action care of the audience and employ behavioral scene theory to observe the activity characteristics of community residents in different years. Behavior setting believes that residents' activities have clear and definite spatiality and that specific places and people's behaviors are inseparable ecological integral units (Proshansky, Ittelson, & Rivlin, 1976). To analyze the interactive relationship between non-individual behaviors and environmental characteristics, A theoretical approach is provided. According to the behavioral needs, life needs, activity needs, and spiritual needs of residents of different age groups, reshape the green space with refined design and humanization. Through research, it was found that most of the residents in old communities are elderly and children. Therefore, in the community renewal design, attention should be paid to improving the walking environment, smoothing the road network, enhancing the accessibility of facilities, and adding barrier-free facilities, rest seats, handrails, etc. In age-friendly facilities, the activity spaces for the elderly and children should be arranged adjacently to create an activity venue shared by "elderly + children" intergenerational integration and multiple subjects. Design children's activity facilities with high safety and fun to achieve flexible integration of different types of facilities (Zheng, 2023, pp. 126-128); through active social participation and intergenerational activities, we promote equality and tolerance in the social environment and reflect socialist humanistic care value orientation and institutional advantages.

5.3 Minimally Invasive Restoration

Through field research, it was found that a large number of illegal buildings in the old community have seriously squeezed the public space in the community and infringed on the public rights and interests of residents, so it is necessary to coordinate and communicate with multiple parties for these illegal buildings, and demolish them in time to restore the building texture (Zhu, 2023, pp. 102-104), expand the area of public space, eliminate potential safety hazards, and improve the living environment of residents. Given the aging degree of the building, the roof tile finishing layer, protective layer cracking, waterproof layer, thermal insulation layer, roof structure damage, and other roof problems caused by lack of effective maintenance are repaired and strengthened by necessary engineering measures. At the same time, the original chaotic attachments of the building façade, such as air conditioning, awning, water pipes, etc., should be sorted out, and the scale of the air conditioning unit and awning should be unified to maintain the harmony between the building façade and the overall environmental style.

5.4 Memorable Places

Maurice Halbwachs believes that memory is not personal but is influenced and constituted by the social environment and groups. Memory is social, and "collective" and "society" are the practical subjects of memory. Memory is a social construction and a collective behavior (Cai & He, 2023, pp. 112-116).
A community is such a "memorable place" that can carry the collective and individual memories of community members, linking the cultural history and memory of individuals and society and generating a "spirit of place" in the continuous interaction between community residents and community space. For example, the "Transition Museum" on Dinghai Road, Yangpu District, Shanghai, "presents" old memories through photography, object display, artistic creation, cultural and creative design, etc., leads people through the "memory corridor," and creates a building that belongs to Dinghai residents. "Memory Place" re-experiences the unique charm of the old alley and realizes the continuation of the "memory of the alley."

5.5 Autonomy and Co-Construction

The 19th National Congress of the Communist Party of China pointed out that the people's demand for "a better life" should be placed at the core of socialist construction in the new era, a new social governance pattern of "co-construction, co-governance, and sharing" should be created, and the construction of community governance systems should be strengthened. Including community public spaces, urban public space micro-renewal is a continuous and progressive process from planning and design to maintenance and management, and its core is public participation (Su, 2021).

Implement participatory renewal in which residents co-construct, share, and promote community co-governance. Through an organizational model that combines "top-down" and "bottom-up" and balances the interest demands of all parties, a new social governance pattern of "co-construction, co-governance, and sharing" can be achieved (Zhang et al., 2023, pp. 95-103). Coordinated by planners and with the participation of governments, social organizations, and residents (Figure 3), participatory green spaces such as community parks and pocket parks are constructed. For example, in Shanghai's long-term series of micro-renewal activities for old community parks, community parks are designed, constructed, managed, and maintained through government funding guidance, professional guidance from social organization planners and designers, and residents' voluntary organizational participation, not only promotes communication and interaction between neighbors but also improves residents' active participation in community public affairs. The positive interaction of residents' autonomy promotes the sustainable renewal of the community (Kuang, Huang, & Lu, 2021, pp. 14-19).

Figure 3. Multi-party collaborative governance relationship diagram (drawn by the author).

6. Conclusion

In the process of urban renewal in the current stock era, how to stimulate the spontaneity and participation of social and community residents through space creation and social governance is an important part of community construction (Hou, 2019, pp. 23-27). This paper provides a comprehensive perspective on urban renewal and future life scene planning by delving into the interweaving relationship between parks and old neighborhoods. Through the in-depth understanding of the residents of the site and the cultural characteristics of the site environment, starting from the small space nodes, the design exploration is carried out according to local conditions, and finally, the overall vitality of the old community is stimulated, and the public space environment with cultural characteristics, economic rationality, and humanistic care is created.

The construction of park cities and the renewal design of old communities should coordinate and cooperate to form a planning and construction model of park communities, realize the full coverage and sharing of park cities, and build a better living space that people yearn for.

We hope that these findings can provide inspiration for urban planners, policymakers, and community residents and promote urban renewal to better meet people's expectations for livability, health, and sustainable development so that people can feel the atmosphere of the park at their "doorstep," further explore the implementation path of urban old community renewal in the new era of sustainable development, and contribute to shaping a more humane and eco-friendly urban future.

KEYWORDS | BEACH WELLBEING, OUTDOOR DESIGN, SEASIDE ENVIRONMENTS, DESIGN FOR SOCIALITY, INTERSPECIES DESIGN

ABSTRACT | This paper proposes the synthesis of an academic research which, starting from 2016, examines projects, products, services and researches considering seaside environments as strategic places to examine in an innovative way how models of social well-being converge and change in relation of tacit, declared and emerging needs. The contribution intends to describe the role of design which, as a project science that integrates skills capable of generating and supporting development actions, offers concrete and unprecedented models of relationships, health, well-being, care of the body and the person when referred to the specific place. These actions are in some way to transform themselves into enabling and multiplying factors of social, community and intercultural connections. On the beach, therefore, the complexity of contemporary living is fully reflected: from the evolution of customs and habits to technological innovation; from economic to social changes; from ideological to cultural transitions. In addition to this, the beach context is notoriously characterized by the combination of natural elements, artefacts and rituals bound to the limits imposed by landscape protections in relation to the benefits of local communities, the beneficiaries of the sea coasts and the economic chains operating in the tourist-seaside sector. And it is precisely in this complex framework that those “devices” endowed with principles of coexistence between territory and people take shape, also in an attempt to balance the degree of anthropization of nature with bathing solutions which are able to consider new priorities and sensitivities. The beach environment also represents the close relationship between typology-service-user and how these changes over time. In this direction, the beach becomes a metaphor for the inhabited space in which man regularly brings together needs and interests. This is why, beyond leisure, well-being, relaxation, contact with nature, the beach reconstructs a multifaceted seasonally inhabited microcosm which draws from the city the idea of an expanded square in which public-private needs converge which welcomes and places for interpersonal, and in which relationships are tested in a dimension of sustainable opening. Among the design topics for the beach, it is possible to cite the continuous search for “models of harmony” between exposure of the body, social acceptance and natural elements; ecosystems sustainability; the appropriate use of inaccessible areas or “submerged beach” strips; spatial and urban regeneration; the relationship of the seaside system with territorial specificities, communities and local heritages; the entry of increasingly digital technologies; the updating and implementation of models of sharing and sociality between natural needs and personal needs; inclusiveness, interculturality and demographic changes; personal well-being and care also as access to the democracy of services; the new global health challenges. The selection of examples that will be described on an international scale will therefore have the task of representing how the beach habitat is a significant place to show the possible coexistence between anthropic activities and ecological emergencies such as to provide a map of good practices exemplifying a progressive culture which has as its objective a concrete regeneration of the seaside environment.

1. Introduction: From Healthcare to Wellness

From a methodological point of view, this contribution proposes a speculative reading carried out through case studies selected as models of good practices and as such representative of some areas of the product-service relationship in which values and solutions can be identified that belong to a kind of "new bathing culture."

These are selected examples of which strengths or weaknesses were not voluntarily analyzed in a strict sense but assumed to outline a kind of phenomenology of merit to which to give the task of outlining an overall frame of reference to represent the complexity of design phenomena that are traced on the beach environment between well-being, sociality and sustainability. Therefore, it was – not of the historical examples – primarily to form a kind of "empirical-speculative mapping" for a subsequent "mapping of practices," that is, to offer "gateways" capable of leading us among some of the most emergent traces of the "Spiaggiaverde" research.

The beach, in the classical tradition, is considered a mystical place, a line of contact between the land and the mysteries of the sea, a boundary between the solid and liquid worlds, and moreover a territory of the 'advent of life', but, moreover, an unpleasant, anxiogenic and dangerous area. The forerunners of this change of perspective are some French poets (e.g., Théophile de Viau, Tristan l'Hermite, Saint-Amant) who, from the beginning of the 17th century, "celebrate the ineffable joys of lurking on cliff tops, walking along the sandy shores and observing the changes in sea water" (Corbin, 1990). In this period, the beach gradually becomes a place of meditation and landscape contemplation; a natural environment - appealing to both Enlightenment and Romanticists - in a "subtle balance" between hermitic retreat and urban hubbub for which it is nevertheless preferable to be attended by "some particular person with whom to communicate in order to avoid the tedious solitude and oppressive multitude" (De la Hoguette, 1648).

Apart from a few exceptions, until the 18th century, the attraction to the properties of bathing did not yet possess the widespread character that we recognize today. However, the useful dimension of the beach comes to the fore and is concretely defined: its 'tranquility' as opposed to the pollution and noise of northern European cities, coupled with the promotion of medical therapies praising the beneficial effects of fresh bathing and salty air, makes coastal resorts 'desirable spaces' within a few decades. In fact, seawater began to be attributed curative properties in the same way as thermal water. In the mid-1700s, British coastal towns such as Scarborough, Brighton, Margate and Weymouth began to structure themselves to attract wealthy people who had the opportunity to indulge in seaside holidays to cure themselves of tuberculosis, asthma or simply regenerate from increasingly crowded and polluted urban environments. There was, in essence, a need to equip the beaches with support services for holidaymakers to make bathing comfortable, safe and, above all, compatible with the sense of decency and social rules of the time. In fact, undressing in public or showing oneself in a swimming costume was considered improper. It was also inappropriate to jump, run along the beach, or 'fool around in the waves' (Spurrier, 2008). Surprisingly, at least until the Victorian age, it was considered permissible to bathe naked, but always with health rather than a recreational or sporting purpose in mind, i.e. to dive briefly in the absence of the opposite sex and preferably in conditions of maximum isolation from potential prying eyes. In order to make this 'medical ritual' (Chase, 2005) adhere to the customary requirements of the Edwardian age, so-called bathing machines were developed: wooden and fabric huts mounted on mobile wagons (privately fitted out or rented) that were pulled into the sea like sedan chairs, often with the help of horses or by means of winches and mooring ropes.

Figure 1. A perspective view of Scarborough, John Setterington, 1735.

The first known representation of cabins on wheels appears in an engraving by John Setterington in 1735, but it was in 1750 that Benjamin Beale developed a model equipped with ladders, a small window and a fan-shaped awning (called a modesty hood) to safeguard the privacy of holidaymakers while bathing. This provided bathers with a means to cross the beach and a space to change and store their belongings (Darcy, 2020).

2. Not Only Leisure

Generally speaking, it is therefore possible to consider modern seaside tourism as an invention 'prototyped' and developed in British coastal cities and then, throughout the 1800s, extended across Europe to Normandy, south-western France, Italy, areas of Scandinavia and northern Germany. A tourist model capable, from time to time, of adapting to the different conditions of the context in which it is welcomed, implemented by the cult of health and sociality, as well as enriched with increasingly complete and complementary services declined in recreational, relaxation and entertainment components. The first architectural structures that were to be the forerunners of modern establishments were called 'kursaal' (treatment rooms), but, despite their name, they are very different spaces from simple places for treatment. Instead, they are large spaces offering, in a general way, both regenerating and socializing activities: social entertainment and various services including dance halls, restaurants, bathing and spa services, reading or relaxation rooms, games rooms, and theatres. Even in their earliest developments, they are primarily mundane and elitist places that involve strolling along walkways (pleasure pier) with the sea as a backdrop, while bathing in the sea is a self-defeating pleasure at first sight due to the 'brutal' immersion envisaged as a kind of shock therapy similar to a spa. Ultimately, "the beach has gone from being a source of food and a place where journeys begin and end, to a place of fun and recreation" (Weaver, Oppermann, 2000) and, over the years, from being a place for simple, practical relaxation to an area organized and spread out over twenty-four hours for an increasingly broader concept of personal 'care' and socialization (La Pietra).
The idea of 'leisure as compensation' (Löfgren, 2001)) developed in the industrial society of the 19th century. A 1903 guidebook for promoting tourism in the Catskill Mountains (USA) supports the following thesis: “We need change, we cannot live by monotony or systematic routine. Each of the five senses needs a new diet and a change of regime. This is not possible in the atmosphere or horizon of one's own city, even if one stops working or doing other activities completely. Everything has to be changed: the air, the environment, the room. The food. The people we meet, the sounds we hear; to detach ourselves from the rest and secure the desired benefits.” (Hendricks, 1903) The desire to possess the beach spread in the European continent from the first decades of the 19th century. Even if timidly: 'bathing still consists of a quick dive, you "catch

the wave", you breathe iodine, but you don't swim. The swimming costume is an invention of the 20th century and only after 1920 did one lie in the sun' (Boyer, 1997). Throughout the 20th century, and especially after the Second World War, innovations were experimented in bathing environments all over the world, capable of solving the various technical contextual criticalities and evolving needs, customs and models of both individual and collective well-being.

3. Individual Wellbeing

Due to the general aggressiveness of seaside environments (sunshine, exposure to winds, salt, strong thermal variations), solutions for individual protection are necessary, understood as a mediation between the pleasantness of exposure to natural and meteorological elements and the possible discomfort caused by them. A historical type of bathing furniture born precisely from the search for this balance is certainly the so-called 'strandkorb' (Potthast, 2024). Such seats, for private use, have been known since the 16th century in Hamburg (1595), Lübeck (1611), Bremen (1648) and Cologne (1773). The first real single-seater strandkorb (literally 'beach basket') did, however, make its appearance in 1882 and was made by Wilhelm Bartelmann, a basket-maker from Rostock, for Elfriede von Maltzahns, a lady suffering from rheumatism (and therefore particularly sensitive to the cold wind) who often went on holiday to Warnemünde. The strandkorb comes in two main variants: the first is in the shape of a chest with a straight cover and drawer footrest, used mainly on North Sea beaches; the second is in the shape of a basket with a rounded wicker cover, used mainly on Baltic Sea beaches. In both cases, the main feature of these bathing chairs is the high canopy back that provides cover and protection from wind, sun and rain. The use of the strandkorb began to spread after Bartelmann's wife, Elisabeth, opened a bathing establishment near the Warnemünde Lighthouse in 1894 where, for the first time, seating was offered for hire. Elisabeth, as well as understanding and publicising the use of these seats/cabins as a bathing service, encourages her husband to develop the project further. Bartelmann then designed the two-seater version with a canopy, footrests and side folding tables. Felix Schneider in 1893 patented a model that could be folded and transported as a kind of large picnic basket. Then, in 1897, Johann Falck, Bartelman's previous collaborator, improved the mechanical system for opening and adjusting the backrest, defining the model that is still in use today.

Figure 2. Strandhotel U. Kaiserhof, Rudolf Jahn, Borkum-Dresden, 1899, postcard.

In 1820, the British surgeon and paleontologist Sir Everard Home conducted the first scientific studies on the effects of sun exposure on skin burns. The first sunscreen with a chemical composition was formulated experimentally in 1891 by the German Friedrich Hammer. The association between skin cancer and prolonged exposure to sunlight was then discovered in 1894 by two separate studies. In Germany, Paul Unna observed degenerative changes on exposed areas of sailors' skin and, in France, William Dubreuilh, Professor of Dermatology at the University of Bordeaux, analyzed the incidence of actinic keratoses and skin cancers in vineyard workers (Ma, Yoo, 2021).

Despite these important discoveries, the invention and clearance of bathing within a few decades 'freed' bodies, making exposure socially accepted in much of the world. After the First World War, summer sunbathing began to be fashionable and, widely, synonymous with affluence, beauty, availability of leisure time and good health, and no longer a symbol of poverty and toil. Until then, in fact, it was mainly fishermen and farmers who had dark skin. In 1935, French chemist Eugène Schueller, founder of the brand L'Oreal, formulated the radiation-filtering lotion 'Ambre Solaire Huile'. In 1956, the German physicist Rudolf Schulz introduced the concept of the sun protection factor (SPF) (Svarc, 2015). Until then, the real effectiveness of sunscreens was only suggested or simply promised by the slogans and images of increasingly uninhibited advertising posters. In essence, however, the first preparations are not very stable, do not resist water and only protect against UVB radiation, the main nuisance of which is erythema.

Today, on the other hand, the common lotions provide protection against UVA rays and, consequently, are indispensable products for conscious and truly careful bathing to prevent skin melanomas. There are some interesting contemporary design projects that deal with sun protection in an alternative way to chemical cosmetics. For example, SUN+ (Rosso, 2018) is a research on shapes, artefacts, production processes and materials designed to protect in a 'physical' way from overexposure to the sun's rays. The Dutch designers Brecht Duijf and Lenneke Langenhuijsen, integrating the theme with a marked eco-environmental and systemic sensitivity, propose a study straddling product and fashion design that tackles the objective of testing possible alternatives to the use of sun creams that are potentially harmful to the skin and, moreover, require polluting production processes and distribution practices. Starting from historical research on traditional cosmetic solutions (such as, for example, the use of ash or natural dyes), Buro Belén subsequently directed its investigation towards different sunscreen solutions, including temporary shelters and, more generally, textiles. This led to the definition of a collection centred on the adoption of filters and fabrics of vegetable origin for the creation of wearable accessories and mobile tents capable of providing adequate sun protection. Unseen Sunglasses, for example, replace ordinary lenses with an ultra-light metal material that is filigree machined and colour-matched to different human phototypes. The particular micro-etching lets in a third of the sunlight; which is sufficient to guarantee adequate protection for the wearer's eyes, without inhibiting their vision. The Vitamin Hat, on the other hand, is a sisal fibre hat characterized by a flap so wide that it is able to shade the wearer's entire body, but without hindering the physiological production of vitamin D. Sun Veils are natural garments that wrap around the body, defining, by layering, different degrees of solar filtering. Prosol D is a beach umbrella with an asymmetrical cover made of a specific biopolymer fabric developed in cooperation with the Institute of Textile Chemistry and Textile Physics at the University of Innsbruck. Finally, the Shadecloth range includes different types of 'textile barriers', designed and treated to provide varying conditions of protection according to the different phases of an outdoor day. These solutions, therefore, experiment with the physicality of sun protection by offering solutions that are at the same time natural, sustainable and healthy.

Figure 3. Sun+, Buro Belén (Brecht Duijf and Lenneke Langenhuijsen), 2016.

One project, on the other hand, that introduces smart technologies for sun protection is the My skin track micro-device designed by Yves Bèhar (Fuseproject) to constantly monitor sun exposure and to promote a model of tanning aesthetics that is not detached from correct dermatological prevention practices. The small sensor, developed by L'Oréal's Technology Incubator in collaboration with La Roche-Posay and presented in 2018 at the Consumer Electronics Show in Las Vegas, measures and records the user's exposure to UVA and UVB rays, environmental pollution, pollen and humidity (McNeill, 2019). The device also provides immediate updates on a person's general health status, storing the collected data for up to three months. The battery-free sensor is activated by sunlight using the NFC (Near Field Communication) technology of the user's smartphone. The aim is to provide bathers with an easy-to-use, discreet and effective accessory for collecting and organizing useful information to increase awareness of their skin's well-being and thus be able to take preventive action against melanomas or other skin diseases. The device is resistant to water and overheating, can be stuck directly onto a fingernail and is equipped with a metal clip that allows it to be clipped onto a bathing suit. In an updated version, the technology of this small digital 'button' is being incorporated into an adhesive patch that can be applied directly to the skin.

4. Social Wellbeing

The second group of case studies collects initiatives capable of acting on the scale of the beach-space with actions capable of imagining for the context shared and, therefore, socializing times, themes and fruitions. The beach thus becomes an 'open square', a place of dialogue between residents and holidaymakers, an ideal and multifunctional space for 'being well together' and for hosting the functions of welcome, dialogue, culture and collaboration.

With the Bibliobeach project, for instance, Matali Crasset creates a pop-up library that transfers free book lending services to a seaside context in a temporary and light format. The structure exploits materials and construction systems typical of outdoor furniture: aluminium profiles, and colored canvas and mechanisms for simple folding. The result is a sort of "cultural isle" consisting of a central location for the operator, delivery desks and three rest areas where one can "immerse" oneself in reading while lying on large mats

and protected by appropriate shade curtains. The Bibliobeach thus decontextualizes and makes the use of common library services more friendly and informal, offering itself as a "satellite" opportunity to share the pleasure of reading.

Another peculiar case study is the Sci-Fi Hot Tub by Zoe Walker and Neil Bromwich (2006). This is an inflatable platform for experimenting with a model of an immersive and contemplative bathing experience in high nature-value lake settings. The inflatable island, shaped like an iceberg, is equipped with a heated pool that accommodates participants in a warm and comfortable condition as they float and 'sail' through sublime, but also potentially hostile environments. The contrast between this shared 'comfort zone' and the vast expanse of nature encourages, in the designers' intentions, confrontation and collaboration between users in an isolated, non-hierarchical context. This defines a playful-conceptual experience capable of fostering dialogue between people and a general state of physical and emotional well-being for users. The artists worked with researchers from the Phase One Drugs Trials Unit at Hammersmith Medicines Research. The medical team led by Dr Mark Down defined a scientific methodology to assess the relationship between the art installations and the audience. The project thus explores the emotional impact of an art experience on the well-being of its users (Walker, Bromwich, 2009).

Figure 4. Sci-fi Hot tub, Zoe Walker & Neil Bromwich, 2006.

The Festival Internacional de Benicàssim, commonly abbreviated simply as FIB, is, since 1995, an annual art and music event that takes place in the city of Benicàssim, in the Comunidad Valenciana, Spain. The program includes mainly pop, rock and electronic artists, as well as short films, fashion shows and art installations for public enjoyment. The festival is held in July and includes performance areas, camping and bathing areas. The beach area, during the days of the event, must therefore be able to fulfil many functions, absorb an exceptional load of users, and provide diversified activities at different times of the day and night. In 2013, a group composed of several Spanish designers united under the name Collectivo Desenfreno, realized a temporary installation on the beach using, with a ready-made approach, transennas, metal fences, lighting bodies and shading fabrics. Specifically, the project stems from the

analysis of certain contrasts and criticalities that occur on the beach of Benicàssim during the days of the event. The designers identified two main types of targets: the holidaymakers, i.e. the ordinary beach vacationers, and the festivalgoers or Fibbers, the music festival tourists who live at night while relaxing on the beach during the day. In order to adhere to the needs and expectations of these two complementary targets, and to create opportunities for socializing between them, the installation has been arranged to be, during the day, a lounge area equipped with hammocks, deckchairs and tables for free use. At night, then, it transforms into a lighthouse; a luminous totem serving as a point of reference and aggregation.

The Weltevree Strandtuin bathing pavilion designed in 2015 by Floris Schoonderbeek explores new ways of recreational enjoyment that are not limited to the passive provision of goods and services, but which, in a general sense of eco-social awareness, invite holidaymakers to play an active role in the functioning of the bathing space (Välk, 2019). The temporary pavilion is designed to be energy self-sufficient and to utilize, in a self-sustainable manner, all that the beach has to offer: the wind barriers are made of dunes, wood collected nearby by the users themselves feeds small ovens for food and stoves for heating the water for the two relaxation pools, solar and wind energy provide the electricity needed for lighting and cooling systems, and a local well provides fresh water. Food and drink are kept cold in the Groundfridge cell, which utilizes the insulating effect of the sand. The Strandtuin, in the designer's intentions, does not put the visitor in "a cottage overlooking the sea", but requires a collaborative effort thus making him feel part of and creator of the place. It brings him into direct contact with the elements of the context, making him a proactive subject in commensurate with them with a non-predatory attitude, but in search of a possible balance between nature and the pleasantness of using the seaside resort. The holidaymaker thus becomes a bit of a bricoleur, a bit of a maker, a bit of a romantic castaway and has fun, collaborating concretely with his peers, to create sufficient conditions of comfort and anthropization.

Figure 5. Slingswing, WMB studio, Winter Stations, Toronto, 2015.

Another unique initiative is the international Winter Stations design competition which has been held annually since 2015 in Toronto, Ontario, Canada. Participants are tasked with designing temporary winter installations that incorporate existing lifeguard towers between Kew and Woodbine city beaches. The structures, disused in the cold period, are considered anchoring and distribution points for installations that have the aim of encouraging the use of the beach even in the cold periods by both local and occasional users and allowing them to experiment with new models of interaction with a normally unwelcoming context.

5. Interspecies Wellbeing

Today, the need for strategies oriented towards introducing models of dialogue and interspecies collaboration is strongly emerging. They are needed solutions useful to redefine the role of the human race in relation to other living species (plants and animals) and, on a broader scale of impact, to face global environmental emergencies. These have to be new models of "pacts" in which human activities connected to bathing or, more generally, to the use of beaches and marine environments, are not in conflict with ecological needs. Human interventions, indeed, can activate processes of environmental regeneration which, at the same time, recover and strengthen habitats and develop new non-predatory and, therefore, sustainable touristic economies. They are interventions, therefore, which do not preclude nature from human enjoyment with the aim of protecting it and which actually are characterized by a high intrinsic level of technical complexity that necessarily has to be managed in a holistic and interdisciplinary manner.
In reference to this eco-social sensitivity, for example, it is possible to mention "Underwater sculpture" (Gocova, 2013), the artistic research conducted since 2006 by Jason deCaires Taylor. In collaboration with some marine biologists, the sculptor, using a neutral pH cement, shaped groups of human figures to give life to submerged installations acting as passive dwellings for the proliferation of several marine species. This project puts art at the service of the sea. These sculptural groups serve as a warning about the ecological duties from which man cannot escape as the guardian of a unique and fragile heritage. The enjoyment of these mutable and hybrid works by tourists equipped with diving masks therefore becomes a metaphor for the relationship between nature and artifice in the suspended grandeur of the depths of the sea; but above all it experiments with new possible ways to conceive a sustainable coexistence between anthropic development, cultural growth and the creation of a model of tourism that is aware and respectful of the environment. Another experience that combines ecological and social practices is the Reef Cells project developed by Christopher Xavier O'hare (USA) since 2005. The research develops modules designed for the maximization of biodiversity in the marine environment through the production of an artificial coral reef characterized by cavities interconnected and internal surfaces that recreate ideal habitats for the taking root of marine species. Thanks to the use of a particular fiber-reinforced cement and a manual manufacturing technique, it is possible to obtain thin surfaces and light blocks in which the ratio between the overall volume and the interconnected internal space compared to the quantity of material used and the minimum area of the occupied seabed is optimized. The dimensions, the irregular and rough shapes and the spatial organization of the internal voids are designed to obtain diversified modules capable of camouflaging and integrating with the ocean floor. The construction of the modules involves the creation of layers of free-form concrete "veneers" around a base with a column which guarantees rigidity and facilitates transport and lifting operations of the final structure. The modules are made manually with a simplified construction technique and are therefore practicable by volunteers from environmental associations. The project, for this reason, is a virtuous example of involvement and balance between local communities, environmental needs, scientific research and systemic development of the economies connected to bathing.

Another unique research in introducing universal priorities to the design of submerged beach use is the Sea Bathing Facility by Carlos Mourão Pereira (2007). It is an inclusive seaside path composed of a system of basins, walkways, seats and landing places designed to accommodate a wide range of users (children, elderly, blind, people with limited mobility) in conditions of safety, comfort and dignity (Ebrahem, Alsaadani, El Sayad, Elseragy, 2018). The direct contact with nature is facilitated and encouraged since the structure protects bathers from wave motion and, at the same time, defines small habitats in which marine life can naturally develop. These biological tanks thus become invitations to discover plant and animal

species in a multisensory and integrated way. Everything is made of recycled concrete, a material that meets functional, economic and ecological needs, as well as requirements for resistance to sea water. Furthermore, the basin system does not require a mechanical water filtering system because, thanks to its position and shape, it exploits the tides as opportunities for water recirculation and purification and "biological exchange" between basins and the ocean. Furthermore, this specific location "on the water's surface" is designed to encourage a seaside experience that is as symbiotic as possible with nature. This “accessible border” space therefore takes on a rich and specific multisensorial character. It is an adaptive place where wind and water interact in a mediated form with the coast, and therefore where anyone can enjoy the pleasant tactile, olfactory, acoustic and material sensations of the marine elements.

Econcrete (Sella, Perkol-Finkel, Rella, 2018), then, is an interdisciplinary macro-research which, since 2012, has involved biologists, ecologists, environmental engineers, designers and specialists in concrete technology for the creation of particular blocks for the stabilization of the seabed and the construction of coastal barriers. The modules, characterized by tube-like surface depressions, are made with a specific mix of chemically balanced concrete which guarantees a level of microporosity that favors the growth of organisms such as algae, oysters, corals or barnacles. These organisms act as an ecosystem nursery and as a biological glue, improving the strength and durability of the structures and, therefore, increasing their stability and longevity. The result is an intervention model and a construction practice that does not damage marine habitats but understands them and acts with them, facilitating the best conditions for the development of healthy and diversified ecosystems that are also capable of contributing to the quality and effectiveness of the infrastructure. The ECOncrete mix is up to 10% stronger than traditional concrete, with a 70% lower carbon footprint when used in combination with slag cement and is designed not to release particles into the marine environment. In recent years, pilot barriers have been installed in different natural and climatic contexts (temperate, tropical and estuaries) and in urban port areas. In few months, in different ecosystems it has been observed that the units manage to develop a high range of native species within them. These "living infrastructures" have now been adopted globally in green architecture projects in Spain, Holland, the United States of America, Israel, England, Germany, France and Hong Kong.

Figure 6. Econcrete, Ido Sella and Shimrit Perkol-Finkel, 2012.

Another international research and innovation center for the marine environment is the Reef Design Lab (since 2013). The Australian multidisciplinary company is specialized in the design of infrastructures for the development or support of marine habitats for commercial or research applications. The company collaborates with different types of marine researchers, including coastal protection experts, eco-engineers

and biologists. The studio was founded by industrial designer Alex Goad who leads a team based in Menton. The research group's overall work focuses on combining experimental materials and digital fabrication technologies with traditional coastal management techniques to create economically and environmentally sustainable solutions that respond to current and future ecological emergencies. The MARS project (2013), for example, addresses the critical issues of coral reefs due, globally, to ocean warming and acidification, destructive fishing practices, and the presence of invasive species. The project, aimed to create a nursery for corals, develops a three-dimensional and modular structure that can be transported by small boats and installed by divers without the aid of heavy machinery (to which many communities do not have access). The system can also be built in reference to local specific needs or recovery objectives. The modules are manufactured through 3D printing using a particular inert ceramic compound. The Living Seawalls project (2018) was developed in partnership with biologists from the Sydney Institute of Marine Science to test the possibility of making ecologically productive artificial coastal walls such as dams and barriers in ports or urban areas (Bishop, Vozzo, Mayer-Pinto, Dafforn, 2022). Normally these vertical surfaces are flat, continuous and free of cracks or surface textures. These conditions make their colonization by native organisms difficult. On the contrary, the project proposes a system of hexagonal concrete panels morphologically designed to encourage the development of a varied plant and animal microecology. The Wave Break project (2022), on the other hand, is aimed at improving a possible balance between marine habitat and tourist activities. Large porous bells, located near the submerged beaches, provide coastal protection, reduce erosion phenomena caused by the force of the waves, enrich the natural habitat, thus constituting a hybrid and dynamic attraction for snorkeling activities during the high tide phases and for naturalistic observations during low tide phases. The first modules were made with a mixture of ecological concrete mixed with fragments of locally sourced marine shells.

Similarly, the X-REEF project (XtreeE - SEABOOST, 2017) applies 3D printing processes for the creation of large concrete products to be used as ecological nurseries and for the restoration of coral reefs. Designed in collaboration with biologists, the dimensions, the shapes and the textures of the cavities were, once again, have been defined to maximize the reproduction of the underwater species. A first prototype was immersed in the Calanques natural park in France. The technology adopted, specifically, made it possible to recreate the morphological complexity typical of the so-called "coralligen". Coralligen is a marine bioconstruction, that is, a permanent structure formed by the stratification of some plant species that grow by accumulating calcium carbonate on the cell wall. This type of growth significantly increases the volume, complexity and heterogeneity of the marine habitat, attracting a large number of other animals and plants. Consequently, the coralligenous is a very biologically rich environment, so much so that it is considered the second most important biodiversity hotspot in the Mediterranean, after the Posidonia meadows. In nature, this peculiar ecosystem can take several hundred years to form and then gives shelter to thousands of living species including fish, crustaceans, corals, algae, plants and mollusks.

Another example of effective and sustainable collaboration between human intervention and biological needs is the Tetrapots project by Sheng-Hung Lee - Wan Kee (2014). Artificial sea defense infrastructures are usually composed of stacked breakwater modules of various shapes. These are considered highly impactful from a landscape point of view and, under certain conditions, not sufficient to counteract the continuous action of wind and waves. Mangroves actually perform the function of protection and mitigation between water and land in nature, but due to the greenhouse effect and global warming, it is estimated that more than 35% of this valuable plant has already disappeared. The Tetrapot cavities are designed to host and develop mangroves, thus generating a symbiotic relationship between nature and artifice. The roots of the mangroves will, over time, strengthen the bond between the modules by holding them in place and thus creating a more effective chain of shoreline protection. they will come together to create a long-lasting sea defence of growing trees and roots that help hold the blocks in place. As the plants continue to grow backwards from Tetrapot, the roots intertwine and gradually form a natural defence from the sea. The product thus not only prevents soil erosion but also helps to protect and create a natural habitat (Salam, Prasad, Noor, 2023).

In 2018, due to the destructive force of Typhoon Mangkhut, the city of Hong Kong lost about 80 per cent of its coral reef. Designers from the Robotic Fabrication Lab, as part of the Fabrication and Material Technologies Lab in the Faculty of Architecture, and marine scientists from the Swire Institute of Marine Science (SWIMS) in the Faculty of Science at HKU jointly developed a new method for reef restoration, using 3D-printed artificial 'tiles' specially designed to promote the rooting and, thus, proliferation of corals (Lange, Ratoi, Co, 2020). In July 2020, the field trial started with the installation of an area of around 40 square metres of terracotta modules prototyped by digital manufacturing. The test was conducted at three selected sites within the Marine Park, including Coral Beach, Moon Island and a sheltered bay near the WWF Marine Life Centre. Specifically, the modules promote the restoration of corals and various forms of marine microhabitat in general by providing a structurally complex and porous mesh for coral attachment and preventing sedimentation, a major threat to corals. The recent 3D-printed artificial reef designs present are site-specific and a universal solution may be difficult to calibrate, as there are various types of underwater conditions. However, a common denominator, pioneered by the Japanese team, can be considered the use of natural materials, i.e. capable of not altering the underwater flora and fauna. To this end, the researchers deemed clay suitable as it is chemically similar to the calcium carbonate found in real coral reefs.

Figure 7. 3D Printed tiles, Robotic Fabrication Lab, University of Hong Kong Faculty of Architecture, University of Hong Kong Swire Institute of Marine Science, 2020.

6. Conclusions

The analysis of these specific case studies demonstrates how much the beach environment is a complex microcosm in which they are experimented with sustainability issues centred on principles of well-being and sociality. These models of sustainability are entirely centred on an equally complex thought of anthropogenic and environmental regeneration that in confronting design culture brings into focus how much design space there is to fulfil and sustain social, economic, and technological needs in addition to those imposed by climate changes. Therefore, by selecting different experiences, objectives and geographies, the examples illustrated to highlight the strong relationship that insists between "natural heritage", "bathing context" and "design role" in different possible product-service combinations. That is to say, whatever design action is developed in the beach-sea relationship, it demands intelligent practices in the mediation between nature and artifice. For this reason, the beach, as a territory, represents a privileged place from which to observe the responsibility of the project in proceeding according to different and possible models of development and of an answer to evolving needs. In other words, a context from which to examine the responsibility of the project and designers in introducing appropriate regenerative actions. In this direction, among the project themes that most interpret these objectives, design culture has to face new challenges for ecosystem sustainability, for the appropriate use of impervious areas or of the "submerged beach" strips, for a renewed relationship of the beach system with territorial specificities, for the adoption of digital technologies, for the updating and the implementation of models of sharing and sociability between natural and personal needs; demographic changes; and personal well-being and care.

All together, these important topics show how the beach as a composite habitat is a significant place to show the possible coexistence between human activities and ecological emergencies. In the end, all that has been said so far spills over in a methodological key into the possibility that for designers the beach environment can be an "objective context" from which to examine the responsibility of the project and therefore of the designers in introducing targeted redevelopment actions. A redevelopment that can - not without risk - test the reconciliation of different objectives also from playful activities capable of dialoguing with the social dimension and environmental sustainability. To be consequently open to experimentation, to the unexpected, to the reversibility of the result in the certainty that design is a "heteronomous" discipline because of the uninterrupted relationship and dependence it has with other knowledge (interdisciplinary vocation). This awareness enables design and designers to move beyond a "simple" problem solving model to a "consciousness of reality" that requires designers to constantly understand that it is never about making products or services but deploying effects in the world.

ABSTRACT | The aim of this paper is to describe the collective engagement and design approach adopted inside a European technology-enhanced ambient assisted living project, aimed at supporting the autonomy and self-management of health of the older people, through the use of innovative technological devices. The collective design methodology adopted in the research, including interviews, sharing sessions, co-design workshop and affinity diagrams, aimed at investigating the concept of Active Living with a mixed top-down and bottom-up approach, by combining theoretical definitions with user perspective for deriving scenarios and functionalities to stimulate older people. The following factors of Active Living were identified as the main dimensions of older people's experience: (a) empowerment, (b) perceived self-efficacy, (c) autonomy. This research allowed us to discuss and reconsider these dimensions and to propose novel factors for defining Active Living as an emerging experiential and interactional reality consisting of a balance between the personal sphere and the relational one. Technology acceptance and adoption play a fundamental role in supporting patients with mild cognitive impairment disease (MCI) when technology is designed, and perceived, as a tool that facilitates self-determination.

1. Introduction

The population is gradually ageing, with global life expectancy increasing by more than 6 years between 2000 and 2019, from 66.8 years in 2000 to 73.4 years in 2019. In addition, it is estimated that in 2050 more than 20% of the population will be over 60 years old (World Health Organization, 2015). For these reasons, interest in ageing is growing: despite improved living conditions, increasing life expectancy in fact brings with it challenges, related to physical and cognitive deterioration (Inouye, Studenski & Tinetti, 2007). A particularly problematic cognitive-related expression of ageing is dementia. While not totally disabling in most cases, the various forms of dementia still negatively affect a person's health and quality of life. Dementia sufferers are particularly exposed to social isolation (Hackett, Steptoe, Cadar & Fancourt, 2019), depression (Ong, Uchino & Wethington, 2016) agitation, apathy and anxiety (Cerejeira, Lagarto & Mukaetova-Ladinska, 2012). In addition, dementia is also associated with an increased likelihood of falls, difficulty with self-care and social relationships, and memory problems (Miranda-Castillo, Woods & Orrell, 2010; Wilcox, 2009).

Dementia in older people can be considered as the last step in a slow process, ranging from normal cognitive decline due to aging, to mild cognitive impairment (MCI), to full-blown dementia (Jongsiriyanyong & Limpawattana, 2018). Faced with this scenario, some solutions are needed in order to be able to intervene early, as soon as the first signs of cognitive decline emerge, so that the older person can remain autonomous and independent as long as possible and delay the progression of deterioration, supporting them in all those activities that are impaired (Sosa et al., 2012).

It is in this context that the present research is set. The research aims to ensure the well-being of people with mild cognitive impairment by supporting their autonomy and self-management through the use of an innovative modular mobile App, that delivers coaching services related to nutrition, physical activity, cognitive exercises, and social relationships. The system is thought to help older people with MCI to become more resistant to the changes the old age brings and take better care of themselves.

The technology is designed as an open, modular, and adaptable platform to provide self-management and coaching services to people with MCI, integrating informal and professional assistants as needed, to be used independently or in combination with lifestyle monitoring systems or wearable devices on the market. The approach used in this research is a user-centered one, that is, based on end-user participation at all stages of design in order to adequately address the needs of target users, ethical and cross-cultural dimensions, and to monitor and validate the psychosocial impact of the technology (De Vito Dabbs et al., 2009). Indeed, it has often been noted that people with mild cognitive impairment or other similar diagnoses are often not included in research (Chopra, 2021) and data collection comes from the field of caregiving, while instead “to give voice to people with dementia and increase their level of empowerment even in research processes, it is important to include them as valued participants. Therefore, public and patient involvement (PPI) and co-production, especially in an interdisciplinary health care and design context, is important to bring together, adapt, adopt, amalgamate, and develop appropriate methods to facilitate people with dementia as active partners in every stage of research” (Niedderer et al., 2017).

2. Active Living Framework

In line with the healthy aging definition that focuses on the optimisation of opportunities (Swedish National Institute of Public Health, 2007) a multidimensional concept has been used for the design of the system, based on the meaningful integration of five main elements:

- healthy nutrition;
- daily physical exercise;
- regular cognitive and mental activities;
- maintaining social contacts inside and outside the family;
- keeping an active interest in society.

Such elements are tightly interwoven since maintaining good physical health and functioning plays an important role in facilitating mobility and enables older adults to perform more integrated functional tasks which include activities of daily living, fulfillment of social roles, and recreational activities. Furthermore, good cognitive health is linked to social connectedness, independence, and life activities, and it might be preserved and enhanced by maintaining an intellectually engaged and physically active lifestyle (Halaweh, Dahlin-Ivanoff, Svantesson, & Willén, 2018; Bourassa, Memel, Woolverton, & Sbarra, 2017).
We identified the following factors as main dimensions of older people's experience:

- empowerment;
- perceived self-efficacy;
- autonomy.

2.1 Empowerment

The notion of empowerment (Perkins & Zimmerman, 1995) is foundational in our approach since it does represent the overall scope of an intervention. The empowerment is a multidimensional concept constituted by several components including supporting older people to keep their current levels of mental functioning; by preventing possible decay in cognitive and social skills; by coping with adverse events and negative experiences; and by exploiting latent resources (Mitzner et a, 2010). That is why, in order to empower older people to live independently, designers should make sure that older people can adapt and configure devices according to their personal circumstances in a way that their independence can be supported and be constantly renegotiated (Giaccardi, Kuijerb & Nevenc, 2016; Giaccardi, Nicenboim, 2018). Renegotiation of self-image may support the idea of iterative empowerment pathways as structured, organized and goal-oriented paths for a healthy population integrating multiple levels of skill-support.

2.2 Perceived Self-Efficacy

Self-efficacy can be defined as a personal judgment of ‘how well one can execute courses of action required to deal with prospective situations’ (Bandura, 1982). In general, individuals with high perceived self-efficacy are determined and show more effort across a broader range of tasks than people with a lower level of self-efficacy.

Staying active is reportedly connected to self-efficacy since it implies good physical functioning and the ability to autonomously reach a goal. It has to be noted that decreased levels of self-efficacy, resulting from low levels of exposure to related stimuli, are also associated with higher levels of anxiety and this is particularly relevant in the interaction design for the elderly.

2.3 Autonomy

Staying independent was viewed as a major characteristic of ageing well. Beyond the participants' living status (alone or with family), the importance of being independent was connected with the autonomous status of the older adults. A major concern that was frequently mentioned in the user research was not being or becoming a burden to others. In particular, along with the interactive discussions in all groups, target users involved in the user research reflected on the necessity of staying independent in performing their daily life activities including both personal and instrumental activities.

We have used the Active Living components to analyze, understand and interpret the findings from the empirical research on users by investigating:

- How the users might confirm, integrate and expand the definition?
- How the users’ perspectives might allow the researchers to disentangle this concept?
- How the users’ concerns, motivations and internal experiences might enrich the design of the interactions?

3. Research Methodology

The research and design methodology developed in the project integrates methods and techniques from a broad range of disciplines, from ethnography and psychology to Design research and Participatory design. The research methodology adopted in the research involved 41 participants (both people with and without a diagnosis of MCI) from Italy, Switzerland, the Netherlands and Canada in user research and design materials explorations and 6 expert participants including researchers and scientists from clinical psychology, interaction design, and technology development.

The following table shows participants numbers, divided by the activities carried out in each country, and the paragraph below reports the description of the activities:

Table 1. Participants involved in the study.

Activity	Scope	Italy	The Netherlands	Switzerland	Canada
Interviews	Collect qualitative data about “Active living” meaning	10 participants	10 participants	4 participants	/
Evaluation of Envisioning Scenario in participatory sessions	Define system future User Experience and functionalities	4 participants	5 participants	/	3 participants
Exploration of digital materials in Co-design sessions	Validate task flows and design solutions defined, by using interactive mockups	4 participants	/	/	/
Affinity Diagram	Requirements elicitations	2 experts	1 experts	1 experts	2 experts

3.1 Interviews and Sharing Sessions with the End-Users

Interviews have been carried out by expert partners able to establish a relationship of trust and reciprocity with people of concern, to use an appropriate language, a participatory approach and to keep in mind cultural markers and to manage any vulnerabilities. Through interviews, experts have had the opportunity to collect qualitative data about what “Active living” means for elderly people.

Field data collected in the first part of the research have been used as input for Scenario-based design, addressing the system service and user experience.

3.2 Evaluation of Envisioning Scenario in Participatory Design Sessions

The team has defined 3 main scenarios with a few User eXperience (UX) /User Interface (UI) Statements to be validated together with participants to explore the future system functionalities. These materials were presented to end users in order to identify and understand their perspectives about those affirmations, in terms of acceptance, perceived utility and satisfaction. Here below an example:

Personas: Elizabeth is 74 years old and lives alone since her husband passed away a few years ago. Nevertheless Beth is a determined and dynamic woman. She is constantly on the move. Beth handles all her daily activities, such as grocery shopping and housework. She is also very active in the social field. She likes to do things for others, like getting groceries for her neighbors.

When she gets out, she prefers to walk, but in case of necessity, she uses a bus, which is another opportunity to socialize! She has no relevant age-related physical problem but she recently noticed that her memory is getting worse. She loves meeting up with her friends, especially to play Bridge. Once a month, she goes to the theater. Elizabeth is quite capable with technology. She uses a tablet to search for online recipes and to consult the theater's program. She also uses a smartphone to communicate with her family.

[Extract of] Envisioning Scenario:
Beth heard that tomorrow evening there will be a performance and set the appointment on the calendar. The system checks the events organized in the town and compares the collected data with those recorded by Elizabeth. The system detects a gap in data: a similar event will take place in two days. So the system offers further information on the theater program and asks her: "Are you sure your event is correct? Do you want to check?"

Statement [to validate with participants]: I believe that a tool for checking my calendar and confirming the scheduled event, could be useful.

Participant answer: "This service is like a guardian angel. It could be a great brain aid. If developed well, it could be very useful."

In doing so, Storytelling has been emphasized for the Active Living concept exploration, to elicit intrinsic motivation issues and to explore alternative futures with relation to the 'as-is' experience of MCI and formal/ informal caregivers.

In general, the use of scenarios (Carroll, 1995; Carroll, 1997) allowed to structure data gathered through activity analysis while envisioning the role and functionalities of the system, and the assessing and validating the envisioned solutions from a technical perspective. The validation of these scenarios, allowed to revise the preliminary formulation by enriching and extending them.

The scenarios that came from, represented the starting point used to design and define a set of interactive mockups, useful in the following phase.

3.3 Exploration of Digital Materials in Co-Design Sessions

Starting from the data collected during the previous activity, experts used the revised scenarios to build specific task flows, defining the most effective User Experience. Based on these task flows the team designed the User interface and relative screens to test the UX. These screens were then used to create a first prototype to be submitted to end users, obtaining an interactive mockup. The flow sequences were designed using Sketch. The prototype was animated with Adobe XD creating a mixed interaction in which direct touch interaction was combined with the "Wizard of Oz" technique to allow users to interact with the interface while the application functionalities are simulated. This technique requires the user to interact with the system to be evaluated, while a hidden operator processes the user input and consequently simulates the system response. This method allowed experts to test with end users a few specific flows and stimulate the discussion for generating new ideas. This exploration session has been carried out with 4 participants and allowed the team to elicit and validate the "Active Living" Requirements that emerged during all the previous phases.

3.4 Affinity Diagram

The affinity diagram is a problem-solving technique useful to organize data according to its natural relationships. This tool, also known as affinity chart, thematic analysis and K-J method, was created by the Japanese anthropologist (more specifically the ethnographer) Kawakita Jiro. Over time, multiple variants of this method were elaborated and improved (Plain, 2007).

This technique is considered very useful to manage a large collection of mixed data that is too complex to proceed directly to the requirements stage of the project. Compared to the usage of one of the formal techniques - such as task or workflow analysis - through the affinity diagram activities, the risk of losing the users' context decreases. In fact, it is particularly adopted during the design process, to secure the quality of qualitative data and allow bridging the UX research to the design phase, avoiding the loss of information, significance and conceptual connections among data.

This step-by-step approach (Alänge, 2009) provided the designers with the possibility of using sticky notes with a group of participants. The aim was to group the information in macro thematic categories and identify conceptual links among them to define a set of design recommendations.

The session started from the definition of the main research question.

People involved had to identify what is the problem they want to investigate and figure out. This question formulation facilitated the focus on facts during the data collection. The second step consisted in writing down the insights - collected during the contextual research - on sticky notes. At this point, the sticky notes were grouped by the principle of affinity. The first level grouping allowed gathering information with the same meaning. A headline was added to each group referring to the general theme.

The clustering has been repeated a second time, depending on the complexity of the issue and allows for a higher level of abstraction. As Alänge (2009) confirms this process continues until a shared understanding has been reached. In particular, this process stopped as soon as the panel obtained a few supergroups: they are thematic categories able to contain all the sticky notes with a common significance. These supergroups were then linked to show interrelationships among them. Using the arrows, the team proceeded with the connections between the main topics. The direction of the arrows indicated the consequentiality and allowed us to identify the order of reading of the contents. Defining relationships meant understanding and prioritizing the most important issues influencing the question analyzed. For what concerns the Affinity Diagram related to this project, the session has been carried out remotely, using the Mural visual collaboration online software. The team was made by six participants from consortium countries, Italy, The Netherlands, Switzerland and Canada, following the below questions:

- What does Active Living mean for aging people?
- Which are the main Active Living components?
- How can we design interactive technologies to support Active Living?

Starting from this data, the research group validated all the information currently available. At this point, participants have followed a partially different process compared to the traditional affinity diagram method. The following step consisted of prioritizing the topics and figuring out what the team considered most significant, by voting both main clusters and single items. Each participant had to express his preference for a maximum of 15 votes, (by using a star icon) and once the activity was completed, the team shared opinions and thoughts. Participants were asked to be aware of which values, motives, and priorities they were using as foundation ideas before starting ranking:

- Is this your user’s priorities, your organization’s, the stakeholder’s, or your own? Which ones should you put the most emphasis on?

4. Findings from Design and User Research

This paragraph reports the main findings from the user research activities. All the participants in the engagement sessions have been stimulated to take part with questions and proposals and for exploring the interactions strategies with a coaching service. The participatory sessions allowed us to understand the real needs of users, their motivations, habits, but above all their concerns and frustrations. Users have positively participated at the validation of the scenarios, emphasizing the aspects of the project that are most relevant and useful to them.

4.1 Results from Interviews

Direct interviews with people with mild cognitive impairment (MCI) allowed the researchers to directly explore memory degradation, how do people react to forgetfulness and loss of cognitive abilities. As also reported here below, motivation is crucial to carry out cognitive tasks:

> "I know that it would be important to train memory with reading, crossword puzzles … but these activities bore me. Some years ago, I loved reading a lot of books and sports newspapers." (participant 1 - IT);
>
> "I take care of my mind more than my body. In fact, playing in a theatre company, I often have to learn my lines from the script by memory. This is a good exercise to train my memory. I also read a lot and I like crossword puzzles and rebuses." (participant 3 - IT)

In particular, the majority of respondents reported that they use a variety of strategies including timetables, and crossword puzzles, like:

> "I use different strategies to not forget my appointment. I have a timetable where I put the bills and I mark the expiration dates. I also set the alerts on my smartphone to remind me of my appointments." (participant 3 - IT);
>
> "I also play cards on the computer to maintain my memory training." (participant 5 - IT);
>
> "I think it's very important to keep my mind trained. I do crossword puzzles and I read to exercise my mind." (participant 8 - IT).

Other participants in the research questioned the importance of planning, as reported here:

> "I always plan what to cook the next day and the housework to do. I never write down my plans, but I try to keep them in mind." (participant 8 - IT);
>
> "Planning is not important for me. I will see what tomorrow will bring, everything will be alright. When you plan something, it can turn out very different in the end" (participant 3 - NL).

Cognitive activity has also been related to the ability to use and the acceptability of technology, as reported here:

> "I am not able to use it. I have only a mobile phone. I am not interested in learning the use of the main technological devices (smartphone, laptop …)." (participant 1 - IT) and here "I don't like very much technology but I able to use smartphone, Internet and I have also Facebook profile" (participant 2 - IT).

An increasing number of situations in the daily life of the elderly have been pervasively modified by the use of technology, including storing pictures, monitoring physical activity, and communicating with people, as reported here:

> "I always use my laptop, smartphone, and Internet. I like technology very much and I often store and modify my photos on my computer." (participant 3 - NL);
>
> "I really like technology and I always use the Internet, laptop, social networks, and smartphone. I also use a pedometer that monitors my progress and performances. I can see them through an app on my smartphone." (participant 5 - IT);
>
> "It is important for me to communicate with people by means of my phone" (participant 3 - NL);
>
> "I send emails for the choir, I make photos and copy files for Spanish class. Then I can make the spaces larger and use different colors for the translations. I get emails from the pharmacy". (participant 4 - NL).

As emerged from the interviews, social relationships are a key aspect for older people. In particular, the end users consider social life as an essential aspect of maintaining an active and satisfactory life:

> "Looking at these images I think that the most important is to maintain social relationships because I like to compare my opinions with other people on different topics. It makes me feel alive." (Participant 1 - IT);
>
> "I believe that the lifestyle should be appropriate to the age of the person. For me, social relationships are essential to a healthy life. I take good care of relationships with my family." (Participant 3 - IT);
>
> "I need to have a lot of social relationships to be happy. I need to discuss and spend time with colleagues, friends, family, and grandchildren. I wouldn't know how to live without social relations." (Participant 6 - IT).

This element therefore shows that isolation can lead to worsening the daily life of people suffering from cognitive impairment. Maintaining constant social relationships allows people to have a better attitude and feel more motivated to follow a healthier lifestyle, as reported in the following quotes about personal interests' sharing:

> "I think that to have a healthy life is to stay fit and cultivate hobbies and interests." (Participant 1-IT);
>
> "He likes to cook for the residents of the two flats here. He made soup for Easter and we had brunch. He really enjoys doing that" (wife) (Participant 5 NL);
>
> "Sometimes I call my friend to grab something to eat in the city nearby" (participant 8 NL).

This aspect has been broadly considered by the team during the definition of scenarios.

4.2 Results from Evaluation of Envisioning Scenarios

Among the aspects that emerged during this activity, the use of technology had a relevant importance. Very different points of view have emerged on this issue. As shown below, some users (the ones more capable with the technology) were interested and excited to use the proposed system. On the other hand, users less familiar with the technology were quite frightened. This leads the team to deduce that it is important to design solutions that are particularly suitable for this less convinced target, trying to foster greater trust in technology.

Future scenarios allowed eliciting opposite attitudes towards technology, ranging from personal skepticism towards technology, until very enthusiastic perspectives. These attitudes might be seen in statements like:

> "I am not very much interested in technology." (Participant 11- IT)

> "This service is like a guardian angel. It could be a great brain aid. If developed well, it could be very useful." (Participant 12- IT);

> "I would love to use it! I'm very curious about technology. I think technology could represent a proper aid if it's used in the correct way." (Participant 13- IT).

Some of the participants also highlighted the cognitive aid role that technology might play, such as:

> "With these modern systems we use the brain less than years ago. In the past when you had to call someone you had to remember your phone numbers. Today we are used to pressing a key and calling quickly. On the other hand it is also true that technology simplifies your life." (Participant 12- IT).

Among the most important results of the participatory sessions it has been reported that seniors, their relatives and caregivers need to be aware of the benefits of physical activity. Not only to increase motivation towards physical activity but also towards the use of technology as a motivator. Results also show that lack of competence is the most important barrier to engage in physical activity. Possibilities for social interaction are shown to be the main motivator. However, it should not affect seniors' sense of competence and autonomy. Goals' setting is already widely used in the whole caretaking process. The goals and pop-up notifications should be succinctly, specific and should focus on resolving the critical causes of the lack of hunger. The notifications should stimulate a new and healthier eat/drink rhythm. It is important to create awareness in a positive way. Elderly may get a negative experience with the system because of unreachable goals. The difficulty level of the goals should therefore automatically adjust to the skills of the person. It should not be too confrontational and should stimulate a positive mindset. wasting water for brushing teeth).

4.3 Results from Mockup Exploration

By using the interactive mock-up in co-design sessions, people were allowed to enter into two main components, like Physical Activity and Memory. Regarding the first one, all the participants were aware about the importance of regular physical exercise, and reported to exercise at least once a week. At the same time, when the team proposed the usage of a device, like a smartwatch to monitor physical parameters, not all the people were committed, as reported here:

> "I'm always on the move. It seems interesting, but I don't feel the need to have a smartwatch" (Participant 16- IT);

> “I already have one (she wears it). Instead I am very interested in having additional information about my physical activity, know how many kilometers I have traveled, heart rate, etc. I am a curious person. I do a lot of physical activity, in addition to walking, I go to the gym 3 times a week.” (Participant 17- IT);
>
> “I'm not interested in having a smartwatch. I don't do much physical activity. I usually walk a little and in these moments, I prefer to do it alone." (Participant 18- IT).

This exploration allowed the authors to highlight that people want to maintain their autonomy and independence and not everyone feels the need to monitor their physical activity in such detail. For what concerns memory, people have reported that they need to write down all important appointments and information they have to remember. In general, the system was positively accepted, as reported here:

> “For me it would be very useful to have help to remind me of things. The tablet would be perfect because I sign everything, shopping, visits, appointments and I do it on a calendar or smartphone” (Participant 17- IT).

At the same time, it is essential for people to be able to maintain their autonomy. Designing for this target means providing tools that, according to personal needs, allow them to feel autonomous and able to take care of themselves, as it happens with social relations, materials used as cognitive artifacts, like the post-it, and the use of the personal agenda: as reported here:

> “I prefer to remember things by myself. I don't want to get help from this point of view. If I need, I am asking for some help. My husband always tends to remind me of things." (Participant 18- IT);
>
> “Sometimes I wonder, "Did I do this? Once done, I throw the related post-it” (Participant 18- IT);
>
> “I usually use the agenda to remember things, but I think that the system help could be useful. I would use it.” (Participant 17- IT).

4.4 Results from Affinity Diagram

Keeping in mind the starting questions, the researchers taking part in these sessions were engaged in trying to make sense of the clusters of concepts and creating supergroups in order to answer the question: “What factors are most strongly affecting the starting issue/problem and how these factors are interrelated?”. As reported in Figure 1, the awareness of independent living represents one of the most important themes that the group of participants was discussing.

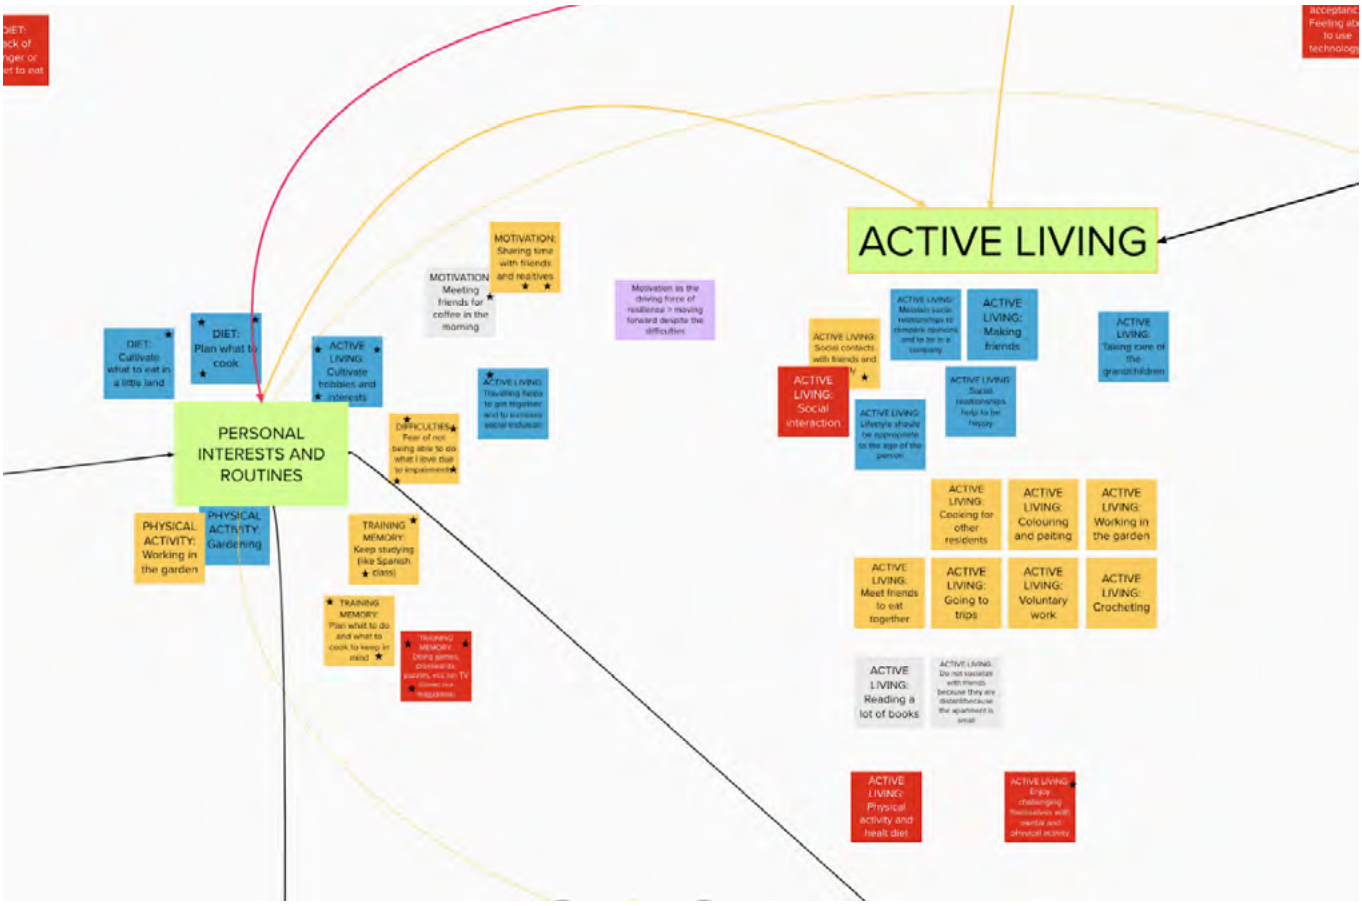

Figure 1. Awareness cluster with the detail of evidence of results from the research.
Some post-its include the preference star as well.

Most interestingly, the Affinity Diagram allowed the experts to create connections among the Active Living components, as reported by the other activities that have been carried out in this research. Figure 2 shows an example of the supergroups of clusters that have been created in the session.

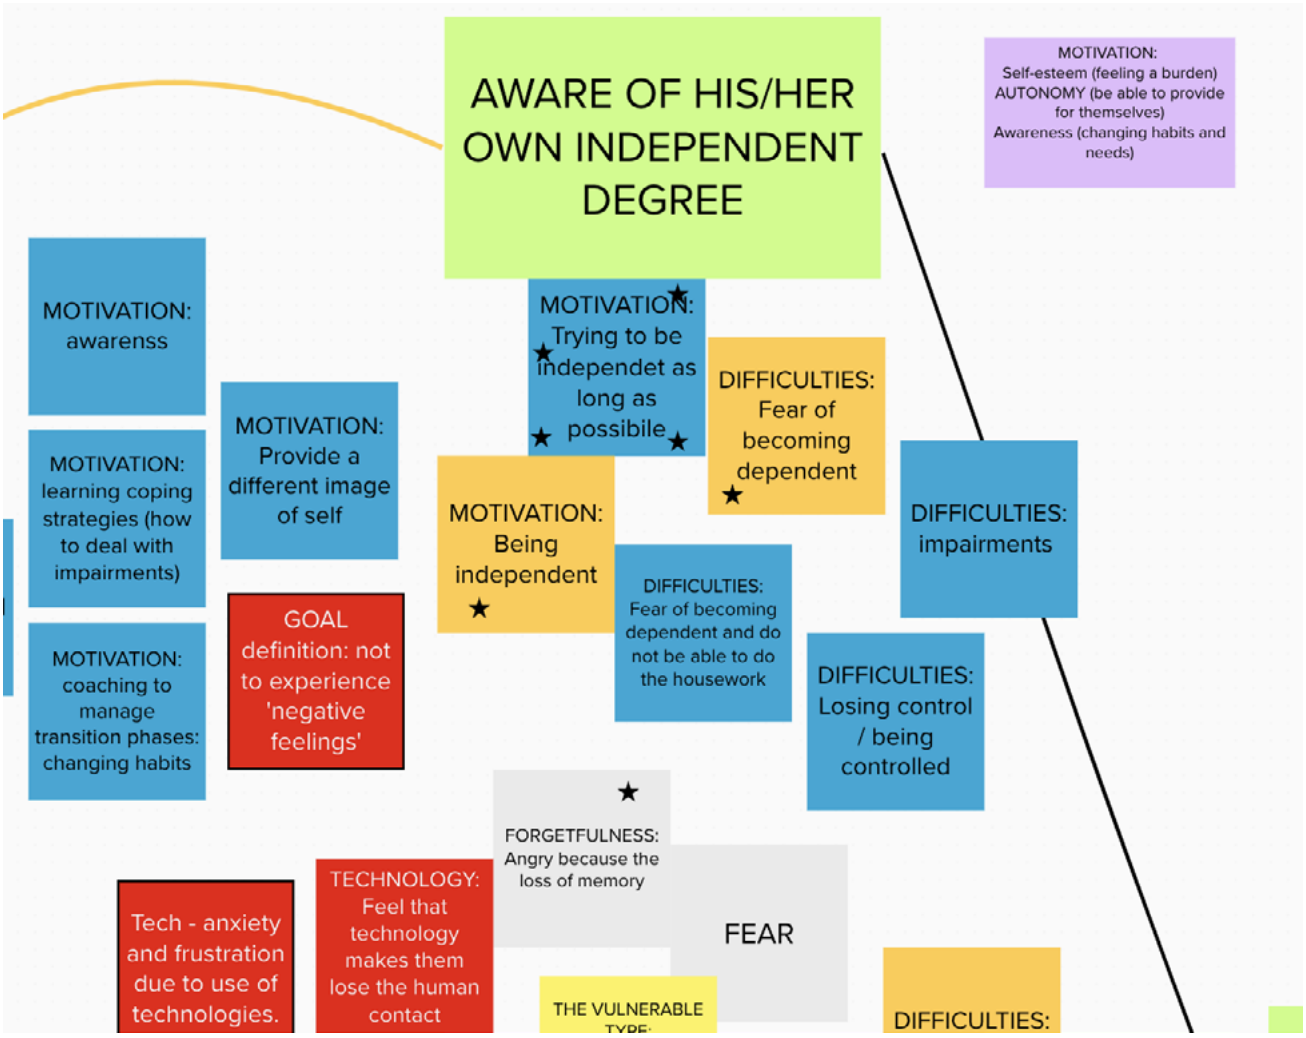

Figure 2. Connections among the clusters to create supergroups.

The Affinity Diagram allowed us to process and elaborate the qualitative data obtained by the user research into a structured knowledge base around the Active Living definition for the intervention. In our framework, Active Living is strongly grounded on the opportunity to stay fit while cultivating personal hobbies, like for example cooking, driving, painting and reading and with sharing personal interests and experiences. Action and interests are thus aimed at maintaining social relationships and contacts: negotiating ideas and values, discussing personal opinions with other people on different topics is considered essential for a healthy life. Social connections in fact may amplify, suggest, trigger a series of novel interests and stimulate people with MCI to live in a more positive way.

Regarding technology, the patients with MCI involved in our design phases have shown a higher level of acceptance if technology is perceived as a tool to facilitate self-determination. Technology is expected to be user-friendly and designed considering the possible visual impairments that can occur in old age and the limited users' skills. Technology should not provide "orders": the user must feel that he can choose and have full control of the activities he is carrying out. Also considering motivational aspects, the recommendations could be linked to the interests and activities that the user prefers: the user appears more favourable to implicitly receiving coaching advice.

5. Conclusion

In order to complement the top-down theoretical definition of Active Living provided in Par. 2, this research allowed the team to consider Active Living as an emerging reality consisting of a balance between the personal sphere and the relational one. In other words, a person is more motivated to live in a healthy way,

when he/she tries to maintain independence, including self-esteem, autonomy in daily activities, acceptance and awareness about the changing habits and needs, and carry on positive and inspiring relationships. In particular, motivation plays a key role in leading a healthy and satisfying life and represents the driving force of resilience that allows us to move forward despite difficulties. Motivation is also achieved through cultivating personal hobbies and interests, like for example cooking, driving, painting and reading.

Older people's participation in the exploration of Active Living allowed the team to verify the hidden assumptions behind research hypotheses and to disclose their actual perspectives about cognitive decline, self-perception and active ageing expectations. Personal life conditions, inner motivation challenges and management of dynamically changing health conditions are all factors that might be considered at the heart of assistive technology research and design through the active participation of people with vulnerabilities. stimulate and support awareness and individual decision-making actively, and promote collective participation to generate common critical thinking that can address the challenges of the climate crisis by contributing to more responsible and sustainable social and cultural progress.

About the Authors:

Alessandro Pollini, PhD, is a researcher in Industrial Design with a background in interaction design, human-computer interaction and cognitive ergonomics, dealing with the design of interactive and relational products and on the functional, formal and use implementation of technology in the holistic, distributed, embodied and situational nature of experience.

Tania Sabatini is a visual and interaction designer. His activity focuses on the study and design of the relationship between user and interface. He deals with UX/UI design and Service Design, applying his skills in healthcare research projects.

Arlene Astell is Associate Professor, Department of Psychiatry and Department of Occupational Sciences & Occupational Therapy, University of Toronto. Her work includes the creative application of technology, with a particular interest in supporting people to live well with a diagnosis of dementia.

Danielle Saney, PhD, is specialized in Neuroscience at the University of Waterloo. Her work with persons living with Alzheimer's and dementia has driven her specific research interests in understanding the neural pathways involved in cognition changes and the behavioural hallmarks of pathological ageing.

Lorena Rossi is Chief of Centre of Innovative Models for Ageing Care and Technology of I.N.R.C.A. Her main interest is in the use of ICT technologies for the care of elderly people.

Roberta Bevilacqua is psychologist psychotherapist, specialized in Clinical Psychology at the Bologna University, with a master in Clinical Neuropsychology at the Padua University. Research interests are technology acceptance, AI, social and rehabilitation robotics, usability, coaching, user-centred and participatory design, health and eHealth literacy.

KEYWORDS | SERVICE DESIGN, OLD ADULTS, PET ADOPTION, USABILITY, DIGITAL ENGAGEMENT

ABSTRACT | Social isolation and loneliness can play an important role in Italian old adults' health. Adopting a pet could help mitigate negative health effects and could at the same time help reduce the number of animals living in shelters. Digital platforms can be a useful instrument to improve pet adoption rates thanks to matchmaking processes; however, little research has been done on verifying if old adults can effectively benefit from their use. This study follows the development of a service concept, afFido, that focuses on applying a matchmaking pattern to pet adoption and support. Nine participants explored their relationships with having pets and five testers were recruited to investigate the usability of an app prototype. The qualitative interviews have highlighted the presence of fear of attachment and loss which can prevent pet adoption in particular among male old adults. The digital platform's usability scored lower than average due to a perceived lack of information as well as conflicts between common matchmaking patterns and the testers' knowledge. To become effective, digital pet adoption services should focus on including emotional issues in their narrative and may benefit from working together with old adults in reinterpreting matchmaking patterns to improve their usability.

1. Introduction

The Italian population is rapidly ageing. As of 2021, 23.5% of its population of 59.2 million people is 65 years and over (Istituto Nazionale di Statistica, 2022), and in 2050 this age group could grow to 33-36.7% (Istituto Nazionale di Statistica, 2022). Old adults are subjected to discrimination rooted in ageism (Krekula, 2009) and can become socially isolated due to their representation as socially useless, determining a negative impact on their health (Kobayashi & Steptoe, 2018). Loneliness, although not determined by isolation (de Jong Gierveld et al., 2006), can still worsen its effects (Pinquart & Sörensen, 2001) and have independent negative effects on cognitive functions (Luchetti et al., 2020) and general health (Luo et al., 2012). In Italy, old adults' social isolation and loneliness rates vary on the basis of the geographical area (Cavallero et al., 2006; Fiordelli et al., 2020).

Loneliness can also be influenced by feelings of uselessness (Aartsen & Jylhä, 2011) which can be heightened by detachment from adult children (Gu et al., 2016) and health issues preventing autonomy and social involvement (Curzio et al., 2017).

Interactions between humans and animals have been shown to be effective against loneliness (Banks & Banks, 2002; Kanamori et al., 2003; Krause-Parello, 2008) and in improving social interactions among groups (Sollami et al., 2017). Having a pet can also be beneficial to socialization as it can help old adults meet new people (Scheibeck et al., 2011) as well as satisfy their need for attachment support (Krause-Parello, 2008) in cases where communities do not exist or are difficult to develop due to physical or social barriers.

Animals in Italy experience a similar state of social abandonment to that of old adults, with an important number of animals spending their lives in shelters (Innocenti, 2019) that also have a strong impact on the economy (Ministero della Salute, 2023). Old adults could play an important role in reducing the population of animals in shelters as they may possess free time paired with high energy levels (World Health Organization, 2021) to support a pet in their lives. In Italy, only 12.1% of couples and 11% of single old adults aged 75 and over have a dog (Istituto Nazionale di Statistica, 2020), and it is unclear what the stance of Italian old adults on pet adoption is. Previous studies analyzed the pets' characteristics influence on adoption (Hawes et al.,2018; Powell et al., 2021) adopters' family status (Mondelli et al., 2004) and adoption return factors (Fatjó et al., 2015; Hawes et al., 2020; Powell et al., 2021). In cases where the adopter's age is mentioned (Shore, 2005) there was no analysis of the correlation between adoption motivation and age.

During the last decade there has been a rise in studies on digital pet adoption services. These services allow their users to put up adoption announcements and choose a pet manually (Santy et al., 2018) or by filtering through position (Magdum et al., 2023) or matchmaking processes (Allison, 2019; Davis et al., 2019). Matchmaking adoption strategies may reduce adoption drop-outs and could be perceived as useful activities if presented as a direct help to shelters (Davis et al., 2019). As of now, no study has focused on testing the usability of a match-making pattern applied to pet adoption.

Digital services may appear useless for old adults, but in Italy 60.4% of people aged 65-74 were reported having access to an internet connection, with lower adoption rates for older adults (Istituto Nazionale di Statistica, 2023). According to the Silver Economy field, old adults are a growing target for the development of new products and services (Laperche et al., 2019), a theory supported by the investment of 1,901,000 euros by Italian old adults in this sector in 2021 (Itinerari previdenziali, 2022). Nevertheless, technological products do not reach their target due to cultural, economic (Klimczuk, 2016) and social issues, as old adults perceive technology to be too difficult to use due to their age and avoid it as it heightens their interiorized ageist beliefs (Caspi et al., 2019). However, old adults navigate lower complexity platforms similarly to younger people (Ziefle & Bay, 2005) and those who use technology present better cognitive and memory functions (Benge et al., 2023; Scullin et al., 2022). One possible solution to the development of successful services could be a focus on low-technology solutions (Lipp & Peine, 2022) integrating digital and physical practices and planned with the involvement of old adults.

2. Research Questions

Based on the current research state, the main goal of this study was to individuate what are the basis for the development of a digital pet adoption service for Italian old adults as of 2023. This problem includes two main variables: Italian old adults' stance on pet adoption and their digitalization skills.

In particular, the study has been focused on these specific issues:

- What are the current trends in pet adoption among Italian old adults?
- What are the discrepancies between Italian old adults' perceived digital skills and their effective ones?
- How would a matchmaking-based adoption service fit with old adults' mental models?

The relevance of this study has been supported by the 2023 animal adoption campaign held by the municipality of Rome and directed towards old adults' communities (Roma Capitale, 2023).

3. Methodology

3.1 Data Collection Methods

The first research step was to understand how having a pet is perceived by old adults. Semi-structured phenomenological interviews were conducted with old adults residing in Rome. Nine old adults above the age of 65 (M=75, SD=4,86, age range 69 – 83), five male and four female, were recruited. Seven were recruited following a consecutive sampling method by visiting two old adults' communities, Centro Giovani Anziani Cornelia (four participants) and Centro Anziani Valcannuta (three participants). Two interviewees were recruited through word of mouth. The median length of the interview was 09:42 minutes (SD=0,23). Four interviews were conducted in an office located in an old adults' centre, with the president being present in the room, three interviews were held in the main hall of the centre, one was held outside a public café and one online on a Teams call, using a personal laptop. At the beginning of the interview, the participants were introduced to the research topic and gave their informed consent, agreeing to have their voice recorded.

The interview was structured to initially obtain an evaluation of the participants' current neighbourhood and a recount of a typical week in order to evaluate their social activity levels and the presence of any external barriers to socialization. After that, the participants were asked to describe their relationship with technology and if they received any help using it to investigate their digital skill levels and whether it influenced their relationships with other people. Lastly, the interviewees were inquired about current or past pets and their thoughts on the implications of having a pet and if and how they would adopt one. These questions were planned to evaluate the current adoption trends among old adults and to collect insights on the possible difficulties faced while having a pet. Additional questions were added according to the context; participants with no pets were invited to explain their refusal, whereas those with pets were asked to share their experiences with them.

The prototype of the service was designed on Figma. The usability test was open to people aged 65 or over who had to currently have a pet or have had one in the last five years and would define themselves as pet lovers. The testing phase involved five people over 65 years old (M=71,6, SD= 6,11), with one being a returning participant from the initial interviews, and the others being recruited through snowballing recruitment. Three tests were conducted in person by using a laptop with a mouse and a trackpad available, while two tests were conducted online via Google Meets. The median length of the test was 43 minutes (SD=0,11).

At the beginning of the test, the participants were asked three questions aimed at assessing their digital skills: “How many hours do you spend surfing the internet or using apps in a typical week?”, “Which websites and/or apps do you use the most?” and “Are there any websites or apps you particularly like or hate, and why?”.

After this phase, the participants interacted with the prototype. The moderator briefly explained the service’s options and introduced the testers to a roleplay scenario in which they had to pretend to be women interested in adopting a pet. The testers were to complete two main tasks, sending an adoption request and subscribing to a support plan while guided by a moderator. After each main task the participants were asked to take a survey hosted on Google Forms based on the Single Ease Question (SEQ) rating scale used to assess the tasks’ difficulty level (Sauro, 2012). The survey consisted of a single question measured on a 7-point Likert scale inquiring on the task execution difficulty (“How easy or difficult was the adoption process?”, “How easy or difficult was the support request process?”). At the end of the usability test the participants were asked to evaluate the prototype’s usability according to the Usability Metric for User Experience Lite (UMUX-Lite) scale, a simplified usability model derived from the UMUX scale (Schrepp et al.,2023) consisting of two statements followed by a 7-point Likert scale (“The platform’s characteristics meet my necessities”, “This platform is easy to use”).

3.2 Analysis Method

The interviews were transcribed in order to conduct a thematic analysis and highlight recurrent themes used by the interviewees. The coding processes were conducted by one author. The initial coding phase was conducted by means of an empathy map, a tool used to summarize visual information, thoughts, actions and positive and negative experiences obtained through interviews (Gibbons, 2018) that has been used as an initial deductive coding frame. The second coding phase was based on inductive coding, and its results were later re-assessed following pattern coding and thematic analysis with the objective of identifying similar experiences, highlighting diverging opinions and understanding deeper motives behind the accounts. The codes were arranged following a focused, hierarchical coding structure, with the first coding level representing the main topic, followed by the interviewee assessment and categorization of the condition (Saldaña, 2013). The information obtained through the interviews was coded individuating three main topics: current pet stance, social activity, and digital skills.

With regards to user testing, the data obtained by the initial interview was coded through a digital assessment scale used by the usability team of the UK government (Hurst, 2015). The scale is based on Go ON UK’s “Basic Digital Skills” definitions and included seven questions measured on a 4-point Likert scale, with 0 identifying no digital skills and 4 representing full control of basic digital skills. The qualitative information obtained through the interviews has been codified following the scale by converting the information into a numerical value. The testers’ digital skills were evaluated by summing together all the points and calculating the average value.

The data from the usability test has been subjected to a descriptive statistical analysis measuring the usability values of the prototype. The usability score of the prototype has been calculated by summing together the scores given by each participant to the two UMUX-Lite items, Ease of Use and Usefulness (Q1+Q2=QA), and then subtracting two from the initial score (QA-1=QB). The result has then been multiplied by 8.33 to bring it on a scale from 0 to 100 (Melissourgos, 2023). The general usability score has been obtained by summing all five UMUX-Lite scores together and calculating the average value.

It is possible to convert the UMUX-Lite score to another usability scale, the System Usability Scale (SUS) (Schrepp et al., 2023) in order to compare the scores to platforms previously analysed. The method used in this research is the one-item interpolation working only with the Ease of Use item and converting its score to a 100-point base by applying the following formula: SUS = (*Ease* – 1) * (100/6).

4. Service Definition

A digital pet adoption service, AfFido, was designed following the information obtained through the interviews. The main functions are adoption and post-adoption support in which the service acts as a mediator between shelters for the former and trained figures for the latter. The user is matched to them through a survey and can choose to select their preferred option. The service is aimed at reducing waiting times and adoption returns thanks to the initial match-making phase, which is autonomously conducted by the user and can result in reduced workload for shelters too. The support figure can call the user or visit them in person; in the second case, the user can also have pet products be delivered to their house or receive basic vet visits at home. Further options also include sponsoring pet-based activities held at old adults' centers as well as promoting interactions between pet-loving old adults by applying once again match-making practices.

Four different personas were designed to summarize specific users for our field of analysis (Stickdorn et al., 2018). The main differentiations between them were based on diverging stances on pet adoption, combining them with compatible habits, needs and pain points.

The personas' experiences in reaching the adoption and support goals and the necessary touchpoints were summarized through means of general (Figure 1) and user-specific (Figure 2) Journeys (Stickdorn et al., 2018). Considering the varied digitalization levels of Italian old adults, a digital pet adoption service seems to benefit from being paired with in-person and call centre touchpoints. For the persona with the highest digitalization skill, the platform could be present in all steps, whereas for personas with a limited usage of technology, the platform could be introduced after the pre-service phase. For the other persona, the digital platform could be the initial touchpoint for one, whereas it could be implemented after a first introduction for the other two personas.

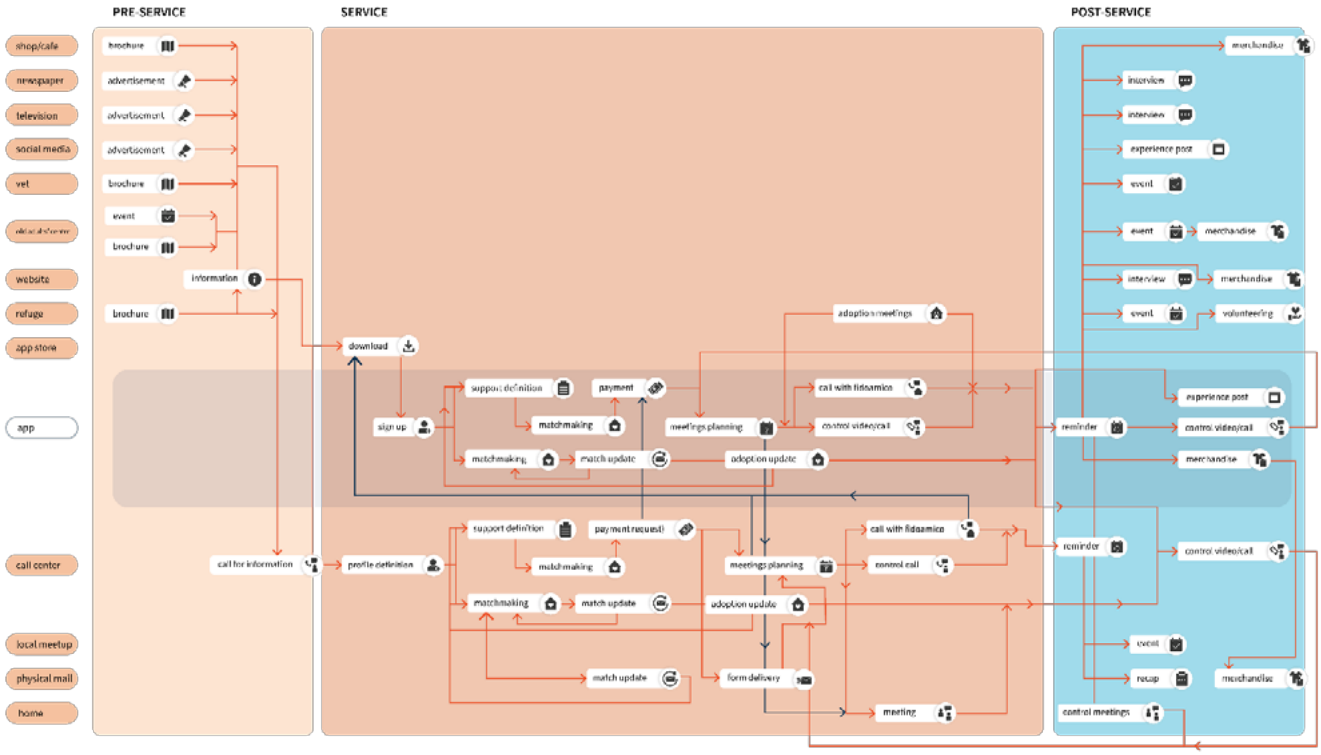

Figure 1. User Journey including all touchpoints, with a focus on digital (app) ones. The arrows in dark blue highlight conversion points from phone-based interactions to app ones.

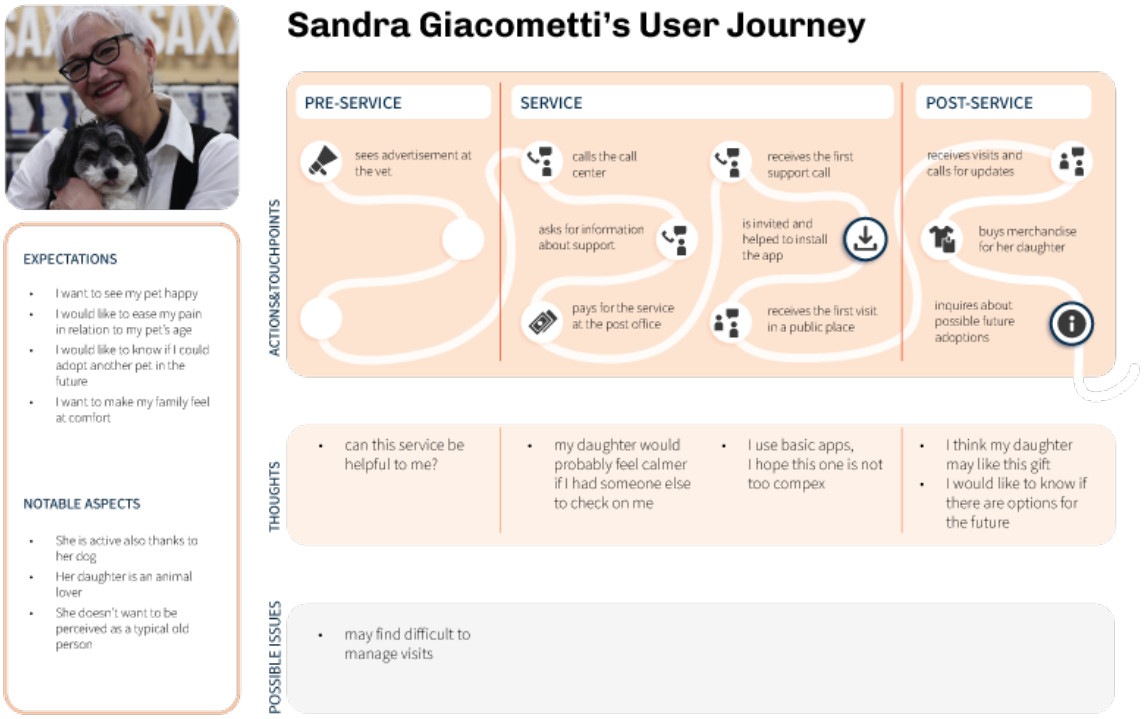

Figure 2. Persona-specific User Journey. The steps highlighted in blue represent digital touchpoints.

At the same time, a Service ecosystem was designed to highlight all the actors involved in digital and in-person interactions (Figure 3). This step was useful to understand the complexity of the general system as well as which interactions to prioritize in the development planning phase. By comparing the information obtained, persona-specific service blueprints were used to investigate the relationships between the service components and the user (Gibbons, 2017).

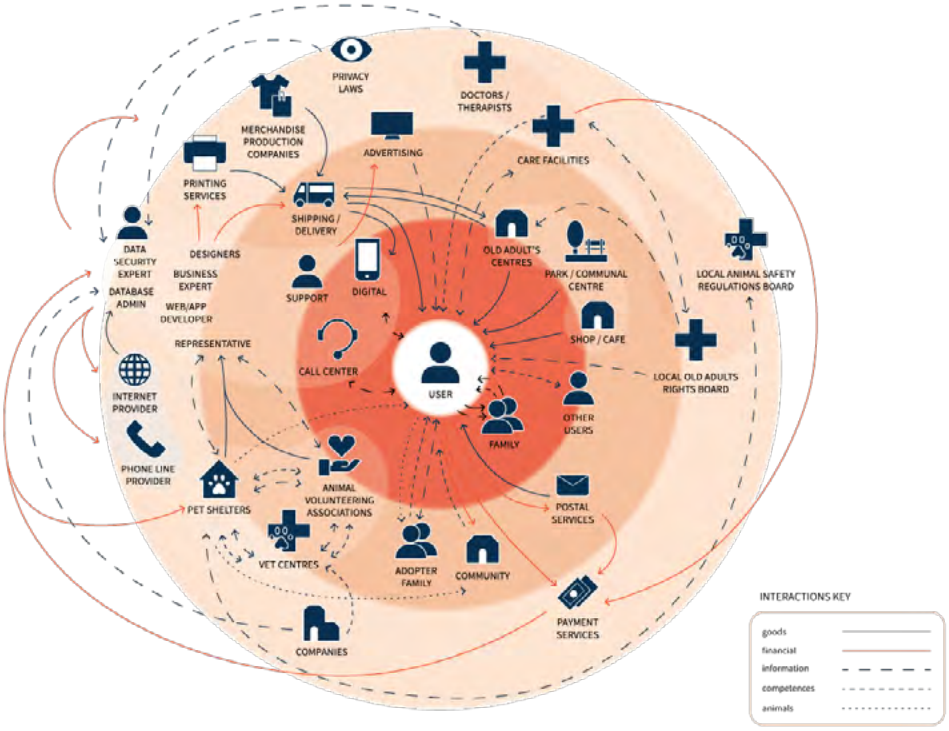

Figure 3. Visual representation of the service ecosystem.

5. Experimental Development: afFido

The service's prototype was based on the analysis of two existing platforms, Petfinder (https://www.petfinder.com) and empethy (https://www.empethy.it), which both offer the possibility to take a test to be matched with compatible pets.

The digital platform was structured as a responsive design (Figure 4) to satisfy all possible device usage. The interactive prototype was presented as a tablet app that included the two matchmaking processes of finding a compatible pet and a suitable support figure; the tablet ratio was chosen as it was hypothesized that any visual issues with this phase could be encountered on smaller screens.

Figure 4. AfFido's digital platform shown on different devices.

The pet matchmaking phase was ideated to include a survey followed by a list of three compatible pets (Figure 5) with the intention of testing if showing three to four items, recommended for better information retainment (Galitz, 2007), would make the process understandable to old adult users.

The prototype was designed following Web Content Accessibility Guidelines (WCAG) in their WCAG 2.0 version (Web Accessibility Initiative, 2023). The colour palette used was compliant with the success criterion 1.4.3 Contrast (Minimum) reporting that "The visual presentation of text and images of text has a contrast ratio of at least 4.5:1" (WAI, 2023). The colour orange (#F04D23) was chosen due to its ambiguous status as an accessible colour determined by worse performance over dark backgrounds (Pereira et al., 2022). The components were designed in order to be bigger than 41 mm, a measure that has defined to be accessible to people with Parkinson's (Nunes et al., 2016).

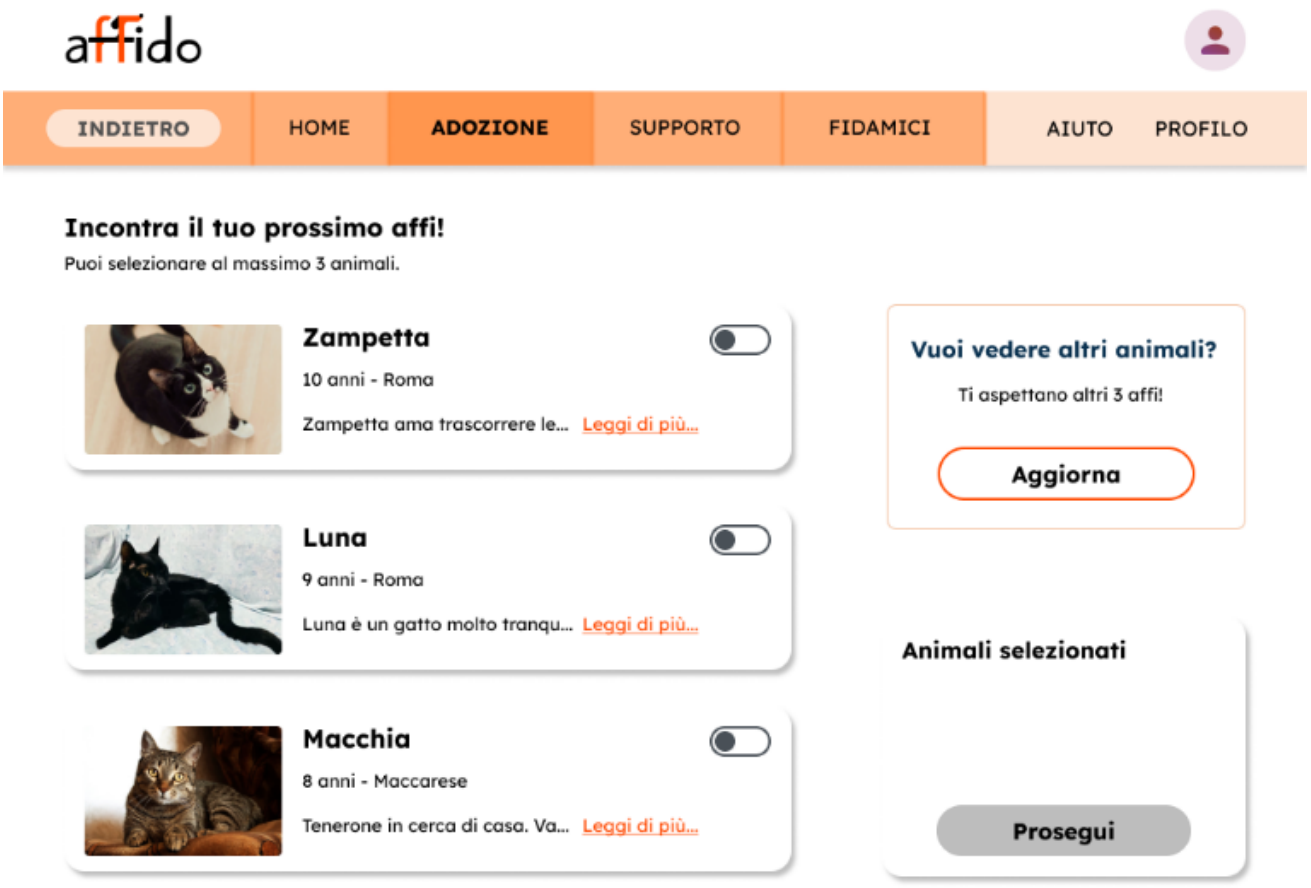

Figure 5. The pet selection page as shown on the prototype. The participants could click on the Update (*Aggiorna)* button on the top right side to show other adoptable pets.

6. Results

6.1 Interview

Four participants reported having at least a pet dog, while five did not have any pets at the moment of the interview and all but one reported not wanting one at the moment. Two interviewees personally got their pet, with one buying them and another adopting it, while the other two had it from their adult children. Seven participants had at least one pet in the past. Six participants would hypothetically adopt a pet in the future, with three expressing an interest in adopting from a pet shelter, one in buying and the other two not expressing preferences. The participants reported four main reasons not to adopt a pet (see Table 1). Three participants referenced the concept of having a pet as a family member, with two of them presenting it as a negative aspect. All male interviewees presented limits in talking about their affection towards animals, with two participants overcoming their initial fear during the interview.

When asked about their digital devices, all nine participants reported using a smartphone at a basic level, and only one used a PC. Eight interviewees indicated using WhatsApp, five Facebook and three Instagram. Two participants interpreted the word “technology” and the concept of using technological device as the usage of specific devices. Five participants made references to their past activities when talking about their relationship with technology. Eight participants admitted receiving help to use technological devices, with six participants receiving help from their adult children, two from their son-in-law, and one did not indicate any specific figure. Five participants held positive views on technology, one negative, and three were indifferent about it.

Seven participants reported attending an old people's centre. Four interviewees are caregivers; all of them help their adult children and one helps with their grandchildren. All nine participants mentioned interacting with their family or friends, with two also reporting going out alone if needed. Two participants mentioned having health issues, although only one reported them having an impact on his social life. Three participants related their physical activity to their pets.

Table 1. Participants' history of pet ownership and negative adoption stances.

Participant	Age	Gender	Past pets	Reasons not to adopt
P1	65	Male	Yes	NA
P2	NA	Male	No	Lack of time, Lack of space, Not interested
P3	75	Male	Yes	NA
P4	70	Male	Yes	Lack of space, Fear of loss
P5	NA	Female	Yes	NA
P6	74	Female	No	Lack of time, Not interested
P7	NA	Female	Yes	Not interested
P8	79	Female	Yes	NA
P9	83	Male	Yes	Health issues

6.2 User Testing

The average digital skill level obtained by the five testers was of 2.93 (SD=0.73), with the minimum value of 2 and the maximum value of 3.85. The average SEQ score has been reported to be around a 5.4 value (SD=0.47) for both questions. All testers were able to complete the main tasks with only brief interruptions that were solved autonomously or with light interventions from the moderator.

For UMUX-Lite scores on the platform's usability, the average usefulness score was of 6 (SD=1) and the average ease of use score presented an average of 4.6 (SD=1.14) (Figure 6). The average UMUX-Lite score was of 71.63 (SD=8.5), with the highest score of 74.97 and the lowest of 58.31. The corresponding average SUS value was 60 (SD=16.99).

All testers encountered issues using the prototype's functions but to different degrees. Three participants mistook text for clickable elements, two struggled with dropdown menus and toggles, one did not know how to use checkboxes and three had trouble understanding written indications.

Three testers did not initially understand how to proceed with selecting the desired pets after the survey phase, but after the intervention of the moderator two of them managed to correctly interact with the prototype.

All users expressed perplexity at the words "*affi*" and "*fidaiuto*" used to identify respectively the pets and the human support figures. Three testers reported perplexity at the drawings used to represent the adoption functions, not understanding their meaning.

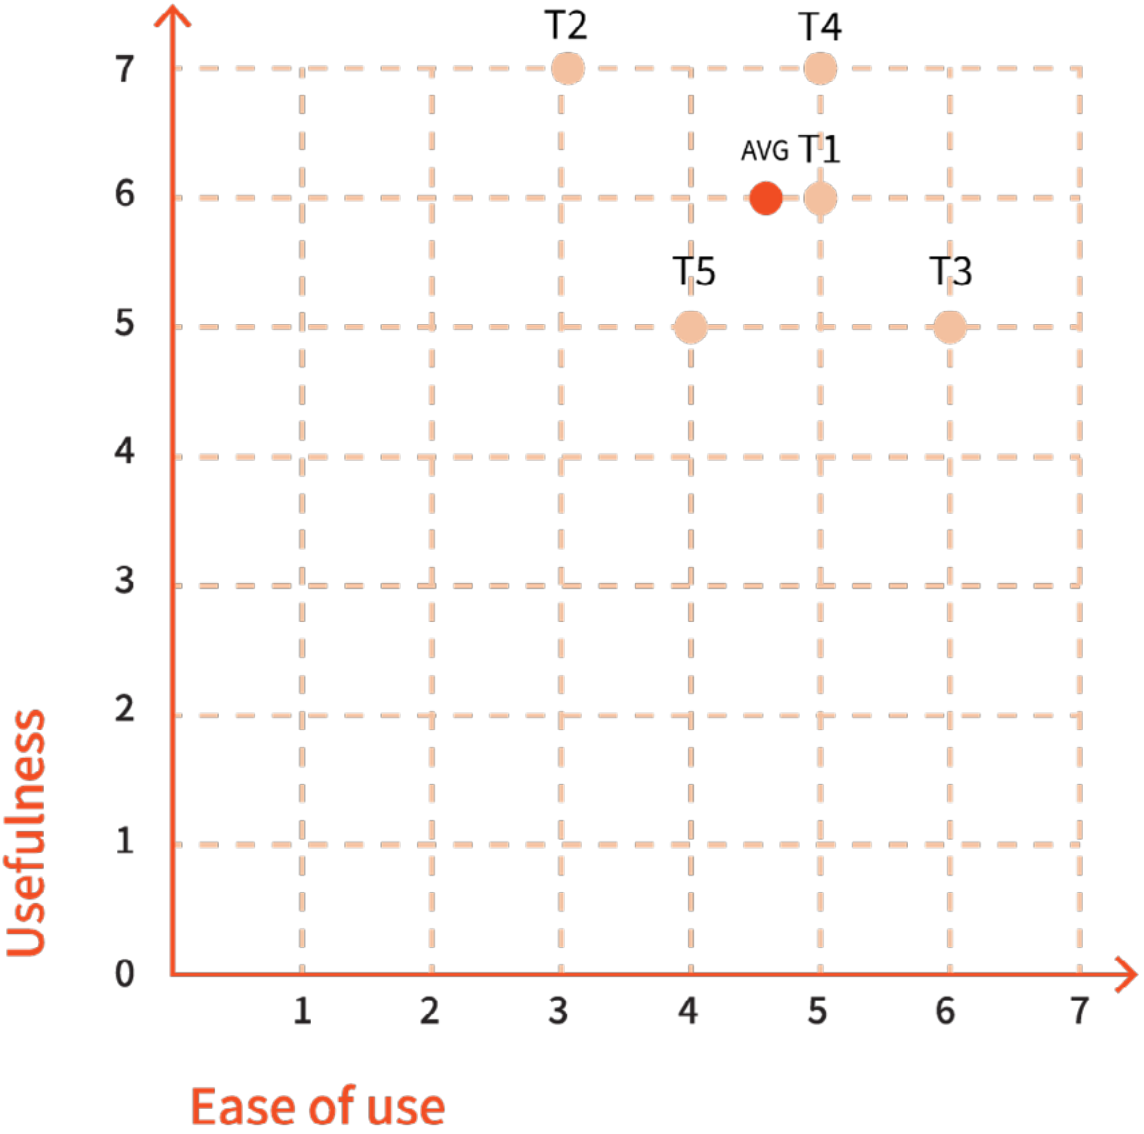

Figure 6. Scatter graph representing the relationship between the Ease of use and Usefulness scores for each test and the average score.

7. Discussion

7.1 Old Adults, Pets and Technology: An Overview

The participants presented three different stances towards pet adoption, with people who were strongly in favour of adopting a dog, people who were in doubt, and people who were against it. When asked about past experiences with animals all participants who had a pet and those who were in doubt about adopting reported having had pets that they cared about. These results are in line with observations on past pet experience being a predictor for future involvement with pets (Banks & Banks, 2002).

When it comes to disinterest in pet adoption, the participants who were strongly against it lamented the lack of space in their house as the main issue, present also among the reasons for returning or abandoning pets (Fatjó et al., 2015; Powell et al., 2021). For two participants becoming attached to the pet was a negative factor as it could interfere with their current lifestyle: “I do not want pets because they become part of the family, and since I am always out, I could not take care of them.” The participants who

expressed this view were also those who reported being active in their old adults' communities. Having a pet was also reported to be a possible source of negative feelings for P4:

> "No, I don't want pets anymore because you get attached to them and you have to take care of them and – I can't do that. […] I feel like I'm missing something, and this isn't right."

This avoidant behaviour could be interpreted as a tendency to avoid negative emotions (Van Assche et al., 2013). It is also possible to notice the presence of underlying pet grief, which had an impact on pet owners too as they feared losing their pets: "I tremble now, as her age is significant, and every day – she's well kept, for God's sake". The data on pet grief is compliant with reports on pet loss and its status as a form of disenfranchised grief (Brown et al., 2023), to which corresponds a difficulty in communicating about pets with other people. In fact, when talking about her pet's story, P8 commented:

> "It is as if they [pets] were a family member. I know that when I say this to someone who doesn't like pets, they look at me as if I were stupid. […] I also say silly things such as 'Come to mom', but if friends of mine who do not share these passions were to hear me, they would think I lost my mind."

These comments are in line with other findings on discretion being a fundamental component to old adults with pets or experiencing pet loss grief (Brown et al., 2023). The difference between pet-havers and people who do not like them was seen as a moral failing by two pet-havers, as one of them commented: "They [people who do not want pets] are egoist […] Taking care of a pet means being inclined to sacrifice yourself."

It was also possible to identify different display of affection towards pets. All pet owners but one, when invited to talk about their animals, voluntarily shared emotional information of them. Participant 5 was immediately invested on talking about her pet dog, and even imitated him, while P8 preferred sharing her pet's adoption story. Participant 3 was initially detached, taking time before talking about his dog; a similar reaction was observed in P9, who waited before deciding not to talk about his late dog.

All participants who presented contradictory feelings towards pets or took time to open up about their relationship with them were male. Participant 1 presented an unexpected behaviour, as he did not report being attached to his hunt dogs, whereas participant 2, vocally against adopting pets, spontaneously recollected a time when he identified his neighbour's dog as being jealous:

> "When my daughter gave me her dog and [the other dog] saw me with him, he was like this [mimicking exaggerated open eyes], he was furious, as he was jealous. I had to throw two, three biscuits to him."

This behaviour seems to be in line with previous research on the impact of gender stereotypes on expressing emotions (Hess et al., 2000; Kelly & Hutson-Comeaux, 2000), which see men expressing sad emotional states less than women and expecting themselves to appear happier when recounting negative events, which may explain the apparent detachment from their pets. This observation is further supported by the comments of P6, who proudly stated that: "I don't have animals and I don't want them […] I have been told 'It's a blessing that you are not like other women'."

One participant reported being physically active also thanks to taking her dog out and confirmed that she liked to walk and was healthy. Participant 3 used to go out with his dog but now stopped due to a leg injury. These observations are in line with former studies on the correlation between dog ownership and physical exercise (Curl et al., 2017).

Family members played a strong role in adopting a pet, as for P8 and P9 the animal had first been adopted by a younger family member and was later left to live with them, as P9 reports "I had the dog in "loan for use" from my daughter's ex-boyfriend". For P9, the lack of in-person support and his health issues made it

impossible for him to adopt a dog: “If I had this safety [having a trusted person to take his dog out], I would obviously pay and I would have no doubts, I would immediately adopt a dog.”

With regards to technology, all but one participant admitted being helped by family members or friends to varying degrees, with most participants expecting to be helped by adult children, a finding in line with previous research (Hunsaker et al., 2019). Participant 6 recounted her smartphone usage improvement story since her son’s observations on her attitude:

> “He once scolded me because I always asked him to solve my issues, and he told me that I had to learn to read instead of randomly tapping on the screen. […] I once encountered an error, I read it and I thought to myself that I could solve it.”

The interview has confirmed the trend on smartphone usage (Itinerari previdenziali, 2022), and surprisingly no participant reported using a tablet device. The only participant who used a PC, P9, believed this skill to have helped him stay active:

> “My peers are left abandoned inside their homes, they spend their time in front of the television, [I see] they aren’t motivated. I respect them but I do not agree with what they do.”

Two participants had an unexpected reaction to being asked about their relationship to technology, as they interpreted it as being able to work with complex machines, thus requiring the moderator to reword the question. More than half of them also believed that you could only possess digital skills if you had a strong interest in technology or were a young person, contradicting their own current experiences. It is possible to identify an expertise-based narrative that is in line with previous research on old adults and negative reactions to technology introduction in later stages of life (Barnard et al.,2013; Morris & Venkatesh, 2000; Selwyn et al., 2003).

7.2 Usability Test

With regards to usability scores, the prototype was classified as on the lower end of the acceptable usability level. It could be hypothesized that the scores would have been lower if the moderator had not been present, as testers commented: “I would have rated this lower if I had been alone”, “I rated it a six due to the necessity of asking for help”.

Being able to ask for help elicited different reactions in the testers, as the presence of a function to directly access the app’s help desk reassured P3, but increased P1’s frustration, leading her to comment “I don’t want to ask for help, I’m not interested in it” in a frustrated tone.

One of the main elements that impacted the usability was the perceived ambiguity of buttons and text, with the latter being mistaken as interactive and buttons being identified only after a second navigation of the interface. The difficulty in using buttons and toggles may also be related to the use of a laptop during the test, which may have been confusing for smartphone users. All five participants did not report having any sightseeing issues, but one tester struggled with reading dark blue text on an orange button; when asked if he had any issues identifying the text, he did not comment on it but was visibly distressed.

The introduction of the fragmented pet list determined mixed results. The pattern had been introduced with the objective of avoiding too many stimuli in a single page; however, the mechanism posed various issues to the testers and appeared complex to understand without a proper introduction, as one tester commented: “Did the other pets disappear?”. Other reactions included feeling upset due to the failed matchmaking, as it was considered to have not been adequately communicated during the survey. The results may be explained by the presence of significant differences in the mental models of old adults with respect to standard user testing participants.

The use of drawings turned out to not be sufficient to convey information, as most testers ignored or did not understand them. The drawings used in the prototype were more akin to flat icons' style, which has been shown to be less effective due to the absence of any references to real objects (Wu et al., 2022). The results of this study do not necessarily correlate to a lack of learning abilities and adaptability in old adults, as most participants were able to interact with unknown elements by the end of the test after receiving verbal or visual feedback. This finding is in line with previous research on the effectiveness of support in digital learning (Martínez-Alcalá et al., 2018; Pirhonen et al., 2020). During the test phase, some users commented on the options, remarking that the choices did not fit with their beliefs: "This is not my birthdate", "I would like to adopt a dog". All users also expressed perplexity at the unusual words used in the prototype, which may be due to changes in guessing abilities for unknown words determined by ageing (Mcginnis & Zelinski, 2003).

8. Recommendations

When working on new services the main research step is directed towards assessing the needs and adoption barriers of potential users or stakeholders. The following recommendations are directed towards the development of services for old adults which can include topics similar to pet adoption.

1. *Hypothesize the presence of hidden emotional barriers*. A social issue can be influenced by complex factors that may go unnoticed in quantitative research. When conducting quantitative or qualitative research, consider interacting with old adults who are apparently not potential users to verify the presence of such factors.
2. *Structure interviews with emotional barriers in mind*. All interviews with male old adults were characterized by a fear of attachment expression. When interacting with old adults, it is suggestible to re-explore emotional topics after having established a safe environment, possibly by indirectly showing positive examples.
3. *Interpret the user's digital skill level*. When planning research involving digital skill evaluation, include questions identifying the extent of external help. It could be useful to identify a scale or an evaluation by specific support situations which could be defined by exploring hypothetical scenarios with the participant.
4. *Investigate the presence of different mental schemes*. When designing digital platforms for old adults it could be useful to test existing conventions by subjecting them to new, older or non-expert users to highlight issues that may have been accepted by habitual users.
5. *Consider polarizing factors in the user testing narrative*. Pretending to adopt a cat when loving dogs can been a distracting element to testers. If it is fundamental to include such elements, collect the participants' preferences through pre-test surveys to plan roleplay activities which accommodate their inclinations.
6. *Design tailored onboarding experiences*. Old adults can be frustrated when offered unneeded support. Future onboarding practices could assess the users' needs through a survey or on-demand help in order to allow old adults to retain their independence and help platforms include multiple user typologies.

9. Limitations and Future Directions

The generalizability of the results has been limited by the restricted pool of testers. Further studies could focus on quantitative research to validate the extension of the reported experiences in Italy.

It is possible to observe how former studies on pet ownership analysed a general population (Albright et al., 2022; Pikhartova et al., 2014), women (Krause-Parello, 2012; Ory & Goldberg, 1983; Watson & Weinstein, 1993; Zasloff & Kidd, 1994) or explicitly admitted not finding many male pet owners (Brown et al., 2023).

Considering the restricted number of participants in this study, future research could explore the relationship between current male pet owners and their pets and investigate any positive or negative patterns to consider in future interventions.

To further support the development of pet adoption interventions with old adults, future research could define the current interest in using digital solutions and receiving in-person and online support among this demographic.

With regards to usability, the findings of this research could be corroborated by quantitative tests defining the incidence of communication issues and pattern incompatibility here reported. The matchmaking pattern could be reinterpreted by finding a compromise between a list and a curated view, without limiting the user's actions. Further research should analyse the discrepancies between younger adults and older adults with high digital skills in order to highlight any usability and accessibility issues that may go overlooked due to mental schemes adapted to existing solutions.

10. Conclusions

Pet adoption from old adults is promoted by evidence of its positive impact on loneliness, but it is not widespread in Italy (ISTAT, 2020). Along with typical issues such as lack of space and free time, Italian old adults may refrain from adopting pets due to fear of loss and, for male old adults in particular, a general fear of emotional attachment. It is also possible to highlight the presence of two distinct groups of old adults, with pet-loving ones feeling detached from people disinterested in pets. The results of this study suggest taking into account the role played by emotional and social issues when designing services aimed at interventions with animals or other polarizing elements.

With regard to digitalization, the majority of participants reported using digital devices and platforms. Regardless of their abilities, all participants considered human support as an essential aspect of their abilities, suggesting the need for a reinterpretation of digital skill assessment in old adults. Matchmaking-based digital services can be an accessible option to find an adoptable pet for old adults if paired with sufficient information and onboarding sessions tailored to different digital skill levels. The interaction with the prototype of a digital pet adoption platform has highlighted the contribution determined by onboarding issues in discouraging old adults in their approach towards technology. Testing established patterns and elements with users from pre-internet generations may help identify areas of improvement and optimization which could simplify their usage for all.

About the Authors:

Angela Giambattista is a Researcher and Assistant Professor at the Department of Planning, Design, and Technology of Architecture, Sapienza University of Rome, Italy. Her research interests concern product and service design, human-centered design and user experiences, with a particular focus on design for health and well-being.

Carlotta Soddu is a recent graduate in the Product and Service Design master's degree at Sapienza University of Rome. Her thesis project focuses on Italian old adults and their relationship with pets with reference to isolation and socialization.

Cosimo Miraglia is a postdoctoral fellow in Sociology of Cultural and Communication Processes at the Department of Communication and Social Research (CoRiS) of Sapienza, University of Rome. He conducts research on user experience, youth, cultural practices, and gender and media.

Acknowledgements: we would like to thank the old adults' communities Centro Giovani Anziani Cornelia and Centro Anziani Valcannuta for their availability and support during the research as well as the participants who kindly took part in the research.

ENHANCING WELLBEING: EMPOWERING INDIVIDUAL AND COMMUNITY NEEDS FOR SHARED IMPACT.

Line Ulrika Christiansen*[a]

a Opendot, Milan, Italy
* line@opendotlab.it

DOI: 10.63442/WMKM6127

ABSTRACT | *How can we ensure that individual and community needs are effectively empowered to generate a shared impact on optimizing wellbeing?*

Today, the health and care sector has technologies and methods at its disposal that could change it for good and improve the quality of life of millions of people with physical and cognitive disabilities, whether temporary or permanent. The integration of new technologies, ranging from digital fabrication to advancements in machine learning and AI, offers unprecedented opportunities to revolutionise how we approach solutions in various domains. Particularly in the realm of affective computing, where machines can interpret and respond to human emotions, the potential for adaptation and personalization is profound.
This intersectionality presents a unique avenue for addressing fragility, embracing pedagogy, accommodating disabilities, and fostering collaborative design. By harnessing these technologies, we can create tailored solutions that cater to individual needs and circumstances, thereby mitigating fragility by providing targeted support.

Moreover, in the realm of pedagogy, personalized learning experiences can enhance educational outcomes by catering to diverse learning styles and abilities. For individuals with disabilities, technology can serve as a powerful tool for empowerment, enabling greater independence and participation in various aspects of life. Additionally, collaborative design processes enriched by technology facilitate inclusive decision-making, ensuring that diverse perspectives are incorporated from the outset.
Thus, by leveraging these technological advancements, we can not only make solutions more efficient but also more inclusive and impactful, addressing the multifaceted challenges of our time.

However, by addressing the multifaceted challenges posed by disabilities and other complex issues, it becomes increasingly evident that technology alone cannot provide comprehensive solutions. Instead, the importance of employing a collaborative approach such as co-design emerges as paramount. Co-design stands as a methodology through which customized solutions are crafted and tailored precisely to meet the unique needs of the stakeholders involved. By bringing together a diverse array of participants, including designers, manufacturers, developers, healthcare professionals, and individuals with disabilities alongside their caregivers, co-design ensures a holistic and inclusive process. This collaborative effort fosters innovation, empathy, and a deep understanding of the nuanced requirements, ultimately leading to more effective and impactful solutions.

The Glifo project exemplifies the convergence of co-design and technology, showcasing both the collective achievements and the potential for collaborative impact. Created in collaboration with the TOG Foundation, Glifo, in English Glyph, is a customized writing aid that helps children with a complex neurological disorder to write and draw.

A purposeful sign, lightweight, adjustable, washable, and, thanks to 3D printing, a customizable writing tool. It was born from the joint planning of makers, designers, therapists, and families of children with disabilities to help children with complex neurological pathologies to write and draw independently.
Today, it is available via open-source 3D printing documentation.

Create positive impact on **real needs** with **empowerment of all actors** through **shared innovation.**

open dot

Fragility, pedagogy, disability and **collaborative design -** it is no longer **'design for all'** but **'each and everyone'.**

How can we ensure that individual and community needs are effectively empowered to generate a shared impact on optimising wellbeing?

An **approach** centred on social good to create real change through shared and open innovation.

A **goal** based on real needs, from macro-level impact to providing effective solutions for individual needs.

A **methodology** based on a human-centred design approach, aiming for relevant and impactful design created by all stakeholders.

open dot **TOG**

Manifesto of co-design for Health & Care

1 Listen and observe

Co-design means creating a space where all opinions, competences and experiences count and are useful, it means to enact a process based on listening.

2 Teach and learn

We are all experts in something and reciprocal training is fundamental: doctors, designers and individuals with disabilities, experts in their condition, sharing knowledge and competences, intersecting them.

3 Speak the same language

Break down the wall of anglicisms and technical jargon, in favor of a common language that everyone can understand.

4 Share the real needs

The goal is to solve a real need, no matter how small or big, what really matters is focusing on the reason. The "how" comes after.

5 Think and design together

Moments of sharing, exchange and collective design guide the group towards the final idea, stimulating everyone's creativity when it comes to devising new and innovative solutions able to address real needs.

6 Materialize the idea

The production of a first prototype allows us, thanks to software, digital fabrication technologies and rapid prototyping, to touch, explore, and test the idea. And last but not least, customize it.

7 Prototype, prototype

The prototyping phase is a spiral process in which projects improve by increasing versions, and through continuous dialogue on how to perfect the object.

8 Replicate, scale, share

A well designed project on its own could be useful and replicated to also respond to others' needs. Here is where the value of the open source philosophy comes into play: sharing the process and the final solution is a way to enrich the project and to amplify its social impact.

The design process is a **laboratory**!

A journey from the realms of **digital fabrication** to the frontiers of **machine learning** and **AI** including the intersections and complexity of **affective computing**.

A lightweight, adjustable, washable and custom-made writing support thanks to **3D printing**.

Born from the **co-planning** between **makers**, **designers**, **therapists** and families of **children** with disabilities, to help children with complex neurological pathologies to write and draw independently.

SayEye

Manuale mobile

Ensuring a domain where fluid communication between **care-receivers, families,** and **children** becomes possible.

An eye tracking-based software that allows people with complex neurological diseases to communicate through eye movement.

TOP! Together to Play is a videogame suite to improve therapy for kids with complex neurological disorders.

The suite offers rehabilitation and **learning sessions** based on videogames and interactive activities, thanks to **eye-tracking technology**.

Empowerment through **Open-Source**

ARI-TEST: SET THE FOCUS ON THE USER EXPERIENCE IN THE DESIGN OF A SELF-SAMPLING DEVICE FOR HPV DETECTION IN WOMEN.

Macarena Silva*[a], Alberto Gonzalez[a], Ivan Caro[a]

a Pontificia Universidad Católica de Chile, Chile
* mdsilva12@uc.cl

DOI: 10.63442/KWLB2766

KEYWORDS | HPV DETECTION, CERVICAL CANCER, HEALTHCARE DESIGN, SELF-SAMPLING, PREVENTION

ABSTRACT | Human Papillomavirus (HPV) is regarded as the main cause of Cervical Cancer (CC), affecting over 440 million people worldwide (UC Christus Healthcare Network, s.f.), diagnosing over 600 thousand women each year, from which half of them die (WHO, 2023). In Chile, this outlook worsens, where 70% of over a thousand women who are diagnosed yearly die (Urrutia, 2015).

It constitutes a global public problem, which has among its causes the inequality of access to healthcare services, refusal on the part of women to attend their gynecological check-ups, and other socioeconomic determinants (WHO, 2023) that complicate the situation. In the research, different critical interactions were raised, the most relevant is the lack of time and the discomfort generated by the PAP test (Papanicolau) experience, which distances women from the examination and, therefore, the early detection as well. These diseases are asymptomatic and don't show obvious signs until they are in an advanced state and treatment becomes limited. However, its effects can be treated when detected in time.

This implies that we're facing a design problem that was not addressed as such. A healthcare and well-being concern that's affecting people's quality of life, so setting the view in the user's experience is something that wasn't being contemplated in these types of exams. The project proceeded considering the multiple aspects of the challenge but taking as priority those that directly influence the promotion of early detection.

The research started as an undergraduate thesis in 2022 at the School of Design of Pontificia Universidad Católica de Chile, and it is currently financed by the National Research and Development Agency, Chile's main funding state institution in research matters.

Ari-test eases vaginal self-sampling for HPV detection, allowing women to regain agency over their gynecological experience and self-care by granting the possibility of access to the exam in a simple way from the comfort and privacy of their homes.

The design process was approached from the iterative methodology of Health Design Thinking, which focuses on the real needs and behaviors of users instead of seeing them as patients defined by illness (Ku and Lupton, 2018). Including users in the process through co-designing tools and considering their gynecological experiences was crucial and challenged us to go beyond designing only for their bodies but working for and with them.

Different self-sampling devices from other parts of the world were reviewed and studied, suggesting a response to medical or laboratory perspectives instead of considering women's experiences. This concept became crucial for the development of the research, passing from a distant and invasive experience to a closer and easier one that promotes self-care, involving women with self-sampling, a technique that can help reach global targets of screening (WHO, 2023). In the following stages of the research, in collaboration with the CancerLab of Universidad Católica del Norte, the Ari-test device will be validated with 60 women from the Coquimbo region, Chile's territory with the highest CC indicators.

While design, by its very nature and purpose, strives to reduce entropy within artificial environments, entropy is concurrently on the rise, not only within the natural world but also within the realm of human existence. The segmentation of design, driven by increasingly specialized fields, gives rise to new layers of meaning while universal concepts become depleted. Is sustainable design merely another method of shaping commodities, or can it encompass a comprehensive systems perspective? Within this complex domain, the parameters governing its operation can be defined, offering a fertile ground for scholarly exploration. We invite contributions to the track “Taming Entropy: Systems Design for Climate and Change”, where we aim to shed light on the leverage points of high efficiency within the design of sustainable systems.

As outlined in the call for papers, the concept of sustainability is frequently compromised by market-driven logic, resulting in practices of greenwashing and distortions of value systems. While there are numerous examples that illustrate this phenomenon, perhaps the most striking is the observation that, despite a series of international climate conferences (COP 1-27), agreements (e.g., Stockholm 1972; Rio 1992; Kyoto 1997; Paris 2015), and institutions (e.g., IPCC, 1988), meaningful reductions in carbon dioxide emissions have only occurred temporarily—during the global financial crisis of 2008 (Kallis, 2017) and the COVID-19 lockdowns. The question remains: why have we not met the goals of climate strategies? Why has the transition to a circular economy not occurred, and why does consumption continue to increase? The answer lies in the neoliberal economic

system, where the imperative for growth overrides the values underpinning sustainable strategies. The concept of sustainable development (Brundtland, 1987), while conceptually tautological, has been subject to criticism even before its formalization (Meadows, Randers, & Meadows, 2004; Illich, 1984; Lányi, 2022). Nevertheless, the United Nations adopted 17 Sustainable Development Goals (SDGs) based on this concept. Although the majority of these goals reflect a morally sound systemic perspective, the influence of market forces remains evident, particularly in SDG 8: Decent Work and Economic Growth.

The first session, entitled *Designing Education for Tomorrow,* focused on the integration of ecological perspectives into education. Both the morning session and the afternoon workshops highlighted the importance of developing education that is aligned with ecological principles. Whether addressing museum pedagogy, gamification, immersive UX design, or the introduction of new curricula, uncompromising solutions require the persistent efforts of dedicated practitioners. From Mongolia to Europe, during what was the warmest spring on record, it remains essential to emphasize that the ecological crisis is not separate from the crisis of civilization but rather a consequence of it. It is not global warming that we should be fighting—global warming is not an external threat to humanity, nor is it a catastrophe detached from us. Moreover, the aim is not to "save the planet," as the Earth will undoubtedly survive without us. Instead, we must redefine our understanding of progress and the good life, recognizing that the fundamental needs of humanity have remained unchanged over the past 20,000 years. These needs encompass more than just basic survival; they include the need for a meaningful existence and a sense of belonging within a supportive community. The unquestioning belief in progress has led to the reduction of knowledge to mere utility (thereby limiting our ability to understand both others and ourselves), the redefinition of freedom as consumption, and the conflation of creation and work with production. Means have become ends (Lányi, 2022, p. 23). To the question of whether there is still time to articulate and teach these concepts through the language of design, the presenters responded that there is not—yet they agreed that there is no alternative.

The second session, entitled *Taming Entropy by Products,* explored whether truly sustainable product and service design is possible. The inherent contradictions—whether a product is made from sustainable sources or produced through a reuse approach, it still results in new production and consumption—raise the question of whether these contradictions can be resolved through the principles of circularity and efficiency. The presentations, posters, and workshops in this session reflected a complex perspective, one that considers not only the energy and materials invested in a product or service but also its utility and the impact it has on shaping societal views. A disheartening conclusion from the panel discussion was that, contrary to the optimistic messages often conveyed by sustainability advocates, technologies that support circularity have been unable to keep pace with the increasing rates of production and consumption. A striking example of this is the millions of tons of textile waste that remain unprocessed and are often incinerated annually, as only a small percentage of clothing is recyclable, and the recycling industry lacks the political influence necessary to effect regulatory change.

The third session, titled *Systems Design,* adopted a broader interpretation of systems thinking, addressing urban-scale social problems as well as the physical and linguistic systems of ecology and the question of responsibility. The responsibility of designers extends far beyond the application of sustainable technologies, encompassing the broader interpretation of systemic perspectives. Why is there no overlap between the growing global housing crisis and the increasing sprawl of real estate developments? The institutionalized certification systems associated with greenwashing provide shameful evidence of this, as sustainability certifications are routinely awarded to building complexes that contribute to environmental degradation and have life cycles of less than 20 years. Despite the façade of sustainability, these practices obscure critical environmental and well-being issues. For instance, why was a particular building constructed in the first place? What was previously located on the site, and what alternatives could have been pursued? Whom does the building serve, and what are the environmental and social impacts of its construction and operation? Which building regulations had to be altered to facilitate its construction, and why? What message does this send to the city's residents, many of whom will never be able to afford to live in these spaces?

Capitalism, as it operates today, colonizes sustainable models and corrupts decision-making processes. In Track 8, our aim was to explore the coping strategies and intervention points identified by designers from diverse parts of the world, all of whom operate within this global framework. How do these designers attempt to avoid the traps embedded in the notion of sustainable development? The presenters and exhibitors of this track demonstrated a relentless commitment to the challenge of taming entropy, both within artificial environments and within the realm of human existence.

KEYWORDS | EDUCATION FOR SUSTAINABLE DEVELOPMENT (ESD), ANTICIPATORY COMPETENCE, GAME-BASED LEARNING (GBL), BOARD GAME, COGNITIVE DEVELOPMENT

ABSTRACT | This study grounded in game-based learning theory, developed a board game based on the Education for Sustainable Development (ESD) theory for fostering anticipatory competency in 7-11-year-old children. The „Future Island" board game is designed for collaborative play among four players, aiming to protect islands from being submerged due to environmental crises. The game design incorporates five core concepts of anticipatory competency: future orientation, scenario planning, strategic systems thinking, interpersonal competence, and environmental knowledge. Qualitative research was conducted in both Guangzhou and Shenzhen using observational and interview methods with 28 children over two experiments. The purpose was to validate whether children's understanding of the game varies with age and whether the game effectively stimulates anticipatory competency in children. Analysis of the children's gameplay results revealed that their understanding of the game increased with age, and the "Future Island" board game effectively mobilizes children's anticipatory competency in the field of ESD.

1. Introduction

By 2022, the devastating impacts of climate change, biodiversity loss, pollution, and waste have become increasingly severe (UNEP, 2022). To enhance citizens' environmental awareness, the 2030 Sustainable Development Agenda explicitly integrates Education for Sustainable Development (ESD) principles into all educational category systems (UN, 2015). This article focuses on qualitative research using the Game-Based Learning method to explore the effectiveness of a board game to mobilize the anticipatory competence of children aged 7-11 in ESD.

ESD aims to develop competencies that empower individuals considering current and future social, cultural, economic, and environmental impacts, both locally and globally (Tejedor et al., 2019). Researchers have identified the anticipatory competence of the cognitive domain as one key competence that ESD ought to promote (Barth, Godemann & Rieckmann, 2007). Anticipatory competence involves the person's ability to envision and construct coherent future scenarios (Arnim, Lauren & Charles, 2011). The current focus is on insufficient coverage of age groups, that is, most research on expected abilities is concentrated in higher education rather than early childhood education (Senan & Marco, 2016). However, children in middle childhood already have logical thinking, reasoning, debating, and problem-solving abilities, which are the basic abilities required to develop anticipatory competence (Andrew, 1984). Thus, this article fills the research gap by studying the anticipatory competence of children aged 7-11 years old.

Game-Based Learning (GBL) is a type of gameplay with defined learning outcomes (Rosemary, Robert & James, 2002). Future Island is a board game designed to improve the anticipatory competence of children aged 7–11 in ESD. Addressing the impact of global climate warming on rising sea levels; players collaboratively anticipate environmental crises to protect the island from submersion due to increasing seawater levels. The game enhances children's anticipatory competence through engaging mechanics. Firstly, it cultivates children's Scenario Planning skill and Future Orientation skill by defending the island (Wiek, Withycombe & Redman, 2011). Secondly, it improves children's Strategic Systems Thinking ability by predicting the impact of human behavior on environmental crises. Thirdly, the multiplayer collaborative format of the game fosters children's capacity to connect with stakeholders. Lastly, the game promotes an understanding of environmental conservation through the presentation of diverse environmental crisis cards. Overall, the author posits Hypothesis 1: Children aged 7–11 years differed in their understanding level of the board game content developed in this study by age. And Hypothesis 2: This board game can effectively mobilize children's anticipatory competency in the field of ESD.

This study primarily involves qualitative research to validate these hypotheses, including board game experiments under GBL methods, Observation, interviews, etc. The team invited 7–11-year-old participants from Guangzhou and Shenzhen to participate in Future Island trials. The effectiveness of the model is measured by observing and analyzing children's performance in the game. Future work involves iterative optimization of the game model and incorporating Game-Based learning (GBL) to enhance various ESD capabilities, further advancing children's environmental awareness.

2. Literature Review

2.1 Anticipatory Competence in Education for Sustainable Development (ESD)

ESD is an educational approach that integrates the principles of sustainable development into teaching and learning practices. It aims to empower individuals to make informed decisions and take responsible actions for environmental integrity, economic viability, and a just society (UNESCO, 2014). ESD can be divided into three domains: Cognitive domain, Socio-emotional domain and Behavioral domain, and Anticipatory is one of the key competences in cognitive domain. A pivotal aspect of ESD is the development of anticipatory competence, which enables individuals to engage with future dimensions, anticipate potential outcomes, and craft visions for a sustainable future (Ojala, 2012). In the context of global environmental challenges, where the ability to think ahead and prepare for various future scenarios is crucial for effective decision-making and problem-solving.

Table 1. Key competencies in "ESD" can be divided into three domains.

	Cognitive domain	Socio-emotional domain	Behavioral domain
Key Competency	1 Systems thinking	5 Collaboration	7 Strategic
	2 Anticipatory	6 Self-awareness	8 Integrated problem-solving
	3 Normative		
	4 Critical thinking		

Anticipatory competence in ESD can be broken down into several components：

1. **Future Orientation:** This component involves the ability to think beyond the present and consider the long-term implications of current actions and decisions. It requires an understanding of the temporal scale and the ability to work across different time horizons, which is particularly important when dealing with sustainability issues that often have delayed consequences (Rieckmann, 2012).
2. **Scenario Planning:** Anticipatory competence includes the capacity to create and analyze alternative future scenarios, both desirable and undesirable. This allows individuals to identify potential risks and opportunities, and to develop strategies to achieve preferred outcomes while avoiding or mitigating negative ones (Ojala, 2012).
3. **Strategic Systems Thinking:** This combined component encompasses the capacity to create and analyze alternative future scenarios, both desirable and undesirable, and to understand the interconnectedness of systems. It allows individuals to identify potential risks and opportunities, develop strategies to achieve preferred outcomes, and navigate the complex feedback loops and unintended consequences that can arise from sustainability-related actions (Barth et al., 2007; Ojala, 2012).
4. **Interpersonal Competence:** Anticipatory competence is also about the ability to collaborate effectively with others. This includes the capacity to communicate, negotiate, and work in diverse teams to achieve common sustainability objectives (Wiek et al., 2011).
5. **Environmental Knowledge:** Environmental knowledge is essential for anticipatory competence as it provides the foundational understanding of ecological systems, natural resource management, and the impact of human activities on the environment. This knowledge enables individuals to make informed decisions that are grounded in scientific evidence and contribute to the conservation and restoration of ecosystems (Tschakert & Dietrich, 2010).

Anticipatory competence enables individuals to navigate these uncertainties by considering a range of possible futures, evaluating the plausibility and consistency of different scenarios, and making informed decisions that align with sustainability principles. Moreover, anticipatory competence supports the development of a proactive and adaptive mindset, which is crucial for addressing the 'wicked problems' of sustainability (Rittel & Webber, 1973). In conclusion, anticipatory competence in ESD is essential because it equips learners with the tools to actively shape their future rather than passively accept it (Gardiner & Rieckmann, 2015).

2.2 Anticipatory Competence in 7-11-Year-Old Children

Despite the recognized importance of anticipatory competence in ESD, the majority of research and educational initiatives have focused on adolescents and young adults (Taimur & Sattar, 2019). This demographic is often at the forefront of discussions surrounding sustainability, as they are the ones who will inherit the consequences of current environmental policies and practices. However, there is a notable absence of research and targeted educational strategies for children aged 7-11 years, a critical period in their cognitive and social development according to Piaget's theory of cognitive development (Piaget,

1952). This age group is in the concrete operational stage, where they begin to understand the reversibility of operations and can think logically about concrete events (Piaget, 1952). This stage is particularly suitable for introducing sustainability concepts and fostering anticipatory thinking, as children at this age can grasp the implications of their actions on the environment and society (Ojala, 2017).

The lack of focus on children in this age group in ESD research and practice is concerning, as this demographic represents the future stewards of the planet. By not engaging them in anticipatory thinking, we miss the opportunity to instill the foundational skills and values necessary for sustainable living from an early age. The importance of fostering anticipatory thinking in children is multifaceted. Firstly, it enhances their cognitive development by encouraging them to think critically and systematically about the future (Withycombe, 2010). This includes understanding cause and effect relationships, considering multiple perspectives, and evaluating potential risks and benefits. Secondly, it supports their social and emotional development by fostering empathy, collaboration, and a sense of responsibility towards the environment and future generations. Lastly, it prepares them for active citizenship, equipping them with the skills to participate in socio-political processes and contribute to sustainable development initiatives (Cebrián, Junyent, & Mulà, 2020).

In conclusion, the development of anticipatory thinking competencies in children aged 7-11 is a critical yet underexplored area within ESD. By integrating age-appropriate strategies into educational practices, educators can help shape a generation of children who are equipped to engage proactively with sustainability challenges and contribute to a more sustainable future. This requires a concerted effort from educators, policymakers, and researchers to create a more inclusive and holistic approach to sustainability education that reaches and empowers children from all backgrounds and cultures.

2.3 Game-Based Learning Approach and Board Game

Game-based learning refers to the utilization of certain gaming principles and their application in real-life scenarios to engage users (Trybus, 2015). Board Games as part of effective Game-Based Learning strategies, more and more researchers and producers are focusing on this area (Santos, 2017). Research including children aged 7 to 11 strongly suggests that board games are an effective tool for encouraging active learning and knowledge retention, and that board games can help children learn even better than traditional forms of teaching (Weisberg et al. 2015). Many game settings of board games are very useful in promoting children's learning, for example: teachers can ask open-ended questions to help children think more deeply; the introduction of dice helps reduce adult control and allows children to maintain a sense of control in the game; The mechanics of multiplayer games can help children enhance their social skills, etc. (Hassinger-Das et al. 2017). Therefore, as one of the important game forms of GBL, board games can well exercise children's independent learning ability.

Although board games have great benefits in promoting children's learning, there is currently a lack of board game designs for children in the field of ESD that enhance their expected abilities. The currently known training for expected competencies is the „The City of Phoenix" themed workshop designed for college students (Withycombe, 2010). Most of the board games in other ESD fields are simple environmentally themed games, such as the board game „Go, Goals" (SDG, 2020) designed by the United Nations Regional Information Center to help children understand the sustainable development goals. Therefore, there is currently a lack of environmentally themed children's serious board games in the research field, especially in the field of ESD ability training.

In conclusion, board games have the potential to promote children's learning more broadly (SuttonSmith 1979; Singer, Golinkoff, and Hirsh-Pasek 2006). And anticipatory abilities as an important ability in the field of ESD, and one of the abilities that children aged 7-11 years old most need to cultivate, there competency are need some suitable board games as GBL materials to help children better master anticipatory.

2.4 Research Gap

Firstly, there is limited attention to young audiences: current expectations learning primarily targets university students, with a notable lack of research focused on children aged 7-11. Despite the crucial role of this age group in the development of anticipatory competency, they have largely been overlooked in game-based learning research.

Secondly, training on anticipatory abilities in Education for Sustainable Development (ESD) mostly concentrates on workshops, classroom lectures, etc., lacking game-based learning approaches, particularly important and effective board game training for children.

Therefore, this study will design a board game for cultivating anticipatory competency in ESD for children aged 7-11, and validate its reliability through a series of qualitative experiments.

3. Research Questions

RQ1: In this study, would the content of the board game developed lead to different levels of understanding among children aged 7-11 based on their age differences?
H1: Children aged 7–11 years differed in their understanding level of the board game content developed in this study by age.

RQ2: Does this board game have the potential to engage children's anticipatory competency in the field of ESD?
H2: This board game can effectively mobilize children's anticipatory competency in the field of ESD.

4. Methodology

4.1 GBL Method: Board Game Design Background and Conceptual Structure

The method used in this study is the board game in game-based-learning, and the name of the board game is „The future island". The game was designed based on the principles of ESD, specifically targeting the development of anticipatory competence. The game's mechanics were crafted to simulate environmental challenges and encourage strategic decision-making, reflecting the cognitive, socio-emotional, and behavioral domains of ESD, etc.

The background of the board game is that four players must take on the roles of an artist, an engineer, a marine biologist, and a renewable energy scientist, respectively. Through teamwork and playing skill cards, they aim to prevent sea level rise and the submergence of islands to win the game. The rules of this board game are designed entirely around the five components of anticipatory competency:

1. **Future Orientation:** Players need to judge in each round whether the impact of human behavior on environmental crisis events will be exacerbated, weakened, or have no impact. In this process, players need to think about the dimension of time, focus on the present, and consider the impact of human behavior on the environment in the future. Therefore, children's Future Orientation ability can be developed.
2. **Scenario Planning:** Players need to reasonably analyze the environmental crisis events that occur in each round, then think about which skill card in their hand is most suitable for solving the current event. In the process of thinking, players naturally adapt solutions to environmental crisis scenarios, which exercises children's Scenario Planning abilities.

3. **Strategic Systems Thinking:** During the game, players need to constantly calculate which character skill cards are needed to solve the current environmental crisis. At the same time, it is also necessary to predict in advance what impact the drawn human behavior cards will have on the environmental crisis. Sometimes players need to give up staged victories in exchange for final victory. These combination thinking can effectively exercise children's Strategic Systems Thinking ability.
4. **Interpersonal Competence:** The game is a group cooperation mode. Players need to communicate multiple times to determine which character skill cards the entire group should play in this round to solve the current environmental crisis. What kind of choices need to be made when the interests of
the team and the interests of the individual are put in front of you? This is the Interpersonal Competence that players can develop while playing games.
5. **Environmental Knowledge:** The environmental crisis cards in this game include events such as melting glaciers, and extreme heat waves; the human behavior cards include environmentally related events such as "the tourist group in Future Island litters garbage"; the character skill cards include „monitoring the rate of sea level rise" and so on. In the process of playing the game, players will gradually master the knowledge related to the environment.

4.2 GBL Method: Cards, Rules and Steps of the Board Game

1. **Introduction of board game cards and other props:**

   Skill card: The skill cards are the available skills that players possess. There are a total of four roles and sixteen skill cards.

(a) (b) (c) (d)

Figure 1. Examples of skill cards: (a) Oceanographer Skill Card 1; (b) Oceanographer Skill Card 2; (c) Oceanographer Skill Card 3; (d) Oceanographer Skill Card 4.

(a) (b) (c)

Figure 2. Examples of skill cards: (a) Energy Scientist Skill Card 1; (b) Engineer Skill Card 1; (c) Artist Skill Card 1.

Environmental crisis card: Environmental crisis cards are environmental crisis events that need to be resolved in each round. There are six environmental crisis cards in total.

(a) (b) (c) (d) (e) (f)

Figure 3. Examples of Environmental crisis cards: (a) Energy Crisis Card; (b) Glacial Melting Card; (c) Extreme Heatwave Card; (d) Forest Loss Card; (e) Seawater Pollution Card; (f) Fish Decline Card.

Human Behavior Card: Human behavior cards are human behaviors that will have different impacts on the environment. There are 9 human behavior cards in total.

Figure 4. Example of Human Behavior Card.

Table 2. Example for what impact does human behavior have on different environmental crisis events.

	Energy Crisis Event	Glacial Melting Event	Extreme Heatwave Event	Forest Loss Event	Seawater Pollution Event	Fish Decline Event
In order to develop new projects, Future Island tourism has severely damaged the natural ecological reserve on the island.	No effect	Double crystals	Double crystals	Double crystals	Double crystals	Double crystals

Ocean Card: The ocean card is a scoring item, and each player initially has three ocean cards. For each round lost, a player must place one ocean card near the island, representing a rise in sea level by one unit.

Crystal: The crystal is a scoring item, and each player initially has 4 crystals representing their own character's color. White crystals are the ones that need to be spent to resolve the events on the environmental crisis cards.

(a) (b)

Figure 5. (a) Examples of the Ocean Card; (b) Examples of the Crystal.

2. **Introduction of basic rules:** In "The Future Island" board game, four players form a team, and the team's ultimate mission is to defend the island from rising sea levels. The game consists of six rounds in total. In each round, different environmental crisis events will occur. The team must cooperate to play skill cards to solve the current environmental crisis events. If the team can successfully solve three of the six environmental crisis events, the island will not be submerged.

3. **Introduction of game steps:** The board game is divided into four phases: Events Step, Skills Step, Human Behavior Step, Resolution Step, and a brief description of each phase is provided below.

Events Step: There are a total of 6 environmental crisis cards, one card is played in each round, and the cards are played in the order of 1-6. As a group, discuss what happened, and how many crystals are needed to solve this incident.

Skills Step: Everyone decides whether to play a skill card and which card to play based on the crystal points in their hand. There is no limit to the number of people playing cards in each round. It should be noted that when children play a skill card, they should say how this skill card solves the current environmental crisis. After playing a skill card in each round, place the consumed crystals in the counting area according to the „Crystal points" marked on the skill card.

Human Behavior Step: Each round, a random Human Behavior card is drawn. The group discusses its impact: Positive halves Environmental Crisis card's crystals, negative doubles, no

impact maintains. If the team's total skill card crystals match or exceed the Environmental Crisis card's, they win. Players using skill cards get 1 crystal each; most crystals on a card earn 1 extra. If not, team loses; each discards an Ocean card, raising sea level by 1.

Resolution Step: If three of the six rounds are won, the future island will not be submerged by the sea water and the defense will be successful! If the future island is successfully defended, the crystal points in the counting area will be counted, and the person with the most crystal points will win an additional personal championship victory. The game proceeds to the next round until the game's termination criteria are met.

Figure 6. Game Process Overview and First Round Game Example.

4.3 Research Method: Qualitative Research Method

The main purpose of this study is to answer the two hypotheses mentioned above. H1: Children aged 7–11 years differed in their understanding level of the board game content developed in this study by age; H2: This board game can effectively mobilize children's anticipatory competency in the field of ESD. In this study, the experimenters will use qualitative analysis to analyze the experimental results. Qualitative research is a research method focused on thoughts, concepts, or experiences (American University, 2020). There are many qualitative methods, with the most common types being interviews and observations (Creswell, 2007).

Observational method is described as a technique of observing and describing subjects' behavior, involving simply observing phenomena until some form of intuition or insight is gained (Kumar, 2022). Children's thinking and behavior patterns are very different from adults, and we cannot get the complete information we want by asking. Therefore, observation method is necessary in this study, and these observations can serve as the basis for subsequent analysis. Additionally, interviewing is another specific type of interaction, typically involving researchers asking questions to interview participants and participants responding to those questions (Brinkmann, S., & Kvale, S., 2018). Therefore, in this experiment, interviews are used as a complement to the observational method to help researchers obtain the necessary information.

To sum up, in this study, researchers will conduct two experiments using board games as props to verify H1 and H2. Specifically, Experiment 1 used the observation method, and Experiment 2 used the observation method and interviews.

5. Experiment

5.1 Experiment 1 Observation: Context and Procedure

In Experiment 1, the authors will test H1: Children aged 7–11 years differed in their understanding level of the board game content developed in this study by age. The study conducted its first qualitative survey on 8 children at the Another Art Museum in Guangzhou, Guangdong Province, China on May 19, 2023 (Guangzhou Group). A second qualitative survey was conducted on 12 children at the First Store Life Festival in Futian District, Shenzhen City, Guangdong Province, China on November 17, 2023 (Shenzhen Group). There are 20 qualitative experimenters in Experiment1, covering various age groups from 7 to 11 years old, and there are 4 experimenters in each age group. Both experiments used an open-ended board game experience workshop format, with participants randomly assigned to groups to ensure a mix of age and gender. The independent variables of this experiment are children of different ages, the control variables are the same game steps and the same number of children of each age group, and the dependent variable is whether the children can understand the rules of the game. The experimenters used observational methods to analyze whether children in the target age group's understanding of the game differed by age. In this experiment, the experimenter followed the following steps to conduct the observation experiment.

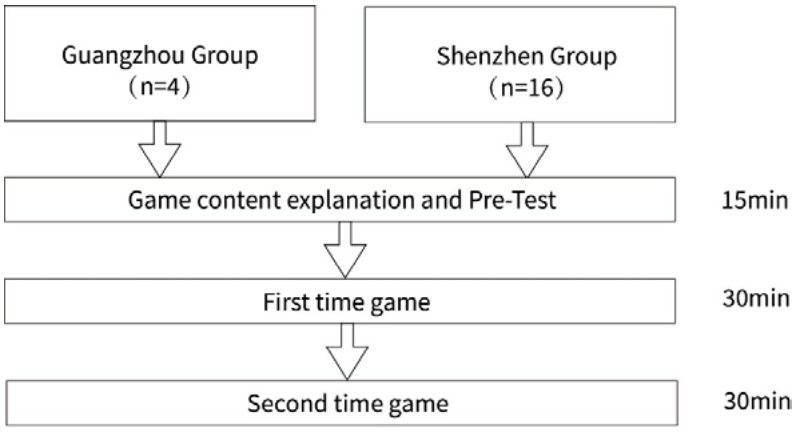

Figure 7. Experiment 1 Procedure.

1. Game content explanation and Pre-Test: Before the game starts, staff will explain the game content to each group and conduct pre-tests to ensure that the game-related information delivered to each child at the beginning is consistent.

2. First and second time Game: Observers use observation methods during the game to observe the children's understanding of the game. Children's understanding of game content can be divided into three dimensions: understanding of card text, understanding of game rules, and understanding of the way to victory. During the game, observers will carefully observe each player's choices, actions, judgments, and interactions with other players. Each dimension is rated on a seven-point scale and details low, medium, and high behaviors, with higher scores indicating greater understanding of the game content for that dimension. Ratings include the quality and frequency of observed behavior, and the scores are not mutually exclusive; for example, a child might simultaneously demonstrate understanding of card text, understanding of game rules, and understanding of winning in two rounds of play.

(a) (b)

Figure 8. (a) Game scene photo of the Guangzhou group; (b) Game scene photo of the Shenzhen group.

5.2 Experiment 1: Analysis and Summary

Firstly, in the observation phase, observers are asked to write down examples of relevant behaviors for each dimension. Then during the scoring phase, observers refer to "The Future Island" instruction manual and compare the descriptions of children's behavior it provides with their own observation notes to determine scores for each dimension. For example, a sign of a high score in the „Understanding of card text" dimension is that the child can read the text on the card fluently and conduct reasonable analysis of the text. Observers arrive at a final numerical score by determining how well the description matches the observed behavior. For example, a child whose behavior fully fits the description of „Completely understand the text on the card" would receive 5 points, while a child who mostly fits the description in the high range, but has some behaviors in the middle range, would receive 4 points. A child who fully fits the mid-range description will receive a 3, while a child who mostly fits the mid-range description but has some low-range behaviors will receive a 2. Finally in the calculation phase, the observers averaged the data for each age group to obtain a final score.

Table 3. Example for Score calculation for 7 years old age group.

Participant number	Participant age	The understanding of game content can be divided into three sub-items			Overall score	Average score
		Understanding of card text	Understanding of game rules	Understanding the way to victory		
1	7	4	5	4	13	10.25
2	7	4	4	4	12	
3	7	2	3	2	7	
4	7	2	3	4	9	

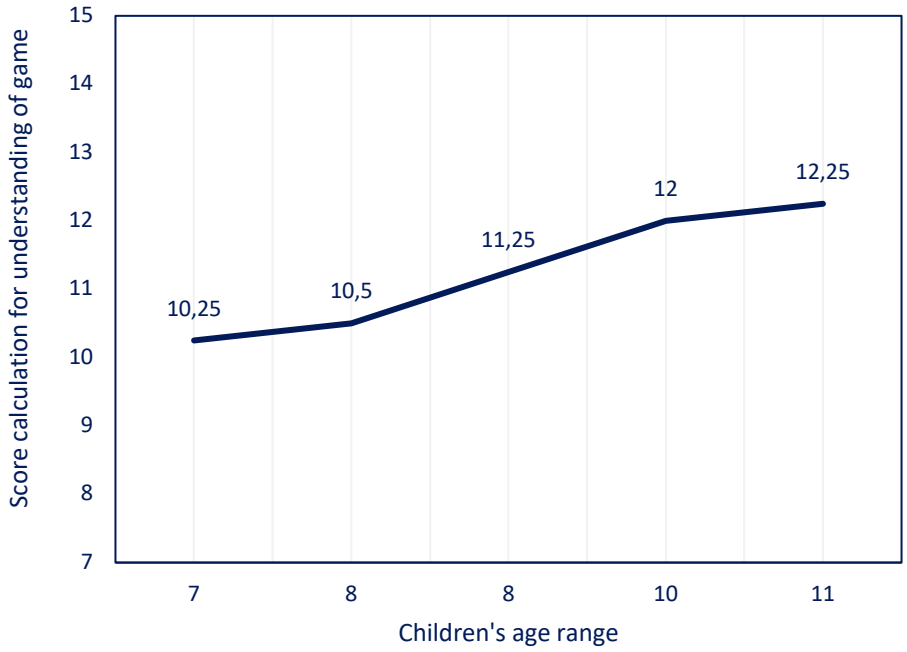

Figure 9. Line chart of scores for children of different ages on their level of understanding of the game.

Through data analysis, the author believes that hypothesis 1 is provable, that is, Children aged 7–11 years differed in their understanding level of the board game content developed in this study by age. And as age increases, children's understanding of the rules of the game gradually rises. In addition, it can be found that children aged 7-8 years old have a low understanding of the game, so the researcher made some modifications to the game rules, that is, simplifying the text content and game rules, so that children aged 7-8 years can better understand the game.

5.3 Experiment 2: Context and Procedure

In Experiment 2, the author will verify H2: This board game can effectively mobilize children's anticipatory abilities in the field of ESD. According to the results of the first experiment, the experimenters found that children aged 7-8 years old had a lower understanding of the content of board games. After improving the content of the board game, the experimenters will focus on selecting the age group of children aged 7-8 for E2 test. The study conducted a qualitative survey among 8 children on January 28, 2024, at the Futian District Library in Shenzhen, Guangdong Province, China (Shenzhen group2). Before starting the survey, each parent signed an informed consent form. The experiment used an open-ended board game

experience workshop format, with participants randomly assigned to groups to ensure a mix of age and gender. The research methods of Experiment 2 were observation and interview. In this experiment, the experimenter followed the following steps to conduct the experiment：

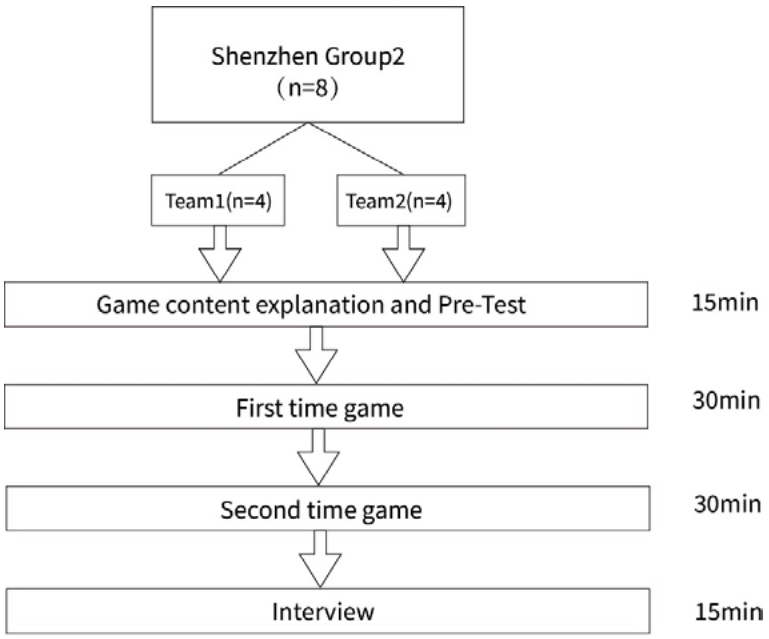

Figure 10. Experiment 2 Procedure.

1. First and second time Game: Observers used observation methods during the game to observe whether the children's expected abilities were mobilized by the board game. The observer will use the child's speech, decision-making, reaction speed and other information during the board game to judge the child's expected ability level in this round of the game. The researchers focused on the following questions and their corresponding abilities in the two-round game:

Scenario Planning: Can children understand the scenarios in the environmental crisis card and human behavior cards?
Future Orientation: Can children correctly judge the impact of human behavior cards after they are drawn?
Strategic Systems Thinking: How many times did children win the game and what strategies did they develop?
Interpersonal Competence: Do children communicate frequently with group members?

2. Interview: Observation methods will be supplemented by interview sessions, in which researchers will communicate directly with the children after the game. The interview session will help researchers obtain more information about whether children's predictive abilities are mobilized. The researchers focused on the following questions and their corresponding competencies during the interviews:

Strategic Systems Thinking: Do you know the methods that can both lead to team victory and individual victory?
Interpersonal Competence: What do you think your role is within the team? What efforts did you make to win?
Environmental Knowledge: What environmental knowledge did you learn after playing this game?

Figure 11. Game scene photo of the Shenzhen group 2.

5.4 Experiment 2 Analysis and Summary

The researchers obtained information about whether children's expected abilities were mobilized through observation and interviews, and sorted them out according to the framework of the five basic abilities of expected abilities:

1. Scenario Planning: After the second time of play, most children were able to accurately describe the scenarios on the environmental crisis cards and were able to provide diverse solutions to fixed events. For example, when Timmy, a 7-year-old boy who played the role of an oceanographer, encountered an energy crisis, he played a skill card for purifying seawater and explained that purified seawater can be used as a new energy source to solve the energy crisis. Therefore, the researchers believe that the game mechanism of this board game, which invites children to take their own roles into the situation and solve the current environmental crisis by providing a variety of scenario cards, can effectively mobilize children's scenario planning ability in anticipatory abilities.

2. Future Orientation: During the first time of play, children's judgments about human behavior cards were limited to whether they were good or bad behavior. However, in the second time of the game, most children were able to use the current human behavior cards to further think about how these behaviors will affect the environment in the future. For example, an 8-year-old boy named Duoduo was able to deduce that human fishing of large quantities of fish may have a negative impact on ocean biodiversity in the future. Therefore, researchers believe that this board game effectively mobilizes children's Future Orientation ability in anticipatory abilities by setting up human behavior cards and guiding children to think about the impact of these behaviors in the future.

3. Strategic Systems Thinking: During the observation phase, researchers discovered that neither team won in the first time of the game and that their crystals had been exhausted early in the game. In the second time of the game, they re-formulated their game strategy, allocated crystal points reasonably and won the game. During the interview phase, the researcher asked children what strategies could help the team win. Duoduo said: „In the early game, skill cards with fewer crystal points should be produced, and in the late game, skill cards with more crystal points should be produced, so that there are enough crystal points. „ Therefore, by observing and interviewing children as they developed different play strategies, the researchers determined that children's strategic systems thinking in anticipatory abilities was mobilized.

4. Interpersonal Competence: During the observation phase, the researcher found that children on the same team had almost no communication in the first time of the game. However, the frequency of communication between the two teams increased significantly in the second time of the game. For example: A girl named Xuanxuan explained the meaning of environmental crisis

cards to her teammates and discussed with her teammates what skills should be played. Her positive communication helped the team win consecutively. During the interview phase, the researcher asked what role did the children play in the team? Xuanxuan replied that she acted as translator and strategist. Therefore, researchers determined that the game mechanics of this board game can mobilize children's Interpersonal Competence in expected abilities.

5. Environmental Knowledge: During the interview session, the researchers asked the children what environmental knowledge they had gained through board games, and each child was able to answer more than two answers, such as: not throwing garbage into the sea, not wasting food, protecting forests, saving energy, etc. The researchers therefore determined that children's knowledge of environmental protection in their anticipatory abilities can be mobilized through this board game.

After analyzing the observation records and interview records, the author believes that hypothesis 2 can be proved, that is the board game can effectively mobilize children's anticipatory abilities in the field of ESD. Children can exercise the five details of anticipatory abilities when playing board games.

6. Contribution

6.1 Theoretical Contribution

Firstly, this study extends the research on anticipatory competence in the ESD field to the board game field, providing new insights into the application of this important capability in the ESD field in game-based-learning. It explores how the unique characteristics of board games influence children's Anticipatory Competence, thereby broadening the theoretical scope of ESD competency systems in contemporary learning environments. Moreover, this study addresses a significant gap in the literature on competency-based board games in the field of ESD. The study contributes to a deeper understanding of how board game design contributes to educational outcomes for children aged 7-11 years. Finally, the study refines board game design by unearthing a theoretical framework of expected abilities and provides a holistic view by linking it to qualitative insights into player experience. This approach enriches the academic conversation in ESD education and game research, providing an understanding of the interplay between game-based learning and ESD competency development.

6.2 Practical Implications

The results of this study provide valuable guidance for the development of board game designs. By studying how to translate theories that are difficult for children to understand into fun and accessible games, game designers can create more educational and effective learning tools. Futhermore, the results of this study can serve as a resource for educators by providing evidence-based strategies for integrating low-cost board games into educational curricula. This can increase student engagement and improve learning outcomes, especially in terms of expected competencies in the environmental field. Finally, the results of this study may help policymakers develop guidelines for the inclusion of board games as a learning tool in educational settings. By leveraging these insights, education policies can be better adapted to optimize the benefits of GBL in promoting student development and learning effectiveness.

7. Limitation and Future Work

Regarding the game design, children have reported that there are too few environmental crisis cards, which leads to a lack of variety and can result in boredom. Additionally, the initial quantities of crystals and positive human behavior cards are limited, causing the game to become more challenging in later rounds as players are more likely to lose. Moreover, about the experimental research: The sample size of the qualitative survey is too small, resulting in incomplete feedback from children. And there is a lack of quantitative research and control groups to determine whether children's anticipatory abilities have improved after playing the game.

Moving forward, the author plans to add more environmental crisis and human behavior cards to enhance the richness of the game. The study will also continue to investigate whether other competencies within the ESD field, beyond anticipatory abilities, can be adapted into game formats. In the experimental domain, quantitative research will be conducted using larger sample sizes to assess the effectiveness of the games in improving children's anticipatory abilities. Additionally, follow-up studies will be considered to examine the long-term impact of board games on the development of children's expected competencies.

8. Conclusion

This study uses a board game called "The Future Island" to improve children's anticipatory abilities in the field of ESD. Through the literature review, it was learned that expected capabilities can be divided into five factors: scenario planning, future orientation, strategic systems thinking, interpersonal competence and environmental knowledge. The game mechanism of this board game is designed around these five factors. During the research phase, observations and interviews were used to verify children's understanding of the game and the effect of mobilizing expected abilities. The research results show that "The Future Island" board game can effectively mobilize the anticipatory abilities of children aged 7-11, and as the children's age increases, children's understanding of the content of the board game becomes higher. In the future, the author will further optimize the game design, conduct diversified experiments, and increase the sample size of the experiments.

About the Authors:

Yanning Zheng is a designer and biomaterials researcher. She graduated from the Royal College of Art in 2022, and then founded Shenzhen XUENING Technology Co., Ltd. Her research interests include educational psychology, corncob powder composite material, and glass blowing art.

Kaiyu Zheng graduated from Fordham University with a master's degree. She is committed to exploring sustainable lifestyles and founded the cultural company Shenzhen Cabbage Culture Development Co., Ltd. Research directions are communication, marketing, advertising, digital media.

Keer Wei graduated from Royal College of Art in 2022, is a practice-based design researcher specializing in social and cultural-related design research. Her research covers a wide range of areas, including ethical botany and environmental sustainability, community building and collaborative design.

Acknowledgements: We would like to express our sincere gratitude to our collaborator Junjie Jiang. He provided the research group with a suitable venue for board game activities, which allowed our research to proceed smoothly. We would also like to thank Mrs. Xi, Manqi, and Zhibei for their help in venue coordination, organization planning, and parent reception during the board game activities. We would also like to thank Teacher Song from Peking University, who provided us with guidance during the early abstract writing process. Finally, we would like to express our gratitude to our family and friends who provided the lovely support and companionship during the process of writing our thesis.

KEYWORDS | POST-PARTICIPATION, ECOLOGICAL CITIZENSHIP, CO-CREATION, COMMUNICATION, SHARED AGENCY

ABSTRACT | Design research has metamorphosed over the last ten years, with discipline titles becoming muted and complex. Discipline terminology previously dictated outputs, for example product design included artefact outputs, but now includes strategic direction, highlighting the importance of clear communication. This change serves as a catalyst for enquiry, not only in what design is, but shifting the speculative realm of what it can do, cultivate, or foster.

This position paper underscores the importance of language in shaping sustainable futures diverging from conventional paths. Climate change impacts all life forms, and design has a dual role as a solution and a challenge in confronting climate-related issues (Godelnik, R. 2021). The distinction between participation and empowering individuals to have agency emerges as pivotal in this context. This however is reliant on the systems, interventions, and agency those individuals are empowered with. Emphasising language's significance in post-participatory activities - the shift in how we can think about design methods, moving beyond typical user involvement to empower communities and foster more inclusive, dynamic results, bringing agency, choice, and citizenship. This article addresses how language has been underexplored within "design for sustainable practices" compared to its prevalence in "design for inclusion" (Nuñez, 2013; Reed and Monk, 2006).

1. Introduction

Traditionally, 'participation' is defined as attending and participating rather than having a sense of autonomy. Going beyond this, into what has been termed ‘post-participatory,’ are approaches such as Engaging Design (ED). ED initiates active involvement (as a new route by which to generate design propositions) within communities and society. ED is an empowering practice, traversing beyond participation in the traditional sense of attending and participating, energizing communities, providing agency, and facilitating 'self-authored' and 'community-authored' responsible change (Phillips and Gant, 2021).

Our agenda within The Ecological Citizens network+ project aims to work collaboratively with citizens in this responsible way, actively shaping environments within a contemporary design framework. The project looks to foster and proactively encourage (through technologically appropriate interventions) Ecological Citizenship for positive climate action, while funding and working with a network of projects. As such, the project underscores language as a crucial component in design, influencing perceptions and power dynamics in co-design processes (Sanders et al., 2008, p.16).

The objective of this article is to propose a glossary of terms. The suggested glossary, curated here by team members of The Ecological Citizens network+, offers a preliminary glimpse into terms commonly employed in discussions about design for sustainable practices. These terms, including, for example, 'gatekeeper' and 'preferable futures,' prompt the need to interrogate and comprehend nuanced meanings, assumptions, potential cross-disciplinary misunderstanding, and variations in interpretation. Ultimately, the study advocates for an inclusive design approach driving responsible transformations in the face of challenges like the climate crisis, climate justice, and ecocide. The approach used here looks at language and terminology aiming to foster collaborative and inclusive approaches crucial for sustainable transitions without marginalizing or undermining societies or cultures.

The People & Planet Consumer Insights report (2023) underscores the significance of engaging diverse audiences on "people and planet" topics, blending rational and emotional dimensions. Language and comprehension, as the report suggests, become pivotal in this engagement. Here, the concept of people and planet encapsulates distant futures, envisioning a world where everyone is included, possesses agency, and collaborates to achieve shared goals. Plus, the glossary provokes reflection on the potential implications and nuances associated with linguistic choices, advocating for language that is not only reflective of contemporary design frameworks but also instrumental in driving positive and responsible transformations in societal and cultural contexts.

Our perception of design is inherently shaped by the intangible nature of speculative and design fictions, where the boundaries between imagination and reality blur. In these creative realms, language becomes the linchpin, weaving narratives that transcend the tangible, challenging conventional notions of what design can be. These speculative narratives not only illuminate potential futures but underscore the profound role language plays in anchoring and navigating the landscape of design exploration.

Understanding these terms holds significant importance in fostering collective action that does not reinforce systems of structural inequality (Costanza-Chock, 2020, p.23), especially in addressing the pervasive impact of climate change on our global community. Recognizing this, it becomes crucial to acknowledge the potential influence of language on individuals' autonomy and self-perception in their roles, considering diverse backgrounds and perspectives. In the context of 'post-participatory' co-design practices related to climate change, thoughtful cultivation of language becomes imperative.

Design practices are also intricately linked to individual roles, skills, relationships, and perspectives (Marxt and Hacklin, 2005, p.416). Therefore, it's crucial to grasp how this diverse array of backgrounds and experiences influences the definition of terms and the use of language. For example, designers and facilitators bring their own cultural perspectives, making language a fundamental component of co-design.

However, language encompasses more than just terms; it doesn't inherently spark dialogue on its own (Rodenburg, 2018). Within various fields like employment and education, power imbalances and hierarchies persist (Shenk et al., 2023). Language holds the ability to either empower or marginalise, influencing trust and inclusivity. Design, encompassing specialised practices across multiple fields and drawing from everyday lived experience knowledge (Costanza-Chock, 2020), serves as a dynamic arena where power imbalances persist, mirroring broader societal issues. Plus, interpretations can shield meanings held by different languages. Take, for example, the Welsh term "Cynefin." While its English translation is "habitat," its significance extends far beyond, encapsulating a holistic concept that integrates the physical, social, cultural, spiritual, and economic dimensions of a place. It delves into the intricate interactions among these dimensions, offering a comprehensive understanding of the interconnected nature of a locale (Mayo, 2023). Plus, consider the example "paint it" and "cover it in paint," which are used interchangeably in certain instances, alongside their unique implications in different contexts. In the realm of decorating, both phrases may essentially convey similar meanings, indicating the application of paint to an area. However, when applied to artistic painting, "paint it" may imply the creation of a scene or portrait, allowing for a more open and interpretive approach. On the other hand, "cover it in paint" implies a thorough and complete application, suggesting total coverage. Recognizing these subtle differences enhances our understanding of how language nuances contribute to varied interpretations in different scenarios.

These instances highlight the intricate nature of language, where subtle nuances can lead to misunderstandings or reinforce bias. This underscores the significance of navigating linguistic intricacies by conducting activities such as collaborative glossary generation, as detailed here.

1.1 Fostering Design in a Post-Participatory Landscape

Post-Participatory design represents a shift in how we think about design methods, moving beyond typical user involvement to empower communities and foster more inclusive, dynamic results, shifting the landscape bringing agency, choice, and citizenship. This shift in methodology is rooted in various design-led languages such as living labs, co-design, participatory design, pluriversal design, user-centred design, planet-centred design, and design for/with ageing (Tironi et al., 2023, Brophy et al., 2023). These interconnected concepts significantly impact the engagement of communities in the design process. Building upon Frayling's theories and design-driven approaches (Frayling, 1994), practitioners seek to enhance co-design practices by using precise terminology. A tangible demonstration of this impact is reflected in our deliberate use of the term 'design proposals' instead of 'solutions' (Gaver et al., 1999). This choice underscores the importance of incorporating diverse voices right from the inception of a design proposal, emphasising the avoidance of prescribing a solution. Careful choice of language is particularly important when engaging with diverse groups of people. By working in an effective collaborative way with communities, there is a necessity to acknowledge and honour the diverse values of indigenous populations, embracing non-colonial design principles (Valencia Sáiz, 2005), (Ivison et al., 2000). The differences in participatory design approaches based on national contexts and cultures, emphasise the need for heightened awareness of the limitations of personal viewpoints in representing diverse cultural backgrounds (Cahill et al., 2007). This restricted understanding of diverse perspectives constrains open discourse in emerging design propositions. Calls to revisit design-centric dialogues to include criteria guiding local solutions and broader visions are emerging. This discourse should foster a dialogic approach, encouraging diverse participants, including design experts, to interact, exchange ideas, and embrace their roles (Tham, 2021).

1.2 Why Focus on Language?

Language is integral to co-design and the 'post-participatory' discipline, shaping how parties perceive and engage in the process (Cooke and Soria-Donlan, 2019). In digital design, it goes beyond technical skills; it requires considering the human element and navigating cognitive complexities (Gray, 2016). Exploring semiotics and product language offers profound insights into how linguistic elements influence the product landscape, enhancing the co-design journey. Different language interpretations impact how co-design is

conveyed, executed, and measured (Kleinsmann and Valkenburg, 2008). Understanding diverse language perspectives is crucial for inclusive design in these realms, often dealing with intangibles and narratives (Huybrechts et al., 2017).

The recognition of language's power to both include and exclude emphasises the need for thoughtful word choices and a serious consideration of their impact. For instance, terms like 'user' and 'stakeholder' carry negative connotations, linked to addiction, exploitation, or corporate agendas that may perpetuate colonialist attitudes (Kleinsmann and Valkenburg, 2008; Banerjee, 1999). Exploring alternatives like 'interested party' instead of 'stakeholder' sparks pertinent discussions about fostering action and agency among citizens. The understanding gap in common terminology can significantly affect citizens' agency, calling for discussions around political agency and civil society perspectives in promoting citizenship. Language holds immense power in framing co-design sessions, influencing design justice, and contributing to the vision of a sustainable future. How we describe climate change and the emotions and actions these descriptions evoke are critical in shaping our collective perception of the future and our ability to instigate change.

1.3 Our Positionality

In the landscape of design discourse, the Ecological Citizen(s) team recognises its roles as citizens, researchers, and designers. Design (as a practice) has transformed in the last decade with advances in new practices, definitions including; Community Technology (Hess, 1979), Public-Interest Technologies (Ford Foundation, 2024) and Citizen Designers (Heller, & Vienne, 2003). Members of our team draw from these contemporary design practices and apply them to the critical questions of how humanity can live sustainably. Our strength is in our different disciplinary backgrounds, the network we are building lies in creative problem-solving within the expansive domain of design, distinct from the expertise of language experts. As we navigate this intersection of disciplines, we acknowledge and address the gaps in our knowledge. Embracing a holistic approach, we celebrate our expertise while openly acknowledging the expertise and lived experiences our team may lack. This conscious recognition fosters a culture of humility and openness within our collaborative efforts. This conscious acknowledgment allows us to address knowledge gaps effectively. We actively integrate diverse perspectives into our team, placing value on input beyond our immediate disciplines. This inclusive approach contributes to a comprehensive understanding of the challenges we tackle, promoting an environment where humility and openness are embraced.

We position ourselves as active participants in an expansive dialogue, presenting research characterised by an inclusive structure, delving into the profound impact of language in contemporary discussions on community action and citizen cultures. Our work serves as a valuable resource, fostering collaboration and fresh perspectives among scholars, practitioners, and participants. By avoiding the 'god trick' (Haraway, 2016) – the detached and objective reporting on subjects – we ground our perspectives in personal experiences and professional engagements, avoiding impersonal authorship and upholding accountability. In discussing language, we recognise the richness of cognitive and physical diversity, understanding that ways in which diverse brains and bodies work contribute uniquely to our understanding of ecological issues. Embracing varied perspectives allows us to glean insights from different modes of thinking, influencing design language beyond mere vocabulary into spatial, visual, haptic, and sonic experiences (Costanza-Chock, 2020). This multi-sensory approach acknowledges the importance of making ecological concepts more accessible and engaging. Inclusive design language bridges gaps in accessibility, fostering a shared understanding of environmental issues through interactive installations, visually compelling graphics, or immersive sonic experiences.

Additionally, we acknowledge our team's limitations and the lack of diversity in certain backgrounds. We openly admit our lack of experience in certain areas, understanding the importance of humility in the face of complex ecological challenges. Recognising that our approach is embedded in Western European viewpoints, and as such we need to emphasise inclusivity by embracing other perspectives. We aim to create a comprehensive strategy for building a sustainable global community, including non-humans. The project encourages a holistic approach that integrates insights from ecology, ethology, and environmental

science, recognising the intricate balance of our planet, involving both human and non-human realms. This approach challenges the dominance of predatory and capitalist ways of knowing, valuing alternative paradigms such as cooperation-based ecosystems (Energy Observer, 2023). By incorporating narratives that emphasise cooperation, reciprocity, and holistic interconnectedness, we aim to shift the focus from purely monetary values to a more comprehensive understanding of sustainability encompassing social, environmental, and economic well-being.

2. Method

The glossary of terms utilised in this study is curated through our collaborative efforts in *the Ecological Citizen(s) network*[+]. We, a diverse array of experts spanning ecological sustainability, design, and community engagement, have created this essential compendium aimed at cataloguing, refining, and unifying the terminologies crucial to our joint endeavours in participatory, sustainable, and design-led initiatives. Our discussions explore the intricate realms of design methodologies, with a particular focus on integrating participatory approaches and sustainable practices within projects.

This process is characterised by our collaborative sessions, conversations, and thorough deliberations, aiming to extract and articulate terms specifically pertinent to the convergence of Ecological Citizenship (Jagers et al., 2013), participatory design principles (Spinuzzi, 2005), and sustainability frameworks. Our primary objective is to construct a comprehensive repository that captures the intricate, multifaceted dimensions intrinsic to the essence and depth of our work. During our discussions, significant terms that naturally arise and spark conversation are documented and subsequently incorporated into the glossary. We are then encouraged to contribute our own perspectives, interpretations, and definitions for each term, thereby highlighting the diverse range of meanings associated with them. To promote transparency and clarity, the glossary document is made accessible to all of us. This accessibility allows us to add new terms, or clarify existing ones, if we perceive variations in understanding among our colleagues. To facilitate open and honest contributions, the option for anonymous input is also provided. Furthermore, the EC glossary has been designed with designated sections for us to append supplementary information, evidence, or factors we deem important. This structure aims to encourage thorough documentation, enabling us to provide context and substantiate our individual understandings of the terms.

The terms entered into the EC glossary, along with our respective explanations, undergo analysis with core members of our group (backgrounds in social science, design, art). This analytical process aims to unravel the diverse understandings of each term and elucidate the main reasons behind these variations. Firstly, we examine entries to identify patterns and commonalities in the provided explanations. By categorising and clustering similar interpretations, we seek to discern any consensus or recurring themes among us. Simultaneously, we delve into instances where discrepancies or varied understandings emerge. These points of contention are closely scrutinised to uncover the underlying factors contributing to the diversity of perspectives. Factors such as our individual experiences, professional backgrounds, or contextual nuances are incorporated where possible and considered in this analysis. Following the analysis of varied glossary term understandings within our group, an additional layer of depth is introduced by seeking theoretical insights. We recognise the value of grounding our interpretations in established theories and conceptual frameworks, to provide further evidence and context for the diverse perspectives captured in the glossary.

The process involves consulting relevant literature, academic sources, and established theoretical frameworks that pertain to the specific terms in question. This exploration aims to identify existing theories that align with, or contradict, the interpretations within the glossary entries. By doing so, we seek to validate and enrich our understanding of the terms, with insights from scholarly research and established academic discourse.

3. Results

Within the *Ecological Citizens*, the evolution of the glossary stemmed from the natural flow of organic discussions within routine team meetings. These sessions were characterised by their inclusivity, allowing for open dialogues that encourage team members to contribute insights from their diverse disciplinary backgrounds. As the team delved into various aspects of *Ecological Citizenship*, sustainability, and design, terms such as “gatekeeper”, “preferable futures”, “agency”, “bottom-up”, “client”, “citizen”, “community”, “expert”, “hyper-local”, “layperson”, “more than human”, “participant”, “non-human”, “stakeholder”, “steward”, “top down”, “touchpoint”, “user”, and “volunteer” naturally emerged in discussions. Table 1, details firstly the overview of the team regarding specific terms, along with reflection of varying cross-disciplinary theoretical commentaries on the term.

Table 1: Glossary terms and insights from *Ecological Citizens* team members are to their definitions, and understandings.

Term	Insights from EC team on terminology	Reflections on cross-disciplinary variations
Agency	‘Agency' was suggested to encompass the inherent capacity of an individual or group to take action and wield influence. The term sparked debates over the nuanced question of just how much autonomy and influence someone or a group genuinely holds within a specific system. It's crucial to note that agency isn't something that can simply be handed over to an individual; rather, it emerges from the intricate interplay of personal and collective capabilities within a given context, meaning care is needed in its use.	The concept of agency is intricately tied to personal empowerment in psychology, involving self-efficacy and autonomy. This underscores the importance of individuals acknowledging and leveraging their potential to influence preferred future trajectories, as the Ecological Citizen(s) seek to assist with. In governance and sociology, agency is closely associated with decision-making powers, exerting a significant impact on policy formation and societal frameworks. However, it is crucial to approach the use of agency with care, recognising its dual nature. While in psychology, it acts as an internal force driving personal empowerment, in governance and sociology, it manifests as a dynamic force influencing collective decision-making.
Bottom-up	Team members attributed different meanings to the term 'bottom-up' and its approach, with a significant aspect being its association with a lower-status position. Notably, ambiguity arises regarding its operationalisation and the extent of grassroots engagement, especially when scrutinising the intricate details of the precise origins of these initiatives. Caution was emphasised by team members when using the term due to the fluidity of the 'bottom-up' concept, which allows for interpretive flexibility. This flexibility enables organisations and individuals to tailor its definition to align with their specific objectives or ideological frameworks, further emphasising the potential for a lower-status connotation.	Within governance, it might involve community-driven policies; while in design, it could refer to user-driven innovations, further highlighting the need to be context specific and cautious in its use.
Client	Discussions on the use of the term ‘client’ revolved particularly around power dynamics, acknowledging that it implies a transactional relationship, with one party being in service to another, often failing to capture the iterative nature of many partnerships, such as designer/client relationships. The term "client" does not adequately reflect the evolving and collaborative nature of these interactions. Participatory activities, which involve individuals and stakeholders in decision-making processes, challenge the term "client" by underscoring the empowerment of those shaping the design or decision-making process. Terms like "partner" are considered more fitting as they better express the collaborative essence, moving away from the transactional connotations associated with the term "client."	In psychology, the term might relate to a patient; whereas in business or design, it could refer to a customer or user.

Term	Insights from EC team on terminology	Reflections on cross-disciplinary variations
Citizen	The term "citizen," traditionally signifying a member of a state or community with specific rights and responsibilities, requires caution in design and participatory activities due to variations in understanding, and the notion that citizenship and membership to nations is for many complex and perhaps, for some, harbours issues of exclusion. As such, team members suggested that designers might adopt more inclusive terms like "community member" or "vested interest party" to better capture the diversity and complexities inherent in the design and participation processes, avoiding unintended exclusions and promoting a more equitable and culturally sensitive approach.	In political science, it relates to legal status, whereas in sociology or design, it might emphasise community engagement or participation.
Community	The term "community" typically refers to a group of individuals sharing common interests, characteristics, or geographical locations; yet within design and participatory activities, its understanding can vary, necessitating caution in its use. Interpretations of "community" differ concerning boundaries, inclusivity, and cohesion. It might encompass a local neighbourhood, an online community, or a group bound by cultural ties. Discussions with the team suggested designers need to be mindful of these variations, as assumptions about the nature and extent of a community can impact the inclusivity of design processes. A term that seems universally understood may carry diverse meanings, potentially leading to miscommunications or overlooking the needs of specific subgroups. Therefore, precision and sensitivity in language are crucial to ensure that the term "community" is applied contextually, fostering a more accurate understanding of the diverse groups involved in design and participatory activities.	In sociology, it involves social structures, while in urban planning or design, it might relate to neighbourhood dynamics and spatial arrangements.
Expert	The term "expert" denotes an individual with specialised knowledge or skills in a particular field. However, within design and participatory activities, its understanding can vary, necessitating caution in its use. The contestation revolves around defining expertise, expertise hierarchy, and the criteria for labelling someone as an expert. In design, team members suggested expertise may encompass diverse domains, including technical proficiency, user experience insights, or cultural understanding, meaning caution is essential as the traditional hierarchical view of expertise might overlook valuable perspectives from non-traditional experts, such as end-users or community members.	In academia, expertise might be defined by research contributions; while in industry, it might focus on practical experience.
Gatekeeper	The term "gatekeeper" can have varied meanings within design and participatory activities, requiring caution in its use. In different contexts, a gatekeeper might be understood as a person, institution, or system controlling access to information, resources, or decision-making processes. Depending on the perspective, a gatekeeper can be seen as a facilitator enabling equitable access, or a barrier restricting entry. In design, issues can arise because design processes often involve multiple actors, and the role of gatekeepers can influence the inclusivity of these activities. When using the term, team members suggested a mindfulness of the potential power dynamics associated with gatekeeping is required, ensuring that it aligns with the principles of fairness, transparency, and equal representation.	The term might vary in interpretation between disciplines. For instance, in sociology, it could refer to social hierarchies, while in design, it might encompass access control in participatory processes.
Hyper-local	The term "hyper-local" refers to a highly localised or geographically specific context within design and participatory activities. Contested meanings arise regarding the scope and scale of what constitutes "hyper-local," particularly considering variations in geographical size and social dynamics. The definition may differ depending on the design project, cultural factors, or community characteristics. What is considered hyper-local in one context might not apply universally. Designers must be attentive to the nuances of the term, ensuring that its application aligns with the specific context at hand.	In journalism, it might relate to neighbourhood news, while in environmental studies, it could involve micro-scale ecological systems.

Term	Insights from EC team on terminology	Reflections on cross-disciplinary variations
Layperson	The term "layperson" refers to someone without specialised knowledge in a particular field, but its understanding within design and participatory activities can vary, necessitating caution in its use. Contestation emerged within the team around defining the extent of knowledge considered "specialised" and the expertise gap between professionals and laypersons. In design, where collaborative processes often involve diverse stakeholders, the term "layperson" may inadvertently imply a hierarchy that could marginalise the perspectives of individuals with lived experience. As such awareness is crucial as the line between specialised and general knowledge can be subjective and context-dependent.	In medicine, it refers to non-professionals, while in design or technology, it could relate to non-experts.
More than human	The term "more than human" emphasises considering entities beyond humans, including animals, ecosystems, or artificial intelligence, within the scope of human-centred design. However, discussions around meanings concerned the ethical considerations, responsibilities, and rights attributed to these "more than human" entities. In design and participatory activities, understanding the term can vary based on perspectives regarding the moral obligations and considerations owed to non-human elements. As a team there is the suggestion of a need to navigate the ethical complexities associated with extending design considerations to include these entities, with questions about their rights, agency, and the potential impact of design decisions on their well-being introducing challenges that require careful consideration.	In environmental ethics, it relates to non-human entities' intrinsic value, while in design, it might involve inclusive design practices considering diverse users.
Participant	The term "participant" refers to someone involved in a particular activity or process within design and participatory activities, but caution is needed in its use due to potential variations in understanding; however, the level of involvement, distinctions between active and passive participation, and the perceived roles of participants within a given process, are key aspects in need of discernment when using the term. Participant can encompass a spectrum of engagement, from those actively contributing, to those with more passive involvement. Team members suggested a need to be mindful of the diverse ways participants may interpret their roles and contributions, ensuring that the term accurately captures the range of engagement within a specific context.	In research, it could involve study subjects, while in design, it might involve actors engaged in co-creation processes.
Preferable future	"Preferable futures" refer to futures that are considered desirable, ethical, and just. Team members suggested that the concept of desirability and ethicality is subjective and as such discerning its precise use is important, especially considering 'preferable' can differ significantly based on cultural and disciplinary viewpoints. What may be deemed preferable in one cultural or disciplinary context might not align with the values or perspectives of another. There is a need to be cautious in assuming a universal understanding of what constitutes a preferable future and be attentive to diverse cultural, social, and ethical considerations.	The interpretation might vary between environmental sciences, sociology, and design. For environmental sciences, it could relate to sustainability, while in sociology, it could involve societal well-being.
Non-human	The term "non-human" refers to entities or beings that are not classified as human. However, its use within design and participatory activities can cause ambiguity, regarding the inclusion of various entities such as animals, ecosystems, or artificial intelligence within this category. Debates can emerge about the ethical considerations and treatment of these entities, as different perspectives exist on their rights, agency, and the responsibilities humans bear toward them.	In environmental studies, it might include ecosystems, while in technology, it could encompass AI or robotics.

Term	Insights from EC team on terminology	Reflections on cross-disciplinary variations
Stakeholder	The term "stakeholder" denotes an individual or group with vested interests or influence in a particular process or system within design and participatory activities. However, discussion within the team suggested its use may be contentious regarding the identification, prioritisation, and representation of stakeholders, as well as their roles and responsibilities. The understanding of who qualifies as a stakeholder can vary based on perspectives and may involve negotiations about whose interests should be considered. Additionally, debates may emerge concerning the level of influence different stakeholders should have, and the ethical considerations related to power dynamics. Plus "stakeholder" also holds colonial connections, with a stakeholder being a person who drove a stake into the land to demarcate the land they were occupying or, in many cases, stealing from indigenous territories. This historical association underscores the term's colonial legacy, and as such when considering the term, we must be acutely aware of this context to avoid perpetuating power imbalances, or inadvertently replicating colonial practices	In business, stakeholders might involve investors, while in urban planning, they could be residents or community groups.
Steward	The term "steward" refers to someone responsible for caring for or managing something within the context of design and participatory activities. Within the project's context, interpretations varied, leading to debates regarding the scope of stewardship, the extent of responsibilities, and the ethical considerations guiding stewardship actions. Different perspectives on what constitutes appropriate care, the boundaries of stewardship, and the ethical implications of management decisions can contribute to varying understandings of the term.	In ecology, it might relate to environmental conservation, while in governance, it could involve responsible management of resources.
Top down	The term "top-down" signifies an approach in which decisions or directives originate from higher levels of authority and are implemented downward. Within the team, concerns of the term's use centred around centralised versus decentralised decision-making and the efficacy of top-down approaches, criticising them for lacking inclusivity and neglecting grassroots perspectives.	In management, it might relate to hierarchical structures, while in governance, it could involve policy implementation.
Touchpoint	The term "touchpoint" signifies a specific interaction or moment of contact between an individual or group and a product, service, or system within the context of design and participatory activities. When using the term however, team members suggested interpretations may vary, leading to debates about defining the scope and significance of touchpoints. Some may emphasise the tangible points of contact, while others may consider broader aspects, including digital interactions and emotional engagements; meaning there should be caution to avoid assumptions about the universality of touchpoints and be attuned to diverse perspectives on what constitutes a meaningful interaction.	In marketing, it might relate to customer engagement, while in design, it could involve user interface interactions.
User	The term "user" details an individual who interacts with a product, service, or system(s). However, there were concerns raised that some may view users narrowly, focusing on their roles as consumers, while others may advocate for a more inclusive perspective that acknowledges diverse skill levels, backgrounds, and the potential for users to actively contribute to the design process through co-creation. As such the term "user" can imply a more passive role, lacking the recognition of active involvement and collaboration that co-creation entails, for instance. Consequently, there is the need to exercise caution to avoid limiting their understanding of users to mere consumers and recognise the potential for collaborative engagement, where users become contributors, providing valuable insights.	In technology, it might involve end-users, while in design, it could encompass diverse user personas.

Term	Insights from EC team on terminology	Reflections on cross-disciplinary variations
Volunteer	The term "volunteer" refers to someone who offers their time or services without monetary compensation within the context of design and participatory activities. Within the team, it was suggested that care is needed in the terms used, to avoid assumptions about the uniformity of motivations and commitment levels among volunteers. Additionally, recognising potential power dynamics and ensuring a respectful and inclusive environment for volunteers is essential to prevent unintended consequences.	In social sciences, it could relate to civic engagement, while in humanitarian fields, it might involve disaster relief efforts.

A key theme emerging from the glossary revolves around power dynamics. The term "agency" emerges as a concept with differing possible values attached, encapsulating the capacity of individuals or groups to act and exert influence (Bandura, 2000). While psychology tends to view it as personal empowerment; governance and sociology engage in debates concerning the distribution of decision-making power within systems. This ongoing discourse emphasises the crucial need for design practices that actively transform power dynamics. Such practices aim to empower communities and amplify the voices of marginalised groups, or indeed "grassroots groups" (Smith and Ely, 2015), enabling them to act as agents of change in shaping sustainable futures. Additionally, the reimagining of relationships talks to power dynamics, with terms such as ‘client’ and ‘collaborator’ in need of attention. The concept of the "client," traditionally denoting the receiver of services, is transformed in sustainable design. Power dynamics and responsibilities within this relationship become fluid, blurring the lines between passive recipient and active collaborator. Design demands a shift towards viewing users, citizens, and communities as co-creators with shared ownership and responsibility for shaping sustainable solutions. The potential power of gatekeepers is also emergent. Can they be facilitators of equitable participation or formidable barriers restricting entry? The answer lies not in the gatekeeper itself but in its function. Design must actively dismantle gatekeeping structures, ensuring open access to knowledge and resources for all participants, regardless of background or expertise.

The second key theme emergent from the glossary is the need to consider beyond traditional views of what citizens are, and can, do. For instance, embracing a diverse interpretation of what a "community" could be, paves the way for design practices embracing the fluidity and inclusivity of communities, weaving together diverse perspectives for holistic solutions. Connected to "community" (Sedita and Blasi, 2021) and its diverse perspectives, is the need to reconsider expertise, and challenge hierarchies. Indeed, the term "expert," signifying specialised knowledge, undergoes deconstruction in sustainable design. Traditional academic definitions face challenges from industry-focused perspectives valuing practical experience. This contest necessitates acknowledging diverse forms of expertise, including indigenous knowledge and local knowledge, embedded within communities, to enrich design processes and empower a wider range of voices. These voices, for instance, could be from "laypersons." However, by questioning the boundaries of "specialisation," design can empower multiple actors to become active co-creators. Open-source platforms, accessible tools, and inclusive workshops can bridge the knowledge gap, transforming laypeople from passive subjects into informed participants shaping their sustainable environments.

The third area of findings from the glossary is that of fostering different futures. For instance, the notion of hyper-local solutions for a global future: "hyper-local," emphasising highly localised contexts, sparks debate on scope and scale. While journalism associates it with neighbourhood news, environmental studies delve into micro-scale ecological systems. This diversity underscores the importance of tailoring design solutions to the specific characteristics and needs of each hyper-local context, recognising unique ecological, social, and cultural landscapes. Plus, there is the suggestion to envisage shared futures, and incorporate more than human perspectives. The concept of "more than human," encompassing entities beyond humans in design processes, challenges anthropocentric perspectives. Debates on ethical considerations and responsibilities towards these entities highlight the need for design to embrace a biocentric worldview. Ecological systems, animals, and even AI, are recognised as active participants in shaping sustainable futures. Lastly, there is also the need to navigate ethical complexities when it comes to building preferable futures. Cultural and disciplinary viewpoints significantly influence what constitutes a "preferable" future, necessitating cross-

disciplinary dialogue and collaborative visioning processes. Design plays a crucial role in facilitating these conversations, ensuring that sustainable solutions reflect diverse perspectives.

4. Discussion

The Ecological Citizen(s) organically developed its glossary through inclusive team meetings that encouraged contributions from diverse disciplinary backgrounds. As we explore Ecological Citizenship, sustainability, and design, terms like 'gatekeeper,' 'preferable futures,' 'agency,' 'bottom-up,' and 'volunteer' have naturally emerged, becoming integral components of our discussions, reflecting the multifaceted considerations of the project. In sustainable participatory design, terms are influential agents shaping foundational aspects and guiding ethical decision-making. Distinctions between terms like 'sustainability' and 'resilience' signal nuanced preferences, influencing the ethical framework. Recognising the contested nature of these terms is crucial to ensure shared understanding and cooperation, and respect for the diversity of backgrounds which formulate varied approaches and understandings.

This diversity of language and the multilingual nature of our international team, with Welsh, Norwegian, French, and English spoken, heightens the necessity for interpersonal understanding in the design realm. Language, extending beyond a mere communication tool, shapes cultural perspectives, especially in discussions about nature and the environment. Our commitment to linguistic diversity aligns with the acknowledgment that different languages offer distinct lenses through which we perceive and engage with the natural world. Recognising implicit hierarchies within terms, the team acknowledges the power dynamics in participatory design processes, emphasising language choices beyond communication efficiency to promote inclusivity and equity.

Furthermore, our commitment extends to promoting language that represents non-humans.The intentional shift towards inclusive and precise language within participatory design practices acknowledges the transformative potential of language in altering power dynamics. This conscious alteration ensures a more democratic decision-making process, allowing diverse voices, including non-human perspectives, to shape design outcomes. With members of *the Ecological Citizen(s)* team holding a particular interest in promoting non-humans in design decisions, the adoption of precise and inclusive language fostered collaboration, minimised misunderstandings, and created a common understanding, leading to more cohesive teamwork and a collective approach to problem-solving, particularly for non-human parties who cannot speak for themselves. Plus, the impact of knowledge encapsulated in terms within participatory design extends beyond the design community, resonating through various societal layers, and directly influencing communities with diverse values. The ethical considerations arising from the impact of knowledge involve awareness of the potential consequences of terms on diverse communities, emphasising the need for sensitivity to cultural nuances, and recognising the interconnectedness of social, cultural, and environmental challenges.

5. Conclusion

This article delves into the transformative journey of design research over the past decade, where disciplinary titles have evolved into complex, muted forms. The shift in design terminology, from focusing solely on tangible outputs to encompassing strategic direction, underscores the importance of language in shaping the field. This paper emphasises the role of language in propelling Ecological Citizenship and steering the trajectory toward sustainable futures, diverging from conventional paths.

As the impacts of climate change are ever more present, design emerges as both a solution and a challenge in confronting climate-related issues. The distinction between mere participation and empowering individuals to have agency becomes pivotal, contingent on the systems, interventions, and agency those individuals are empowered with. The article has shed light on the underexplored realm of language in "design for sustainable practices," compared to its prevalence in "design for inclusion." The presented iterative glossary lays the groundwork for the burgeoning field of post-participation, not as an authoritative guide, but as a collaborative effort reflecting the diverse interpretations within the evolving design

landscape. The exploration underscores language as a crucial component in design, influencing perceptions and power dynamics in co-design processes. The advocacy for language fostering collaboration, aligns with contemporary notions where precision in language cultivates trust and propagates cultural understanding. Exploring the significant impact of language within design emphasises its pivotal role in shaping perceptions, power dynamics, and socio-cultural intricacies. The example glossary, curated by the *Ecological Citizen(s)* team, offers a preliminary glimpse into terms commonly employed in discussions about design, for sustainable practices. These terms prompt the need to comprehend their nuanced meanings, potential cross-disciplinary misunderstandings, and variations in interpretation. Understanding how these terms are used and perceived differently becomes essential in fostering effective communication and shared understanding within the discourse.

Ultimately, this study advocates for an inclusive design approach that harnesses language to empower communities and individuals while driving responsible transformations in the face of challenges like the climate crisis and fostering climate justice. This article positions language and comprehension at the core of engaging diverse audiences on people and planet topics, recognising them as rational and emotional drivers. This encompasses distant futures where inclusivity, agency, and shared aims unite us all.

About the Authors:

Luke Gooding is a Research Associate at SEI, University of York, focusing on stakeholder involvement in energy systems and community equity in sustainable living.

Sharon Baurley is a Professor of Design & Materials, RCA. Leads interdisciplinary R&D projects on sustainable materials, circular economy, and design innovation.

Emily Boxall is a Cross-disciplinary designer at RCA specializing in social innovation, sustainability, and community collaboration for environmental well-being.

Daniel Knox is a Product design advisor at Wrexham University, experienced in sustainable consumer goods, previously at Dyson and Unilever.

Charlotte Nordmoen is a Design researcher at RCA, exploring material influence in Human-Computer Interaction and ecological design.

Robert Phillips is a Principal Investigator at RCA. Focuses on sustainable design, citizen science, and open design, with multiple patents and international projects.

Alec Shepley is a Professor of Art and Society at Wrexham University. Combines art with ecological and social themes, with extensive international exhibitions.

Tracy Simpson is a Curator and Research Associate at Wrexham University. Co-director of Addo, focusing on collaborative art projects and resilience in visual arts.

Sarah West is a Director at SEI York, specializing in citizen science, biodiversity, air pollution, and health, aiming to diversify participant engagement.

Joanna Wright is an Interdisciplinary artist and researcher at Wrexham University, focusing on ecological projects and community collaborations, Senior Fellow at MIT's Co-Creation Studio.

Acknowledgements: We thank: Dan Price for administration support. The Ecological Citizen(s) is a cross-RCA research network led by Dr. Rob Phillips, with Professor Sharon Baurley, and Tom Simmons, in partnership with Professor Sarah West of the Stockholm Environment Institute (SEI) at the University of York, and Professor Alec Shepley of the Faculty of Arts, Science and Technology at Wrexham Glyndŵr University, and partners from industry, third sector, NGO. Ecological Citizen(s) is a Digital Economy Network+ project funded by the UKRI Digital Economy Programme, that is focused on digital interventions that can create 'the conditions to make change' towards a sustainable post-industrial society. The work was supported by the EPSRC Network+ award (EP/W020610/1).

KEYWORDS | ECOLOGY, DESIGN EDUCATION, SUSTAINABILITY BY DESIGN, TRANSITION DESIGN, PLANET-ORIENTED DESIGN

ABSTRACT | The Anthropocene era, marked by unprecedented human impact on the Earth's processes, necessitates a paradigm shift in education, particularly in design disciplines. This article explores the transformation of a five-year design curriculum at a French industrial design school, introducing a proposal for a cross-curricular "Sustainability by design" programme. The central question addressed is how to make ecology an integral pillar, not merely an additional dimension, in the design process. The article outlines the conceptual framework for this shift, emphasising the need for a planet-oriented design that considers Earth as a complex system intertwined with human history and culture. Divided into two sections, the first contextualises the necessity of changing cosmology for education, while the second provides a concrete proposal for the program, addressing challenges in content, methodology, and ethics. This article serves as a case study, aiming to be transposable to other design schools and highlighting the essential skills and knowledge required for designers to embrace a planet-oriented design approach.

1. Introduction

The new paradigms emerging from the Anthropocene (Crutzen and Stoermer, 2000) are challenging our understanding of the influence of human activities on the planet's processes and natural phenomena. A huge number of publications in various disciplines explain the urgent need for a profound shift in human perception and values for a more decentralised and sustainable way of living. So, how, and what to teach for a design adapted to the earth's new bio-geo-chemical regime? How to implement new teaching formats to better equip designers facing increasing challenges?

Future designers have the responsibility to design sustainable artefacts (viable, feasible, long-lasting, and socially desirable) that consider the environment and its limits. More than ever, they must mediate between different stakeholders and collaborate with other production professions (industrialists, engineers, developers, etc.). So, changing cosmology will call for new ways of thinking about design, limits, and leverages of designers in conjunction with the other disciplines. It also raises the question of the responsibility of design schools in preparing designers for the cross-disciplinary environment they will face in their professional path.

This article presents an initiative currently underway to transform the teaching model of a 5-year design curricula of a French industrial design school. The driving force behind the idea of a cross-curricular programme named “Sustainability by design” is the following question: How can we ensure that ecology is not an additional dimension of the design project but rather serves as a fundamental pillar? Therefore, the aim of this article isn’t to present a panorama of course results, but to sketch out the first milestones on the road to transforming the syllabus, so that ecology forms the spine of the curriculum, and consequently of the design process.

Even if this future programme shares many of the core beliefs of the Transition Design Approach developed at Carnegie Mellon University (Irwin, 2015; 2018; 2022), it is important to note that this programme is not intended as a specialization. It aims to add in the design process a holistic understanding of the relationship between humans and the planet, considering the Earth both as a physical entity and a complex system intertwined with human history and culture (Chakrabarty, 2019).
This article is therefore based on our school as a case study but is intended to be transposable to other design schools. It seeks to determine what invariants in terms of skills and knowledge all designers should have in order to move towards a planet-oriented design, i.e., that takes account of the planet as a system of systems, focusing not only on pedagogy—facilitating the acquisition of new skills and knowledge—but also on education, encompassing the execution of projects aligned with the values and ethics inherent to designers. Contents, formats, and ethics are thus the three categories of challenges to be addressed by a design school and constitute what this article seeks to enlighten.

To this end, the article is divided into two sections. The first explains and contextualises the need to change the cosmology of education, and then proposes a conceptual framework specific to design. The second section develops the programme proposal in more concrete terms. It is based on the challenges involved in making these changes in a design school and organized into four sub-categories: (1) new (and adaptable) contents, (2) a proposal of a strategy of implementation of these contents, (3) specific formats for design students’ profile, and (4) ethical positioning of the school through the hierarchization of values and a redefinition of assessment criteria.

2. Changing Cosmology: A Consensus for Education

A holistic understanding of the causes and effects of the Anthropocene (Crutzen and Stoermer, 2000) is necessary to have a multi-perspective overview of the Earth system. Considered as a dynamic network of relationships, an interdisciplinary vision of the planet allows designers to have a cross-scale approach, from the individual experience, passing through intermediary scales and different temporal consequences

to its planetary impact. It is the only way to find relevant answers to complex problems such as those we are facing and support a socio-technical transition.

Changing cosmology is clearly the first priority for students of all disciplines. It's about understanding how a world in which humans have evolved was created and how, as a humanity, we are now reshaping that world leading to uncertain futures. It involves updating educational content to align with the latest scientific discoveries and theories about the origins and evolution of the universe, and consequently the Earth system. This initial awareness enables students to envision a sustainable future for humanity within the Earth system. This involves integrating the science of global warming into existing subjects, taking into account other ecological disasters - biodiversity, pollution, etc. - as well as the principles of sustainability and the social and ethical dimensions of change.

2.1 From International to National Context

Meeting the challenges of the Anthropocene requires well-informed, committed individuals. Yet the complexity of climate change and other ecological challenges is still poorly understood by general population. In response, there is an emerging international consensus regarding the fundamental importance of education in addressing the ecological challenges that are being posed. Universities are intended to offer more space to develop essential knowledge and skills that allow individuals to contribute meaningfully to current challenges (Reimers, 2020; Leal Filho & al. 2021).

This consensus is obviously shared in France, which is moving from recommending to urging the universities to take action. In recent years, several recommendations on the transformation of higher education have been produced by non-governmental organizations or groups of researchers, such as *Campus des transitions* for various disciplines (Renouard & al., 2020) or *The Shift Project* in the field of engineering (The Shift Project & INSA Group, 2022) but also in finance, public administration, culture and health, examining also the issue of teacher training. At the same time, the French Ministry of Higher Education and Research (MESR) set up a working group comprising representatives from higher education, associations, businesses, local authorities and leading scientists in the fields of climate and biodiversity. Their report highlighted the urgent need to radically transform the French higher education system by adapting existing courses and, where necessary, creating new ones. In the short term, 100% of learners should be trained in the ecological transition. These changes must be developed based on a common foundation of five skills: understand the balances and limits of our world through a systems approach, grasping estimates and uncertainties through foresight analysis, elaborating shared diagnoses and solutions, using tools to bring about change and acting responsibly (Jouzel & Abadie, 2022).
Very recently, and based on these reports, the MESR published a set of specifications for all universities on how to integrate climate change education into formal education curricula including pedagogical teams training (MESR, 2023). The key point is that all bachelor's level students must have a knowledge base (of at least 30 hours) based on a scientific consensus with an interdisciplinary approach. It should cover climate change, biodiversity and its preservation, resources and their availability, as well as sustainable transition and social equity. The courses must be structured around action ("hands-on" projects, case studies).

Design schools are even more concerned by these transformations. Indeed, as a skills connector, and claiming the systems approach as part of their DNA, designers will have a crucial role in addressing the Anthropocene challenges. Sustainability has been integrated into design curricula already for several years. But a "subtle paradox" persists. Even if most design professors are fully convinced of the relevance of this issue, the assessment criteria for what makes a good design have not evolved enough in this direction (Ramirez, 2007). So, if "the task thus becomes the designing of the 'object of design' so that it, in turn, can design sustaining 'relations and effects', to which form, and function are subordinate." (Fry, 2009, p.187), what are the prerequisites for designers to adapt their profession?

Sharing the conviction that we need to change cosmology, and before presenting how the "sustainability by design" programme attempts to address this question, we propose to specify the conceptual framework chosen to think about the transformation of design and its teaching.

2.2 Mesology as Conceptual Framework for Design

In the French language, there is a distinction between two translations of the word environment: The first one, "*environnement*" refers to all the physical elements and phenomena that surround a living organism (including sometimes social and cultural conditions that surround the human). The second, "milieu" refers to all the material elements and physical circumstances that surround, influence or condition living organisms. Augustin Berque's concept of mesology is based on the study of "milieux" (in the plural form), which refers to the relations between all the elements that constitute the ecosystem and permit maintaining life (Bergue, 1996). Because it offers a better understanding of interdependencies between beings and the earth system, it is interesting to base the pedagogical programme on a mesological perspective to face the challenges of the Anthropocene. It means shifting our worldview from a world seen as an environment (something external we can change it without being affected) to a world seen as a *milieu* (both external and internal, shaping and shaped by the beings in it).

The philosopher Victor Petit breaks it down into two worldviews, each influencing a different approach to design:

> "In one case, it is possible to design 'ecologically' without compromising the standards of design; in the other, it is impossible. [...] In other words, to change the environment, all you have to do is change it, whereas to change the milieu, you have to change yourself (change your norms)." (Petit, 2015)

This change in norms requires a clear and well-enunciated ethical stance. This means redefining defended values and prioritizing them, and ideally in consultation with the people involved. A section devoted to this aspect, from a design school perspective, will be developed in the following section.

In addition, design practice can be more or less attentive to the living world: design that's indifferent to the living, design at odds with the living, or design in collaboration with the living (Pignier, 2017). So, when we talk about designing for the living, from a mesological perspective, it's not just about coming up with solutions for other living beings (even if it can be a part of this design), but designing for humans considering their "milieu" including natural, social, economic, and political environment. A milieu-oriented design has thus to consider living systems as both a starting and an end point. The concept of milieu also ties in with the principles of deep ecology laid out by Arne Næss. He introduced the idea of "ecosophy," a holistic and ecocentric approach to environmental philosophy that rejects the idea of humans as separate entities within the environment, favouring a relational perspective and recognizing the inherent worth of all living beings and ecosystems. Organisms are thus interdependent nodes in a network, and their identities hinge on their intrinsic relationships (Næss, 2017).

In this vein, milieu-oriented design plays a part in acknowledging the interconnectedness between humans and non-humans. It factors in the inclusion of humans in the living equation. Designing for and with the living is all about a milieu-focused design and requires designers to redefine our existence in this world as humans, redefining the boundaries of our influence and responsibilities.

Changing cosmology and adopting this conceptual framework raises several questions and challenges for design education. The following section presents a proposal of a cross-curricular "sustainability by design" programme incorporating recommendations emerging from scientific literature, various organizations' reports and official French government documents. It aims to initiate addressing the challenges in terms of content, methodology and ethics, corresponding to the three parts of the section.

3. Developing a Cross-Curricular Programme for Design Students

Starting from this conceptual framework, this section presents the three challenges underlying the development of a cross-curricular programme that allow design students learn about the physical constraints of climate change and integrate them in their milieu-oriented design process. First, the pedagogical contents up to date with the scientific research; second, the pedagogical formats which must provide a different learning experience appropriate to the design students profile; and finally values and ethics, which must be clearly formulated by the school and reflected in each project.

This article presents a framework for designing pedagogical progression (Fig.1). It has been thought out to allow design students to answer three questions progressively: (1) Where are we? (2) What can we do? (3) What is desirable versus what is really possible? Each question is paired with an objective to be reached in terms of knowledge (bringing by pedagogical contents) and skills to be developed (through experimenting different pedagogical formats): (1) Develop a sufficient and up-to-date scientific and technical culture, (2) strengthen the systemic approach and consider the global ecosystem (including technology) both as a starting and end point, and (3) Act for a milieu-oriented design (including all dimensions: biological, social, political, cultural, technical, economic, etc.), expressing its own specificity, values and ethical stance as a designer.

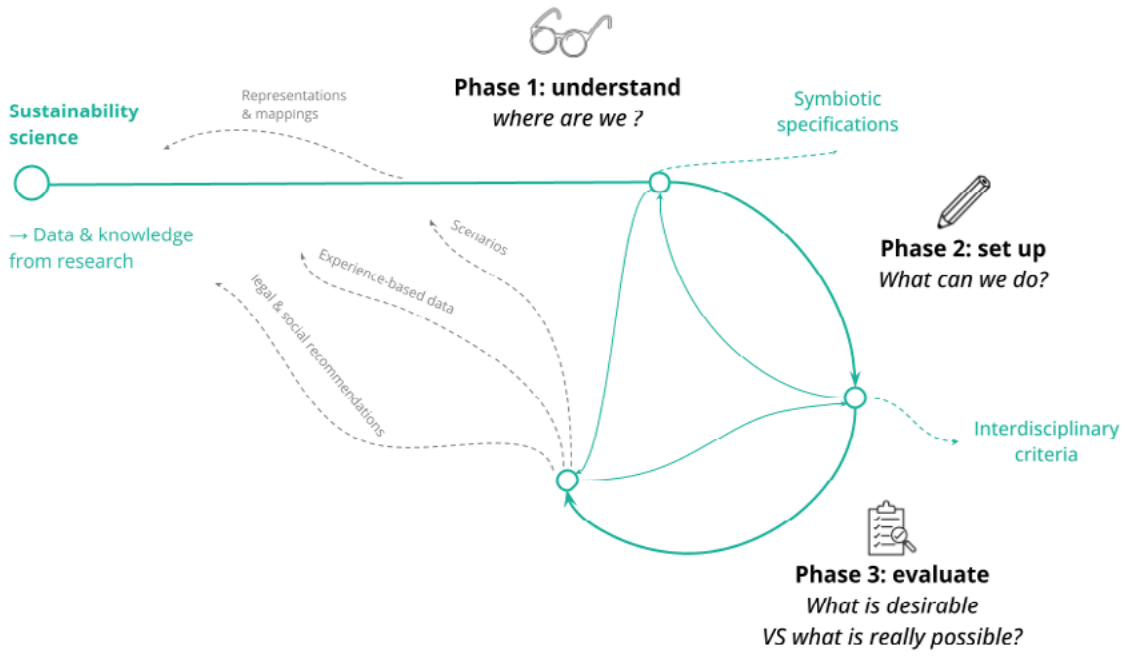

Figure 1. Pedagogical progression framework of the cross-curricular “sustainability by design” programme.

3.1 Pedagogical contents

The pedagogical content is based on inputs from sustainability science that bring together multi-perspective research from natural and social sciences, engineering and medicine (Clark & Harley, 2019). It is organised into three iterative phases: understand, set up and evaluate, which provide some of the answers to the three questions above (Figure 1). These three phases are interrelated and not necessarily chronological. As part of the project, the different inputs from each phase will enable the future designers to confront a reflexive process on several scales. This will develop the ability to zoom in and out, from the micro experience with the design artefact to its implications on a planetary scale, and vice versa, in designing from planetary constraints, helping individuals through the necessary transitions.

"*Where are we?*" Phase 1: Understand

In this first phase, the aim is to build an up-to-date scientific culture, backed up by research to include the latest established knowledge, particularly in the field of Earth System Science (including several disciplines such as chemistry, physics, biology, etc.).

Understanding well what is meant by the Anthropocene is crucial. Students need to know fundamental principles of living organisms (photosynthesis, biological cycles, biodiversity, etc.) and geo-biochemical cycles of the Earth system. Even if the current emergency focuses the debate on CO2 emissions and the measures to be put in place to decarbonise, it is important to have broader and more systemic considerations: criticality of materials, fossil/renewable energies, climatic trends by region, etc. This involves understanding materials, their classification and different potentialities, and the criticality of each material according to its characteristics and availability.

It is also very important to address concepts related to Anthropocene. Discussing several concepts as Planetary Boundaries (Steffen & al., 2015), "Technocene" focusing on the impact of technology on the Earth's systems and ecosystems, and "Capitalocene" highlighting the role of capitalism in ecological destruction (López-Corona & Magallanes-Guijón, 2020; Moore, 2017; Malm & Hornborg, 2014), is a way to understand how complexity of the current situation raises different questions depending on the disciplines and conceptual influences.

Moreover, to understand the planetary scale involved in developing any new product or service, designers need to understand the history that has made human activity the primary threat to the world's habitability for many species, including humans. So, it is essential that designers have a historical approach to technological development and its impact on the modification of individual needs, social organizations (political decisions, economic mouvements) and the Earth system dynamics. This includes a new, more global approach to history, including human civilization and the history of life and the Earth (Chakrabarty, 2019). The historical approach must also include the history of ecological struggles, as it informs about actions taken by various populations to face some climate change problems and the reasons for their success or failure.

"*What can we do?*" Phase 2: Set-Up

The second phase aims to connect knowledge with action. So, the courses should enable design students to circumscribe their limits and levers of action more clearly. With sufficient scientific knowledge to understand how living organisms and technologies work, new specifications that take into account the complexity of the Earth system are needed for the design project. The aim is to move away from technical specifications towards a kind of "symbiotic specifications" that encompasses the project in its "milieu", including material and energy resources, living beings and their (positive and negative) interactions with the socio-economic, legal and political systems in which they are embedded. So, an eco-design approach has to be redefined in the systemic meaning, as "it is not the object that must be 'eco-compatible', but the production-consumption system as a whole" (Petit, 2015).

And because changing the system entirely means coming up against regulations and administrative procedures, it is important training design students to deal with public policy. So, this programme includes a field project in partnership with local authorities, and preferably in collaboration with political science students to promote cross-fertilization of skills and prepare both of them working together.

Moreover, admitting the paradigm of interdependence between species opens up new avenues for designing methods with living organisms. So, the set-up phase therefore comprises two dimensions for reinventing the design process with living systems, to be applied separately or together in the project.

First, by learning from the way living beings use biological strategies to adapt their specific characteristics to an environment. Courses on biomimicry design can be a way to innovate about structures, materials,

energy efficiency…etc. But, using living beings as models and mentors (Stevens & al., 2019) must be coupled with a good scientific knowledge base (from the 'understand' phase) to avoid superficial or naive projects (i.e. that do "like nature" but with unsustainable materials).

Second, by designing for and with living systems. It requires reconsidering the human place in the whole system by building on ecosystem services. This approach aims at reinventing ways of collaborations between species, up to co-design with non-humans (Romani et al., 2022). This approach seeks to design, produce and recycle in a different way by integrating the 'know-how' of certain species (fungi, algae, bacteria, plants, etc.). As researchers work on the "intelligence" of living organism and their application to resolve some complex network problems (Poissonnier & al., 2019), the example of ecoLogicStudio project shows how architects involved a living being into their design process. Indeed, they trained an algorithm to behave as an acellular slime mould organism (commonly known as the blob) to redesign an urban network (ecoLogicStudio, 2021).

In fine, this phase provides skills to navigate complexity and find the way to act with living systems thinking from relationships between systems. Different ways and levels of actions can be experienced: changing trajectories by designing transitioning paths (Irwin, 2018), redirecting (Fry, 2009) or even dismantling and closing activities (Bonnet & al., 2021). Any design intervention needs to develop mediation skills to facilitate common understanding and debates between stakeholders to define the most advantageous, or at least the less harming, design intervention for all stakeholders, including non-human living beings.

"*What is desirable VS what is really possible?*" Phase 3: Evaluate

Recently, the designer Manuel Lima states that designers can no longer presume to deliver solutions without measuring their impact (Lima, 2023). He proposed to add an equally important third step to the double diamond design process theorized by the British Design Council. So, the third block of courses in our programme is a response to this 'third diamond' imperative. Design students need to learn how to assess the relevance of a project within its "milieu" by defining success metrics (impacts on the natural elements, climate, biodiversity and anthropological effects). Also, they do project these impacts over the medium and long term. Evaluation phase courses are obviously related to the knowledge acquired during the understanding phase, as it requires a solid grounding in physical and socio-cultural reality.

In other words, making the right assessment is a question of projecting into different futures and then coming back to the present to iterate on the project.

Moreover, visioning a sustainable world has the power of motivating us to reach this potential future. In 1993, Donella Meadows was already suggesting the use of visioning as a driving force to believe that radical changes are possible, and then to lead it (Meadows, 1994). So, as she said, "children are natural visionaries", design students have to re-learn visioning. In the Transition Design Approach, the ability to project futures from present data is an essential skill to improve for designers. This capacity of having a future vision where the problem is resolved is an important step to imagine a transition pathway with multiple design interventions (Irwin, 2015; 2018). So, to develop their ability to navigate between different timescales of a single problem and to project a multitude of potential scenarios, all designers must be trained with both foresight and design fiction methods. The foresight method enables students to reframe a problem at multiple levels and scales looking at the connections between people, problems and things (Irwin, 2018) while exploring short-, mid- and long-term effects of interrelated solutions. In a complementary way, design fiction allows students to generate a wide range of utopian and dystopian scenarios to hypothesize and ask questions about the transformation of values, beliefs and practices and their consequences. Moreover, the artefacts designed can create a communication situation so as to make people debate about desirability (or not) of future scenarios (Mollon, 2019). Integrating design fiction will therefore develop the mediation skill of designers. This skill is becoming increasingly necessary, as effective transitions are so closely contingent on collective decision-making.

To summarize, table 1 below presents the essential courses in this programme and how they correspond to the skills needed for the ecological transition identified in the two documents from the Ministry of Higher Education and Research (Jouzel & Abbadie, 2022; MESR, 2023). It is important to notify that this table is not a proposal of a pedagogical mockup in itself, but a theorical model that can be used as a guideline for improving, reorienting and implementing courses.

Table 1. Courses and associated skills of the cross-curricular “sustainability by design” programme.

Question to be answered	Where are we?	What can we do?	What is desirable versus what is really possible?
Phase	Understand	Set-Up	Evaluate
Courses	Introduction to Anthropocene and related concepts (technocene, capitalocene, planetary boundaries, etc.) Fundamental principles of living organisms (photosynthesis, biological cycles, biodiversity, etc.) Resources: materials & energy (classification, uses, recyclability, etc.) History of technological development and socio-economic effects History of ecological struggles	Governance models Workshop with local authorities Changing trajectories (transition, redirection, dismantling, closing) Design & biomimicry Design with living organisms	Foresight Fictional writing Design fiction
Associated skills	Consider a systemic approach and be aware of scales (local vs. global)		Developing a forecasting analysis
		Co-building diagnosis and solutions (mediation, facilitation, co-design)	
	Knowing how to implement transitions (realism, technical and organizational feasibility)		

To ensure the success of a transformation, we need to reach a unified agreement on the core elements of sustainability that must be incorporated into the curriculum for training designers. According to literature review and discussions within the school, there is common agreement on the relevance of modifying design education in this way. However, the way in which this material will be shared with students is still under discussion. The following section attempts to address this challenge by identifying emerging initiatives from which to continue building our cross-curricular “sustainability by design” programme and its deployment.

3.2 Implementation Strategies

Based on the theoretical proposal of pedagogical contents and a first overview of pedagogical formats that may be suitable to design students’ profile, the implementation strategy needs to be developed jointly with all the school's pedagogical supervisors. To do so, we have identified a number of key actions to be implemented progressively. Firstly, we need to carry out an analysis of existing courses. Then we need to study the possibility of redirecting the content of certain cross-disciplinary courses (such as storyboarding, writing or human and social sciences) towards ecology-related content. Next, we should experiment with setting up joint projects between these courses and the representation courses (such as sketching or prototyping). Finally, either simultaneously with the previous stage or afterwards, we need to add the necessary new specific courses (such as scientific culture or historical approach of ecological struggles).

So as a first step, an inventory of existing courses dealing wholly or partly with sustainability issues was conducted (see table 2). To compile this inventory, a 30-minute interview was held with each pedagogical supervisors (common core first years, product design, interior design, brand design, ux design, transportation design). As well as a design project, it's essential to determine what content had already been introduced, to explore the desire for new pedagogical developments, as well as the gaps and difficulties in deploying specific content or formats. It is also useful to start involving the pedagogical supervisors to co-build the strategy of deployment of this programme.

Table 2. Inventory of existing courses dealing wholly or partly with sustainability issues.

Year	Courses dedicated to ecological issues	Courses partially addressing ecological issues
First year	"Climate Fresk" workshop	Biomechanics Upcycling (or) make mycelium (or) experimental cooking Workshop*
Second year	Design & naturalistic immersion	Biomechanics Mapping Tools
Third year	Eco-design (systemic approach) Eco-construction/Eco-production (introduction to materials, carbon footprint, reparability, assembly & disassembly) Neo-industrial workshop Technical culture	Human and social sciences Lighting
Fourth year	Eco-design (systemic approach) Eco-construction /Eco-production Design in territories Industrial upcycling	Human and social sciences Projects in partnership with an organization
Fifth year		Projects in partnership with an organization

*These workshops are optional, so will only involve some of the students.

Table 2 aggregates all courses in the school. It should be noted that there are still disparities regarding courses and hours, depending on the design discipline. Moreover, from the fourth year, a major part of the courses is project-based, usually in partnership with organizations. So, the ratio of pedagogical time devoted to ecological issues is hard to measure as the content depends on the brief of the partner companies. Questions raised by this model of teaching through partnerships will be addressed in the section relating to the ethical challenge. Some other identified limitations relate to problems beyond the teacher or the school's scope. Interviews revealed frustrations linked to the limited levers of designers, such as infrastructures, business imperatives, outdated regulations, and too restrictive norms about some materials. Such restrictions sometimes inhibit alternative solutions deployment as reuse-based design, for example. This highlights the fact that technical skills alone are not enough to deal with complexity and confirms the need to train all designers in political issues so that they can anticipate, support, or take part in the transformation of public policies.

The initial actions to prepare for the implementation of the cross-curricular "sustainability by design" programme has also raised a number of issues in terms of the school's ethical positioning and its influence on the speed of deployment. This will be discussed in the "ethics challenge" section trying to address some of these questions but above all, its aim is to initiate a discussion that concerns design as much as other disciplines.

Following the inventory, the second stage of the implementation strategy is underway. We have therefore identified certain course formats to be adapted to the theoretical content (table 1) and investigated innovative formats that might be worth deploying. The following section presents several pedagogical formats that need to be supported, developed, and used as inspiration for other courses.

3.3 Pedagogical Formats

According to the UNESCO report on climate change education (2019), cognitive learning is favored over social and emotional or behavioral learning. However, it has been shown that in order to influence attitudes and behaviors, climate change education should be based on deeper learning because didactic approaches focused principally on the transmission of scientific knowledge do not (Reimers, 2020). This is even more important for disciplines such as design, where knowledge is based on practice. Indeed, it is important to adapt scientific content, which is sometimes highly technical, to pedagogy based on practice and projects. How can we preserve the specific characteristics of designers while providing them with the scientific knowledge they need to practice their profession in a constrained future?

In the beginning of their first year, students take part in a *Climate Fresk* workshop, a collaborative and science-based workshop, mostly from the IPCC reports (climatefresk.org). Its methodology is based on mapping the causes and effects of climate change about a specific object or problem to enable participants to have an open and positive conversation about climate change and imagine some solutions. It's generally animated by older students trained as facilitators by the organization that creates this workshop. This first step is seen as an introduction and an awareness-raising exercise rather than a course. Adding the *2tonnes* workshop (en.2tonnes.org) to the "sustainability by design" programme is also planned. This workshop, designed as a serious game, will provide an understanding of the individual, collective and influential levers for achieving concrete reductions in CO2 emissions, on the individual and the national level. It will help first year students move on from mapping problems and potential solutions (experienced in the *Climate Fresk* workshop) to taking decisions on concrete actions to implement.

In 2023, another experiment at the start of the academic year involved the whole school. All the students took part in a design fiction workshop, in partnership with a reference consultancy firm regarding energy and climate challenges. Each group dealt with a use (clothing, food, housing, transport, healthcare, transport, information, entertainment) that was constrained by a model of society, a trajectory for global warming (from 1.5° to 3°) and a state of biodiversity. The aim was to imagine what life could be like in 2060, informed by several scientific studies.

Another example of a course to consider for its format. In response to the need to combat "environmental amnesia" (Kahn, 2007), the "*design & naturalistic immersion*" course offers an off-campus format that immerses second-year students in a direct relationship with living things. Combining knowledge of biology and design tools, the teacher takes advantage of a walk in the forest to explain the fundamentals of photosynthesis and the biological cycle. The students are invited to take notes by sketching, collecting elements and creating maps. This methodology permits a concrete and powerful insight into the 'others' who inhabit the world and on whom we depend. Similar initiatives are in the process of co-design with some professors before being implemented.

Understanding how we reached the Anthropocene also involves learning the tools for diagnosing a complex situation. As well, in addition to the courses to be incorporated (for phase 1 understand, Table 1) a large part of the courses focusing on developing reading and writing skills will be devoted to ecology-related themes. So, courses such as sketching, storyboarding or narrative writing are meant to be reoriented to address sustainability topics. During those courses, design representation skills will be used to extract and organize data from scientific papers and reports. For example, in the reading course, students will have to read the latest IPCC report and extract data that will be used during both narrative writing and sketch courses to describe the process of a research project and represent its results using more easily accessible media. It implies a new kind of coordination between teachers of different disciplines.

Once the contributions of scientific disciplines to the teaching of design have been discussed, it is important to note that design methodologies can also provide valuable contributions to the scientific community (see figure 1). Indeed, in their process of understanding, designers do not reproduce knowledge in the same way as researchers, science journalists or popularisation specialists, but provide their own expertise through their sensitive interpretation of the world. Formalised into models, visualisations or maps, these contributions can enrich scientific productions by making data tangible. This helps first in making complexity legible and apprehensible. Creative media used by designers are useful for researchers to popularise and spread knowledge that can be understood by a wide audience. Secondly, the designers' methods of fieldwork provide an enrichment of the research with sensitive data derived from narratives and illustrations of real-life experiences. Ultimately, this can shed light on blind areas or highlighting links that were previously undetected due to the hyper-specialisation of research disciplines, thus inspiring the exploration of new fields of research. Design can consequently play a role and be one of the disciplines contributing to sustainability science.

3.4 Ethics Challenge

If the question of sustainability is limited to the preservation or restoration of conditions favorable to human life, to a matter of subsistence (Fry, 2009), then design should only be assessed through the materialistic prism of what it produces and destroys. Yet the symbolic dimension is just as vital to human life, as it conditions our being-in-the-world, and therefore our use of its resources. Thus, we need to change preconceptions about what comprises good design including all those dimensions of habitability: physical, psychological, socio-economic and spiritual (Findeli, 2022).

One of the major challenges in terms of ethics is therefore to reconsider the project evaluation system and redefine what comprises good design. If we consider a new framework for assessing projects, what balance should be made between criteria that are strictly material and criteria linked to experiential benefits?

Currently the evaluation criteria focus more on the acquisition of skills and respect of the design process steps. Sustainability can have almost a similar value to form, functionality, user-friendliness and other criteria (Ramirez, 2007). Instead, a new multidisciplinary evaluation grid must be established. The physical aspects of the project should be systematically assessed, i.e., the level to which the project has addressed the impacts of the entire value chain (supply & production chain). In addition, the social implications of this physical aspect also need to be considered, i.e., the social effects of the potential extraction of natural resources or the waste management involved. Thus, the courses in the evaluation phase will also contribute to this ethical positioning of the school visible through a project-wide scale. This aligns with the idea of introducing the third diamond in the design process (Lima, 2023). In this case, students will then have to present, with each project, a mapping of all these aspects, similar to what they do regarding business issues, for example.

The school's values are also reflected in the collaboration model it establishes with organizations for pedagogical projects. Training models based on partnerships with companies, like that of our school, is highly beneficial for both companies and students. But, in a world where dominant industrial paradigms are no longer sustainable, it raises several new questions about ethical stance: as a school, should we assess the maturity of companies on this topic before setting up a partnership? Should we select only those that are clearly committed to the ecological transition? Or should we decide to redirect the briefs so that the projects provide a deeper understanding of the sciences of sustainability?
Those questions are still discussed between pedagogical staff and students.

4. Conclusion

"The designer of the future is a mix of psychologist and anthropologist, sociologist and ecologist, system theorist and futurist, activist and reformer" (Lima, 2023, p.197). In the conclusion of his latest book, the designer Manuel Lima came to the same conclusions as many of us. As a design school, we therefore have a responsibility to cultivate all these facets of the designer of the future, in addition to provide a scientific knowledge to understand Earth system and technologies on which humanity depends.

The cross-curricular programme "sustainability by design" presented in this article has been designed accordingly. Drawing on the etymological definition of ecology as the study of relationships between living organisms and their physical environment, this programme is aimed at making ecology the driving principle behind the design process. It is based on three iterative phases: understand, set up and evaluate, enabling future designers to link knowledge to action.

To get started, based on the recommendations of the scientific literature, as well as those of government institutions or teachers, the most urgent thing is to strengthen the foundations of fundamental knowledge in the first three years, so that design students can then put their knowledge into practice and experiment as early and as much as possible during their studies. The main objective is to provide them with operational skills to address different levels of change (behavioral, organizational and political). The "sustainability by design" programme outlined in this article is a proposal of the pedagogical progression over a five-year curriculum. However, even if it has been conceived as a cross-curricular programme, it must be adapted according to the specific needs of each design specialization (product design, interior design, brand design, UX design, transportation design…).

This contribution has three aims. Firstly, to join the international scientific community in emphasising the urgency and necessity of changing cosmology, which implies changing content and methods of transmitting information. Knowing that this knowledge is recent and growing, and that some of it remains unknown, raises new questions in scientific research and can enable design to contribute concretely to research into sustainability science.

Secondly, to propose a framework for building a cross-curricular programme meeting the challenges of transforming design education in a French Industrial Design School. This framework is associated with a proposal of a strategy of implementation that would allow this framework to be generalized to other design schools. As a perspective, it would also be interesting to test its adaptation to other disciplines.
In fine, if we follow the principles of living systems, collaboration is one of the strategies that can ensure the survival and evolution of a system. This contribution is thus intended as a way of initiating a dialogue to connect design schools and share best practices on implementation strategies and ethical positioning.

Let's remember that the human origin of the alarming situation we are collectively experiencing can be seen as good news, because we still have the power to change it. The near future can therefore be seen as an enthusiastic period because there are so many things to reinvent, and designers have an important role to play in supporting these multi-level transformations.

About the Author:

Emna Kamoun is an assistant professor at Strate School of Design, she collaborates with a multidisciplinary team of researchers in design and human and social sciences. As a designer, her passion for design narratives woven through and around design grew through her doctoral research in information and communication sciences and semiotics. Presently, she specializes in adapting design education for the Anthropocene era's dynamic challenges.

Acknowledgements: The author would like to thank all the colleagues who took part in the interviews and the numerous discussions on the changes to be implemented in the school.

KEYWORDS | CIRCULAR DESIGN, TRANSITION DESIGN, ADVANCED DESIGN, DESIGN FOR DISASSEMBLY, ECOLOGICAL AWARENESS

ABSTRACT | In Made in Italy industries, craft and industry production coexist, with a continuous relationship between manual technical knowledge and the use of advanced machines. The use of material is fundamental, Italian design has a recognized aesthetic and material imagery because it experiments with materials from the noblest to the most artificial. In this context, the theme of circularity and sustainability is not always central: traditional upholstered products are a conglomerate of components made of different materials whose disposal hardly ever involves disassembly and reuse or repair processes. Through experimentation of circular re-design of an upholstered seat carried out by the author, the article proposes reflections on how to integrate design practices that can allow a circular and sustainable transition of the upholstered product. In the research, Circular Design, an approach capable of shifting perspective between user needs and the systemic implications of the process, is a central discipline of application and study. The anticipatory attributes of Advanced Design and Transition Design are also key disciplines involved. The practice-based methodology used makes it possible to integrate desk and field research and to verify it through an experimentation that aims to be an object of future design vision. The intention is to open the discussion on what strategies the designer can implement to support a circular and sustainable transition of systems products in sectors where experimentation is part of traditional production.

1. Introduction

In the upholstered furniture industry production can be artisanal and industrial. In industrial production, the quality of the products must be predetermined, the materials are designed for machine processing to obtain the greatest number of pieces at the lowest possible cost (Colaço & Matos, 2020). In craft production, on the other hand, quality is closely linked to the skills of the craftsman (Sennet, 2008), to the characteristics of the material he or she knows how to handle, and which determine the production techniques, not vice versa (Cavalli & Comerci, 2017). In Made in Italy industries, craft and industry production coexist, through which there is "a continuous relationship between manual technical knowledge, testing and verification through the use of manual machines and design for industry with technologically advanced machines" (Conti & Motta, 2020, p. 175). Moreover, it is "a production with a strongly artisanal DNA to the point of contemplating the borderline case 'of self-production by the designer'" with a "dedicated and tailor-made business approach, of handmade objects, also tailored to individual needs." (Trincherini, 2020). The use of material in connection with the process is therefore fundamental, Italian design has a recognised aesthetic, morphological and material imagery because it experiments with materials from the noblest to the most artificial and serial (Di Lucchio, 2005).
In this context of traditional knowledge and technological innovation, the theme of circularity and sustainability is not always central: often the creative, when guiding the design process, puts style and aesthetics of the product before. Upholstered products are a conglomerate of components made of different materials whose disposal at the end of their life hardly ever involves disassembly, reuse, maintenance, or repair processes during their service life (Bruno et al., 2022).

Through a design experimentation of circular re-design of an upholstered seat carried out by the author, the article proposes reflections on how to integrate in these contexts sustainable practices that can allow a circular and sustainable transition of the product, give more performing design tools both at an aesthetic and functional level, and provide them in a way that is useful to both the furniture company and the final user. The intention is, therefore, to open the discussion on what design strategies the designer can implement to support a circular and sustainable transition of systems-products critical for the use, application, and selection of materials, in sectors, such as that of Made in Italy, where experimentation is part and parcel of traditional production.

2. A Suitable Context for a Circular and Sustainable Transition

Made in Italy is defined as a set of high-quality products and services made by small and medium-sized enterprises in sectors recognized by the collective imagination and characterized by cultural contents linked to the values and heritage of the territory they belong to (Bertola & Colombi, 2014). The connection with the designer's practices is strong and characterized by complex multi-level logics; product diversity, formal and material identity of products, attention to quality and connection to local communities and knowledge are all characteristics that drive foreign companies to produce parts of their products in Italy (Turrini & Sbordone, 2020). These peculiarities, with the artisanal and industrial process described in the introduction, have over time created a territory capable of integrating sustainable and circular practices, strongly marked by experimentation and innovation.

The circular economy is a regenerative industrial strategy (Ellen MacArthur Foundation, 2013) based on eco-efficiency to keep products, materials, and resources in use as much as possible by reintegrating waste into production processes (European Commission, 2022). Historically, Italy is a country that has found circular strategies to create an economy from a lack of raw materials, characterized by its vocation to offer quality products (Massarutto, 2019). The textile district of Prato, for example, is characterized by production processes that can potentially be considered anticipatory of the circular process for its ability to process regenerated fibers (Trivellin, 2020). In fact, the territory possesses a production culture rooted in recovery and regenerated products, personified in the figure of the “cenciaiolo”, a person who selects rags by composition and color, and enables the recovery of the “cenci” (rags) derived from the textile production.

In Europe, Italy is the first country in terms of recycling (Lotti et al., 2021, p. 17): in 2022 it ranked first in Europe for urban waste recycling with a percentage of 80% compared to 39% of the EU average and, at the same time, waste going to landfills or incinerators without energy recovery decreased from 54% to 40% (ANSA, 2022). Today in Italy, 117 million tons of waste sent for recycling are used as a secondary raw material in the building/infrastructure industry and the Italian industry achieves a circularity rate of around 50% (Symbola, 2021).

However, if we look at the upholstered furniture industry, attention to circularity and sustainability issues are often less rooted for different reasons. Cerulo et al. (2022) identifies several of them:

- The environmental impact resulting from the disposal of textiles and polyurethanes;
- The complex disposal of products as they are made of materials assembled in a mixed and non-reversible way making the product not disassemblable at the end of its life;
- An impactful logistics due to the weight of the finished products that influences packaging and transport modes;
- A supply chain on a global scale with suppliers from different regions.

Each of these characteristics is strongly influenced by material selection, but the cited difficulty of this sector makes it one of the most impactful sectors (Barbaritano et a., 2019), despite the territorial predisposition to adhere to circular practices. The upholstered furniture industry is a relevant production area in the scenario of Made in Italy, and there are several regional districts that are identified internationally for their skills and competences. To avoid fast-furniture products (Griffith, 2017) that lead to the production of furniture with inexpensive materials and not designed to last (Maier, 2021), there is a strong need to understand how to transition the sector's enterprises to circular practices (Cerulo et al., 2022).

In this article, we want to reflect on this circular and sustainable transition process, seeing the designer as a key player, who starts with the material but acts systemically around it.

3. Critical Materials in the Upholstery Industry

Woods, plastics, textiles, and metals are part of the material identity that represents the high-quality level of Italian furniture production. Pellizzari and Genovesi (2021) define circular materials as 'neo-materials' because they come from renewable cultivated resources or because they are made of material that has 're-entered' the production cycle, whether from a homogeneous or different supply chain.

Not all materials mentioned are circular and, in different ways, participate in increasing the environmental impacts of the finished product: while some of them are often recyclable, it happens that in the production phase they consume a high level of energy, emit CO2 and, if the product is not used to last as long as possible, their impact is excessively significant in the production economy (Bruno et al., 2022).

Among the most critical materials are polyurethanes, which are foams of non-renewable fossil origin, assembled with other foamed plastics that, while guaranteeing the desired softness performance by combining different layers of materials, are often not separable at the end of their life. The production of these materials actively participates in CO2 emissions and when they degrade, they release environmentally toxic microparticles into the environment (Bruno et al., 2022). The use of these materials is now being strongly debated and solutions are being sought to introduce the use of expanded polyurethanes of recycled origin into the industry.

Another critical material is textiles and thus cover of upholstered products. Cover poses critical issues both from the point of view of the origin of the materials used - as non-recyclable polyesters, interwoven with other materials in a non-reversible manner - and of the assembly - as they are often sewn to the upholstery making

them not washable, repairable, and replaceable at the end of their life. Furthermore, the assembly of covers on sofas and seats often takes place using fasteners, elements found in various product sectors, which allow the assembly of the various parts of a product. In the fashion and textile sector, they form the connection point between fabrics and act as fastening, adjusting and/or opening elements. Furthermore, in the fashion industry, they can be an identity element for brands (Mitchell & McLoughlin, 2014). From the point of view of product composition, fasteners can be elements that interrupt material continuity as they often consist of different types of plastics also connected to metal components. Their composition is designed to ensure wear resistance but makes recycling complex, in fact, for example in the fashion industry, fabrics need to be separated from fasteners before the material is introduced into a new production cycle (Fantin et al., 2020) as they affect the purity of the material as well as can cause damage to machines (McKinsey & Company, 2022). Today, fasteners are used in the upholstery industry mainly for production reasons: zips are used to facilitate the assembly of pillowcases that cover the foam of the upholstery, buttons are used to make the cover adhere to the foam. Fasteners, in addition to making disassembly for maintenance, washing and disposal difficult, limit the customization possibilities of the product during use as their opening system is often blocked and they do not allow the user to change the cover. Never being able to change the appearance of a product may be one of the reasons why people discard it, the designer must anticipate the human need for modification over time (Goldsworthy & Earley, 2018).

The reasoning on the latter type of product and material is what guided the following experimentation in order to activate a theoretical reasoning based on practice to visualize the designer's scope of action to move the sector towards a circular and sustainable vision.

4. Practice-Based Research for Circular and Sustainable Transition, Guided by Material Selection

Working in anticipation is a key concept in the circular process: being able to foresee the future life cycles of the material and the product that contains it means anticipating the impermanence of needs (Rau & Oberhuber, 2019) and the possible evolutions of current technologies. Advanced Design's ability to work with anticipation and, moreover, to mediate between knowledge (Celaschi, 2008) is a key competence in these contexts in which it is necessary to be able to manage hybrid skills and professions between materials science, economics, and the sustainable use of technologies. In a different but related way, Transition Design seeks to define strategies to design transition paths for complex problems (Irwin 2015), strongly linked to concepts of sustainability, through techniques derived from the intersection between design and the study of futures. The experimentation arose from the application of a design method identified in the author's doctoral research that seeks to integrate these two disciplines with the themes of circularity and sustainability. This methodology sees the designer as a possible support for companies in the sustainable and circular transition of their products made of critical materials; the designer, called “Transition Matter Designer” (Rosato, 2023), designs the gradual metamorphosis of a critical product-system over time in such a way as to allow companies to absorb the change (Irwin, 2015). To activate this process, the Transition Matter Designer applies changes to the product-system by anticipating its metamorphosis over time, applying a gradual transformation from the micro to the macro scale. This means starting from more circumscribed actions, such as changing the material of a single component, and moving to the scale of the supply chain, and to the active involvement of the user in the process to make them aware of the importance of circular processes. The Transition Matter Designer thus proposes an approach to lower Transition Design practices (Irwin, 2018; Kossoff et al., 2015) into system-product design, feeding on the anticipatory attributes of Advanced Design (Celaschi, 2015; Celi, 2010) and aiming at the goals of Circular Design (De los Rios & Charnley, 2017; Moreno et al., 2016), working from materials, the central point of the circular economy (Fig 1). The article applies this methodology to the redesign of the cover of an upholstered seat, as it highlights one of the product components whose materials influence production, service life and disposal, while showing its future systemic development. In defining the transition, the creation of prototypes is a fundamental tool as it materializes futures and outlines possible trajectories of innovation (Celaschi et al., 2014; Iñiguez Flores et al. 2014). The practice-based methodology

(Mossé & Bassereau, 2019) used makes it possible to integrate desk and field research and to verify it through an experimentation that aims to be an object of future design vision. The intention is to open the discussion on what strategies the designer can implement to support a circular and sustainable transition of systems-products in sectors, such as that of Made in Italy upholstered furniture, where experimentation is part of traditional production. The experimentation, which interweaves craft and industrial knowledge typical of the sector, focuses on new solutions for connecting fabrics that allow mono-materiality (Rosato et al., 2023) applied to upholstered seating, and reasoning on how, starting from the selection of materials, technologies, processes and the anticipation of material life cycles, the transition levels of a critical system-product can be designed over time.

In Made in Italy context, designer role is central to work on the historical, psychological, cultural identities, skills and ongoing mutations of the sector (Turrini & Sbordone, 2020).

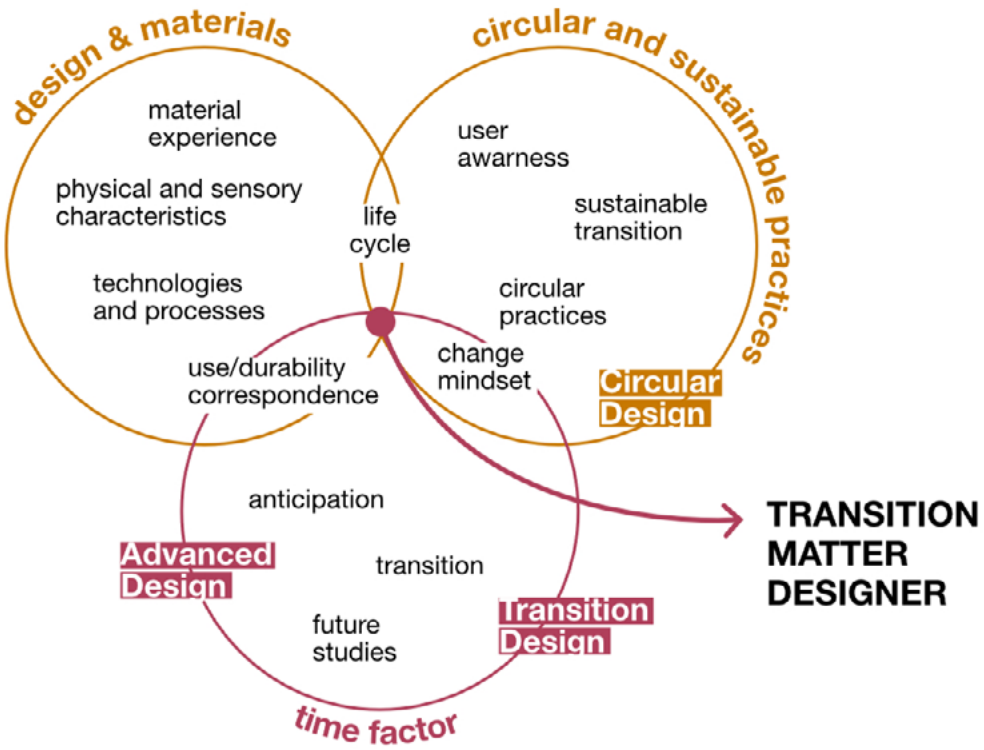

Figure 1. Disciplines relevant to the work of the Transition Matter Designer. Credits: L. Rosato, 2023.

5. Circular Re-Design of the Cover of an Upholstered Chair

The experimentation was therefore developed from the design methodologies of the Transition Matter Designer (Rosato, 2023). He or she uses a transition model that allows him or her to identify which actions to apply to the product in order to design its sustainable and circular transition. These actions are design suggestions of how to modify the product system by acting on four levels: user education, material characterisation, selection of circular production processes and anticipation of material life cycles. These 35 suggestions work on these four design perimeters, working from a micro to a macro scale, and the Transition Matter Designer can select them based on: 1) which ones are not dealt with in existing projects (of which he conducts a thorough research), 2) his personal design sensibility (Celaschi, Formia & Lupo, 2013) and 3) the component of the project on which he wants to act (education, production process, material...).

For the prototype in question, the author applied the methodology of the Transition Matter Designer and identified 10 practices pertaining to the project levels identified to work (Fig. 2).

The redesign of the cover of the upholstered seat started from the integration of the “Knitted Fasteners” (Fig. 3), a metamorphosis of zips, buttons and rivets and conceived to be designed from the textile product assembly, integrated into a knitwear process (Rosato et al., 2023). These elements, realized by the author from the previously described methodology, consist of buttonholes and rings which, when assembled in different combinations, allow the functions of closing, fastening and adjusting systems. Knitted Fasteners create a system that allows the creation of a collection of sustainable and circular fasteners as they allow the creation of mono-material coatings that thus facilitate product recyclability. Furthermore, the use of knitting allows a reduction in pre-consumer waste as it is a technique based on material addition, not subtraction. It is a reversible technique if the tightness of the yarn allows it (Motta, 2019) and, combined with 3D knitting or seamless techniques, can eliminate any element other than the material used in the garment, including seams. The design process of a knitwear garment starts from the selection of the yarn and therefore has more control over the final product, being able to decide on shape, color, texture, material, weight, stitch, processing (Conti & Motta, 2020).

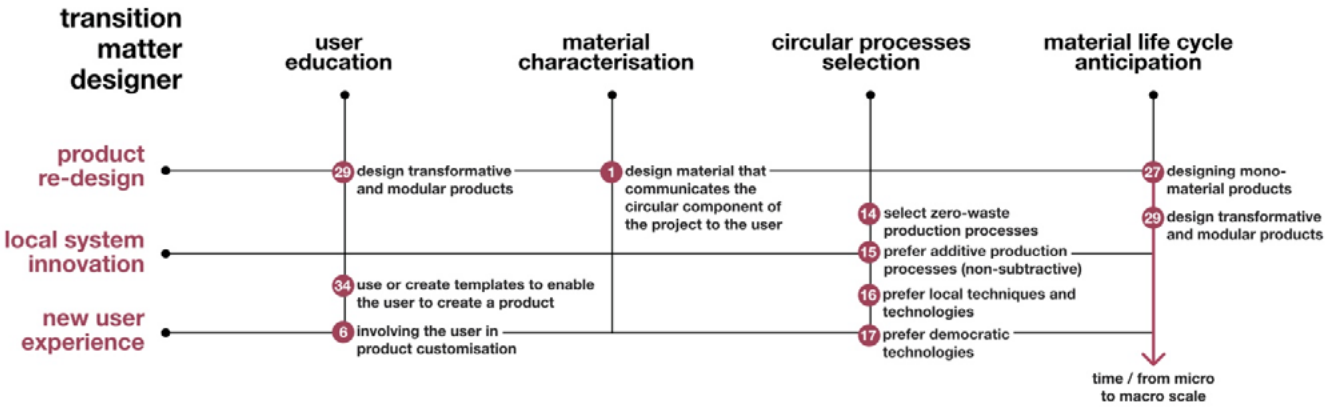

Figure 2. Practices identified for the experimentation. Credits: L. Rosato, 2023.

Knitwear allows more than other technologies to integrate the Knitted Fasteners in the direct production of the garment because it is a technique that already includes in its process both the creation of the fabric and the realization of the textile product, closely linking aesthetics and technique (Eckert, 1999). In the course of the research, other weaving techniques were also identified such as three-dimensional or integral non-rectangular weaving production (Thomas, 2009) or integral weaving approaches (McQuillan 2020; Drews, 2019; Vicerial 2019) but because of the elements described, and the author's close territorial connection of the knitwear districts, it was decided to investigate this technique further, in the knowledge that further developments could include studies on other textile strategies.

By taking advantage of these elements, it was possible to change the configuration of the backrest of the upholstered chair by dividing it into a front and a back and leaving the Knitted Fasteners along the side so as not to bother the user when sitting. For the prototype, a basic model from IKEA was used. This provocative choice was made with respect to the subject of the research both to highlight how small design actions can transform these fast-furniture sectors into places dedicated to circular processes and to focus on the individual object of the research and not the entire product. Due to the shape of the seat chosen and the elasticity of the mesh, the cover of the front and back of the backrest are exactly the same but mirrored. This choice was made to allow the user to create different combinations with only three covers available. This makes it possible to customize the two sides of the back in material, texture, and color, facilitating repair and maintenance but also following the user's need to change tastes over time (Goldsworthy et al., 2018; Karana et. al., 2017). The seat cover is designed in such a way that it can be closed using a system reminiscent of an elastic band in order to allow for quick disassembly and maintenance.

The selected yarns must be pure, recyclable/biodegradable and with renewable origin and therefore circular materials. In the experimentation illustrated, integrating these materials in a design-friendly manner is possible thanks to the techniques used and the conformation of Knitted Fasteners. For the prototypes, 100% recycled and recyclable organic cotton was chosen for reasons of availability, but future tests are planned with other circular materials.

The redesigned seat and back cover (Fig. 4) therefore allow for different levels of complexity in the industry:

- Enables the decrease in the use of complex textile materials that have impacts on component disposal in the industry. Different materials and colors can be used for the front and back of the seat, but the designed fastener system allows this to be reversible and disassembled;
- Promotes product disassembly systems in the short to medium term to customize the product and in the long term to repair or dispose of it in a circular manner through recycling;
- At the production level, disconnecting the upholstery process from the assembly process would allow to increase formal and aesthetic possibilities in the design of the seat. Whereas previously the form was constrained to the need to create a customized cover to be inserted before assembly, with this system the cover could be assembled directly onto the upholstered seat;
- It provides the user with a strong awareness of the process as it makes him an active participant in the circularity of the product. In fact, it participates in the extension of the product's life thanks to the medium to long term choice of customization of the covers and, moreover, the possibility of acting in the same circular aesthetics by finding new combinations of rings and loops. Knitting is a potentially democratic and affordable technology whereby the user can independently produce covers with the same assembly and fastening strategy.

Future developments of the prototype will concern improving the accessibility of opening and closing systems: in order to guarantee the correct tightness of the upholstery and avoid wrinkles, there are many rings and loops in the backrest, and opening and closing the upholstery can become a cumbersome job that is not intuitive or accessible to everyone. Further development of the prototype should focus on speeding up the closing process through the creation of an ad-hoc tool. Furthermore, the limitation of this application of Knitted Fasteners is the contemporary aesthetic tendency to conceal any seams in upholstered seats; a more aesthetically straightforward and suitable system could be thought of.

6. A Circular Project Strategy Based on Anticipation and Transition

The practices of anticipation and transition intersected with circularity and sustainability allowed a vision of how to redesign, starting from a reflection on materials, a critical component of a product system. This, starting from a single component, however, has allowed a systemic work that also intervenes at the level of the supply chain, production and use intervention. In fact, using a transitional logic typical of Transition Design, intersected with the anticipation practices of Advanced Design, applied to the desires of Circular Design, has made it possible to foresee interventions, beginning with these illustrated on a small scale, but already sensing those to come on a large scale. The single-material seat upholstery was the excuse to reason about the future customization of the product, its longevity and how this can be implemented in the future with further modifications. In this sense, the user's awareness increases, and the product is itself the bearer of a message of circularity that educates the user not critically but positively by giving him new opportunities for use. These manifestations of future latent metamorphoses in a gradual logic make changes more easily absorbable and acceptable by companies and the market. In the same way, the reasoning carried out on the selection of circular materials may have tomorrow a deepening on the concept of short and local supply chain that would allow the reduction of transport and logistic impacts as well as an interesting implication on the connection to the knowledge and cultural traditions of the territory, avoiding delocalization and possible unethically controllable processes. Reasoning on a transitional intervention scale allows with small present actions to foresee future ones and to scale the intervention to macro and gradual actions (Rosato, 2023).

At the same time, the selection of circular and sustainable technologies is a fundamental step which, from a systemic perspective, also influences the variables described above. Made in Italy is a context that lends itself well to these transformations and knitwear is a technique that enhances the specificities and skills of the Italian territory. It is one of the historically largest production sectors in Italy, of which there are several districts with extensive technical knowledge that borrows from traditional know-how and relates to a

strong industrial fabric (Conti, 2013). Among the Made in Italy sectors that have evolved from an ancient craftsmanship know-how that Italy has possessed for centuries and that is often due to expertise in the processing of raw materials' (Motta 2019, p. 34), is knitwear, a practice where the link with raw materials is very strong and has led to products that generate an essential link with the world of production (Bertola & Colombi, 2014). This complexity of the knitwear product is one of the reasons that has determined the permanence of knitwear companies in Italy, which, thanks to the small size of the companies involved, have managed to keep production in the territory, avoiding delocalisation to other parts of the world (Motta 2019). These actions highlight how, in acting on the redesign of products where the material is critical, it is essential to bring back innovation for the user who uses it that can improve the quality of life and behavior with and for the product-system.

The practice-based research presented highlights how the potential areas of intervention are diverse and each of them can have different levels of depth, sometimes preparatory to each other, and integrating them all together would lead to a too sudden transformation of the supply chain that would create significant integration difficulties. As Transition Design emphasizes, for interventions to be absorbable there must be the right mindset and predisposition (Irwin, 2015) and, according to the author, this can be done with a gradual transformation time.

7. Conclusion

The article presented a practice-based research to identify possible strategies that, starting from the individual components, lead to the systemic redesign of a product, particularly in the upholstery sector. This was carried out through the use of a methodology being experimented by the author, which envisages the integration of anticipation and transition practices with those typical of circular design in order to identify what the design strategies might be to gradually make companies and the production territory absorb circular innovation in a transition perspective. The research was carried out by choosing the territory of the Made in Italy companies as a context which, due to its characteristics, skills and ability to absorb innovation, constitutes a terrain open to these practices and considering it suitable for metabolizing “projects with hybrid practices between conceptual art and complex projects that circumvent the norms of industrial production by challenging their premises and objectives" and where to contaminate knowledge using "the signs and codes of one discipline as leverage to infiltrate the terrain of another discipline” (Quinz, 2020, pp. 301–302). This project highlights what the designer can do first in designing these products and which are the ones to strive for in order to design the sustainable and circular transition in the sector: the selection of circular materials that improve the monomateriality of the components and thus facilitate disassemblability, the choice of technologies that implement circularity and decrease the production of waste already in the pre-consumption phase, a design process that anticipates the product's life cycles and foresees the different lifetimes of use by extending their temporariness as much as possible, and, finally, in all these processes understand how to make the user responsible and aware as well so as to sensitize him/her to his/her active role in the circularity of the product.

CO-DESIGNING A DECARBONISATION ROADMAP FOR THE HUNGARIAN CONSTRUCTION SECTOR. A DESIGN-LED MISSION APPROACH TO STAKEHOLDER ENGAGEMENT: A CASE STUDY.

Daniella Huszár*[a], Eniko Barbarics[b]

a Hungary Green Building Council, Hungary
b Frontira, Hungary
* daniella.hu@gmail.com

DOI: 10.63442/GLQD9520

KEYWORDS | NET ZERO, BUILDING, DECARBONIZATION, ROADMAP, CO-CREATION

ABSTRACT | In line with global climate goals, the decarbonization of the building sector is an urgent matter. The sector is one of the largest CO2 emitters globally, therefore its potential for emission reduction is unparalleled (IPF, 2022). The World Green Building Council (WGBC) is catalysing this process by funding the creation of sectoral-level decarbonization roadmaps. Such country-specific roadmaps set out a long-term vision for reaching net zero by mid-century for the entire industry. The Hungary Green Building Council, a member of the WGBC is currently in the process of co-designing such a roadmap together with the industry. Hungary is bound by law to reach net zero by 2050. Even though the technology for net zero buildings is widely available (Ürge-Vorsatz et al., 2020), currently there is a very low market and policy awareness on this topic (Szalay et al., 2022). The transition requires a systemic approach regarding the complex character of the construction industry made up of coevolving social and technical components (Singh, 2001). The creation of a macro-level roadmap requires the concerted cooperation of many actors, based on clear and consistent principles. Due to the complexity and interdependence of the value chain, coordinated action is challenging. The process is observed methodologically in the framework of practice based action-research. The research builds on the results of the net zero readiness market research done in 2023, where strategic design methods were employed. This paper summarizes the results of the first Cycle of research. It investigates how design-based methods can function in the Hungarian context to build the case for the engagement strategy for the roadmap where the method of mission-oriented innovation is planned to be employed. The secondary research method is qualitative case study analysis to reflect on transitional barriers and how the chosen method can help overcome them (Robson, 2002). The research contributes to developing a broader body of empirical contextual knowledge of transition barriers for an emerging field of inquiry and can inform diagnosis of problem areas in comparable transition contexts.

1. Introduction

In order to meet global environmental targets, the built environment sector also needs to deliver the required emission reductions. The sector is one of the largest CO2 emitters globally, therefore its potential for emission reduction and neutralization is unparalleled (Ürge-Vorsatz et al., 2020; IPF, 2022). Net zero carbon buildings (NZCBs) are recognized as viable solutions in this context (Ohene et al., 2022a, 2022b, 2023; Pan-Pan, 2020; Þórólfsdóttir, 2023).

Regulations and policies play a key role in promoting NZCBs, with governments globally committing to achieving zero carbon emissions between 2030 and 2060. There is also an increase in market demand for sustainable properties, which is a key catalyst behind the growing interest in NZCBs (IPF, 2022; WGBC, 2022). However, the industry's consciousness of the scale of the problem and responsibilities varies across geographies (IPF).

While there is global advocacy for NZCBs, a consensus on precise parameters and requirements remains elusive (Ohene et al., 2022a; Ohene et al., 2022b; Ohene et al., 2023; Pan-Pan, 2020; Þórólfsdóttir, 2023). Even though the technology for reaching NZCBs is considered widely available (Ürge-Vorsatz et al., 2020), the transition requires a systemic approach taking into account the complex character of the construction industry made up of coevolving social and technical components, such as technologies, policies, infrastructures, markets, institutions, and behaviors, construction industry business and organizational models, demand patterns (Singh, 2021). The complexity and interdependence of the value chain make coordinated action for delivering net-zero (NZ) solutions challenging, requiring concerted cooperation among stakeholders based on clear and consistent principles and criteria (Ohene et al., 2022a; Þórólfsdóttir, 2023). To facilitate this process, design-based methods are increasingly applied in the net-zero transition contexts (Bailie et al. 2023; Wachsmuth et al., 2023; Corr et al., 2023).

In line with the above developments, the Hungarian construction sector also needs to prepare for the transformation and achieve the necessary emission reductions. Even though Hungary is among the few countries obliged by law to reach NZ by mid-century (Act XLIV of 2020), there is a very low market and policy-maker awareness of NZCBs (Szalay et al., 2022).

The Hungary Green Building Council (HuGBC), acting as a business intermediary organization, holds a significant role in uniting stakeholders to raise awareness of NZCBs. It currently represents 156 individual and company members across various segments of the construction sector (see Figure 1 in Appendix). HuGBC leverages its membership in the World Green Building Council (WGBC), a globally operating NGO and a thought leader in the area, to access international best practices and recent developments in the field. The organization currently participates in two WGBC programs aiming to build industry capacity for the NZ transition through the creation of decarburization roadmaps - the *Advancing Net Zero* (ANZ) project at the company level and the *BuildingLife* project at the sectoral level (WGBC, n.d.a, n.d.b).

The ANZ project aims for global buildings to achieve net-zero carbon from 2030 to 2050. It develops tools and programs, including the *Net Zero Carbon Buildings Commitment* (the Commitment), challenging industries to decarbonize building operations by 2030. Signatories of the Commitment accelerate market transformation by acting ahead of mainstream players. Hungary joined the ANZ program in 2022 to advocate for its goals locally (WGBC, n.d.a).

In addition to engaging individual actors, many Green Building Councils (GBCs) commit to developing sectoral strategies for decarbonizing the built environment (Þórólfsdóttir, 2023). These roadmaps outline a vision for achieving NZ by mid-century, incorporating stakeholder action plans. So far, thirty-one countries, including ten in Europe, have published such roadmaps. The *BuildingLife* project harmonizes this process in Europe, and HuGBC is currently involved in the roadmap co-creation with its members and wider industry stakeholders.

In order to explore how to engage its members towards the targets of the ANZ project, HuGBC ran a Net Zero Readiness Stakeholder Research. It aimed to explore barriers and enablers towards the transition to NZCBs. The research also employed design-based methods to develop the engagement strategy and to test a potential tool for engagement. The process was observed in the frame of an action research cycle. The results form the basis of the engagement strategy for the sectoral decarbonization roadmap. This paper summarizes the results of the first cycle and gives an insight into a work in progress with regards to the second.

2. Theoretical Background and Literature Review

The paper frames the decarbonization of the built environment as a transition within a socio-technical regime, encompassing established systems of technologies, building practices, regulations, and actors shaping the design, construction, and maintenance of buildings and infrastructure (Singh, 2001). Transitions are primarily place-based phenomenon, embedded into specific political, institutional, regulatory, and economic settings (Ehnert et al., 2018). It can be conceptually analyzed through the lens of sustainability transition studies and system innovations (Elzen et al., 2004; Markard et al., 2012; Markard et al., 2020).

This view of transition stresses the importance of a multi-level and multi-stakeholder perspective and entails the involvement of actors not traditionally tackled in innovation management and policy (Geels, 2011). It places great emphasis on the collaboration among diverse entities, including state policymakers, regulatory agencies, local authorities, NGOs, citizen groups, private companies, industry organizations, special interest groups, or independent individuals (Kemp et al., 1998 as cited in Elzen et al., 2004). While emphasizing the state's crucial role in driving systemic change, innovation in this context is positioned as a collaborative effort, giving significant importance to bottom-up approaches (Foulds et al., 2023). They act as intermediaries with the capacity of mobilizing communities, facilitating knowledge creation and transfer, fostering civic innovation and allowing room for experimentation (Jütting et al., 2020, Foulds et al., 2023). As such they have the capacity to generate impact on the policy level (Elzen et al., 2004, p. 80.). However, the role of the agency of various actor groups during transition processes, including the strategies of firms has been relatively overlooked in the existing literature on socio-technical transitions (Farla et al., 2012; Markard and Truffer, 2008a as cited in Markard et al., 2012).

Design approaches (e.g. service design, strategic design) are considered as adequate methods in the context of sustainability transitions and systemic change (Jütting, 2020; Whichler, 2018). They can facilitate collaboration, integrate knowledge from various disciplines, help frame challenges and develop clear visions and roadmaps for breaking down missions into actionable steps (Le Masson et al., 2017; Magistretti et al., 2021 as cited in Rabello, 2023). Within the context of sustainability transitions, transition design is becoming a separate and emerging field of inquiry (Gaziulusoy and Ryan, 2017; Gaziulusoy and Öztekin, 2019; Gaziulusoy, 2019).

Research on the relationship between innovation and design ecosystems at the country or regional level is limited (Whicher, 2018). While several studies explore design methodologies in the context of sustainability transitions (e.g. energy, circular economy, transportation) (Glowacki, 2020; Whicher, 2018; Mullaly et al., 2022; Cohen et al., 2023; Baile et al., 2023; Wachsmuth et al., 2023; Gaziulusoy and Öztekin, 2019; Silver, 2022; Auvinen, 2023; Corr et al.), research on the role of design-based methods in building decarbonization is limited and primarily concentrates on technological aspects (Moren-Rangel et al., 2022) or other geographical contexts (Glowacki, 2020).

Most studies in the context of building decarbonization concentrate on various types of technological and socio-political barriers related to the performance and market uptake of NZCBs (Ohene et al., 2022a, 2022b, 2023; Pan-Pan, 2020; Þórólfsdóttir, 2023). Little empirical research exists concerning emerging markets (Ohene et al., 2023). In the Hungarian case of NZCBs, studies have focused on technical characteristics (Ürge-

Vorsatz et al., 2020; Szalay et al., 2018), but the wider range of NZCBs barriers, including policy, political, and cooperative ones, remains underexplored. Some recent studies have examined sustainability transition with a focus on the urban level (Siko-Tomay et al.; 2023; Óvári et al.; 2023; Ehnert et al., 2023) but with limited focus on design-led stakeholder engagement processes (Varjó et al., 2023) and/or the role of NGOs (Neulinger et al., 2023), especially in the context of the building sector. No research was found specifically focusing on stakeholder connectivity in the design of building sector decarbonization within Hungary.

3. Methodology and Research Questions

Considering the above research gaps, the present research aims to apply a multi-stakeholder perspective in order to develop a qualitative case study, informed by action and stakeholder research to answer the following questions:

1. What are the barriers that constrain the transition to NZCBs in Hungary?
2. How can HuGBC engage its members towards the ANZ Commitment and to develop company-level decarbonization roadmaps?
3. How do design-based methods work in this particular geographic context of building decarbonization in helping stakeholder engagement and collaboration?
4. Are design-based methods suitable for the sectoral level roadmap co-creation and what lessons learned from the stakeholder research (Cycle 1) can be utilized in that process?

The research used mixed methods, both quantitative and qualitative.

The primary method used in the study is collaborative inquiry in the tradition of action research (AR) (Reason and Bradbury, 2001). AR falls is a form for engaged scholarship and suits well for studying sustainability transitions. According to the theorist who originated the method, change is facilitated more by identifying and removing barriers than by reinforcing enablers (Coghlan and Miller, 2001). The best way of understanding the system is to change it, and accordingly, AR is increasingly used in system change and sustainability transition contexts (Bartels et al., 2020).

The first cycle of the research was the Net Zero Readiness Stakeholder Research aiming to engage companies to produce company-level decarbonization roadmaps. The aim was to assess their level of awareness and practices on building decarbonization, and their readiness to join the ANZ Commitment. It also aimed to inform the development of an engagement strategy and to explore the role HuGBC can play in accelerating change. The research also aimed to inform the actual state of the sector from the NZ transition perspective.

The lessons from the first cycle served as the basis for the second, the engagement plan for the sectoral level roadmap and the roadmap itself.

Data is derived from the quantitative and qualitative phases of the stakeholder research as detailed below and is supplemented by observational data obtained through participant observation by the authors practitioners throughout the process. This is extended by notes and observations from the design team based on the conviction that participant observation produces significant insights when combined with other primary and secondary data (Lofland et al., 2006; Brannan and Oultram, 2012 as cited in Rabello et al., 2023).

The secondary research method was a qualitative case study analysis of the transitional barriers based on in-depth information from a small number of individuals (Robson, 2002).

The research adopted the organizational level as the unit of stakeholder analysis (Avelino et al., 2016 as cited in Argyriou, 2023). A heterogeneous group of stakeholders from the policy, market, industry, and third sector were approached.

3.1. Cycle 1: Net Zero Readiness Stakeholder Research

The first cycle was composed of 2 phases. The first part was a stakeholder research conducted by HuGBC by two researchers (program manager, and sustainability consultant). This then informed the design research phase run in cooperation with a service design agency (second phase) where two service designers joined the team.

Research among HuGBC Members

In the first phase stakeholder research among HuGBC members was conducted.

It started with a literature review that culminated in the publication of a position paper entitled *Zero Carbon Guideline* (Beleznay et al., 2023). This paper aimed to provide a baseline understanding of NZCBs synthesizing international knowledge (certification schemes, regulations and standards and developed an NZ definition suitable for the Hungarian context).

Then a non-representative online questionnaire was circulated among members of the organization to assess their attitudes and practices vis á vis the papers' findings. Among 136 members 60 responses were collected (Figure 2 in the Appendix).

The results of the questionnaire set the scene for the semi-structured interviews (N = 14) (Figure 6 in Appendix). The aim was to select frontrunners in NZCBs with decision-maker capacity, representing a wide range of actors across the industry including non-members (from policy and related industry fields). Interview participants were asked to describe enablers and barriers and potential solutions and potential first steps to reach the NZCBs sector by 2050.

Phase 2. Inclusion of Design-Based Methods in the Stakeholder Research

The results of the first phase informed the commissioning of a service design agency with the aim to inform the development of the engagement strategy. Two service designers were assigned to the project. They were also tasked to be external eyes, "critical friends" in AR terms in the research.

This phase also aimed to lay the groundwork for meaningful interactions, align stakeholders and gauge their engagement levels to foster a conducive atmosphere for co-creation.

The second phase was composed of 3 steps:

Step 1. Define: two workshops were organized to define the objectives for the process and mapping stakeholders in a Power Interest Matrix. The agency also looked at the interviews and mapped the results into a COM-B model (see below).

Step 2. Co-creation workshops: to test a potential engagement tool, named as a "roadmap template". It was conceived as a strategic gap analysis framework that took the steps and objectives set in the ANZ Commitment as a benchmark and looked at companies' current status, gaps and potential next steps towards it. Stakeholders were grouped as property owners and tenants and could provide feedback on this prototype tool during the workshops (see Figure 7 in the Appendix).

Step 3. Stakeholder workshops: running parallel to Step 2. This third step aimed to look at collaboration opportunities between stakeholders and test a future-oriented design game called Sustainable Future Game (participants in Figure 8 in the Appendix).

Justification for the Design-Based Tools Selected for Phase 2

The COM-B Behavior Change Framework

The COM-B behavior change model (Michie et al., 2011) was used as a key analytical tool in the second phase. It comprises Capability, Opportunity, and Motivation, providing a comprehensive framework to understand and analyze behavior. This model was applied to systematically assess stakeholder's attitudes towards the ANZ objectives. By doing so, valuable insights into the dynamics of behavioral patterns were gained, informing strategies for positive changes aligned with ANZ objectives. Interview transcriptions were meticulously coded to align with COM-B themes, forming the foundation for guiding creative activities in subsequent workshops. This coding system ensured systematic examination and analysis of all data through the COM-B model, offering a cohesive understanding of stakeholder dynamics towards the ANZ initiative.

Integrating Future Scenarios and Gaming for Stakeholder Engagement

Games, traditionally used in urban planning for deliberation and scenario testing (Alexander, 1979), took on a novel role within the context of the research. Their integration with future thinking, crucial for shaping sustainable futures, presented a unique opportunity for engagement. Designed for purposes beyond play, games can become powerful tools for exploring speculative futures, encouraging participants to break from routine thinking and generate desirable alternatives (Rupprecht et al., 2020). The game was adapted to the built environment context based on two game models (Sustainability Futures Game (Hellon, n.d.) and the Nordic Urban Mobility 2050 Futures Game (Nordic Innovation, n.d.)). The resulting game focused on crafting built environment scenarios for 2050, fostering discussions on future states and serving as a basis for prototypical projects. The game sessions aimed to facilitate collaborative exploration, dissolve information silos, and build trust through engagement based on agreed principles (Ampatzidou et al., 2022).

4. Analysis of the Results of Cycle 1

4.1 Drivers and Barriers of Building Decarbonization and the Role of HuGBC

There are 175 signatories of the ANZ commitment on a global level (WGBCb, 2023). Besides companies, public authorities, cities, and regions can also join. Two of the corporate signatories have an outlet in Hungary: a technology company and a building manufacturer, both members of HuGBC. The initial hypothesis of the research was that members of HuGBC wouldn't be ready to sign the *Commitment* due to a lack of capabilities and motivation as it represents a very advanced trajectory within the market of voluntary schemes in building decarbonization. This assumption was based on the literature review and the initial interviews with regional GBCs (Poland, Croatia) and was confirmed by the stakeholder research.

The research has shown that 80% of respondents to the online questionnaire have already taken steps to decarbonize their buildings (for respondents' composition see Figure 2 in Appendix). Reducing energy demand is the most common decarbonization objective, followed by mechanical systems and building automation, strategy development, improvement of the building envelope improvement and the use of on-site renewable energy (Figure 3). Circular resource use and reducing the embodied carbon impact of built-in materials are among the most important and most challenging topics (see Figure 4).

According to respondents' commitment to climate change mitigation and associated branding/PR objectives are the primary drivers (Figure 5), while barriers include high costs, lack of customer expectations and lack of an expert base and decision support strategy. From interviews, it turned out, however, that efforts to reduce operational carbon emissions are driven by the energy crisis.
Global companies with Hungarian subsidiaries lead the way in building decarbonization. But even those companies face challenges regarding the delivery of NZCBs. Even if companies in the construction sector do have a sustainability strategy this does not include determining a pathway on how to reach NZCBs and portfolio by 2030/2050. The high costs and skills requirements to design and deliver NZCBs and the low

demand from clients and investors make the situation more difficult. This is also hampered by a data challenge (lack of available country-specific databases, and lack of transparency of data sources).

Most actors expect an increase in climate ambitions from regulatory change. In this regard the EU Taxonomy (EU, 2020), the Corporate Social Responsibility Directive (EU, 2022) and the current review of the EPBD (EC, 2022) represent opportunities, however, “there is a lot of fumbling in the dark about the concrete effect of these regulations”, as one interviewee put it.

Three key thematic areas emerged from the research where HuGBC should concentrate its efforts.

The first is the lack of appropriate data and measurement systems. Only 30% of respondents to the questionnaire use energy and CO2 emissions records. Moreover, the interviews showed that even frontrunners struggle with this challenge, which also relates to the organizational challenge of developing the right data strategy and new internal processes. This currently hinders commitment as if companies want to set realistic targets, first, they need to know where they currently stand. This could be accelerated with a country-specific scope and target.

The second is education and awareness-raising where HuGBC could step in more actively. 60% of respondents mentioned the need for education on NZCBs. Lack of knowledge on whole-life carbon assessment and methods for embodied carbon measurements are the most sought-after knowledge. This simultaneously means an internal organizational challenge (training need for employees) and the educative role companies might have within their supply chain. Respondents expect "concrete guidelines, case studies, life-cycle analyses based on local and regional data, and best practices to reduce embodied carbon." According to the research, educational activity should focus on the data challenge, internal training revealing climate risks, and the links between ESG compliance and building decarbonization.

The third challenge is the need for new kinds of collaborations based on the culture of openness and transparency that allows for the sharing of best practices. All stakeholders agreed that to achieve the desired carbon-free vision, partnerships and cooperation must be strengthened. The research showed that companies are in the competing phase but to achieve systemic change there is a need to move towards a non-competitive cooperation (Beleznay et al., 2023).

Based on the COM-B analysis, a lack of customer expectations and financial resources can be considered as a lack of opportunity and motivation, however, they are also capability issues, which HuGBC can tackle with an appropriate training portfolio and as a platform of good practices. Apart from the professional service provider stakeholder group, there is no difference between the stakeholders in this regard.

However, to promote corporate engagement, new ways of segmentation are also needed; In the case of front runners (mostly those following a parent company strategy), it is not fear or motivation that needs to be addressed. They make committed and conscious decisions. Their challenge is the international transformation process and a lack of knowledge and data measurement procedures. On the other hand, companies at the beginning of the decarbonization journey have fewer resources but more freedom to adapt their processes. Therefore, HuGBC can have a greater role and impact in facilitating corporate engagement (Figure 9 in Appendix).

The research identified three key players and their challenges HuGBC should focus its activities on:

1. Users as drivers – Users currently lack the knowledge and often the need to create a low-carbon environment. Even with a strong will to change behavior is not clear.
2. Real estate developers as innovators – The transformation processes in large companies are slow and influenced by many factors simultaneously (strategy creation, changing of internal processes, education).
3. State as regulator – The right incentive system, and measurement-based ratings are essential drivers for transformation, which requires increased advocacy efforts.

The research identified three other target groups:

1. New generation – To meet the needs of building users and related students. The office environment and energy use context is a good opportunity for community engagement and partnership building to support responsible use patterns.
2. Utility companies and financial institutions – are less integrated parts of the construction ecosystem, but as both their interest and impact is high, their inclusion is pivotal in the roadmap creation process.
3. Start-ups – integrating start-ups and small businesses experimenting with technological innovation, and new business models into the ecosystem.

These lessons are also consistent with the directions of the ongoing global reassessment of the ANZ project, which is currently being run in consultation with WGBC members and key local industry players.

4.2 The Potential for Design-Based Methods in Sparking Stakeholder Engagement Towards Decarbonization Objectives

In assessing the evaluation of design methods within cycle one, it is essential to establish clear criteria considering aspects such as effectiveness, usability, inclusivity, and adaptability. These criteria serve as guiding parameters to systematically evaluate the success and potential challenges associated with the implementation of design methodologies.

Effectiveness: The tools introduced strategic decision-making methodologies, extending beyond the ANZ project. For instance, they provided insights into which stakeholders would be strategic partners worth strengthening ties with. Interviews and the availability of data unequivocally revealed future ANZ ambassadors. Furthermore, during the future games session, previously less visible players in the ANZ context, such as small manufacturers, were effectively engaged.

Challenges arose from the intention to align with the global ANZ Commitment framework. Interviews highlighted limitations in the roadmap template, affecting its ability to address distinct organizational issues. This led to adjustments in the design of co-creation workshops. While awareness increased, workshops underscored the ongoing need for refinement. This is consistent with the finding that context-specific conditions should be taken into account when replicating and transferring solutions (Foulds et al., 2023). On the other hand, new opportunities have been identified through workshops.

Usability: the games and co-creation sessions successfully reinforced participants' belief in the necessity of closer collaboration. These methods achieved their goal as far as they motivated and engaged participants expressing commitment to initiating changes in collaboration frameworks and promoting more active knowledge-sharing. However, within the ANZ context, which typically emphasizes data-driven methodologies and organizational inertia, some participants found tools like games challenging. This aligns with usability concerns raised in various studies, questioning the tangible results of games. Despite their reported benefits – in providing a comprehensive understanding of complex systems, fostering idea

generation, and a 'fun way' of learning –, challenges in adoption persist. The limited application of serious games and gamified activities in urban planning can be traced back to apprehensions about their immediate, tangible impact (Vervoort, 2022).

Inclusivity: HuGBC engaged with 102 stakeholders, extending the reach of ANZ initiatives beyond the construction sector. While utility companies and financial institutions were included, the implementation of inclusivity remained partial. Inherent limitations, common to NGOs, led to engagement within existing motivated members. However, even among this group, critical voices emerged, emphasizing the need for ongoing collaborative discussions. Critical stakeholders like regulatory bodies and building occupants (e.g. representatives of multinational companies within the service sector) were absent from the engagement. However, the tools highlighted the importance of their future involvement. These initial steps mark the beginning; a fuller systemic inclusion is yet to unfold in the framework of the sectoral roadmap creation.

Adaptability: Cooperation between the research and design team faced obstacles because of several reasons. The abstract and experimental nature of design methods was challenging, particularly for someone with an engineering background lacking prior exposure to these methods, and accustomed to different mindsets and work environments. On the other hand, designers primarily focused on digital products and services found it difficult to navigate the terminology within the sustainability domain, and the lack of specific NZ knowledge made the adaptation of design methods challenging. These difficulties highlight the need for new skills for transition designers (Gaziulusoy, 2018).

Additionally, adaptability plays a crucial role in navigating stakeholder engagement's complex landscape. In a strategic move to enhance effectiveness and scalability, we have introduced advocacy roles within the ecosystem. The identification of advocates by using these methods sets the foundation for transformative advancements, ensuring continuous evolution and widespread impact. The sectoral roadmap stands as a pivotal opportunity in leveraging the identified advocates, paving the way for smoother scalability and extended influence.

4.3 Participant Engagement and Satisfaction Perspective

Stakeholder engagement, as an integral aspect of co-creation, has been meticulously addressed throughout our process, aligning with the principles outlined by Morello and Mahmoud (2018a). Recognizing the importance of a comprehensive understanding of involved stakeholders, we implemented inclusive and tailored approaches at various stages, employing a range of tools to enhance engagement. One noteworthy outcome, drawn from NGO perspectives, identified a pivotal leverage point from COM-B analysis - the deficiency in capability overshadowing motivation. This insight is instrumental for evaluating engagement and satisfaction since it precisely highlights the interventions required. The research elucidated that strengthening collaborations along the knowledge-sharing and value chain is a primary aspiration among stakeholders. The design methods also yielded promising results in drawing in easily accessible yet influential participants. Additionally, participants spontaneously extended assistance to one another during workshops, surpassing prescribed tasks, and revealing a self-driven commitment to collective progress.

Sessions encouraged participants to contemplate their individual sense of responsibility, envision alternative futures, and connect these to their real-world context played a crucial role in enhancing a sense of agency among participants. During the game sessions, participant feedback revealed unexpected opportunities for organizational-level use, emphasizing the transformative impact of the methods and their potential to foster widespread inclusion within organizations. Our experience confirmed that games could indeed play a role in reshaping decision-making models and fostering transformative change at both institutional and community levels with their “all learning together” approach (Bradley et al., 2022, based on Emerson and Nabatchi, 2015). While the unexpected organizational impact is encouraging, challenges faced by participants, such as difficulties detaching from negative scenarios and a tendency towards pessimism, show the need for further refinement.

5. Plans for Cycle 2: Sectoral Decarbonization Roadmap

5.1 Building the Case for Mission-Oriented Innovation

The co-design process of the sectoral decarbonization roadmap has the potential to engage stakeholders beyond HuGBC membership and to make it a truly co-creative endeavor, where the process itself plays as important a role as the end product. We envision the creation of a living document, constantly updated, in which all participants take ownership of the actions and collectively drive the agenda sparking further collaborations.

The results of Cycle 1 inform the planning of the engagement process. The results overall justified the use of design-based methods in our context.

All decarbonization roadmaps produced in the *BuildingLife* projects so far relied on stakeholder engagement but to varying degrees and in different methods. A traditional approach is to set up a steering group composed of key industry actors and sub-working groups segmented by types of actors (e.g. developers, construction companies, policy actors, NGOs) or building types (e.g. new built, retrofit, infrastructure, commercial, public buildings).

In our case we plan to extend this method with the inclusion of the mission-oriented innovation (MOI) approach, which has emerged as a robust method for systemic innovation, aligning stakeholders towards sustainability goals (Jütting, 2020; Bellinson 2021). It fits into our context as it has the potential of breaking down grand challenges (like climate change) into missions (e.g. zero emissions building stock by 2050) and further down into actionable projects in a multi-sectoral way. The method is also being employed in the built environment decarbonisation context at the city level (Bellinson). It will be the first time an NGO would employ the method both in the context of the *BuildingLife* project and in Hungary. This intention is justified by recent academic research where some argue that the growing interest in MOI policy, could result in NGOs taking up this method, and stresses the necessity to enhance their capacities in this regard (Jütting).

The underlying method of MOI is strategic design, which is detailed in a practical guidebook that serves as our starting point (Hill, 2022). The engagement process starts in March, the below table details the plan for stakeholder engagement.

Table 1. Stakeholder engagement plan for the sectoral decarbonization roadmap.

Activity	Justification	Output	Deadline
Literature review (12 roadmaps and academic literature)	To inform the roadmap development and the workshops	Drivers, barriers, stakeholder action plans from the 12 European roadmaps	February
Steering Group (SG) composed of 10 HuGBC members	Results of Cycle 1 mapping will inform the selection, inclusion of identified change agents	Engaged and active SG overseeing the project	February
4 SG meetings	SG work together to oversee the roadmap development and the engagement	Roadmap text	May
8 working groups (WG) per segment	To produce the action plans by segments. Segmented by 8 segments (Figure 10 in Appendix) informed by motivated actors	8 working groups per segment	February
min. 8 Working Group meetings	To produce the action plans by segments		
3 Actors Workshop	to produce a system map which can be considered as a real-time snapshot of the system (i.e. system in the room, Hill, 2022)	System maps that serves the basis of the action/mission planning, candidate mission themes	March - April
SG Design Workshop I.	to synthesize results and reframe them based on angles, levers, layers, levels (Hill, 2022)	candidate mission themes	April
3 Design Workshops	allowing for selected WGs to work in diverse setups, content is informed by the reframing process and Cycle 1 inclusion of scenario planning, visual, narrative techniques	Candidate mission themes, prototype projects, potential demonstrators	May
SG Design Workshop II.	Bringing it all together, roadmap drafting session	Refined mission themes, prototype projects, demonstrators	May

There are several challenges that can be anticipated in the process that should be addressed.

Both Cycle 1 results and the MOI method calls for greater inclusion of policy actors, in order to generate systemic impact, therefore advocacy efforts will have to be increased in this regard. This is also the direction of the current revision of the global ANZ project.

Operationalization of theoretical frameworks into practical actions may present challenges. To resonate with diverse local actors and their unique perspectives, concepts related to decarbonization must be made tangible in practice. Achieving this requires a multilateral dialogue process to break down these concepts, fostering ownership and understanding among participants.

Carbon modelling that will be produced as part of the roadmap introduces another layer of complexity, as finding equilibrium between the “desirable” and “feasible” might involve ongoing negotiation (Wachsmuth, 2023). Tensions may arise between modelled pathways and real-world situations. Balancing aspirations with practical implementation is essential in this context.

The proposed trajectory raises the potential risk of "workshop fatigue" among participants. Successful implementation hinges on strong leadership and commitment from the Steering Group and ultimately from other participants. The advocates identified in Cycle I. are expected to become catalysts by acting as ambassadors and driving the initiative forward.

Additionally, establishing a robust monitoring and evaluation process for the roadmap to become a living document, addressing a current challenge faced by other GBCs, is imperative for tracking progress and ensuring accountability.

6. Future Research and Extension of the Paper

The present paper could be extended with the results and insights gained during the Cycle 2, which is still ongoing. This would enable us to reflect on the design-based and MOI methods based on a larger sample in terms of actors engaged, workshop conducted.

Framing the results as a qualitative case study analysis guided by stakeholder theory and cooperative environmental governance perspectives, as a future research extension, could explore the wider political-economic context of the expected NZ transition, and look at the barriers (both the technical and non-technical) that might constrain the transition process in a more derailed and potentially comparative way. There is limited understanding of these barriers, but addressing them can help to catalyze the system-level change that is required for NZ vision. Such an analysis could inform the practice of professionals within the building industry by providing a context for understanding the obstacles to transition and their impact on systemic change. It is expected that if transition plans are to be successful and inclusive, it is assumed that barriers must be overcome beyond the NZ and construction sector focus.

Such an analysis of the Hungarian context contributes to developing a broader body of empirical knowledge of transition barriers for an emerging field of inquiry, namely net zero transitions and MOI. Further research can also inform the diagnosis of problem areas in comparable transition contexts.

7. Conclusion

The research revealed key, context-specific barriers hindering the transition to NZCBs in Hungary. These barriers include limited awareness, financial constraints, and regulatory uncertainties among HuGBC members. These insights underline the need for tailored engagement strategies that address these specific challenges for which the sectoral roadmap gives an opportunity. A common understanding of the NZCBs objectives for achieving greater alignment, will be helped through the roadmap creation process.

Efforts to engage HuGBC members towards the ANZ Commitment and the development of company- and sectoral-level decarbonization roadmaps are still underway. Transparency and openness, as revealed in expert interviews, are pivotal for overcoming conventional ways of thinking and acting. It requires all participants to critically reflect on their current roles and associated behavioral patterns. Businesses in this regard need to take on increased responsibility, extending beyond their individual companies to encompass their roles in supply chains and society at large. HuGBC has limited capacity and capability in changing a firm's motivation, however with carefully crafted engagement processes, could step into this arena in three key areas. By facilitating sharing of best practices, developing educational activities and promoting increased coherence in addressing the data challenge. For this the carbon-modelling for the sectoral roadmap gives an opportunity. Advocacy efforts for clearer regulatory frameworks should also be

increased. Special emphasis should be placed on actively recruiting and retaining particular groups, such as policymakers and businesses outside the existing HuGBC membership.

Design-based methods have proven effective in this context. Co-creation workshops and game experiments highlighted the adaptability of these methods, showcasing their effectiveness in fostering stakeholder engagement, creative problem-solving, and a sense of ownership.

The study finds that design-based methods are indeed suitable for the collaborative development of sectoral-level roadmaps. Lessons learned from the stakeholder research, can be effectively utilized in this process. The multifaceted approach, incorporating design-based methods, emerges as a valuable strategy for the roadmap. For this the method of mission-oriented innovation is chosen and justified, which incorporates design-methods while providing an effective framework in addressing grand systemic challenges, such as building decarbonization. Breaking away from conventional ways of thinking and doing takes a lot of effort and time. The engagement process itself requires significant motivation from participants who - partly with the help of these methods - should recognize the personal, normative, or moral advantages linked to their engagement.

KEYWORDS | NATURAL HISTORY MUSEUM, DESIGN RESEARCH LAB, ECO-SOCIAL DESIGN, CLIMATE ACTION, SPECULATIVE DESIGN

ABSTRACT | This abstract delves into the overlooked realm of design practices within the context of the evolving roles of natural history museums in times of social and ecological crisis.

Natural History Museums (NHMs) have evolved from mere cabinets of curiosities to vital institutions for interdisciplinary research and education. However, faced with the urgent challenges of the climate crisis, NHMs must question their traditional exhibition spaces and their anthropocentric roles against the backdrop of biodiversity loss, invasive species and changing climates.

This study explores NHMs' complex historical roots and their need to overcome oppressive, colonial, and anthropocentric perspectives on nature. It is considering the design discipline as a stakeholder in reshaping NHMs for climate action and formulates the hypothetical question: "What if NHMs are understood as Design Research Labs for eco-social transition?" This inquiry lays the groundwork for speculative scenarios that explore the transformative potential of design and NHMs. The paper advocates for NHMs to embrace a pluriverse and more-than-human understanding of nature and become playgrounds for co-creative socio-ecological transitions. The study uses the Museum für Naturkunde Berlin as an illustrative example, highlighting innovative initiatives and collaborations but acknowledging challenges in translating visions into reality.
A central focus is on redefining NHMs as places for design-driven democracy, emphasizing the role of design in socio-ecological transformations. The paper discusses the potentials of design for sustainable transitions, highlighting current developments and the role of Design Research Labs as interfaces for NHMs. The study concludes by calling for NHMs to leverage the untapped potential of Design Research Labs, offering a pathway for NHMs to become catalysts for eco-social transitions.

1. Introduction: Rethinking Natural History Museums Through Design Research

Natural History Museums (NHMs) have undergone a remarkable evolution in the past century. Once mere cabinets of curiosities, they have transformed into essential public institutions for interdisciplinary research and educational innovation. Many Natural History Museums were established in the late 19th century – counting more than 600 institutions worldwide until today. Their purpose now extends beyond showcasing the wonders and curiosities of the natural world, dedicated to studying, preserving, and digitizing our planet's biodiversity. However, with the escalating climate crisis, these institutions must rethink their future roles, transitioning from traditional exhibition spaces to interdisciplinary hubs of knowledge transfer, collaborative learning, responsible innovation, community engagement, public debates, and policymaking (Dorfman, 2018; Bakker et al., 2020; Carnall et al., 2013). Their natural history collections give an idea about the vast biodiversity of this planet, telling unlimited stories of resilience, failure, and creative solutions to environmental challenges. Their well-curated exhibitions halls, showcasing the vast diversity of planetary life evoke great enthusiasm until today and become crucial places where people consciously engage with the unknown and unimaginable. Yet behind this lies a partly questionable past and thought patterns that need to be reconsidered.

Especially in light of pressing societal and ecological issues, such as mass extinction, biodiversity loss, species migration, changing climate, rising sea levels, food insecurities and zoonotic pandemics, there is a need for NHMs to question their complex historical roots entangled with oppressive, racist, colonial pasts and the dissemination of human-centred and Western perspectives on nature. They were a fertile ground for narrations, in which (western) humans were perceived as the dominant species. Paradoxically, Natural History Museums are the origin of an understanding of nature that is responsible for many socio-ecological challenges, for which they are now attempting to generate knowledge and solutions.

So, how can they overcome their pasts and pave the way towards a transition to pluriverse and more-than-human understandings of nature and move beyond static exhibition concepts while evolving into playgrounds for co-creative socio-ecological transitions?

This study is a thought experiment that takes a new and unforeseen perspective on Natural History Museums from the design research perspective. In this case, the design discipline is considered as an important stakeholder to shape societal and ecological transformations while including perspectives and needs of different stakeholders and communities – described as “eco-social transitions”. This highlights the systemic role of design that is negotiated against the backdrop of current socio-ecological challenges and is expanded through approaches such as Transition Design (Irwin, 2015), Eco-Social Design (Krois, 2020) or Pluriversal Design (Escobar, 2017). These approaches distinguish themselves by not aiming to develop ready-made solutions, but by using design to raise ecological and socially relevant questions. Furthermore, design research is understood as a practice-based, interdisciplinary, and participatory mode of knowledge transfer that extends beyond academic thinking (Mareis, 2011). This becomes clear through the rise of “Design Research Labs” that function as institutional hubs for knowledge production and exchange, bridging design, science, society, politics, and the economy. If the design discipline has the power to shape transitions on systemic levels, then it is worth exploring these potentials for the urgent transformation of Natural History Museums. Against this backdrop, this study poses the explorative question: "What if NHMs are understood as Design Research Labs for eco-social transition?" This inquiry serves as a foundation for exploring the potential roles of the design discipline in reshaping NHMs.

2. Challenges of Natural History Museums

Despite their importance for an ecological transition, Natural History Museums are currently facing a broad range of challenges on different levels: from dealing with their colonial pasts, anthropocentric understandings of nature, digitalization efforts, to the race against time to preserve and study biodiversity that is disappearing before it is discovered. These hurdles are the starting point of this exploratory study on the potential of design for NHMs and are summarised below.

2.1 Overcoming Colonial Pasts

NHMs grapple with their colonial past, perpetuating a Western-centric understanding of nature that compartmentalizes species within taxonomic groups, reinforcing hierarchical (Western) human evolutionary perspectives. NHMs have long been associated with racism and colonialism, as many of their collections were amassed during the height of European imperialism (Ashby & Machin, 2021; Das & Lowe, 2018; Sheets-Pyenson, 1987). This colonial legacy has led to criticisms of NHMs for their role in the exploitation and erasure of indigenous peoples and cultures, and for perpetuating a Eurocentric view of this planet. Recently, NHMs have begun to grapple with their colonial pasts in various ways. Some NHMs have acknowledged their role in colonialism and have developed action plans to decolonize their collections, exhibitions, and practices, such as the Musée des Confluence in Lyon (Green, 2019) or the Museum für Naturkunde in Berlin (Kaiser et al., 2023). Decolonial museum practices can include returning artefacts to their rightful owners or communities, employing more diverse staff and leadership, including more Indigenous and people of colour, encouraging visitors to reflect on the historical and ongoing legacies of colonialism, or providing more context for the ways in which collections were acquired and showcasing the impacts of colonialism on the peoples and cultures represented in the collections (Van Broekhoven, 2019). While the number of publications about decolonialisation in NHMs are rising, it can be observed that action plans for decolonizing Natural History Museums are not yet an integral part of current exhibitions and are seldomly part of public engagement activities.

To summarise, a look into the current exhibitions of many NHMs still perpetuates in large parts a western-centric perspective on natural history through traditional exhibition concepts that have merely unchanged since the past decade, for instance the Mineral Gallery at the Natural History Museum in London (see images below).

Dealing with the colonial pasts of NHMs requires a commitment to ongoing dialogue, reflection, and action. It also requires a recognition that colonialism is not only a thing of the past, but an ongoing and present reality that continues to shape the world and the relationships between people and institutions.

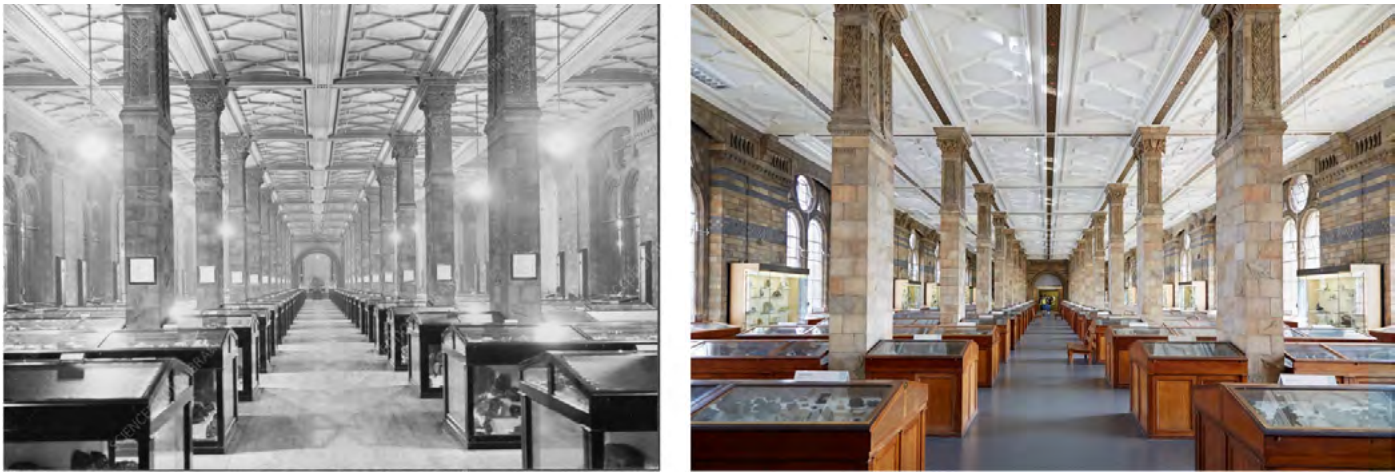

Figure 1. Mineral Gallery in London unchanged since 1881 (1923 and today).

2.2 Rethinking Anthropocentric Understandings of Nature

Natural History Museums (NHMs) have played an important role in gaining knowledge about the interconnectedness of nature, by promoting and interpreting evolutionary theory and Post-Darwinism through their collections, exhibitions, and research programs (Sterling, 2017; Winker, 2004). NHMs have helped establish evolutionary theory as a cornerstone of modern biology and emphasized the interconnectedness of all living things, challenging a human-centred view of nature and establishing a more holistic and integrated understanding of the natural world (Cameron, 2015).

However, NHMs also have a responsibility to address the ways in which their exhibitions and research programs may perpetuate a critically human-dominated and Western-centric understanding of nature. This includes recognizing the impact of the Linnaean system of classification, which has reinforced a human-centred view of nature, reflected Western cultural and philosophical assumptions, and been used to justify the exploitation and domination of non-human organisms and the natural world.

In the context of ecological crisis, it is particularly important for NHMs to take a critical approach to their exhibitions and research programs to challenge human-centred views of nature and establish a more sustainable and equitable relationship between humans, cultures and nature. This study postulates, that NHMs need to find new ways to do this by emphasizing multispecies perspectives that are challenging human exceptionalism. Furthermore, they need to embrace different ways of nature knowledge that go beyond academic knowledge-production.

2.3 Curating the Anthropocene

Against the backdrop of the Anthropocene, NHMs are facing the challenge to include present narratives of a natural history, shaped by human impacts and ecological crisis. This requires a perspective on overarching global connections and impacts of issues such as climate change and biodiversity loss, as well as a reflection of what the effects mean concretely at the local level for different communities (Cameron et al., 2013; Newell et al., 2017; (Koster et al., 2017). Climate change can have different meanings for communities based on geographical roots, values, and cultural beliefs (Hulme, 2014; Reichel, 2020). It emphasizes the moral responsibilities of museums to address socio-ecological challenges, not just by communicating scientific facts but also by engaging communities to debate what the impacts and necessary measures for the preservation of habitats and ecosystems mean for their everyday life. Natural History Museums thus also have a political responsibility, which in turn leads to the challenge of mastering the balancing act between a neutral educational institution and becoming an agent of change.

2.4 Telling Post-Natural Histories and Futures

In addition to the point above, a further challenge is to show how natural history will be written in the future. How do species adapt to a changing climate and anthropocentric habitats? And how do they expand the human-centred concept of the environment and ecosystem in natural history? Adaptation strategies in natural history can be summarized in under the acronym MAD—Migrate, Adapt, or Die. Particularly, migration and the associated invasion of species pose challenge to deal with a high number of uncertainties and unforeseeable consequences in urban and rural planning. Humans have changed the environment so profoundly that it cannot be reverted to its original state – many species have adapted to these new environments, especially observable in urban spaces. Here, Natural History Museums, as central research institutions for the study of evolution, can make a significant contribution to shaping future habitats that provide healthy environments for human and non-human beings (Bakker et al., 2020; Sterling, 2017).

However, human activities (such as urban planning, agriculture or the use of pesticides) also lead to a significant loss of biodiversity. At the same time, a development in modern biotechnology is observable, whose transformative power can have a profound impact on the evolution of life. Genetic research and

synthetic biology not only allow us to read the code of life (DNA) but also to entirely rewrite it. As a result, species could be genetically modified to adapt more quickly to new environmental conditions, however, the effects of such changes on very complex ecosystems are difficult to predict. Some research projects go even further and aim to synthetically create life or even revive extinct species (see George Church or Craig Venter). These developments merge technology, nature, and culture in a very drastic way. They write a new chapter in the natural history of the future. While such developments are already addressed through speculative design interventions in museum contexts (design and art museums, e.g. “Designing for the Sixth Extinction” by Alexandra Daisy Ginsberg), they are only sporadically explored in Natural History Museums. These developments pose a question for Natural History Museums on how they can curate possible natural histories of the future.

2.5 Digitalizing the Infinite

Today, NHMs serve as crucial repositories of genomic information, enabling scientists to unravel ecological and evolutionary knowledge using technological innovations in genetic research, to explore the museum collections in a way that was not imaginable 50 years ago. However, accessibility to the vast and expanding natural history collections remains a challenge, as the majority is hidden behind public exhibition areas and distributed to a few institutions in the western hemisphere (e.g., the Natural History Museums in Washington, Chicago, or London, Berlin). NHMs want to overcome these challenges by digitalizing their collections and adding digital information layers to the specimens and to share them on a global scale (Bakker et al., 2020).

Despite extensive digitization efforts, the full potential of these “extended specimens” (Lendemer et al., 2020) remains underutilized, as there are challenges to make digital archives accessible and to link different knowledge bases (Bakker et al., 2020). Moreover, digitization is associated with high financial costs, which often come at the expense of research. Resources are diverted that are necessary to research and expand collections. The discovery of new species highlights the vastness of the unknown. In particular, the most abundant species, such as insects and microorganisms, and invisible but very relevant actors in ecosystems, are estimated to be only marginally recorded and researched. Preserving and researching these collections is crucial, encapsulating not only billions of years of evolution but also lessons and narratives of resilience, strategy, and innovation. However, in the face of climate change, many species are dying out before they can be discovered and researched.

Above all these specific challenges, NHMs struggle with their own accessibility, aiming to attract "non-visitors" and questioning how to extend the NHM beyond the museum space. Visitors continue to enjoy consistent or increasing numbers, but NHMs remain static places with exhibition concepts largely unchanged for the past 100 years—stuffed animals, minerals, fossils, dinosaurs, and biodiversity walls. Many Natural History Museums, such as the NHM in Berlin are still based on concepts dating back to the 1890s, separating Education and Scientific Collections in the "New Museum" concept (Moldrzyk, 2015). Thus, the challenge lies in bridging science, society, and nature, evolving from occasional public engagement activities towards consistent playgrounds for participation and democracy.

3. The Future Natural History Museum – A Design Challenge?

This study underscores the role of Natural History Museums that integrate exhibition curation with ongoing research in biodiversity, the development of tools for exploration, conservation, and digitization of collections, as well as the establishment and research of educational formats targeting the inclusion of societal target groups. The NHM in Berlin (Museum für Naturkunde Berlin, MfN) serves as an illustrative example. As a former research associate at MfN, the author of this study spent over a year conducting auto-ethnographic observations about challenges and possibilities for NHMs from a design research perspective. The NHM in Berlin boasts one of the largest collections with 30 million specimens in Europe, represents an intriguing use case, as it discusses some innovative initiatives and visions (Moldrzyk, 2015; Rössig et al., 2023)– simultaneously, it shares overall challenges faced by other NHMs, making the implementation of

these initiatives difficult or very slow. Among the initiatives are architectural and strategic reconceptualisations (as exemplified by the "Zukunftsplan" and “Museum Evolution”), as well as new curatorial and collecting approaches (e.g. Moldrzyk, 2015; Sturm et al., 2022), knowledge-transfer initiatives (Weißpflug et al., 2019), and cross-cultural collaborations (as illustrated by the “Museums Lab”). Additionally, MfN Berlin promotes several projects at the intersection of art, design, and science, such as *Art/Nature Interventions* (Hermannstädter, 2019)*Mediasphere for Nature Lab*, *Experimentierfeld* (Rössig et al., 2023), *Netzwerk Naturwissen*, or the *Pollinator Pathmaker* in collaboration with Daisy Ginsberg and the LAS Art Foundation. These initiatives negotiate the future roles and relevance of the museum and demonstrate potential interdisciplinary collaboration with the art and design sector.

However, the museum faces central challenges in translating its vision of becoming an interdisciplinary hub for public engagement and nature-based innovations into reality. These challenges include those explained above, as well as structural issues such as short-term contracts and project durations due to public funding logics, bureaucratic processes, high departmental competition, rigid hierarchical structures on middle management levels, traditional organisational culture, public accessibility, and a lack of open spaces in the exhibition area for explorative formats, to name a few.

So, what is the matter with design? A significant challenge facing the potential of collaborations between design, art, and science lies in the prevalent misunderstanding of design and artistic research within institutional frameworks. Art and design are often perceived primarily as tools for enhancing science communication and public engagement, serving to make scientific concepts more accessible or entertaining to a wide audience. However, in initiatives aimed at Public Engagement within NHMs, this misconception of design proves detrimental.

Public Engagement involves fostering a mutual dialogue between society and science, aiming to address societal needs early in research and innovation processes. Yet, this objective is compromised when design is merely utilized to aesthetically enhance predetermined scientific content for a target audience. Such an approach contradicts contemporary discourses on the transformative potential of design, including Transition Design, Public Interest Design, and Speculative and Critical Design Practices, which advocate for a broader role of design in fostering societal debates.

This paradigm shift entails not only *designing for* communities but also *co-designing with* them. Therefore, for Public Engagement to serve as a vital strategic component within NHMs, the potential of design lies not in the creation of creative participation formats or exhibition concepts but rather in facilitating critical reflections on the roles of NHMs in society. The author posits that by regarding design as an agent of change within NHMs, design researchers can lead impact-oriented, interdisciplinary, and practice-based transformation processes that embrace diverse perspectives and modes of knowledge production.

Against the backdrop of the ecological crisis, which holds varied meanings for different communities, there is an urgent need for more empathetic, inclusive approaches to Public Engagement. Merely fulfilling research-political demands for increased participation risks relegating individuals to involuntary roles in sporadic outreach activities, often lacking in meaningful engagement.

To summarise, participation and involvement are essential drivers for socio-ecological transformations, particularly within public spaces such as NHMs. Therefore, the development of inclusive engagement strategies through design becomes crucial for shaping the future transitions of NHMs.

While this study addresses sensitive issues within NHMs, its aim is not solely to critique challenges but to provide space for radical reimagining from a design perspective. It proposes reconceptualizing NHMs as venues for design-driven innovations, democracy, and safe spaces for exploring collaborative visions of the future that integrate both human and non-human needs.

Furthermore, it advocates for the repositioning of NHMs as co-creative innovation hubs, where design, critical societal reflection, interdisciplinary collaborations, and radical innovations converge to generate

tangible roadmaps for eco-social transitions. These transitions address pressing issues such as biodiversity loss, rising sea levels, climate change, food security, and zoonotic pandemic diseases.

4. The Potentials of Design for Sustainable Transitions

4.1 Current Developments in Design

In summary, there is a fundamental lack of discourse on understanding and knowledge about the actual potentials of design for sustainable transformation, societal inclusion, and critical thinking within Natural History Museums. This gap exists despite ongoing discussions since the 1960s, such as the *Design Methods Movement*, *Radical Design*, or *Participatory Design*, further developed and researched today under numerous practice approaches: Social Design, Transition Design, Critical and Speculative Design, Pluriversal Design, Multispecies Design only to mention a few.

These approaches demonstrate design potentials beyond capitalist, market-driven and (western) human-centric understandings of innovation and transformation. Design plays crucial roles in transdisciplinary and transcultural knowledge transfer by including different stakeholders and approaches from science, politics, business, and ecology from the outset. The involvement of local communities plays a central role, simultaneously expanding the concept of the public towards a more-than-human-centred understanding that also involves the interests of non-human beings (Harles, 2024). Design also acts as an enabler, actively involving target groups through design-based methods to explore and shape desirable futures collaboratively, as well as to critically question technological and societal developments. The potential of design as a relevant force in societal transformation processes becomes obvious within as well outside the discipline.

On the one hand, there is a trend in student projects at interdisciplinary intersections with social and ecological sustainability, showing that emerging designers are aware of their responsibility during their education, as initiatives like the Dutch Design Week or German Design Graduates Award demonstrate. Examples include sustainable material design, critical interventions, and the design of social safe zones.

On the other hand, there is also a structural change through the increasing promotion and establishment of knowledge transfer offices at design universities and networks explicitly seeking application-oriented collaboration to tackle societal and ecological challenges. These transfer offices become essential actors for transformation processes and are often referred to as “Design Research Labs”, such as the Sustainability by Design Lab at Folkwang University of the Arts, Burg Labs at Burg Giebichenstein University of Art, DESIS Labs or the Design Friction Lab at the University of Bozen, to name a few.

Against this background, this study wants to highlight these structural, methodological, and practical approaches evolving in design discipline to showcase how they can support NHMs to transition from static intuitions to driving forces for co-creative innovations, public engagement, educational spaces, political debating grounds for nature rights, and socio-ecological transitions.

4.2 Proposing Design Research Labs as Interfaces for Natural History Museums

The paper emphasizes the untapped potential of Design Research Labs within NHMs as "platforms for collaborative inquiry based on design experiments" (Binder & Brandt, 2008), bridging the gap between lessons learned from the past, contemporary challenges, and collective imaginaries of the future. Design Research Labs seek collaboration between stakeholders from design, public, politics, science and economy and offer unexplored potentials for sustainable transitions which can be summarized through four pillars (Augsten & Harles, 2024):

- Fostering Real-life Innovations: Design Research Labs (DRLs) blend controlled lab environments with real-world scenarios, engaging diverse stakeholders for collaborative knowledge production.
- Acting Responsible and Mission-oriented: DRLs prioritize societal issues, aligning with Responsible Research and Innovation frameworks. They involve the public, marginalized groups, and non-human entities in research, fostering comprehensive, ethically sound, and sustainable innovations.
- Crafting Collaborative Images of the Future: DRLs address uncertainties by intertwining technological, societal, and ecological trends, using design-based approaches like Design Fiction and Speculative Design to facilitate discussions, anticipate future developments, and initiate societal progress.
- Promoting a Multiplicity of Knowledge: DRLs redefine knowledge production by encouraging design-based processes that go beyond traditional academic approaches. They empower both experts and non-experts, promoting shared authorship and inclusive design-based public engagement, ultimately reshaping scientific outcomes.

Against this backdrop, this exploratory paper asks whether the concept of Design Research Labs can act as an interface that bridges the societal responsibility of Natural History Museums with the transformative potentials of design. This leads to a speculative design investigation, opening up a debating ground for stakeholders from the design discipline and NHMs alike: "What if NHMs are understood as Design Research Labs for eco-social transition?" This lays the foundation for the creation of speculative scenarios that explore the transformative potential of design within NHMs.

5. Methodology

The aim of this study is to explore how Natural History Museums can be reconceptualized as Design Research Labs for climate action through speculative scenarios. Drawing on interviews, literature research, and use-case analysis, the paper explores five fields of action for NHMs by developing speculative scenarios with distinct special focuses on relevant developments within the design discipline.
As these scenarios are currently a work-in-progress, this paper gives an overview about the methodological approach, the research framework and first results of possible speculations.

5.1 Research Framework

Since the intersection between design research, design labs, and natural history museums is a subject of investigation that has received little attention thus far, this study attempts to develop its own approach through interdisciplinary integration of various theories and methods. These form the basis for scenario development. The theoretical research is built on three pillars that combine theoretical and practical concepts from museum studies, design research, and anthropology.

1. Museum Studies:
   While focusing on the Natural History Museum as the subject of investigation through design, it is pertinent to outline developments and theoretical concepts discussed in Museum Studies, that are dealing with different modes of visitor and community engagement that extend beyond one-directional science communication such as the *Metabolic Museum* (Deliss, 2020), *Liquid Museum*, the *Interrogative Museum* (Karp & Kratz, 2015)or *The Museum as Process* (Silverman, 2015). A special research focus lies in exploring discussions on science museums, particularly Natural History Museums, at the intersection of Climate Change, the Anthropocene, and future thinking (Dorfman, 2018; Cameron & Nielson, 2015; Newell et al., 2017).

These theoretical foundations provide the fertile starting ground for further explorations into what is coined by the author as *"The Museum as Design Lab."* This concept involves viewing museums not only as repositories of artifacts but as dynamic spaces for design experimentation and innovation.

2. Design Labs as Agents of Change and Knowledge Culture:
To argue the value of the design discipline in transforming static places into hubs for participation, democracy, social innovation, and climate action, the study is based on ongoing investigation of unexplored potentials of *Design Research Labs* as agents of change (Augsten & Harles, 2024). This research builds upon the definition by Binder, who describes labs as 'platforms for collaborative inquiry based on design experiments' (Binder & Brandt 2008). This concept is currently gaining popularity within design education in the D-A-CH region through increased funded projects, such as the *Sustainability by Design Lab* at the University of the Arts Folkwang and *Burg Labs* at the Burg Giebichenstein.
3. Potentials of Speculative, Multispecies, and Pluriversal Design Approaches:
Based on the exploration of Design Research labs, a further look onto specific methodological developments applied within these labs is crucial to pave the way towards practice-based transformative shift. These include *Critical and Speculative Design practices* (Auger, 2013; Bleecker, 2009; Dunne & Raby, 2013; Heidingsfelder, 2018), *Multispecies and Interspecies Design* (Gatto & McCardle, 2019; Haldrup et al., 2022; Harles, 2024; Mancini & Lehtonen, 2018; Metcalfe, 2015; Roudavski, 2021), and Pluriversal and *Decolonizing Design* (Escobar, 2017; Tunstall, 2013*)*. This theoretical deep dive serves as a bridge to the practical part of the research project, illustrated by a range of use-cases. The aim is to provide guidance and requirements for actions that demonstrate the impacts of design-led approaches from a strategic level to practical implementation within NHMs' programs and activities. A special focus is placed on the vast potentials of multispecies design approaches for public engagement, drawing from *the non-human turn* in humanities and social sciences (Grusin, 2015). This encompasses multispecies ethnographies, multispecies histories, posthumanism, political ecologies, among other areas (Haraway, 2013; Kirksey & Helmreich, 2010; Latour & Latour, 2007; Tsing, 2023).

In addition to the theoretical research, a further investigation use-cases at the intersection of design of design practices, museum studies, natural histories, and Anthropocene challenges is part of the research framework. Examples also include investigations on transformative concepts of Natural History Museum, such as the *Richard Gilder Center for Education and Innovation* at the American Museum for Natural History in New York, Musée des Confluences in Lyon or the Naturalis in Leiden. A detailed description of these use-case goes beyond the scope of this paper.

6. Speculations on the Natural History Museum of the Future

The following section briefly outlines four speculative Design Research Lab concepts that are currently being further developed. These initial drafts present initial possible approaches and are open for discussion.

6.1 The Pluriversal Knowledge Lab

This scenario explores the potential of Pluriversal and Decolonizing Design approaches (Escobar, 2017; Tunstall, 2019). Both concepts aim to challenge and transcend dominant Western, colonial, and anthropocentric perspectives that have traditionally influenced design practice and education. Pluriversal and decolonizing design seeks to foster a more diverse, inclusive, and equitable design environment while questioning established Western, colonial, and anthropocentric norms. They aspire to create spaces and processes that enable the coexistence and co-creation of multiple worlds, supporting the self-

determination and self-representation of marginalized communities and contributing to the dismantling of colonial and imperial structures. Additionally, both concepts are concerned with decolonizing knowledge and power structures and promoting a more diverse, inclusive, and equitable design practice and education.

This scenario will investigate how these design approaches provide methodological knowledge for scrutinizing the value of indigenous knowledge and exploring colonial legacies within Natural History Museums.

6.2 The Post Nature Lab

This scenario explores influential concepts of Discursive, Critical, and Speculative Design (Dunne & Raby, 2013; Tharp & Tharp, 2018; Heidingsfelder, 2019) that enable Natural History Museums (NHMs) to reconsider their public engagement strategies, taking action towards future natural histories defined by anthropocentric impacts and driven by significant advancements in Modern Biotechnology and Synthetic Biology. Speculative Design Practices (SDP) constitute a collective category rooted in Radical Design since the 1960s, incorporating methodologies like Speculative Design, Design Fiction, and Adversarial Design. These approaches aim to detach design from market-oriented utility, critically examining societal, technological, economic, and ecological developments. Instead of describing current conditions, they generate fictional narratives and prototypes to stimulate discourse. Recognized beyond disciplinary boundaries, SDP engages the public in scientific and technological innovations. Against the backdrop of climate change, it has the potential to connect researchers, industrial partners, and society to question post-natural developments and their implications on the natural histories of the future. SDP offers the potential to integrate speculative artifacts as a significant part of public outreach. In contrast to previous artifacts and specimens, these are not intended as passive objects of observation but encourage active participation. They bridge lessons from the past with challenges of the present through speculative imaginaries of the future.

6.3 The Nature Rights Lab

This scenario explores the potential of More-than-Human and Multispecies Design approaches (Gatto & McCardle, 2019; Mancini & Lehtonen, 2018; Metcalf, 2015) that engage with non-human agents in the design process. These diverse initiatives, spanning environmental conservation, multispecies urban habitats, coastal region enhancement prototypes, human-plant interactions, and Animal-Computer Interaction for non-human empathy, employ speculative and immersive methodologies. Contemplating socio-ecological challenges from a more-than-human perspective, they generate research questions at the intersection of multispecies ethnographies, conservation, and biological impact assessments. Actively collaborating with experts, NGOs, communities, and stakeholders fosters knowledge transfer and meaningful partnerships. By bridging theory and practice, they contribute to a nuanced approach in speculative design, addressing urgent socio-ecological challenges and translating debates into tangible actions for improvement. Furthermore, the potential of Multispecies Engagement becomes visible in policymaking and democratic processes, where other-than-human beings are considered eligible actors in democratic processes (Sheikh et al., 2023). The necessity to include non-human agents becomes evident as the notion of granting legal rights to non-human beings gains traction at governmental levels, exemplified by initiatives like the “Sumac Kawsay” in Ecuador or the “Te Awa Tupua Act” in New Zealand (Kauffmann & Martin, 2018). They encourage strengthening the political responsibility of NHMs by including other-than-human beings in discussions. In this way, NHMs can rethink public and policy engagement beyond intervention formats toward co-creative policymaking processes.

6.4 The Otherminds Lab

This scenario explores Animal-Interaction Design (Hook, 2019)anticipating the otherness of non-human beings, paving the way for human-nature-machine interactions, and learning from “otherminds,”

representing non-human forms of intelligence (e.g., plants or cephalopods). This scenario lies at the intersection of the first three scenarios above. It pushes the boundaries of the educational and research programs of NHMs, speculating on how such institutions can also position themselves as important collaborators in applied innovation research.

7. Summary and Conclusion

In reimagining the role of Natural History Museums through the lens of design research, this study delves into the evolving narrative of these institutions, recognizing their historical transformations and the pivotal juncture they face amidst escalating ecological crises. From their origins as mere cabinets of curiosities, NHMs have grown into essential interdisciplinary hubs, tasked with studying, preserving, and digitizing the planet's biodiversity.

The challenges confronted by NHMs are multifaceted, ranging from grappling with colonial pasts and anthropocentric views of nature to addressing climate futures, post-natural histories, and the digitalization of vast collections. The paper not only underscores the hurdles faced by NHMs but also introduces a novel perspective, proposing a fundamental shift – envisioning NHMs as Design Research Labs for climate action.

By framing NHMs as Design Research Labs, the study aims to explore the untapped potential of the design discipline in reshaping these institutions. Design Research Labs, as interfaces between design, science, society, and politics, are presented as platforms for collaborative inquiry, fostering real-life innovations, responsible mission-oriented actions, crafting collaborative images of the future, and promoting a multiplicity of knowledge. The paper suggests that such labs within NHMs could serve as dynamic spaces where societal responsibility meets the transformative power of design.

The challenges identified, such as overcoming colonial legacies and anthropocentric perspectives, are viewed not merely as obstacles but as opportunities for design-driven democracy and inclusive participation. The study argues for a paradigm shift, emphasizing that design should be more than an embellishment for science communication. Instead, it should play a strategic role in shaping impactful, empathetic, and inclusive public engagement processes.

In considering NHMs as potential Design Research Labs, the paper raises a speculative question: "What if NHMs are understood as Design Research Labs for eco-social transition?" This inquiry prompts exploration into the transformative potentials of design, initiating a conversation that extends beyond the traditional boundaries of NHMs. The envisioned future is one where NHMs evolve into dynamic, participatory spaces, bridging the gap between static exhibitions and collaborative platforms for socio-ecological imaginaries of the future.

In conclusion, this study serves as a call to action, urging NHMs to embrace their potential as catalysts for biodiversity conservation, environmental justice, and planetary health through design-driven approaches. The envisioned Design Research Labs within NHMs are proposed as catalysts for change, reshaping the narrative of these institutions and fostering a broader understanding of their roles in the face of complex socio-ecological challenges.

By showcasing these use-cases and speculative scenarios for contemplation, the paper not only encourages a reassessment of NHMs as Design Research Labs but also seeks to stimulate conversations about the spatial dimensions of design research and practice within emerging interdisciplinary environments like NHMs.

KEYWORDS | SERVICE DESIGN, SERVICE MASTER PLAN, URBAN FOOD SYSTEM, ALTERNATIVE FOOD NETWORKS

ABSTRACT | Prioritizing sustainable and fair food is essential to achieve the Sustainable Development Goals. While food systems contribute significantly to climate change and social inequality, these issues also severely impact them. Moreover, urbanization intensifies these concerns in cities, highlighting the need for design interventions across various domains. In this context, the Milanese Food System presents an interesting study area. Since 2015, the city has seen alternative food networks flourish alongside the conventional supply chain. These contributions have emerged as critical transformational nodes within Milan's food system. However, together with the conventional ones, they face several challenges, mainly connected to their evolution into actual service solutions. This paper presents ten service design projects by MSc students from the School of Design of Politecnico di Milano (A.Y. 2023-2024) that challenge and rethink the current Milanese Food System and its nodes. Solutions intend to combine social and environmental sustainability in a mitigation or adaptation strategy. At the end of the course, students and the teaching staff collaborated to map their projects into what the authors define as a 'Service Master Plan' for the Milanese Food System in 2030. The plan, already shared with stakeholders in the closing event of the course, provides a comprehensive overview of the actions, people, and infrastructure necessary to implement node-related changes in the city, offering provocations for future development. The course was developed under the OnFoods project, which aims to set the basis for starting design-driven conversations with the Milanese Food System actors, igniting design activism processes that could influence decision-making policies.

1. Background Knowledge: Food Systems, Urban Areas, and Service Design

Contemporary food systems manifest a paradox within themselves. On the one hand, food is one of the goods whose production, delivery, and consumption impact climate change and social inequalities; on the other, climate change has directly reduced food security by affecting water safety and agricultural productivity. If we keep moving inside this paradox, there will be negative impacts on the achievement of the Sustainable Development Goals, as envisioned in the 2030 Agenda for Sustainable Development (IPCC, 2023).

FAO projections (2003) indicate that by 2050, almost seven in ten people will live in cities. With the current food consumption behaviours and globalization of goods, this increasing trend makes cities a strategic point for food studies. During the last years, since the outbreak of the COVID-19 pandemic in 2020 and the conflict in Ukraine in 2022, the weaknesses of the current food system have been exposed, showing an increase in food insecurity and global hunger in comparison to pre-pandemic numbers (FAO, 2023).

Urban areas are relevant in studying agri-food systems, given their impact on food production, distribution, procurement, and consumption. Factors such as the consequences of population density, the effect of citizens' consumption choices, and the emergencies cities risk facing because of climate change (FAO, 2023) make urban areas a context in which possible design actions are several and touch many points of the food system, directly involving the demand side (IPCC, 2023).

Knorr et al. (2018) discuss the challenges of urban food systems and how their complex interrelationships have made it harder to ensure a resilient supply chain. They also underline the impact that the current large-scale and centralized approach to food production has had on the accessibility to food in cities. Because of this complexity and the short time ahead, a deep and effective systemic rethinking is urgently required.

In this context, Milan stands out as an area of study. Since 2015, the city has taken a path of envisioning a new food system with a focus on sustainability. After the Expo 2015, 'Feeding the Planet, Energy for Life', Milan Municipality implemented its own Food Policy. Through the Food Policy, and with actions involving citizens and local organisations, the city has set a future vision for its food system. It is working to rebalance the presence of different operators, rewarding supply chains and systems that prove to be more socially and environmentally virtuous (Comune di Milano, 2024).

Over the past nine years, the city has continued its path towards optimising the food system by involving all stakeholders in improving food quality, promoting healthier and more sustainable diets, creating advanced logistics platforms, coordinating major operators, supporting local producers and businesses, and fighting food waste. A big part of this work comes from informed and proactive groups of citizens joining together to experiment with alternative solutions to the large-centralised system. We can cluster these actions under the umbrella of Alternative Food Networks (AFN); a concept that, as Michael-Villareal et al. (2018) define, arrives in opposition to conventional food systems. While the main distinctions between the two models still need to be clarified, some authors have characterised AFNs by their proximity (short distances, etc.) and sustainability. In this direction, Milan has encouraged experimentation with alternative solutions in an effort to radically transform food practices, increase participation, and spread environmental and social sustainability practices. The city promotes the integration of various systems, scales, and actors within these approaches. Awareness, activation, and collaboration of all stakeholders are recognized as priorities to achieve the changes made urgent by climate change and growing social disparities (Comune di Milano, 2024).

Food system actors use adaptation and mitigation[1] strategies to rethink the Milanese food system processes, to integrate new services, and connect its different nodes. A 'node' is a space (digital, physical or both) inside of the system where different actors and products interact and make exchanges (Aucoin & Fry, 2015). In the case of Milan, the identified nodes are the wholesale market, indoor and outdoor markets, food waste hubs, farmers' markets, and public and private canteens. These nodes constitute an interconnected network that, although characteristic of Milan, can also be identified in other urban areas.

Although Milan has received international recognition for its good practices and policy vision, it still faces many challenges due to the complexity of the system. Several nodes and actors interact at different levels of governance, with imbalanced power, and low and inefficient communication between them. Additionally, managing complex logistics is difficult. As a result, AFNs may struggle to create a model that allows them to replicate or scale their initiatives and distribute their services to different contexts while safeguarding their purpose and identity. Here, there is a clear opportunity and need to rethink Milan's nodes around food.

Design has long played a role in the food sector, covering areas from products and packaging to services and strategies. In cities like Milan, design has significant potential to impact the food system, especially on the demand side. Here, we have identified design opportunities in various areas regarding solutions around mitigation and adaptation strategies. These strategies are crucial not just for cutting carbon emissions but also for addressing climate change impacts (Wang et al., 2023). Studies show that feasible, effective, and low-cost mitigation and adaptation options exist, and that many options are available for reducing emission-intensive consumption, including behavioural and lifestyle changes, which can improve societal well-being. Moreover, research also highlights the importance of integrating climate adaptation into social protection programmes to improve resilience (IPCC, 2023).

This paper presents ten service design projects by MSc students from the School of Design of the Politecnico di Milano (A.Y. 2023-2024) that challenge and rethink the current Milanese Food System and its nodes. Solutions intend to combine social and environmental sustainability in a strategy of mitigation or adaptation. At the end of the course, students and the teaching staff collaborated to map their projects into what the authors define as a 'Service Master Plan' for the food system of Milan in 2030. The plan provides a comprehensive overview of the actions, people, and infrastructure necessary to implement node-related changes in the city.

Following this introduction, the paper outlines the methodology implemented in the design studio course, proceeds with descriptions of the student projects, and concludes with a focus on the Service Master Plan, highlighting results and next steps.

2. A Case Study: Envisioning Alternatives for the Milanese Food System in the 'Urban Food Systems' Design Studio

Our case study builds on the current work of the Politecnico di Milano for OnFoods, a research programme funded under the National Recovery and Resilience Plan (NRRP). The university is working on Spoke 1 of the programme, which aims to improve the efficiency of food value chains to provide food access for society's most vulnerable.

As part of this project, a team of service design researchers from the Polimi Desis Lab is developing scenarios for Milan's food system in 2035. These scenarios intend to spark design-driven conversations with

[1] Adaptation means anticipating the adverse effects of climate change and taking appropriate action to prevent or minimise the damage they can cause, or taking advantage of opportunities that may arise. (...) In essence, adaptation can be understood as the process of adjusting to the current and future effects of climate change (European Environment Agency, 2023). Mitigation means making the impacts of climate change less severe by preventing or reducing the emission of greenhouse gases (GHG) into the atmosphere. (...) In short, mitigation is a human intervention that reduces the sources of GHG emissions and/or enhances the sinks (European Environment Agency, 2023).

different food system actors, identifying contexts that improve food access in the city and encourage new partnerships. The project will end in 2026 with pre-prototyping these new food services, showcasing possible evolutions of the food system.

Aligning with the research project, the ‘Urban Food Systems’ Final Synthesis Studio (LSF) course of the 2023/2024 academic year explored opportunities for reimagining existing or creating new services centred around food in Milan. LSF courses at Politecnico are the culmination of the master's degree in Product-Service System Design. They wrap up the programme's design work by teaching business modelling and co-design methods, preparing students to tackle complex challenges. Each LSF has a unique topic, runs for 4 months, and closes with a public event.

The LSF named ‘Urban Food Systems’ had the general goal of designing a collection of services and solutions that would focus on social and environmental sustainability and combine them into a strategy of adaptation or mitigation to climate change. Students worked with different 'nodes' within the system: pivotal points where significant activities and interactions related to food production, transformation, distribution, and consumption occur. These nodes are the wholesale market, the food hubs, the indoor markets, street markets, farmers' markets, and public and private canteens.

Each node is assigned starting challenges to guide the student's path (table 1). These challenges were identified in advance thanks to the first research phase of the OnFoods project. Here, design researchers analysed food-related nodes from Milan and other cities worldwide through mainly desk research, on-site visits, and interviews with different actors. This process supported the recognition of the most critical nodes and actors in Milan and opened the conversation about the sustainability issues they usually faced. Issues were summarised in eighteen challenges, representing the situation of one node, or different nodes, or the whole food system.

For each node, a short description in the Milanese context is provided below:

Wholesale market: Milan's fruit and vegetable wholesale market, managed by SOGEMI (the Joint Stock Company that, on behalf of the city, manages its wholesale agri-food markets), is the largest wholesale market in Italy, supplying national and international goods to Italy and Europe. Based on small and medium business clients, they also open their spaces to the public on Saturday mornings, selling food at lower prices.

Other activities connect to the distribution of surplus food for charitable purposes.

Food hubs: The Neighbourhood Hubs Against Food Waste are a Milan Food Policy project. The initiative aims to reduce urban food insecurity and food waste by implementing innovative ways of recovering and redistributing surplus food to fragile citizens. Together, actors from the private and public sectors, associations, and academia join to offer food and welfare services at the neighbourhood level.

Indoor markets: Milan's municipality established covered markets in response to urban expansion and growing commercial activities. These markets hold historical significance for Milanese citizens. However, after years of witnessing their commercial activities decrease and their infrastructures decay, the municipality has started a renewal project. The project aims to transform these markets into diffused food distribution points around the city, where citizens can access different non-food services.

Street markets: Itinerant markets that move around neighbourhoods in Milan selling fresh food sourced from the wholesale market. They improve access to fresh food in areas where there are no other markets. However, they face challenges related to their use of public spaces, such as safety concerns, street circulation, and ensuring that the public space is clean after use.

Farmers' markets: Weekly markets where small producers and food crafters from areas near Milan sell their products directly to the public. These markets are always located in the same area, and their participants comply with a set of sustainable and social values for the production and distribution of their goods.

University canteens: They operate through a contracting process, where businesses compete in an open call, and the contract is awarded to the company that presents the most cost-effective proposal. Unfortunately, this approach has led to university food services that often overlook environmental and social considerations.

Table 1. The challenges and nodes.

Challenges	Wholesale market	Farmers' market	Food hubs	Indoor markets	Street markets	University canteens
1. Reducing food waste in all steps of the food chain, from producer to consumer (from: canteens, restaurants, and catering services; greengroceries, indoor and outdoor district markets; the wholesale market; home)	X	X	X	X	X	X
2. Reducing emission of CO2 in all steps of the food chain, from producer to consumer, and achieving net-zero carbon food systems.	X	X	X	X	X	X
3. Facilitating the local supply of local produce to restaurants and canteens.	X	X	X	X	X	X
4.Designing sustainable intra city transportation solutions for food recovery, distribution, and delivery for both B2C and BTB supply chains, considering light vehicles and means.	X	X	X	X	X	X
5. Improving traceability of local food supply chains, including food recovery and redistribution, for social purposes.	X	X	X	X	X	X
6. Defining strategies and solutions to develop agriculture and food production activities within the city (outdoor/indoor).	X	X	X	X	X	X
7. Facilitating the accessibility of final consumers to the wholesale market, to purchase surplus/end-of-life food in bulk.	X					
8. Integrating the kitchen of Milan Restoration (the main food catering for the school system and welfare services in Milano) to the wholesale market.	X		X			X
9. Facilitating the planning, running and management of a farmers' market for both organizers and participants.		X				
10. Facilitating customer access and loyalty to a farmers' market.		X				

11. Integrating food hubs into neighbourhoods and combine them with relevant and complementary services, such as welfare and social services, composting, education, food processing and transformation, etc.			X			
12. Integrating the food neighbourhood hubs with the wholesale market and with the food-hub there located			X			
13. Designing an innovative concept of indoor food market in an integration with the wider food system and the neighbourhood.				X		
14. Increasing and improving the collection and redistribution for charity and social purposes of the surplus/end-of-life food, from outdoor street markets and indoor markets.			X	X	X	
15. Integrating policies and services of healthy dietary guidelines with sustainability guidelines	X	X	X	X	X	X
16. Increasing the consumption of fresh food and plant-based foods, reducing animal proteins in the human diet.	X	X	X	X	X	X
17. Understanding and improving the condition of health and nutrition inequity, and access to urban fresh and healthy food, combating maldistribution of nutrition intake.	X	X	X	X	X	X
18. Providing fresh, nutritious, and quality food to vulnerable people (people in need, urban poor, working poor, etc.) while ensuring fair treatment of all actors.	X	X	X	X	X	X

3. From Research to Service Development: The 'Urban Food Systems' Studio Journey

The field of service design encompasses a wide range of applications. In this final synthesis studio (LSF), the approach to services was twofold. At the node level, the aim was to improve existing solutions or suggest new ones (Meroni & Sangiorgi, 2011), focusing on service-level aspects. At a more systemic and macro level, the goal shifted. Through co-design workshops that introduced these new service ideas as provocations to system actors (Meroni et al., 2018) and by examining and presenting these final services collectively, the aim as service designers was to act as a catalyst for broader transformations (Meroni & Sangiorgi, 2011).

The design studio was organised into 3 macro-phases: a research phase to investigate the food topic and context in Milan, a concept generation phase complemented with the opportunity to co-design new service ideas with the stakeholders of the Milanese food system, and a development and prototyping phase stage in which students, divided into ten groups, went in depth in elaborating ten related service solutions. The studio culminated in a public event, a sort of fair of sustainable ideas engaging all participants at its conclusion. In doing so, the student projects provided actual provocations around what is possible and desirable for the development of the nodes to those currently managing and shaping them.

3.1 Research

Two assignments make up this first phase to help students understand the context and generate an initial compass for envisioning possible project directions. After composing ten groups, students selected a design challenge that crossed with a node (table 1). Parting from the challenge, a desk and field research was performed to better understand the context and stakeholders (figure 1). The aim was to narrow their focus by redefining a more specific challenge that would later fuel the concept creation process.

Figure 1. Some of the results from desk and field research.

Next, students engaged in a blue-sky research exercise. By looking into different cultural inspirations like movies, talks, and exhibitions they gathered new ideas and perspectives about their chosen challenge that they later materialised on an object. The goal was to stimulate the students' creativity and provide a more innovative catalyst for concept creation (figure 2).

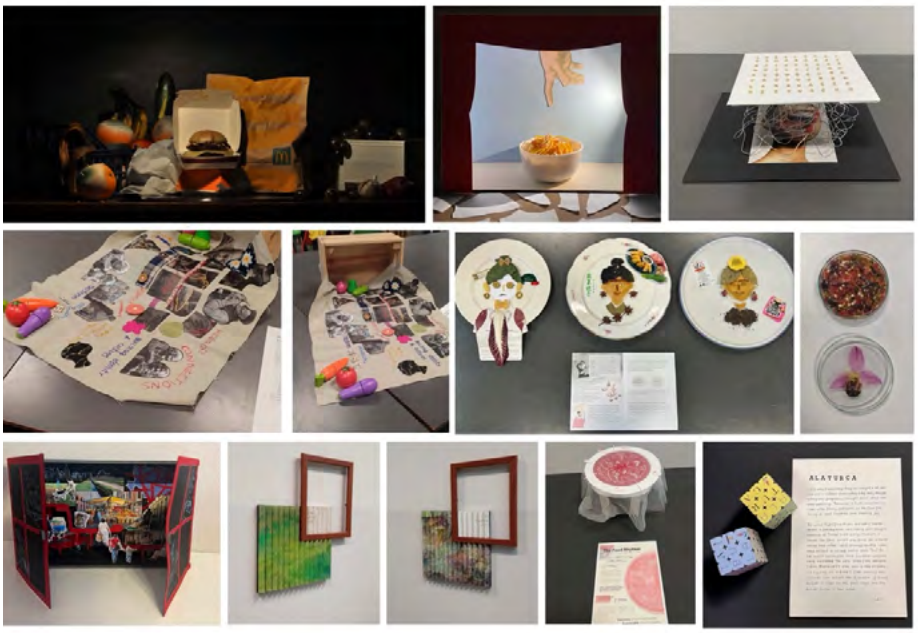

Figure 2. Some objects from Blue Sky research.

3.2 Concept Generation and Co-Design

Students then took their challenge redefinitions and insights from their blue-sky research and performed several brainstorming exercises, some powered by AI, to boost creativity. The result was three most-promising concepts for each group, which they then narrowed down to one.

To assess and enrich their concepts, students then conducted co-design workshops with node stakeholders, users, and experts. This co-design phase aimed to facilitate collaboration between students and various actors in the food system during the concept definition process. Here, the aim was to elaborate on the students' already existing ideas through a thought-provoking process for the actors engaged in the workshops (Meroni et al., 2018).

In advanced design phases, that seek to expand on and consolidate options, like this one, designers recur to specific types of 'prototypes.' These co-design tools (figure 3) are a sort of physical manifestation of the concepts the students see promise in developing (Sanders & Stappers, 2014) mixed with additional components that simulate interactions and behaviours (Meroni et al., 2018). Here, students used the co-design prototypes to explore their ideas with participants, starting a strategic conversation around them.

The co-design workshops served not only for the students to question and enrich their ideas but also as a first provocation for the actors involved in shaping and managing the nodes. The resulting insights altered the students' original service concepts, leading to a rethought concept for each student group.

Figure 3. Codesign tools and presentations.

3.3 PSS Design and Prototyping

In this last phase, students fully fleshed out the resulting concepts from many angles, mirroring the steps that real-world projects take to turn ideas into tangible innovations. They defined the product-service system offering, the user experience, the front and backstage, the touchpoints, and the spatial/urban requirements. They also focused on criteria to measure their idea's impact and how it engaged with different stakeholders, along with its business model and feasibility. (figure 4)

Figure 4. Closing event of the course at the NoLo Market.

The outputs of the 'Urban Food Systems' studio are ten service ideas aiming to make Milan's food system more equitable and sustainable. When we bring these ideas together, showing where they happen and what or who they need to function, we get a big picture of the actions, people, and infrastructure needed to activate node-related changes in the city.

Twine – Connecting indoor markets and the wholesale market

Twine is an online marketplace and distribution network that optimises urban B2B food logistics. With its collection/delivery model, Twine connects suppliers with distributors through a warehouse at the Wholesale market and distribution points in indoor markets.

By optimising intra-urban food logistics, this model presents an opportunity from both an ecological and commercial perspective. It shortens the chain not only geographically—reducing physical distance—but also relationally and informationally, directly connecting suppliers and customers and offering transparency on products and their impact. This solution could lead to improved relationships, a reduced carbon footprint, and an overall more sustainable city.

Al Mercà – Indoor markets

Al Mercà is a digital-enhanced shopping experience in Milan's indoor markets, offering recipe-based shopping lists, market navigation, and real-time product availability, saving time and reducing stress for shoppers.

By leveraging technology and appealing to younger generations, neighbourhood services could strengthen their position in the food distribution sector, offering a competitive alternative to supermarkets. This approach would also enable the expansion of home delivery services, providing an incentive to promote neighbourhood communities and relationships among vendors, encouraging personal promotion.

A un passo da te – Food hubs

A un passo da te is a Mini hub, operating at the neighbourhood scale and distributing food by bicycle, paired with a digital platform that matches beneficiaries with the nearest option for food pick-up and neighbourhood services, benefitting users but also non-profits in delivering their services.

The project aims at creating a network, an opportunity that various stakeholders consider necessary to better achieve common goals, and which is in line with the non-profits' mission to facilitate meaningful dialogue and cooperation.

Cozina – Food hubs

Cozina is a training service linked to the Food hub Gallaratese, providing unemployed youth with professional and life skills in the food sector, offering a pathway to employment and personal empowerment.

Acknowledging the shortcomings of current educational models, which often overlook the distinct needs of individuals and result in a lack of engagement and inclusion, particularly among the youth, this initiative seeks to fill a critical gap. Together with the need in Milan for qualified personnel in the food sector, there is an open opportunity to provide specialised training and employment in this area for individuals who are currently the most vulnerable and marginalised.

Cucinando – Food hubs

Cucinando is a catering training programme using surplus food to address unemployment and food waste, providing practical culinary skills and job market entry support to unemployed persons.

This initiative capitalises on the transformation of surplus food through culinary processes, aligning with the Food Hubs' objectives to maximise the utilization of surplus food, which often arrives in limited quantity and quality. At the same time, it is creating new paths to autonomy and professionalism for the hub's beneficiaries.

ResQ – Food hubs and supermarkets

ResQ is a service that, through a dedicated shelve and refrigerator supermarket section, streamlines the collection and distribution of surplus foods, offering them at advantageous prices for everyone while mitigating the differences between regular consumers and those in need.

Although supermarkets were not initially listed among the nodes presented to students, the project introduces a valuable collaboration between them and social actors. This would lead to the involvement of supermarkets in sustainable practices and to the creation of a network with different partners inside of the system.

ATMarket – Street markets and the wholesale market

ATMarket is a mobile market that travels via buses and trams delivering fresh, quality food to Milan's suburbs with a pricing strategy that makes healthy food more accessible to underserved communities.

The offer combines the already available options of food in the city center with the ones on the outskirts of the city, an opens an opportunity to use public transportation to reduce gaps in peripheral areas.

Co_MAP – Farmers' markets

Co_MAP is a service mapping farmers' markets in Milan and their associated farms to strengthen their connections and facilitate their expansion. The service allows producers, consumers, and the entities organising the markets to have clarity on agricultural production and to better manage market offerings.

Given that Milanese farmers' markets are managed by various entities under differing regulations, this presents a crucial need to enhance their temporal organisation and foster collaboration among organisers. This situation also creates an opportunity to publicise information about agricultural businesses and their

product sales, making it readily accessible and integrated into a digital space for shared knowledge, network growth, and, as a result, increased market participation.

Nostra – University Canteens

Nostra is a student-run canteen at the Bovisa Campus of the Politecnico di Milano offering plant-based meals, where students actively contribute to the food supply on campus, participating in both the management and preparation of meals.

This initiative acknowledges that while plant-based diets are increasingly common, maintaining them can be challenging due to evolving food trends and preferences. University students, however, represent a demographic likely to welcome this dietary approach, especially when combined with culinary education and integrated with management and organisational skills.

CareBites – Hospitals

A new care experience in hospitals starting from food, introducing hydroponic systems for fresh produce and creating an alternative environment for patient care that highlights the link between nutrition and healthcare.

The service would allow for shortening the supply chain, reducing transportation, and fostering a new food culture in a sensitive context where the food system remains "invisible", introducing an element of well-being in an environment characterized by waiting, vulnerability, and pain.

Each of these service ideas, ranging from logistics solutions to canteen services, tackles different aspects of our food system. Despite their diversity, they gain deeper meaning and impact when considered together. This 'vision of togetherness' leads to a Service Master Plan (Meroni & Selloni, 2022) for the Milanese Food System in 2030, showing how these new service ideas link to current nodes in the system, as illustrated in the following section.

4. Conclusions: Towards a Service Master Plan for the Food System of Milan

The main outcome of the studio is the integration of the resulting ten service solutions into a comprehensive document named Service Master Plan that describes how the city could transform and enrich itself over the next decade to increase the sustainability, accessibility, and quality of the food it produces, distributes, and consumes. The general notion of Service Master Plan was originally developed by Meroni and Selloni (2022) in their book ‘Service Design for Urban Commons’: it is described as a planning tool that results from understanding a place and designing services for it, going beyond the spatial planning logic while embedding a service logic (Vargo & Lausch, 2016). It has a high strategic value, as it provides multiple alternatives of what might happen in a specific context in terms of services to facilitate public administrations, stakeholders, civic organizations, and citizens in populating a place with activities consistent with a shared strategy.

The Service Master Plan can be considered as complementary to the traditional urban planning tools. According to Kelly (2010), it must include all the land area subject to the planning jurisdiction, all subject matter connected to the physical development of the community and all the physical elements of plans associated to economic developments. Another important feature that characterises a Service Master Plan is the time dimension: it is crucial to develop it considering a time horizon of about ten to twenty years, envisioning possible scenarios for the future. Here is why, Selloni and Meroni (2022) suggest that the Service Master Plan is above all a ‘scenario driven’ tool that must comprise more than one single option: the underlying reasons for comprising multiple possibilities rather than one can be found in the very nature

of the scenario building theory (Ogilvy, 2002) that assumes that the future is not predictable and the best way to align the interests of diverse stakeholders is to consider a variety of different narratives, providing a range of possible options, even if guided by a common vision and values.

This was precisely what happened in the LSF 'Urban Food Systems': various alternative solutions populate the ideal Service Master Plan for the food system of Milan in 2030, shaping a city distinguished by an increasingly pronounced commitment to sustainability. More specifically, the services are linked and integrated to the 3network of the previously described food nodes (figure 5) and have strategic connections with the stakeholders of both conventional and alternative urban supply chains. This food-related Service Master Plan presents a desirable future scenario for the Milanese food system, emphasising on one side some existing options, but also showing some counter-narratives to the current system. The work of the students was particularly useful to unveil unprecedented possibilities: the educational aim of the studio was to develop their specific ability to propose counter-narratives related to new and more sustainable ways of living, to exercise an activity of envisioning and thinking out-of-the-box that is indeed the very nature of the design job. As Margolin (2012) states, design is essentially a propositional activity and in this specific case the studio 'Urban Food Systems' brought the contribution of proposing new contents: this was valuable to ignite a strategic conversation among the different stakeholders, allowing differentiation in views but also bringing people together toward a shared understanding and envisioning of the Milanese food system (Nardone & Salvini, 2004; Meroni, 2008).

The contribution of the LSF studio was not only to propose contents but also to integrate them in a common Service Master Plan and to add stimuli that raised the conversation within the OnFoods programme to a more 'expert' level (Manzini, 2015). This was fundamental to provide the basis for next steps of the programme and to shape strategies of adaptation and mitigation across various scales and systems, to better identify those modifications made urgent by climate change and social inequalities. In another words, the Service Master Plan was useful to raise crucial (and sometimes neglected) issues and, above all, to propose them in a way that shows their interconnection and interdependence, as this is the very nature of a shared strategic document as the master plan is.

Figure 5. The Milan Food System Service Master Plan for 2030.

Hopefully, the Service Master Plan may well integrate the Milano Food Policy, the strategic plan of the Municipality that, since 2015, governs the urban food system with the aim of making it more sustainable from all perspectives and it may contribute to the evolution of the OnFoods programme that is currently undergoing and aims at developing a new sustainable food model from production to distribution and

consumption. Here there is room for further research, in which the design contribution can span from ideating product, packaging, and communication, to conceiving services, systems and strategies and as stated, to providing scenario-building activities that can generate counter-narratives and ideas out-of-the-box challenging the current situation and envisioning alternative futures.

KEYWORDS | MATERIAL DESIGN, RESPONSIVENESS, PRODUCT AESTHETICS, SUSTAINABILITY

ABSTRACT | Sustainable design thinking challenges perspectives on approaches to material development that are considerate of resources from the natural environment. This involves limiting energy consumption and re-purposing materials' use, qualities, and functions for an extended life span. Using a practice-based research methodology, this research proposes an alternative framework for sustainable textiles with a strong emphasis on designing a material's expressive qualities related to its extended use values: co-creation and wear. The experimental practice looks at the interplay between a material's inherent properties and its craftmanship, as well as aesthetic and expressive values which could extend the duration of use. The research takes a bottom-up approach to sustainable design thinking and exemplifies the design of diverse material strategies through a curated library of responsive textile expressions. The responsive textile samples developed in this research illustrate rich ways of responding and adapting to user actions and their environmental surroundings. The textiles' extended multimodal attributes suggest an alternative framework to design for prolonged lifespan, and exemplify materials that enhance daily life by conserving energy and allowing for customization and location-specific applications.

1. Introduction: A Role of Material Design in the Development of Sustainable Design Thinking

Materials, serving as raw matter for the design of products and spaces, represent our physical interface to the surrounding man-made world, from body to architecture. Similar to the ubiquitous role of technology in our lives, the function of proximate materiality can be termed by using Verbeek's (2004, p.200) descriptions as both pragmatic and hermeneutic. The notions he introduced imply dual values: as a mediator of people's presence and actions in the world, and as a mediator of how reality is presented to us when informing our experiences of the surrounding world. Like technology, the presence of materials is essential in shaping our interactions with artifacts and influencing our daily activities and behavior in the world.

From the perspective of the designer's practice, the value of materials encompasses a range of dimensions from technological development to craftsmanship and artistic expression. Moreover, exposed to use and user's actions, the material transcends the disciplinary borders of the design profession, moving towards the methodology of other disciplines–social sciences. In the context of sustainability, Corbin (2018) refers to the fluid roles materials can play in communicating and connecting diverse knowledge domains across disciplines: art, science, engineering, and social sciences. Designing for sustainability is a dynamic concept that initiates in the technical and product-centric perspective and evolves by integrating the synergy of social and ecological systems (Ceschin and Gaziulusoy, 2016). Thus, seen bottom-up from and outside the design practice, the place of materials in influencing a systemic approach towards sustainable design thinking tackles different aspects of technology, function, expression, human behavior, and empathy for nature.

2. Designing for Extended Lifespan

2.1 Reflections on Product Aesthetics

The enormous amount of resources employed to develop, design, produce, and commercialize products that support and enrich our lives accentuate the importance of looking at the surrounding materiality through the perspective of designing and producing for longevity rather than obsolescence and waste. The length of the life span and obsolescence of the textile products we use depends on the interlace of material qualities, for example, intrinsic raw properties and technologies, as well as immaterial qualities such as aesthetics and emotional values. Design decisions play an important role in influencing the shape and use of objects that surround us. The basic principles for circular design proposed by the Ellen McArthur Foundation (2024) refer to three categories of placeholders: eliminate: focusing on the appropriate material choice with consciousness to the environment; regenerate: using the bio-based material properties to reintegrate them in nature, and third element refers to circulate: keeping the materials in use at their highest value by expanding their life span to the maximum through emotional durability. Moreover, referring to causes of product obsolescence, Packard (c.f. Burns., 2016, p. 42) describes products as being influenced by three fundamental criteria that link to emotional durability: function, quality, and desirability. Even minor technological improvements of newly realized products open the curiosity of use, transforming the existing objects into obsolete ones. As a result, the fast-paced wear of products generates an obsolescence of quality. Referring to the emotional value of products, Packard introduces the term "psychological obsolescence," which refers to the outdated expressions or styles of products that also influence their desirability.

The need for designing for an extended lifespan rather than obsolescence has opened questions regarding the forming of alternative sustainable systems of thinking applied to material design and innovation. This approach views design not only as a problem-solving process but as an innovative approach. It encompasses new territories of understanding for design through expressive dimensions, methods, tools, and skills, as well as behaviours, use, values, alternative consumption and a systemic thinking (Harper,2018; Manzini, 2009))To some people there is no such thing as a sustainable material, rather it is the use of a material that

introduces a sustainable advantage (Thackara, 1997) and it connects to the designer's choices to design for an extended life span. As he describes:

> "Design for sustainability means fostering innovation – not just in products and services, but in work methods, behaviors, and in business processes. This takes designers into uncharted territory; they need new tools, skills, and understanding." (Thackara,1997, p.14)

Hence, there is a need for new ways to approach sustainability as Thakara emphasizes, not just a problem-solving process but from an innovative perspective, that opens new territories of understanding for the practice of design.

The importance of changing perspective by designing for durability and longevity is a strategy pioneered and promoted by the Eternally Yours foundation (van Hinte, 1997). The foundation addresses the importance of designing for an extended "'psychological life span': the time products are able to be perceived and used as worthy objects" (van Hinte, 1997, p.19). Preoccupied with the extended length of the lifetime of products through use and dignified ageing, Hofland (van Hinte, 1997) makes the distinction of two stages to consider in durable design: First, cherishable objects as being cared for and appreciated, and second having a nostalgic value to the user. He emphasizes that nowadays, due to the continuous development of technologies, product development focuses on adding new functions, a development strategy that swiftly transforms products into obsolete objects without ever reaching the cherishable stage. Inspired by the ideology introduced by the Eternally Yours, Materially Yours (Karana, et al, 2017) proposes an alternative framework for sustainable material design with a prolonged life span. In the vision proposed by the researchers, undesired aesthetic qualities such as imperfection become desired in the material design. In addition, the framework proposes new processes that imply the use of more democratic tools and open for the experiential engagement of the designer in the making, together with proposing more open relations between materiality and functionality of objects in daily life.

Another complementary perspective regarding the longevity of use as a response to aesthetic obsolescence is introduced by Chapman (2005). One of the design strategies he proposed in Emotional Durable design refers to the importance of designing complex objects. In his vision, the multiple layers of narratives embedded in objects open for the user's continuous curiosity of discovery. From this, it is understood that complex aesthetic experiences embedded in the design of objects extend the time of discovery and generate new temporal dimensions in relation to use.

Further addressing the temporal dimension of products, Harper (2018) analyzes the role of time expression when designing sustainable products. Reflecting on the expression of time embedded in the character of the artifact, Harper suggests viewing the aesthetics of objects as 'containers of time' can be a method of building durable relationships between users and objects, thereby increasing the importance of the aesthetic dimension in designing sustainable artifacts. The notion of time in product design links the user to the aesthetic dimension of objects as an expression of the quality of craftsmanship, expression of use, and wear, and through the prolonged aesthetic discovery embedded in the design.

2.2 Rethinking Life-Span in Textiles

In the field of textiles, the life span of textile products is relatively short. The rhythm of use, which combines slow and fast paces, depends on the symbolic relation created between the wearer and the garment as a matter of clothing or fashion, as defined by Fletcher and Tham (2004). The durability of the material and expression do not always align, causing a shortening of the life span of textile products (Goldsworthy et al., 2018).

Thus, mass production and the shortening length of life of materials for garments and interiors have created an assiduous search for alternative systems of thinking, starting from the design of material properties to craftsmanship, production, consumption, and end-of-life disassembly and recycling of textile products (Fletcher, 2014; Bigolin et al., 2022). Niinimaki and Lassi (2011) open the discussion on the need for a systemic change in the textile and fashion business to become sustainable. The proposed change is

inclusive, based on real needs and values that demand more engagement from the consumer. This can be understood as an active value creator in the material design chain. Thus, in the framework recommended by Niinimaki and Lassi, new strategies for design should be founded on and include values such as use, emotion, culture, society, and customization.

In the field of responsive and innovative materials, sustainable design thinking introduces alternative perspectives on how to tackle material development in a way considerate to the resources of the natural environment by limiting energy consumption and re-purposing material use and function for a prolonged life span. In this context, textile systems capable of responding and adapting to their environmental surroundings could offer sustainable alternatives to daily living that source and preserve energy, are more locally obtained, and offer multiple possibilities for customization and location-specific applications. Thus, designing textiles with changeability of expression can be a way of extending an emotional bond between a textile object and the user, as well as "a way of creating the potential for durability and aesthetic sustainability" (Harper, 2018, p.85).

Exemplary works in the textile research field introduce alternative perspectives on textile products' lifespan by placing the design of the material changeability in focus and envisioning alternative scenarios of use. The design of temporal textiles expressions with irreversible colour changes, which are created by plant dyes on textiles without the use of mordants, is investigated by Worbin (2013). Signs of ageing, use, and degradation transform the quality of wear as a value rather than a criterion of obsolescence, thus expanding the life span of garments. By exploring the richness of the color palettes achieved by different plant mixtures and by analyzing the perceived transformability of colours on yarns and fabrics, the project proposes an alternative way of using and perceiving changeable colours on textiles. Compared to conventional views, which look at colour durability as a desired quality of textiles, irreversible colour expressions are those that fade and evolve over time due to exposure to natural light and use. The collection of garments that emerge from Worbin's research is designed from the initial stages of the process with the intention to evolve over time. It aims to change preconceptions on the performance of colour and textiles in use by generating acceptance to natural transformability over time.

Keune (2017) proposes another view on the design of transformable textile expressions and use. The transformability of textiles is designed by embedding seeds as active natural materials into woven textile structures. The temporality of the textile expression is dependent on the agency of the raw material used with a specific temporal frame to grow, mature, and decay. The user's involvement and autoethnographic approach become part of the transformation process, ensuring the maintenance of the textile pieces through the management of necessary nutrients for supporting plant growth and appropriate exposure to light sources. The temporality and life span of textile transformation and use determine the transformation of the interiors and their daily experience, which depend on the properties of plants grown in the textile structures and natural seasons.

Sustainable design thinking challenges perspectives on how to approach material development in a way that is considerate of the resources of the natural environment and influence a prolonged use. This may be by conserving energy and re-purposing materials, qualities, and functions for an extended life span. As the research examples demonstrate, alternative uses and life spans that can be generated by the responsive expressions of the emerging bio-based raw materials (Karana, et al., 2017), natural dyes (Worbin, 2013) and active natural materials, for example, seeds (Keune, 2017). Using a similar research methodology based on material exploration, this research aims to start with a bottom-up process to expand the material palette of responsive material systems using the agency of the natural environment and user's actions. Furthermore, the research aims to speculate on diverse design strategies for an extended life span of responsive textiles. This is based on the creation of expressive ways of responding and adapting to user actions and their environmental surroundings.

3. An Experimental Approach

3.1 Method

In order to address the challenges of designing for alternative textile/material life span, the research presented in this paper uses an experimental research methodology (Bang and Eriksen, 2014) and explores the design of responsive textile material systems through the lens of textile design methods. Material prototyping was used here as a method to give a tangible dimension to the ideas contained in the research program and to speculate on the possible scenarios that these materials can inspire. The research began with near-field design at the structural level of textiles using techniques of weaving and knitting. This approach enabled an experiential understanding of the capabilities of the raw material and allowed for speculation on possible scenarios for sustainable making and use of textiles.

Experiments are formed around two primary placeholders: First, extending the material expressive dimension by exploring the intrinsic value of the raw material agency and the appropriateness of craftmanship; and second, speculating on the use dimension by exploring the value of aesthetic discovery embedded in the material design through co-creation and natural phenomena. The prolonged longevity of a material's use is a quintessential dimension for the decisions taken in each sample in the making and design and is informed by the aesthetics of material transformation and use. In the creation of textile samples, we combined reactive yarns (UV rays, PH with conventional textile raw material yarns (wool, cotton, and paper) to explore their relation to the agency of natural phenomena (i.e. UV rays) and how they affect the expression of textiles.

As a result, a material library is developed to present alternative perspectives on sustainable transformative textiles that change their expressions due to environmental stimuli rather than using energy-driven electronics. The material library illustrates different design methods that explore material responsiveness in relationship with the variation of expression as valuable dimensions for proposing alternative life spans. The experiments presented explore methods for designing the expressions of textile materials to vary over their lifespans through changes in colour and light emission in structural textiles triggered by natural phenomena or user’s action. In doing so, ambient energies and considerations of use are incorporated into the design process.

The experiments investigate two types of lifespans: one involved gradual, irreversible colour changes created using the varying properties of fibres, and the other involved reversible colour changes created using UV-responsive yarns that change colour from white to another colour when exposed to UV rays and then back again when no longer exposed to them.

3.2 Exploring the Influence of Natural Phenomena on Textile Expressions Over Time

Designing with Nature: Experiment 1

Gradual, irreversible changes were explored using woven fabrics that had been dyed by taking advantage of fibre properties and using naturally occurring dyestuffs such as organic matter and minerals in the seawater (Talman, 2018). Thus, Jacquard-woven fabrics were exposed to these dyestuffs for varying lengths of time in order to explore the range of colours created. The materials used were selected based on differences in susceptibility to various types of dyestuff and expected lifespans when used in fabrics, and included cellulose-based cotton and paper, protein-based wool, and petroleum-based polyester yarns. These materials absorbed different pigment particles, leading to them reacting differently when exposed to the same dyestuff or environmental conditions.

The influence of exposure to ambient stimuli on the expression of textiles was explored by placing samples of Jacquard-woven fabrics made using wool, paper, polyester, and cotton yarns out environment. One set of samples submerged in the Baltic Sea. Later, the samples were reproduced in the lab using similar water

conditions to test if we could replicate their change (Fig. 1). The samples were exposed to various agents such as minerals, soil, and water, as well as fluctuations in temperature for two months, after which inspection showed that the fabrics had developed a specific colour scheme depending on the environment they had been placed in. The samples that had been submerged in iron-rich water had taken on a range of stronger shades of brown orange and light yellow towards green shades, with the wool yarn also being dyed towards dark brown. The overall surface design of the textile has been altered due to the occurrence in the foreground of the dominant triangular shapes as repeated patterns (Fig. 1). Activated by the conditions in the water, the triangles were capturing the colour in an uneven way that enhanced the depth of the final surface expression.

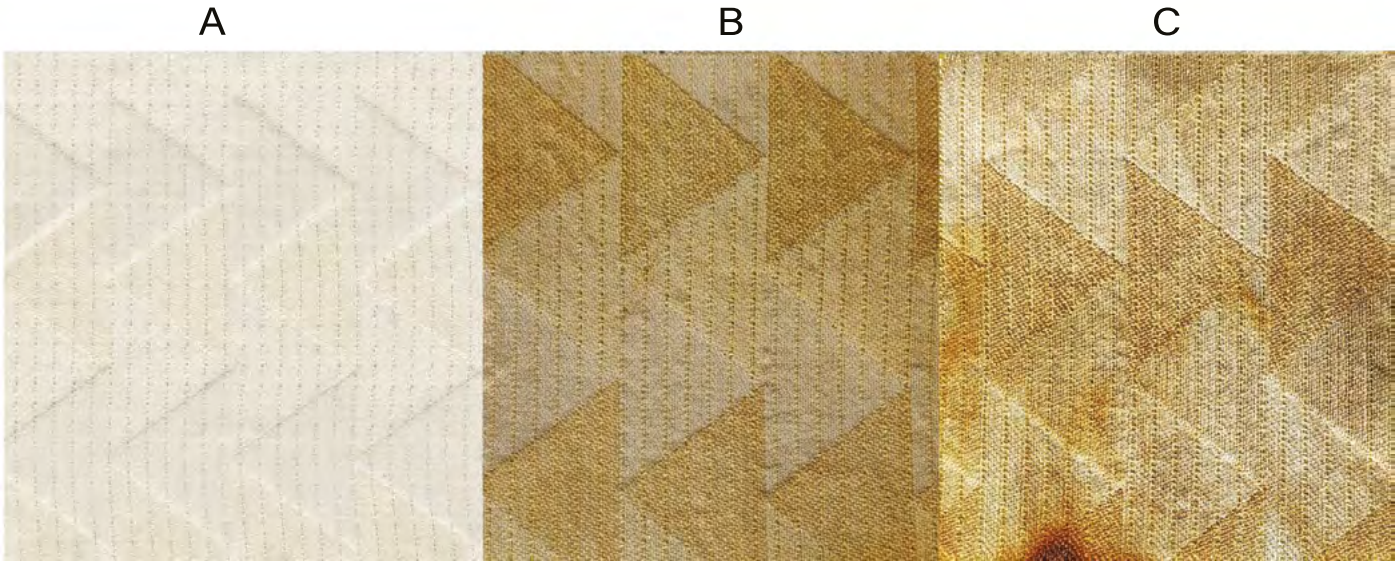

Figure 1. The transformation of the textile design into various color schemes after the exposure to changing water conditions that are rich in iron similar to the iron-rich areas of the Baltic Sea.

Co-designing with Nature: Experiment 2

In the second experiment, colour changes brought about by long-time exposure to natural conditions were explored by placing plain wool/cotton and paper/cotton textile samples along with patterned, Jacquard-woven samples made in wool, paper, polyester, and cotton in closed jars together with different kinds of food waste for a period of several years. At the time of writing, the experiment was on its eighth year and still ongoing. Four of the jars were prepared with plain wool/cotton and paper/cotton textile samples at the bottom and vegetable peels, lingonberries, a banana, and an orange, respectively, were placed on top of the textile samples, and two of the jars had patterned, Jacquard-woven textile samples made of wool, paper, polyester, and cotton yarn placed at the bottom and vegetable peels and coffee grounds, respectively, on top of the samples. The samples were photo-documented after three years, and again after seven years without removing them from the jars (Fig. 2). After three years, the foodstuff had dyed the fabrics in varying shades ranging from red (Fig. 2, row 6: the jar with lingonberries) and orange (Fig. 2, row 2: the jar with vegetable peels) to brown (Fig. 2, row 1: the jar with coffee grounds). The textile samples placed together with the banana and the orange displayed the smallest change (Fig. 2, rows 4 and 5, respectively). After seven years, the colours of all textile samples had faded and were tinted in shades of brown (Fig. 2, column 4). In all samples, the wool yarn had acquired the most colour. It should be noted that there was practically no mould in the jars, which was likely due to the jars having been thoroughly disinfected prior to being prepared.

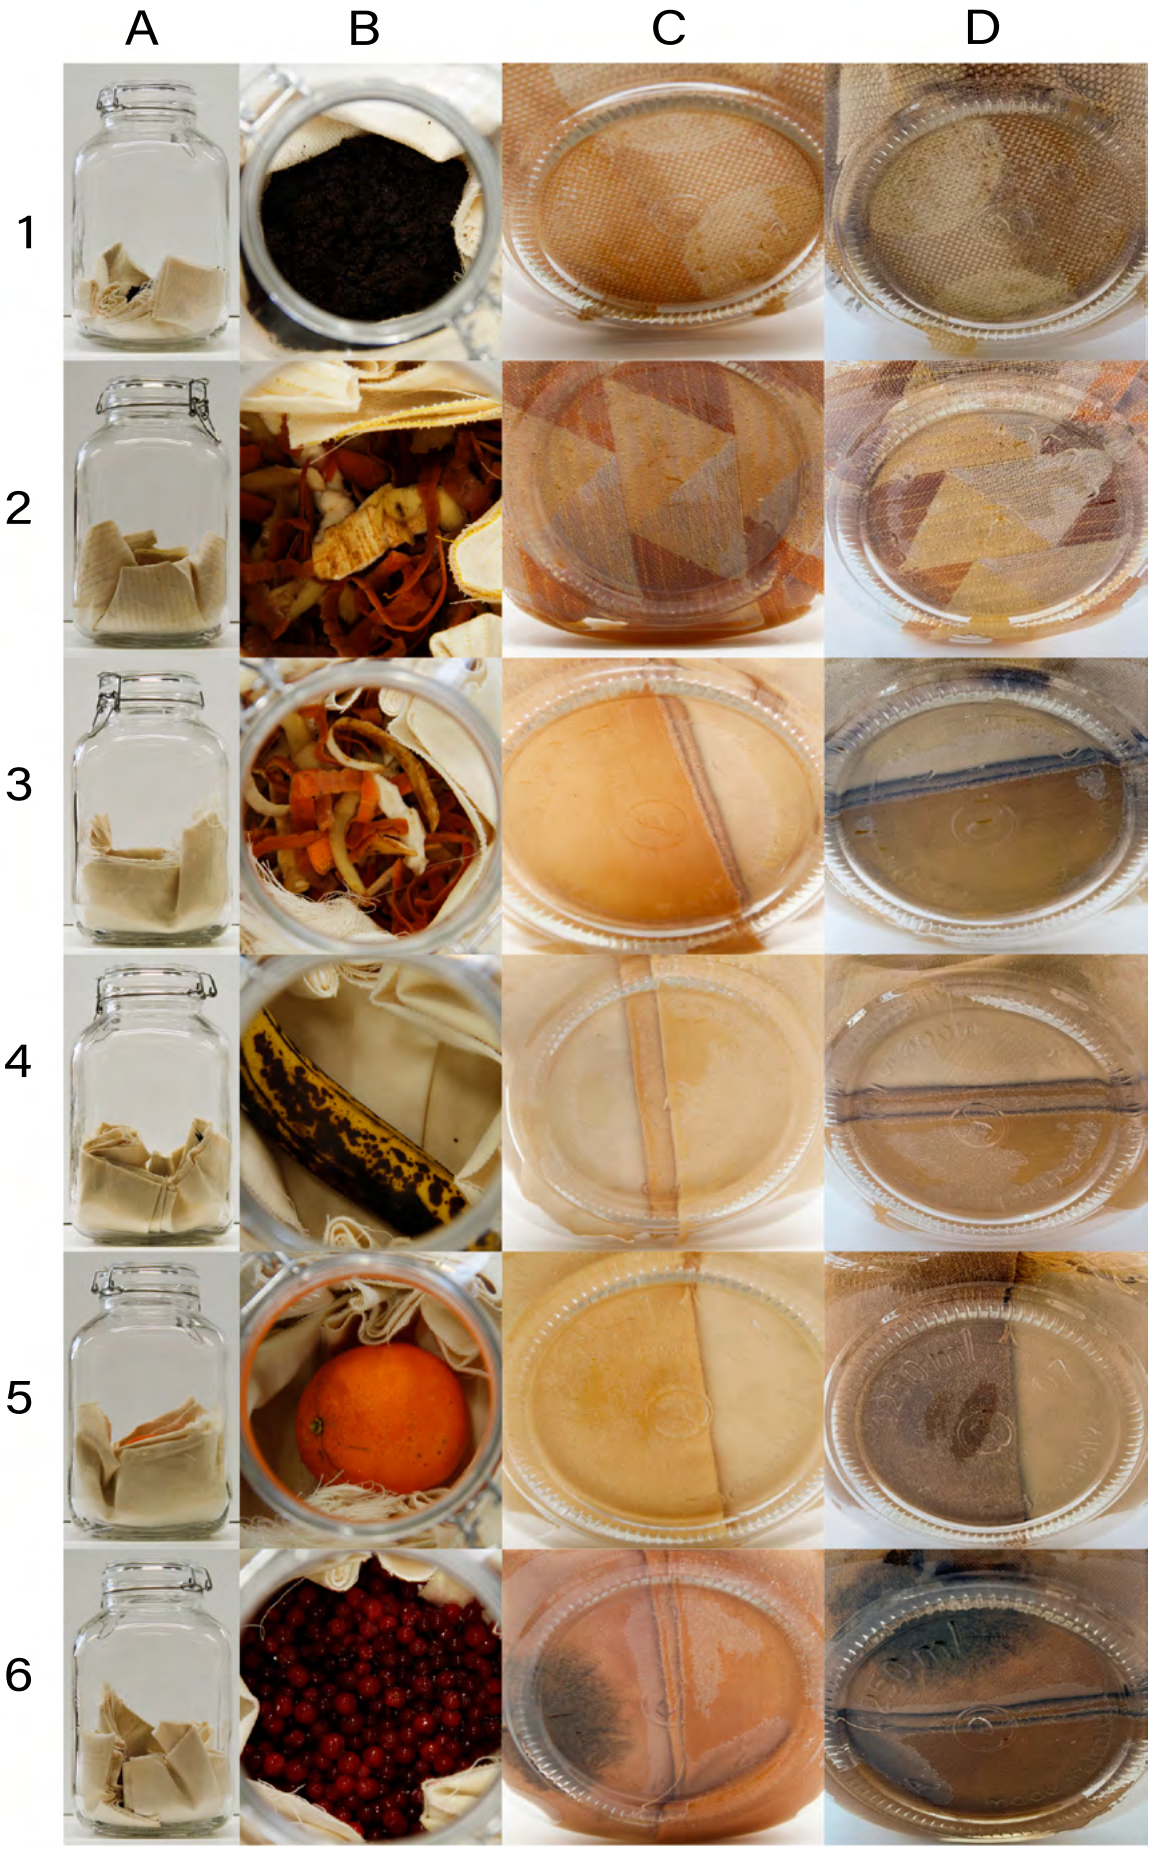

Figure 2. Experiments showing the variation in color on textiles after exposure using fruits and food waste.

3.3 Exploring Recurring Changes Over Time in Response to Ambient Stimuli

Extending the Aesthetic Discovery with Responsive Materials: From Mono-Changes to Multimodal Changes

Mono-Changes: Experiment 3

Short-term, recurring changes were explored using UV-reactive, colour-changing, and light-emitting yarns, which react to the ambient energy of sunlight and therefore change their expressions in outdoor contexts depending on UV intensity. Using yarns in which the colour changes were reversible allowed the creation of textiles that had different expressions in daytime or nighttime, and the UV-reactive, colour-changing yarns changed colour from white to another colour when exposed to UV light, and then back to white again when no longer exposed to light. The light-emitting yarns recharged when placed outdoors, even when not exposed to direct sunlight, and emitted a yellowish glow that was visible in the dark and which lasted for several hours. The UV-reactive colour-changing yarns were made of polyester and had different lengths of life. The photochromic pigments used in colour-changing yarns have a relatively low lightfastness, meaning that over time the dynamic effect decreases and the yarns cease to react to UV stimuli. More durable alternatives based on natural hackmanite crystals exist but are not yet commercially available in yarn form. The photoluminescent pigments used in the light-emitting yarns are harmless to the environment and have exceptionally long lives, as their light-emitting properties either do not deteriorate over time at all or do so to a lesser extent.

The textile samples used in the Experiments 3 were created using Dubied hand-knitting machines and computerized ARM handlooms. The knitted samples explored the effect of UV-reactive colour-changing yarns (Fig 3). Delicate lines of different colors occur in the knitted as exposed to the UV value of daylight. The colour effect is stronger in direct sunlight. When activated, lines of different colours enhance the three-dimensional expression of the knitted shape.

Figure 3. Emerging color changes patterns in knitted structures.

The second series of experiments were woven on a computerised ARM loom. Experiments 4 explored gradient colour effects created by varying the proportion of materials used, as well as weft-warp thread ratio (Fig. 4) in order to create a smooth gradient colour effect that went from relatively low to relatively high light intensity.

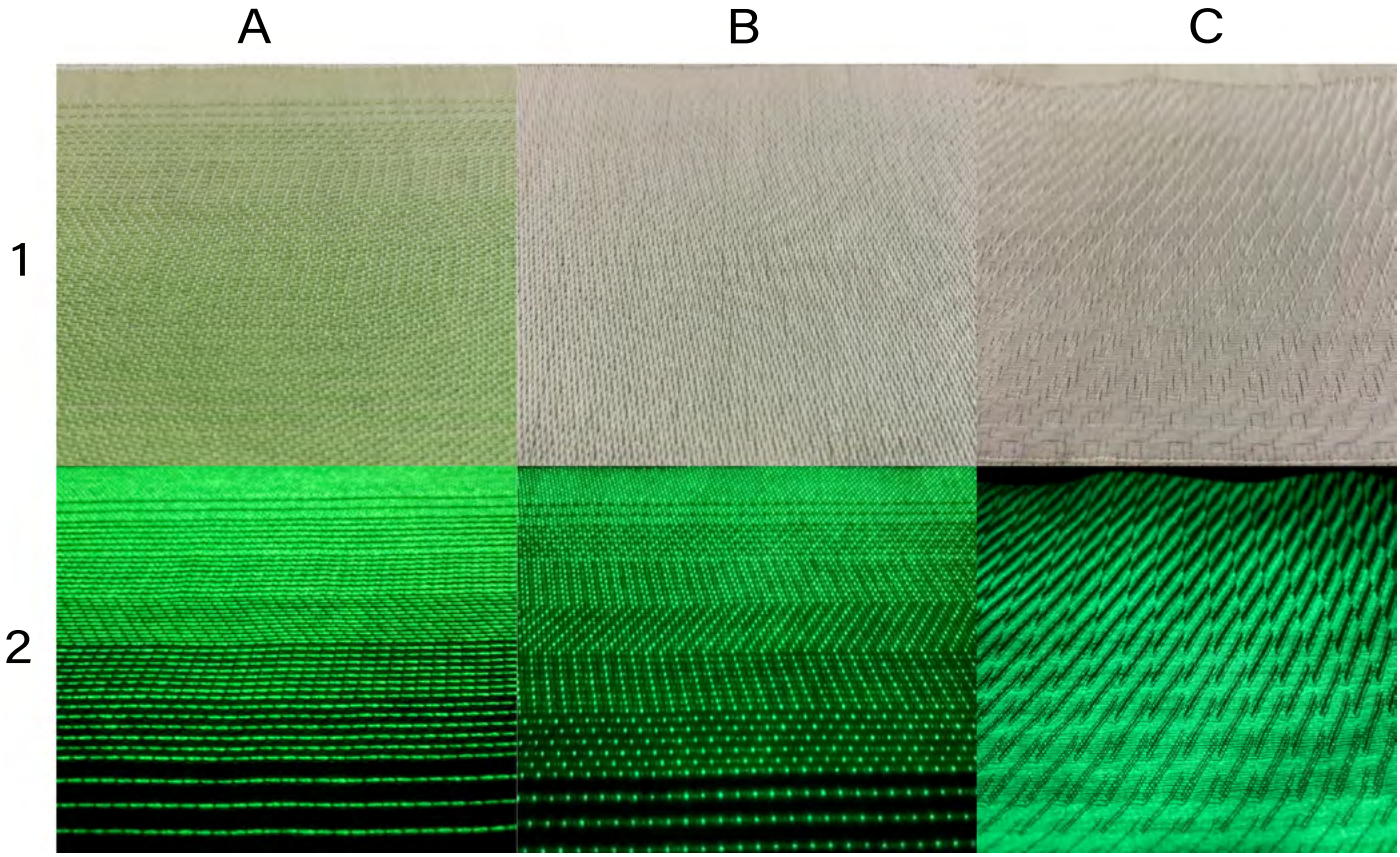

Figure 4. Emerging expressions of the UV-graded patterns in different woven structures.

Dual Changes: Experiment 4

Experiment 4 explored different methods of enhancing the light intensity of the light-emitting yarn and making less prominent the line pattern it created in its inactive state. White paper yarn reflected some light, enhanced the glow effect, and slightly diffused the lines of light created by the light-emitting yarn (Fig. 5, column 1, row 1). Two reflective yarns were also tested, but the intensity of the light emitted by the light-emitting yarn was not strong enough to activate them, therefore they appeared to be black in the dark, which enhanced the contrast in the striped pattern (Fig. 5, column 1, row 2). Reflective yarns could, however, be used to make the fabric visible in the dark when struck by strong light, such as the headlights of cars. To enhance the intensity of the emitted light and disrupt the pattern of the textile, two polyester Lurex bands with metallic coating were used, one of which was a matte gold colour and the other a shiny silver (Fig. 5, column 3, row 1). These gave a subtle shine and texture at close range but were not visible from a distance (Fig. 5, column 3, row 2). An attempt to change the colour of the yellowish glow of the textile sample was made by placing light-emitting yarn between two layers of the transparent, red plastic band; this did not change the colour of the glow, however, and the only effect produced was the glow becoming dimmer due to the red plastic band blocking the light emitted by the light-emitting yarn (Fig. 5, column 3, row 2). In addition, water-soluble polyvinyl alcohol (PVA) and heat-dissolving thermoplastic copolyamide (coPA) yarns were used as auxiliary materials to enable layers of materials in the woven textile samples to be separated from one another. Both PVA and coPA yarns and their residual waste products are harmless to the environment.

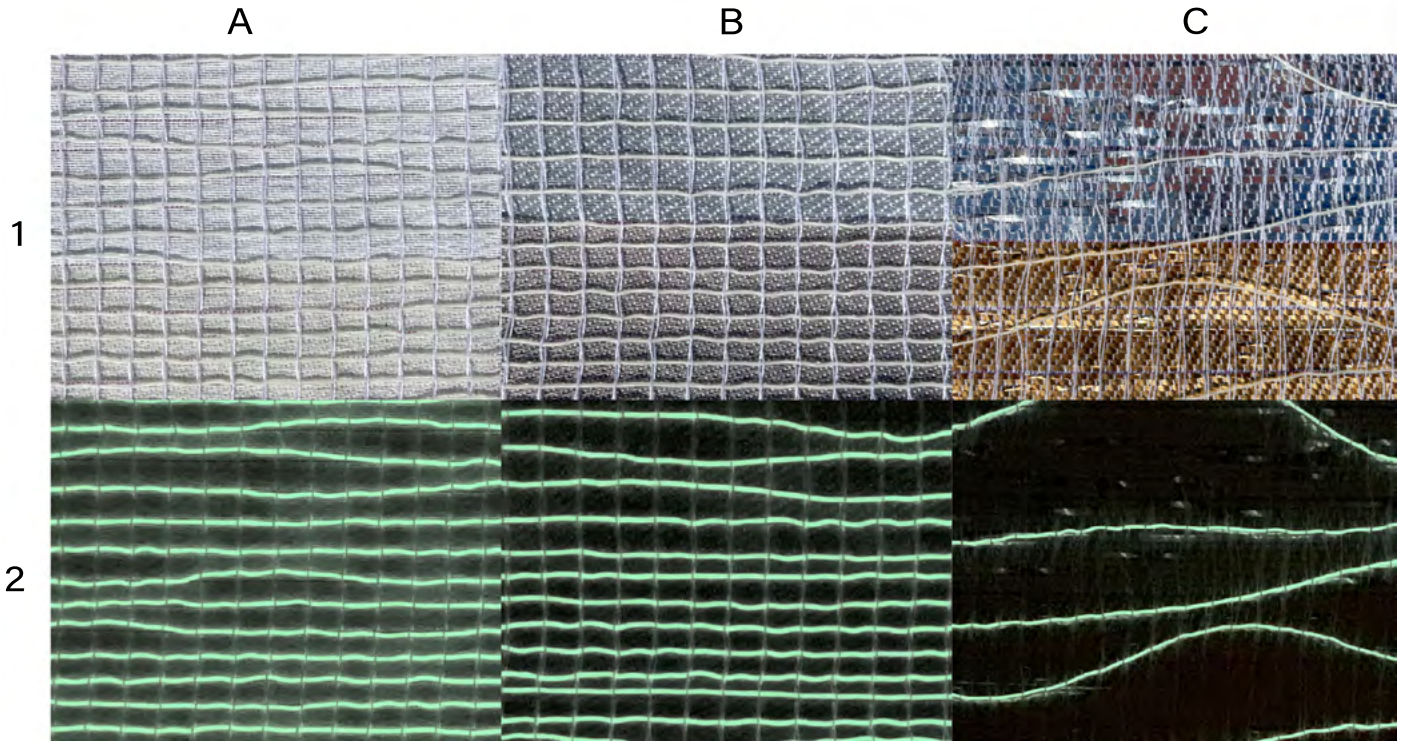

Figure 5. Details of the material layers in the structural design woven design that are seen in the daylight and night time.

Multi-Modal Changes: Experiment 5

Experiment 5 (Fig. 6) is focused on the development of multi-modal expressions that are triggered by the appearance and intensity of UV light. The sample is a mono-material textile based on polyester yarns with different charging capabilities. The background material is knitted with heat-reactive yarns. When exposed to heat, the yarns shrink irreversibly and can keep the desired shape. An origami structure was transferred by pleating the material to demonstrate how three-dimensional shaping can be applied to the material after production. The sample is knitted in an industrial process using an inverse plating technique to apply a repeated pattern on a mesh structure.

The plated pattern is designed with three UV-reactive yarns: two color-changing and one light-emitting. During the daytime, the color-changing yarns transform from white to pink and purple, following a repeated geometric pattern (Fig. 6, B). The quality and the position of the UV light influence the intensity, gradation, and occurrence of the colored pattern on the textile surface and form. The light-emitting yarns are charged during the day and become visible when dark. The creases of the surface influence the difference in intensity of the light pattern (Fig. 6, C). The pattern activates a part of the shape, providing a new expression to the initial form. The sample aims to demonstrate how multi-modal expressions can be embedded in structural design, extending by design the curiosity of surface exploration. The rhythm of change in the pattern of the surface design has a seasonal quality that depends on the intensity of the UV light in the environment. A rainy day can trigger discrete changes in pattern, while in the summer, the color design appears with full intensity. The way the textiles are positioned by the user in relation to the window and the length of exposure determine the color changes and the accuracy of the light-emitting pattern. Changes can also be triggered by the user when using a UV lamp. In this case, the changes appear and disappear at a fast pace compared to the activation given by the natural light.

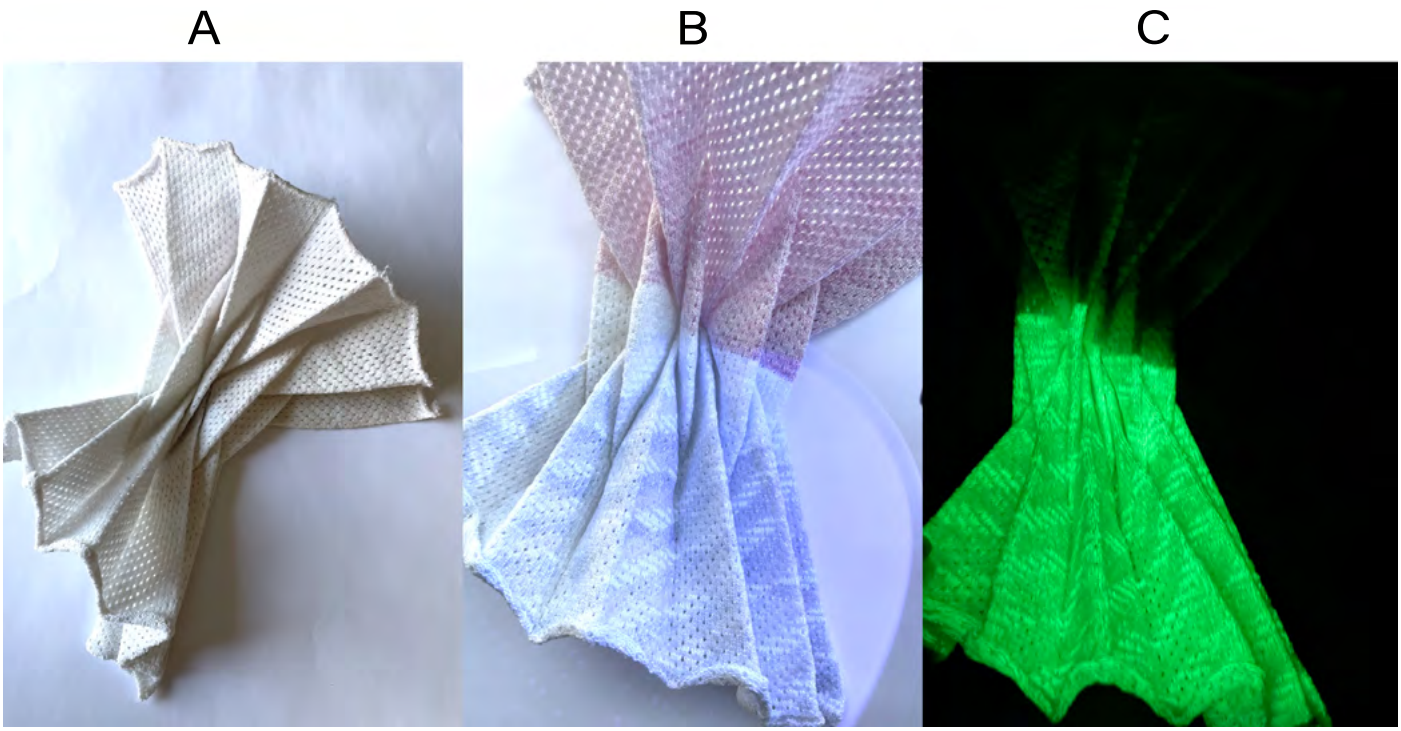

Figure 6. The changeability of textile patterns when exposed to UV light under different lighting conditions.

3.4 Summarizing the Experiments

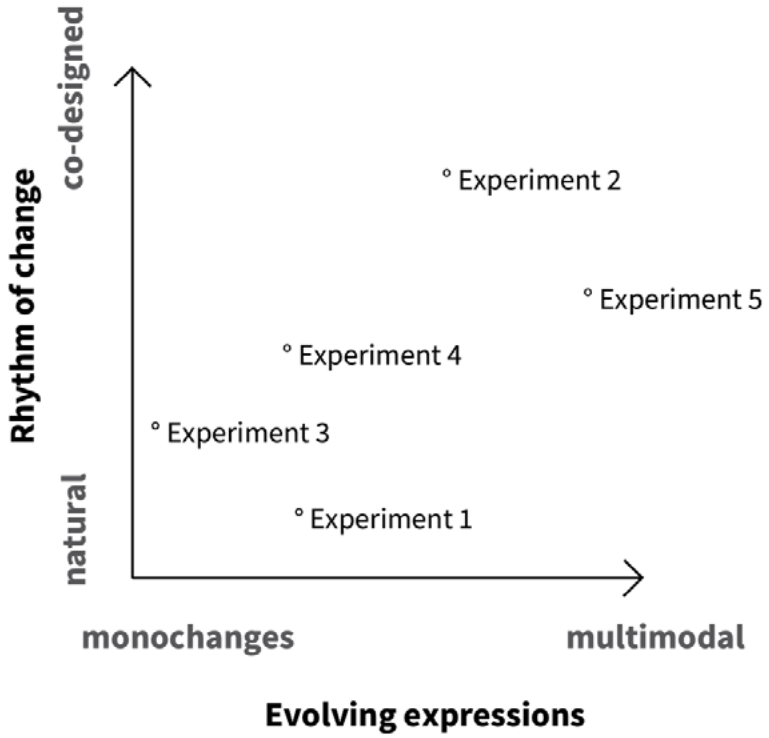

Figure 7. A graphical representation of the experiments structured according to the rhythm of change related to the evolving expressions of textile structures.

A graphical representation (Fig. 7) is proposed as a framework for the experiments to give structure to the material library. The samples are positioned according to rhythms of transformation and the variation of

expressions each material embeds. The evolving expressions in each sample depend on the property of the yarns used and how the structure is designed to exhibit changes. The changes in expression can vary from dual expressions to multi-modal expressions, and the changes may be permanent or reversible. The rhythm of transformation can depend on activation triggered by natural phenomena like the exposure to UV light from the surrounding environment (as in Experiment 3) or the conditions of water such as the presence of bacteria, minerals and the variation of PH values (as in Experiments 1 and 2). Human actions also influence the rhythm of change by manipulating the material surface (as in Experiment 4), varying the material placement in the environment (as in Experiment 5), or by using the agency of the environment to co-design (as in Experiment 2) in the textile using natural or artificial triggers for change.

4. Discussion: Expanding Sustainable Material Systems

For years, material innovation in the field of textiles has been linked to smart textiles as computational materials, which are activated by electrical power. Integrated into daily living, smart textiles aimed to hide complex technology in products using the familiar interface of textiles. However, in recent years, the material paradigm shifted from digital to bio-based materials. Recent research demonstrates that transformation and responsiveness in textile materials can be achieved using bio-based matter to trigger changes through using the agency of the natural environment (Worbin, 2013; Keune, 2017; Talman, 2018). Users can be co-designers to enhance the material expressiveness by surface manipulation and wear (Karana, et al., 2017). To complement this, the textile's extended multimodal attributes presented in this research suggest an alternative responsive material system to design for a prolonged lifespan.

Using experimental research methods, the research illustrates how textile methodology and materiality can be tackled to support sustainability from a bottom-up perspective. The sample library provided by this research extends the research in sustainable, innovative textile systems by exploring the role of material expressiveness. The material library developed exemplifies alternatives to the experience of daily living that both source and preserve energy and offer multiple possibilities for customization and location-specific applications. The context of use for these textiles spans from body to space. Some of the material choices, wool and cotton linen, indicate that some textile samples are more appropriate for use in clothing, such as in the case of Experiments 1, 2 and 3. The material choices in Experiments 4, and 5, which are based on the use of man-made responsive yarns and multimodal expressions, suggest the interior as a context of use. Further, material science collaborations with design fields can innovate on bio-based smart yarns that have properties and expressions like the man-made yarns that were used in this research. This aligns with a vision of sustainable smart materials that can bring a gentler imprint to the environment and can be used in products for daily living that capture and maintain our interest over extended periods of time. A holistic approach can be further developed to combine the properties of the raw materials, their sustainability, and the emotional aspects that counter the obsolescence of expression.

Generally, in the design field, the lifespan of textiles has been discussed from a material durability perspective. In contrast, in this research, we aim to open new dialogues towards the role of design methodology and aesthetics in sustainable product development by suggesting complementary perspectives and strategies. These include the perspective of emotional durability and the strategy of generating more sustainable behaviors through understanding and direct interaction with textile materials and products. The materials proposed relate through their design of natural and man-made fibers and are used to speculate how multi-modal textile expressions can be designed, and how alternative rhythms of use can be created. Complementary to the method of Fletcher and Tham (2004), here, the rhythm of nature as an agent for change is integrated into the textile expression relating to the user's actions and mediates how reality can be presented to us when linking our daily experiences through textiles to the pace of nature. As a result, the graphical illustration proposed by this research aims to structure and characterize the materials developed. The illustration can be used as a framework by others to further develop new material ideas, for example, how responsive textiles as design materials can act as a mediator of people's presence and actions in specific geographic locations or environmental conditions.

The framework developed in this research can also be integrated in the sustainable model proposed by Ceschin & Gaziulusoy (2016) to add the textile/material perspective at the product development level. By relating in this way frameworks of different domains, cross-disciplinary approaches can be further created to expand the material domain to a systemic level. Furthermore, the strategies proposed can be integrated into the design of a broader systemic thinking model for sustainability where the product design level can be enriched, for example, by projecting the concept of emotional durability within new visions. These new visions could start at the material level and generate more personalized object interactions, services, and social innovation that expand on user understanding within its social context.

About the Authors:

Delia Dumitrescu is a professor of textile design and head of the Smart Textiles Design Lab. Her cross-disciplinary research focuses on developing smart material design methods and aesthetics using industrial textile manufacturing and digital technology for diverse applications, e.g., body and interiors.

Erin Lewis is a senior lecturer in textile interaction design. Her research explores smart textile design methods and tools and the use of AI to enhance design creativity. At the material level, she specifically engages with the electromagnetic expressive domain through techniques of industrial weaving and knitting.

Riikka Talman is a senior lecturer in textile design. Using advanced methods for knitting and weaving, her research focuses on the development of alternative design methods for sustainable textile having the material's changeability in expression as the main area of investigation.

Acknowledgements: This research is part of the cross-disciplinary project: Nordic network on smart light-conversion textiles beyond electric circuits (Beyond e-Textiles**)** funded by NordForsk.

KEYWORDS | CLIMATE CARE, SUSTAINABLE INTERACTION DESIGN, SUSTAINABILITY THROUGH DESIGN, PRO-ENVIRONMENTAL BEHAVIOURS, ENHANCED-LEARNING TECHNOLOGY

ABSTRACT | The current climate crisis poses an urgent need to raise people's awareness to promote a socio-cultural transition towards more sustainable and environmentally friendly lifestyles. In this case, technological innovation becomes a tool to support this change by designing interactive experiences that promote social education for sustainable development. Starting from this, the contribution presents the outcomes of an experimental and participatory workshop that uses the Sustainable Interaction Design (SIxD) approach, for the development of design solutions, capable of increasing people's knowledge, values and attitudes, in order to encourage them to adopt pro-environmental behaviours, through experiential learning and interaction.

1. Introduction

The current climate crisis poses an urgent need to raise designers' awareness to promote a socio-cultural transition towards more sustainable and environmentally friendly lifestyles (Clayton, Schwartz, 2019). Designing artefacts, services, and environments effectively about complex, confusing, uncertain, sometimes overwhelming, and often emotionally and politically loaded, such as climate change, climate extremes, and compound events, is challenging but related to the responsibility of design and education to increase ecological awareness.

This field has rapidly grown with the contribution of numerous disciplines, among which we consider Sustainable Interaction Design (SIxD) (Blevis, 2007; Blevis & Blevis, 2010), which has widened and deepened its scope towards establishing an experimental design-driven and human-centred discipline for motivating behavioural change, also concerning automated decisions that overcome people's awareness. Another impact of SIxD relies on integrating meaningfully rich visualisation of climate change trends with design, pedagogy, experiential and reflective actions about ethical decision-making, and emotional interactions (Clarke et al., 2019).

Starting from this, the contribution presents the outcomes of an interaction design education initiative, the Sustainable interaction Design for Climate Care, that has been developed as a design research and education workshop with the goal to foster sustainable futures. The design education workshop applied participatory, experimental, and collective design research competences to the interpretation of the world as made up of complex human-technology-environment assemblages (Light, 2022). The design education activities described in this contribution have been implemented within the EU H2020 funded research and innovation project GreenScent – Smart Citizen Education for a Green Future, a multidisciplinary project aiming to support and enable European citizens, especially the younger generations, to actively become the main actors of social change for sustainable development and environmental protection through education, citizen science, and civic engagement. GreenScent researchers and educators involved in the project have been engaged in the design workshop activities to answer questions like “Can we build on and expand the trained sensitivity to complexity for understanding complex phenomena through design?”, “Can we make use of design research methods to proliferate the means to make sense of the world?”, “Can we design interactive technologies aimed at fostering awareness, empowerment, culture and social coexistence?”.

In particular, the initiative provided the participant students coming from fields like interaction and experience design, graphic design, communication design, and service design, with concepts, methods, materials to tame challenges like designing systems for mitigating complex socio-technical and multi-layered phenomena (Norman & Stappers, 2015), such as climate change.

This contribution has the goal to increase designers' commitment towards sustainability and ultimately to turn design community culture into care through experiential learning and interaction. Par.2 introduces the two main aspects of the design brief that has been proposed to design students: the climate change challenge as a multi-layered and complex issue, and the Sustainable Interaction Design as the main perspective to take and develop for the education initiative.

2. The Design Brief of Sustainable Interaction Design for Climate Care

2.1 Climate Change as a Challenge

In the last few years, recent climate anomalies provoked by global warming, which have caused the hottest record of modern meteorological history and increased the frequency and intensity of extreme climate events, are the indisputable reality of an increasing climate crisis closest to the tipping point (Loi, 2022; Lovelock, 2020).

Indeed, all catastrophic effects caused by the Anthropocene are accelerating their negative impact on our global ecosystem with significant climatic, ecological and environmental changes that encompass environmental pollution, biodiversity loss, desertification, floods, and rising sea levels, which undermine the survival of all living species, including humans (Clarke et al., 2019; Toni, 2020).

Our society must limit Earth's temperature to 1.5°, compared to pre-industrial levels, to mitigate catastrophic consequences on our lives. This manoeuvre would require the reduction of global anthropogenic carbon dioxide emissions by about 45% from 2010 levels by 2030, reaching net zero around 2050 (IPCC, 2018). Since a significant part of these phenomena arises directly from the accumulation of lifestyles and habits related to an economic-industrial society without limits, the current environmental scenario requires a drastic change of direction, which would foster the social transition from an ecological-cultural point of view (Clayton & Schwartz, 2019).

Furthermore, limiting global warming is not only a matter of environmental justice but also social justice towards the new generations and the most vulnerable and marginalised people who suffer the most severe consequences of the dominant industrial system (Escobar, 2018). For these reasons, it is vitally essential to inclusively equip all people with an integrated and holistic approach to sustainability education to untangle and deconstruct the logic of the present and critically reflect on the values, beliefs, and visions that affect the today's technocratic and anthropocentric world, aiming at co-constructing new shared meanings that can contribute growing more accessible, equitable, and environmentally friendly societies (Cebrián & Junyent, 2015; Thackara, 2006).

2.2 Sustainable Interaction Design as a Critical Perspective

Within this scenario, the field of Human-Computer Interaction (HCI) can take on a significant role in supporting and promoting a new social transition capable of increasing people's knowledge, values, and attitudes towards a more sustainable future. That can happen through the construction of new relationships with digital technologies that go beyond the idea of evaluating interaction design as a simple bridging discipline for communicating with machines and of considering it more as a cultural phenomenon capable of transforming anthropocentric design principles and practices into a more responsible approach that relies on climate cure (Light, 2022).

This perspective can find great support in Sustainable Interaction Design (SIxD), i.e. a recent design movement that uses the complex concept of environmental sustainability as a critical key to rethinking the role and outcomes of those design practices that focus their objectives on ideating and developing interactive technologies (Blevis & Stolterman, 2007). As defined by Mankoff and his colleagues (Mankoff et al., 2007), two macro design principles are the backbone of SIxD:

Sustainability through Design: this principle uses interactive technologies for behavioural change that promotes sustainable decision-making processes and lifestyles. It can intervene both at an individual level (for example, making environmental data tangible to encourage people to increase their awareness in improving their ecological footprint) and at a public level, the aim of which is to allow a social movement, collective actions, and a long-term cultural change for advocating environmental sustainability (for example, simulating or predicting the long-term consequences of improper use of fossil fuel transportation or poor waste management).

Sustainability in Design: this principle focuses on promoting responsible design processes and practices for environmental sustainability to limit those technological developing systems implied in producing new physical products and hardware that could have a material impact on the environment, according to practices of minimising material content and consumption, increasing energy efficiency and extending the product life cycle to reduce potential scraps and discards at a minimum.

The objective of the proposition of the Sustainable Interaction Design for Climate Care education initiative is to embrace the principles of participatory and experimental design concerning the creation of interactive

training experiences based on technology-enhanced learning, which are promoted to encourage people to adopt and include pro-environmental behaviours (PEBs) within their lives in everyday society.
The GreenSCENT project framework to provides students participants with examples of hybrid scenarios capable of intertwining the interdisciplinary learning approach of Education for Sustainable Development (Cebrián & Junyent, 2015) – consisting of prioritising competencies such as problem-solving, critical and systemic thinking, and ethical decision-making and behavioural processes – with accessible and inclusive narratives and interactions that enrich the quality and engagement of the user experience.

3. The Sustainable Interaction Design for Climate Care Workshop

3.1 Workshop Methodology

This contribution highlights a particular experimental and participatory design research conducted within the program of annual summer workshops organised and promoted by the Department of Design at the University of the Republic of San Marino. On that occasion, the researchers organised an intensive co-design laboratory on topics related to SIxD for climate care involving 20 students from different Bachelor and Master Degree courses in Design from all over Italy. The entire workshop lasted five working days from Monday to Friday, in which the researchers structured the activities into a strict set of lectures and theoretical and practical activities (Figure 1).

Time Schedule

	MONDAY	TUESDAY	WEDNESDAY	THURSDAY	FRIDAY
9:30		**Lecture 03**	**Workshop**	**Workshop**	**Exhibit development**
10:00		**Lecture 04**	Group presentation	UI Concept development	Poster Preparation & Print
11:00	**Brief Presentation**		Concept development - Interactions - User Experience - Service & Technologies		UI Prototype DEMO Preparation
11:30		**Workshop**			
12:00	**Lecture 01**	Concept generation - Cycle 3	Scenarios > Interactions > Flows		
13:00					
14:00	**Workshop**	Design Concept development:			
15:00	Concept generation - Cycle 1	- Presentation - Concept assessment - Ratings - Concept evolution	Scenarios > Interactions > Flows	UI Concept refinement and validation	**Final Exhibition**
16:00	**Lecture 02**		UI Concept development		
17:00	Concept generation - Cycle 2	Expression of interest > Group creation			
18:00					

Figure 1. Workshop time schedule.

The close collaboration between the participants generates the opportunity to conceive and prototype tangible design solutions aiming at increasing ecological awareness and pro-environmental behaviours. Starting from a short introductory brief in which the research team presented the purpose of the Sustainable Interaction Design for Climate Care education initiative, the same researchers introduced and described the specific objectives and expected outcomes of the workshop. Specifically, the introductory part of the workshop explained to the participants the design methodology they would have adopted during the design process, which was based on design challenge-based learning (Blevis, 2010). This methodology, which lays on the studio-style learning approach, uses a combination of learning strategies such as:

- promoting collaboration;
- encouraging public critique and engagement in peer learning;
- ensuring that thoughtful problem-setting precedes problem-solving;
- fostering transdisciplinary, values-centred goals.

The entire design process divided the laboratory into three macro theoretical and practical modules or activities to develop the project:

- lectures;
- concept generation;
- interaction design concepts prototyping.

The first two macro activities were carried out in the first two days of the workshop. At the same time, the third and most important activity was carried out in the three remaining days that have concluded the laboratory. The proposed design education activities are described in detail in the following sections.

3.2 Design Education 1 – Lectures from the Experts

Over the first two days, this first macro phase provided a series of lectures' and insights conducted by four different experts in the fields of physical geography, behavioural psychology, energy and environmental engineering, digital media accessibility, and responsible innovation for society. Such a diverse panel of researchers allowed participants to acquire fundamental knowledge and skills to address the complexities of issues related to climate change and sustainability through a transdisciplinary perspective. Furthermore, the topics exposed by the various lectures served as theoretical content to support the concept design activity, aiming at helping participants devise design solutions capable of addressing environmental issues related to sustainability and, at the same time, encouraging pro-environmental actions associated with climate care.

During Day 1 and Day 2 the workshop hosted four lectures. That provided specific skills and design ideas that were as consistent as possible with the objectives of the overall research project. In particular, the lessons concerned the following research topics:

- "Climate change: the urgency for a change and a challenge for the future", Prof. Biljana Basarin, Department of Geography, University of Novi Sad, Novi Sad, Serbia;
- "Pro-environmental behaviours", Dr. Raffaele Barresi, Faculty of Psychology, International Telematic University UNINETTUNO, Rome, Italy;
- "Sustainable because Accessible: Inclusion & Diversity", Dr. Sarah Anne Mcdonagh, TransMedia Catalonia, Universitat Autònoma de Barcelona, Barcelona, Spain;
- "Responsible Research and Innovation", Dr. Zarrin Fatima, VTT Technical Research Centre, Helsinki, Finland.

3.3 Design Education 2 – Iterative and Collective Concept Generation

As for the first module, the second activity was conducted in the first two days of the laboratory through two main phases, which allowed the students to creatively generate different design concepts that offered valid solutions for climate care. The first phase was characterised by an intense brainstorming sessopm, which generated a collective mind map in which each participant individually collected and sorted numerous themes, trends, and keywords on sustainability that consequently allowed the students' groups to define the design challenges associated with raising awareness on the urgency of environmental sustainability.

All the design challenges have been identified and collected around eight specific areas of intervention that coincide with the strategic objectives of climate neutrality pursued by the European Green Deal: 1. Climate Change, 2. Clean Energy, 3. Circular Economy, 4. Green Buildings, 5. Smart Mobility, 6. From Farm to Fork, 7. Biodiversity, 8. Zero Pollution.

In particular, design students' groups identified a series of critical issues related to human factors like intrinsic motivation for behavioural change, the role of personal values, the influence of community and group culture. Afterwards, in the second phase of the module, the students associated the design challenges with a divergent design phase of generating future concepts. This last phase adopted the speculative design approach (Dunne & Raby, 2013), which enabled students to imagine possible and alternative technological educational experiences that could solve specific environmental challenges, aiming at encouraging and promoting sustainable solutions for climate care.

In order to facilitate the design concept reporting and documentation of each group design process, the research team provided everyone with paper-based graphic templates to collect and describe all functional, technological, and morphological characteristics of each generated concept. Subsequently, the students clustered all the concept solutions through card sorting based on common areas, characteristics, and keywords on a whiteboard. That process created a collective design space to encourage collective design critique to validate, improve, and/or integrate the proposed solutions (Figure 2). The second module included a further brainstorming cycle and two iterative concept generation and refinement cycles. This last phase concluded in the afternoon of the second day with a definitive design concept development process, where the students presented, discussed and voted on all the final solutions that emerged during the whole concept generation activity. At the end of the voting, the research team divided the students into four groups of four people each. Every group selected a concept among those that received the most interest in being developed and prototyped it in the third phase of the workshop.

Figure 2. Image representing the idea concept generation process for documenting students' ideas and design concepts.

3.4 Design Education 3 – Interaction Design Concept Development and Modelling

The third phase of the research team conducted this third phase of activity in the last three days of the workshop. That module allowed participants to carry out a converging and synthetic design activity, which enabled students to transform the most promising concepts – selected in the previous module – into more defined and tangible design solutions through developing mock-ups and functioning digital prototypes. To study and define all interaction principles and models, and the functional characteristics of each design project, the researchers proposed the students adopt the scenario-based design method. That approach enables designers to report relevant user experiences that show representative cases of real-life situations, which expresses in detail the actions performed by the end-users while interacting with a specific context through a step-by-step description (Carroll, 2000; Rosson & Carroll, 2012). According to the purposes of the workshop, the students represented user scenarios where specific challenges or problems related to sustainability education occurred and were resolved by envisioning possible design futures.

The students envisioned interaction scenarios by adopting at first the visual form of the storyboard (Carroll, 2000) and then the prototyping define and implement the role and look-and-feel of the projects. Once the technological, aesthetic, and functional properties and interaction principles were defined, the students transformed their design into concrete working interface prototypes. Although there were only three days to develop the projects concretely, with the help of the researchers, the participants had the opportunity to validate the functionality and usability of their solutions through a quick interactive and iterative cycle of testing and measurement of the results achieved (Rizzo et al., 2001).

To conclude the work process of design education, all four projects were presented and exhibited by the students in a public plenary presentation in a small exhibition within the university, which involved other students, teachers and external visitors. The presentation consisted of a description of the projects depicted on an A2 presentation table – where students showcased their objectives, interaction scenarios and interface mock-ups – and a demonstration of the interactive prototypes.

4. Results of the Design Workshop

4.1 Design Projects

The final results of the research and design experimentation were represented by design projects, which, in turn, guided them in developing interactive prototypes inspired by SIxD principles. All the final projects open a critical reflection around four themes related to climate care: biodiversity, zero pollution, circular economy, and climate change, which arose from the future scenarios and concept generation and prototyping. The four research projects conceived during the design process of the workshop are described below.

4.2 First Project – B-Place

The B-Place mobile application offers a community-based service based on collaborative and participatory social innovation, which aims to promote travel experiences with reduced environmental impact from a bottom-up perspective (Figure 3). The digital platform aims to facilitate sustainable mobility and ethical and conscious consumption by providing users with an AI-based service that evaluates and compares different destinations to each other according to the degree of sustainability generated by their travel offers.

The level of environmental impact of a given location is generated by an algorithm that combines:

- A quantitative data analysis consisting of open-source environmental parameters deriving from meteorological and air quality stations presented in the local area,
- A qualitative data analysis produced by the reviews by the travellers, which take into consideration a series of evaluation parameters, such as the air quality and liveability of the place, the availability of urban green spaces and the sustainable mobility services, the use of clean energy and the zero-mile power supply provided by local facilities, and the presence of sustainable products and services based on circular economy.

In that way, this open and spontaneous sharing of information allows users to plan their travel itineraries by responsibly choosing many factors, such as sustainable transport, services, and facilities that the community recommends or even provides on the application as a responsible alternative to fast travelling.

Figure 3. Interface mock-ups of the B-Place project.

4.3 Second Project – 123…Earth!

The 123...Earth! design is a relevant example of design for children approach that aims to raise awareness among young generations through hybrid narratives and mobile experiences that allow children to understand and touch the emergency of the climate crisis first-hand (Figure 4). The goal is to develop a multi-sensory experience based on the interaction with a personal teddy bear, which acts as the main character in a Augmented Reality (AR) based storytelling. The teddy bear is thought to demonstrate a tale by mean of a conversational interface. Through personal dialogue with it, the system stimulates reflective learning by requiring kids to take notes of their daily pro-environmental actions, as it is a personal diary capable of recording users' everyday behaviours.
Based on the choices made by the young, the system compares them in relation with those of other online

users to calculate the expected consequences of particular behaviour on the environment at a collective level.

Furthermore, by using some principles of gamification, 123…Earth pushes children to improve themselves and acquire new sustainable skills, collaborating, aiming at overcoming daily challenges that encourage sustainable development (for example, reducing water or energy consumption by carrying out daily environmental activities such as turning off lights when they are not needed or not wasting water for brushing teeth).

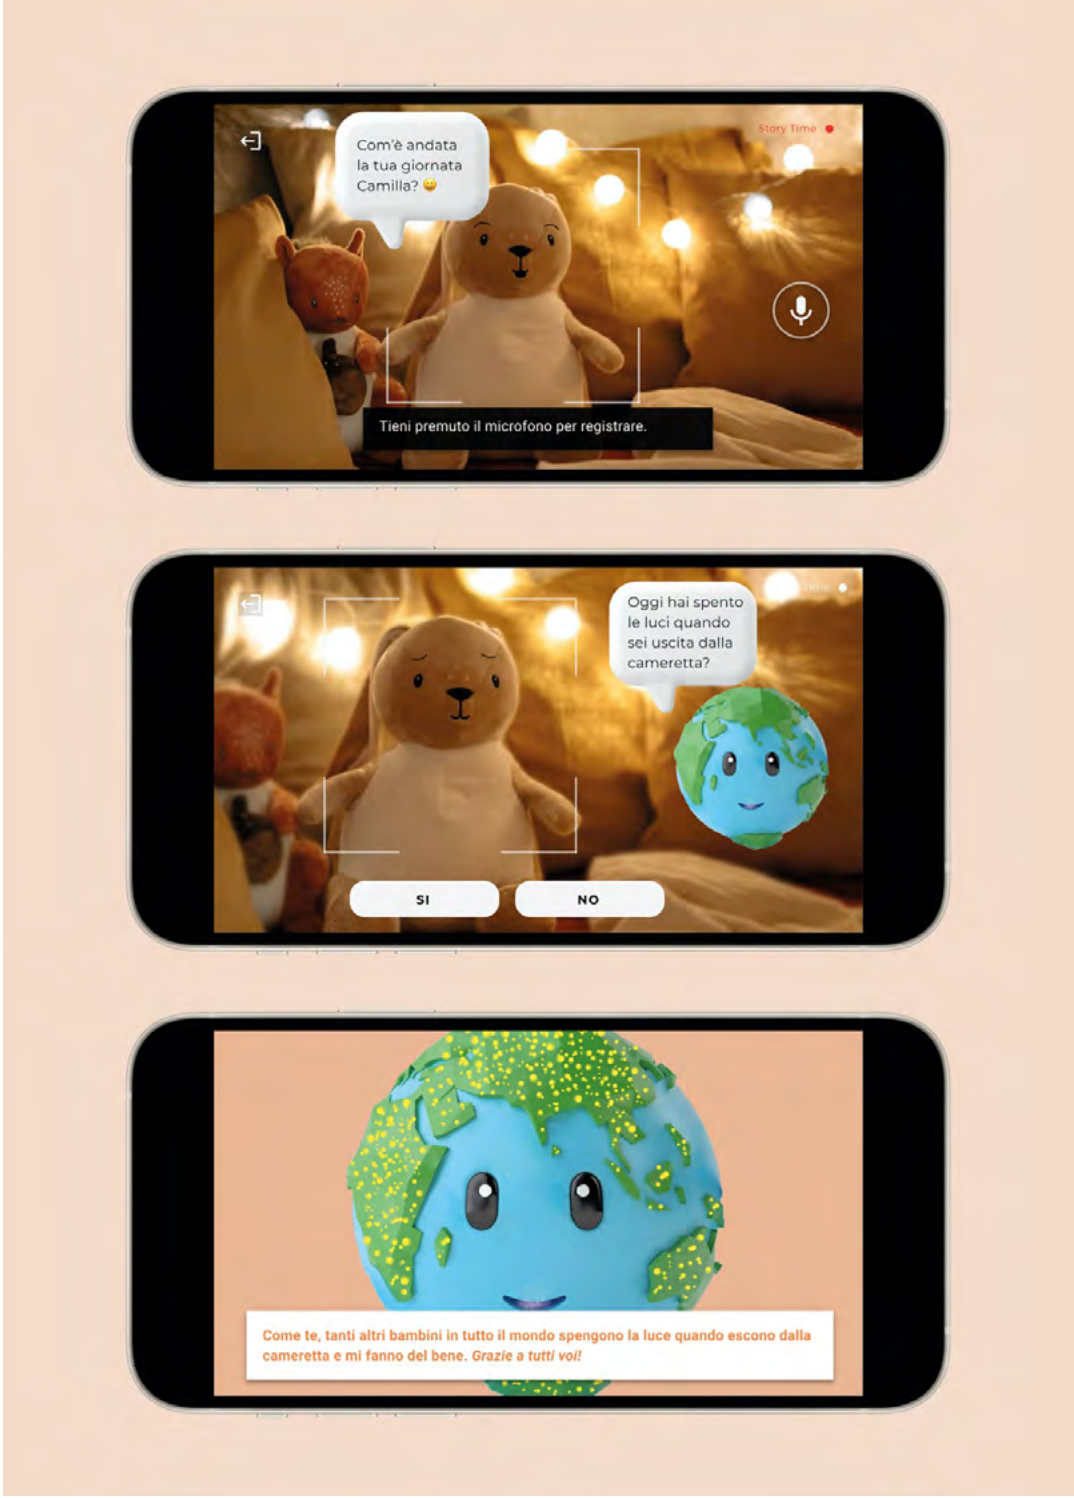

Figure 4. Use case scenario of the project 123…Heart!.

4.4 Third Project – Focus

Focus is a mobile app that explores the biodiversity loss caused by the negative impact of anthropocentric activities on natural ecosystems. In particular, the service aims to increase citizens' awareness of digital pollution through AI-based services. That is a sensitive argument nowadays even though not properly addressed as a source of environmental pollution because invisible and intangible to the users: for example, it is difficult to make it evident in the act of sending an email or uploading a post on a social network. It is hard thus to increase the appropriate awareness of each individual on their behaviour in the digital world.

The service offers a hybrid educational experience that takes place by scanning the photo of specific local vegetable or animal species through the app, from which the users can trace and display all the values relating to its taxonomy and its risk of extinction. Focus will display photos of endangered animals or plants in specific spots of an urban location that are easily visible and accessible to all citizens who wish to engage with the mobile app.

Once the image has been scanned, an image recognition and web crawling service provides the user with the extinction rate of a given species and visualise that through the graphical resolution rate of its corresponding image (Figure 5). The resulting graphic effect, that negatively or positively affects the quality of the image, is therefore proportionally influenced by the percentage rate of extinction of the scanned animal or plant. The greater the degree of extinction of the given species, the greater the degree of pixelation of its image. The species of a given habitat are interconnected with each other as well. So, users can observe how the loss of a species can inevitably compromise the survival of the remaining species annexes.

Furthermore, to stress the urgency that affects the degradation and fragmentation of natural habitats caused by global warming, the system can simulate the loss of biodiversity in a specific local area in the short- or medium-term period by visualising a georeferenced map associated with a timeline.

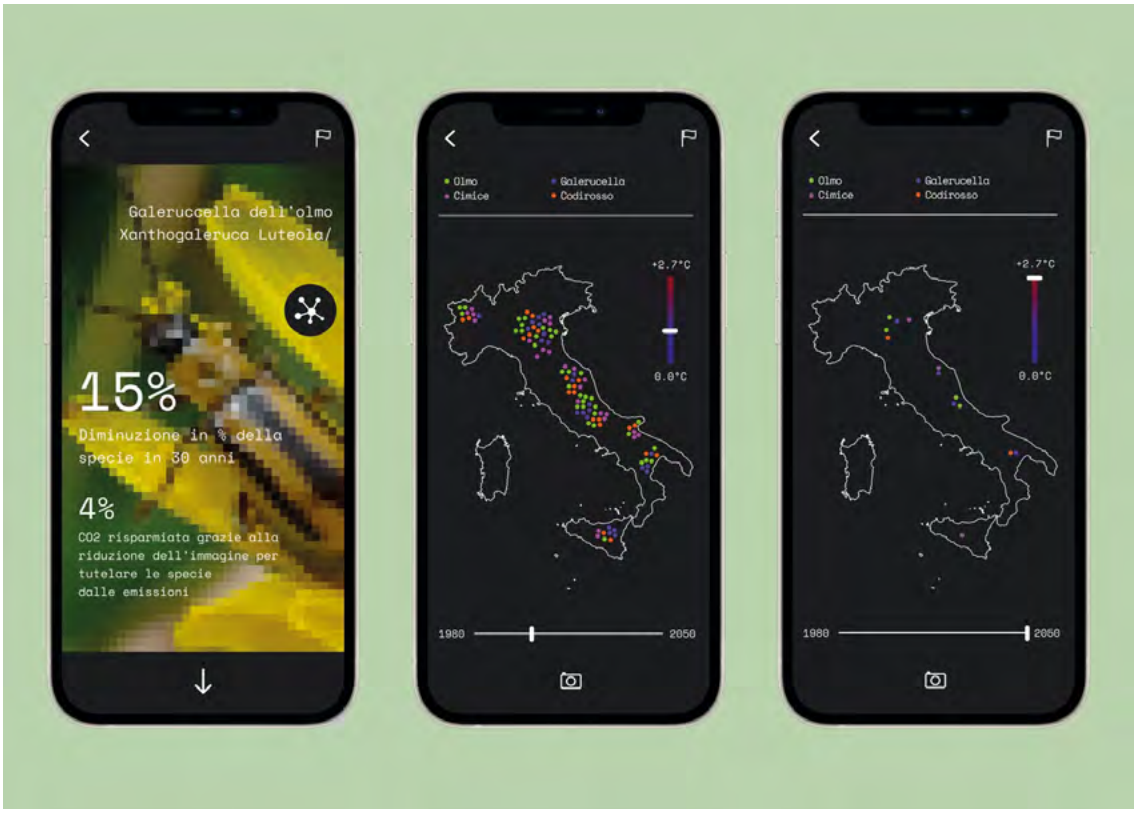

Figure 5. Interface mock-ups of the Focus project: The effect of pixelation emphasises the percentage of extinction of a specific animal or vegetal species.

4.5 Fourth Project – How Much Does it Cost for Us?

How Much Does it Cost for Us? proposes an AI-based mobile app that analyses human decision-making responsibility on conscious consumption choices through a more-than-human perspective in which man lives in an ecosystem that is increasingly interwoven and interconnected with autonomous agents and smart things that give rise to increasingly sustainable, augmented, and intelligent new interactions (Giaccardi & Redström, 2020). Specifically, starting from Lovelock's speculative vision of the Novacene (Lovelock, 2020), namely the era where artificial intelligence permeates everyday life, completely autonomous and intuitive artificial agents become assets that contribute to resolving the problems of climate change by removing human awareness of the climate care equation.

In this case, the prototype explores the idea that human irresponsible behaviours towards environmental care may have no relevance for a sustainable future any more because of that issue will be solved by hyper-intelligent machines – as already happens among the living species of our biosphere – that will be able to adopt resilient and mitigative strategies to regulate the terrestrial ecosystem.

Based on these considerations, the prototype explores and traces new and innovative interaction scenarios between human and technological artefacts in the domestic context.

The project concerns the development of an AI-based plug-in specifically designed for home automation systems such as Alexa, which autonomously manages the consumption on behalf of the users, providing them with affordances and constraints for the action that are designed for making them reflect upon home sustainability. In that case, the plug-in maintains the household carbon footprint within the correct thresholds of environmental sustainability dynamically and adaptively based on the changing situations occurring in the home environment.

However, How Much Does it Cost for Us? seeks a peculiar solution to support users' pro-environmental awareness through daily training. The educational approach occurs through a constant negotiation of decisions with the users, in which each individual is encouraged to reflect on the detriments of their irresponsible actions and, therefore, to adopt virtuous and sustainable behaviours towards the environment (Figure 6). The app monitors the users' daily domestic consumption through the home automation system. If the AI intercepts negative consumption behaviours – for example, the under-load of the washing machine – it temporarily stops human action and invites the users to negotiate their behaviour and to encourage them to make responsible and sustainable decisions. If the users maintain correct and efficient behaviour, the AI supports their actions by showing data and infographics highlighting the reduction of their CO_2 emissions.

Figure 6. An interaction scenario of the How Much Does it Cost for Us? project in the form of visual storytelling.

5. Discussion

The reflections and educational design experiences reported so far highlight the urgency of a substantial change in our lifestyles to promote climate care, which will have to pass through a profound rethinking of the educational paradigms and principles if modern society wants to foster sustainable development. That will aim to become a framework of integrative and multidisciplinary education for behavioural change, which can be adopted and shared at a systemic level by all individuals and social and institutional groups. Specifically, the potential of design-driven approaches for climate care action can take advantage by integrating data-driven explanatory models and AI-based solutions with user-driven approaches. This will enable the definition of intelligent systems for awareness raising, emotional, moral and cognitive engagement, and self-efficacy in introducing behavioural change and novel habits thorugh new interactive artefacts (Garito et al., 2021; Lovelock, 2020).

The results that emerged from the educational experience outline many design values linked to SIxD that can make human-machine interaction more effective in increasing the learning process of pro-environmental behaviours. Final reflections are described here below.

5.1 Making the Invisible Visible

Through the use of data, SIxD must develop design solutions that make those intangible aspects imperceptible to humans visible, such as visualizing complex phenomena related to climate change, predicting the outcome of particular personal decision-making choices or simulating the side effects of anthropocentric development on the planet (Blevis & Blevis, 2010). The proper use of storytelling can support the subjective experience of the interaction by displaying clear evidence of the phenomena objectively and concretely to avoid users generating the formulation of bias or preconceptions on specific assumptions on environmental sustainability.

5.2 Responsible Training

If sustainability is considered a lifelong learning journey (Cebrián & Junyent, 2015), educational training experiences based on SIxD need to sustain their values and principles over time to constantly support people in integrating pro-environmental practices into their everyday practices. For example, products or services that make visible that each of our actions is interconnected to a broader system of ecological interactions are significant solutions that can encourage people to carry out, in many of their habits, only actions that have positive scalar effects on a given environmental problem. In the same way, interactive experiences based on coaching or training that encourage people to compare multiple behavioural choices and habits can increase people's awareness of adopting pro-environmental decisions as they can constantly stimulate people's decision-making process during their routines.

5.3 Sense of Belonging

The SIxD strategies must elicit behavioural change through emotional communication that sensitizes individuals to acquire empathy towards global and collective problems of climate change relating to care and respect for the planet with the same level of attention that we adopt for ourselves (Light, 2022). To do that, products and services must provide engaging experiences that make users feel connected to other people through the same interests, attitudes, or environmental issues to elevate the active participation and collaboration of individuals in a broader social coalition, which can increase climate care collectively (Dourish, 2010; Manzini, 2015).

6. Conclusion

The Sustainable Interaction Design for Climate Care Workshop as been conceived as a design education method for University students with the goal of engaging them in tackling the entropy of our post-modern ecosystems and to exercise with complex systems design, often requiring to reflect upon social, technical and environmental components of our experience in the world.

Interaction design has been centred on information technology and computing innovation from its foundations as an autonomous discipline. The workshop allowed the design students to both get acknowledged about technologies such as Artificial Intelligence and Augmented reality and to design the appropriate interaction and interface models, within the situation of their future design scenarios.

The education initiative taken by the authors wanted to experiment with a workshop arrangement for:

- engaging design students in dealing with complexity as a paradigm for learning systemic, critical and transformative design research;
- committing design students in environmental sustainability and climate care, with the goal of developing their sense of ownership, responsibility and accountability towards the planet survival;
- reaching out a broader audience of those that will be engaged by the design students' work, meaning leveraging upon their design to raise awareness on climate care and to create an impact on the local communities.

The Sustainable Interaction Design for Climate Care Workshop implemented a project-based and challenge-based one-week residential design education centred on teaching, practising and improving the quality of design research methods. Interaction design didactics is thought to benefit from the application and critical revision of methods related to research and study, design concept and design critique, as well as prototyping with digital and material forms, in view of design project improvement.

To conclude, the research shows how SIxD can have a strategic role in increasing designers' commitment towards sustainability because it enables technology-enhanced learning to provide meaningful digital and hybrid experiences, which support experiential and reflective learning, stimulate and support awareness and individual decision-making actively, and promote collective participation to generate common critical thinking that can address the challenges of the climate crisis by contributing to more responsible and sustainable social and cultural progress.

ABSTRACT | The reduction in carbon emissions achieved in this decade will be crucial to limiting climate change and the threat it causes to people and planet (Calvin et al., 2023). To contribute to a transition to net zero, the textile and fashion industry must urgently decouple itself from the use of virgin resources (Sadowski, Perkins and McGarvey, 2021). As put forward by WRAP's Textiles 2030 roadmap, the use of recycled fibres is a key leverage point to reduce impacts including CO2 (WRAP, 2021). However, the textile-to-textile recycling system is currently fractured by the inadequate design of garments. Most garments on the market are not designed for recyclability, and even when they are, they are difficult to identify as such. To limit entropy in the form of material waste, it is therefore urgent that all new clothes should be designed for recycling and clearly labelled for efficient collection.

McKinsey's Scaling Textile Recycling in Europe (McKinsey, 2022) report highlights that real collaboration is needed for the textiles value chain to reach the critical scale needed to provide sufficient feedstock for fibre-to-fibre recycling technologies. Building on previous research providing 'insights for designing with future garments with full recyclability in mind' (Goldsworthy et al, 2019, p47, Hornbuckle et al, 2023, p11) the Quantifying Circularity project brings together partners from both sides of the garment circularity equation: brands and recyclers. The research is carried out by academic and industry go-betweens who bridge the divide between technical recyclers and creative brands. Importantly the project also brought environmental analysts into the process to apply LCA methods to better 'understand the environmental impacts of design decisions' (Goldsworthy et al., 2017, Goldsworthy and Ellams, 2019, Forst et al., 2023). The project aims to develop tools to facilitate the access to specific recycler parameters in the early stages of the design process.

This paper will present the insights from developing and testing guidelines to support designers in embedding recyclability within each product of their collections. The guidelines were tested and refined through three workshops carried out with fashion and textiles brands across the UK. These collaborative sessions produced a range of garment concepts that offered solutions to current recyclability challenges. Across the wide range of brand type and size, some common challenges were identified. These issues highlight the need for a systemic approach to recyclability, one that addresses both the detailed scale of trims as well as shifting agendas and complex communications between stakeholders in the field.

1. Net-Zero Objectives for Fashion

1.1 A Circular Textiles Economy

The fashion and textiles industry is a substantial contributor to the environmental harm generated by human activity (Waste and Resources Action Programme, 2012). To remain within planetary boundaries and work towards the Paris Agreement, it is widely acknowledged that it must undergo rapid and radical change (Amed et al., 2022; World Economic Forum, 2022). Sustainable design practices must be implemented across the entire sector, whether with micro and small fashion brands or large multinational retailers. Reducing impacts through green energy and non-toxic processing is key, but the waste created by manufacturing and consumption and the impacts that come with it must also be addressed. A part of reducing the impacts of fashion on the environment is to transition to a circular textile economy (Ellen MacArthur Foundation, 2017). This includes multiple strategies that enable sustainability, including designing for product longevity, but also importantly designing for materials to be recovered at the end of life to be made into new products of equivalent value.

Research estimates the apparel industry produces approximately 93.1 million tonnes of textile waste annually (Quantis, 2018), yet only 0.5% of global fibres are from recycled pre- or post-consumer textiles (Textile Exchange, 2020). Closing the loop on textiles is a key component of net-zero objectives. As pointed out by WRAP, the diversion of textile waste from landfill and incineration and its use as a secondary resource in the production of new garments is key to achieving targets for decarbonisation (WRAP, 2021). However, there exist multiple challenges to the efficient recovery and recycling of textiles at end of life.

1.2 Design for Recycling

Currently, clothing is not circular because it is not designed to be recycled. Design for recycling is a fundamental principle of circular design that needs to be implemented in all products to achieve the needed shift in the industry. It entails an understanding of end-of-life trajectories for the materials and products that are put on the market today. Initiatives such as the ‘Jeans Redesign Challenge’ (Ellen MacArthur Foundation, 2021) show the enthusiasm for circularity in fashion, but in order for future clothing to be fully circular it must be ‘designed for defined recycling processes and technologies’ (Hornbuckle et al., 2023, p11). Rules such as mono-material design, limiting disruptors and adequate labelling are all key to enabling an uninterrupted flow of resources in a circular economy.

Designers hold a key role in this transition to circularity, it is therefore key to put the tools and knowledge concerning recycling at their disposal, but these tools are not static recommendations. They need to align with the development of recycling technologies as they progress. The quantifying Circularity project thus aims to provide clear and concrete guidelines for design for recycling with input from the recyclers at every stage. Garments are produced based on existing frameworks without this connection cannot guarantee success. The novel angle of this project creates circular design principles on specific and targeted capabilities of fibre-to-fibre recyclers. If we work ‘with recycling science to set the brief for recyclability’ at the outset we improve our chances of success significantly (Goldsworthy et al., 2019, p23).

One major challenge when taking on this approach is the current underdeveloped state of the textile-to-textile recycling sector. While change is happening fast, most recyclers are still in the teething phase of the development of their technology, with key innovation still at pilot stage. While technically textile to textile recycling is completely possible, there are still systemic issues to overcome for garments to be recovered, identified, sorted, and recycled so that they can become fibres in new garments. Much of circular design, including the work presented here, is pre-empting the full optimisation of the recycling system to contribute to its development.

1.3 The Circular Textiles Foundation

From the learnings of setting up the Plan B textile-to-textile thermo-mechanical recycling technology and company, the Circular Textiles Foundation emerged as an answer to the systemic issues slowing down the shift to circularity in the textile industry. The work described is based on the CTF's identification of challenges and opportunities for circularity in fashion. Developing recycling technology is necessary, but will only achieve impact at scale if products are designed to comply with the, sometimes quite strict, parameters for acceptability.

The CTF acts as a spokesperson for recyclers across the world, collecting the most up-to-date information on what input can be accepted for mechanical or chemical recycling. They translate this information into training and support for brands wishing to embark on a circularity journey, addressing the challenges of the current discrepancy between product design and recycling parameters.

1.4 The Textiles Circularity Vision

The overarching aim of the Quantifying Circularity project is to contribute to a shift in circularity across the textile industry, but its focus is on design for recycling. This means that several assumptions about other parts of the system are made. Other aspects of the system including customer behaviours, collection sorting and pre-processing are assumed to work optimally in a best-case scenario configuration. While it is known that improvements are needed in these segments of the system, they are out of scope for this study.

In the vision for circularity represented by this work, garments are collected from the user after a long use phase. The post-consumer waste will then be identified as either fit for resale or non-re-wearable. The non-re-wearable fraction can then be identified for recycling routes. Any garment designed for recycling could be singled out as such thanks to the CTF logo, once recyclability has been noted, the sorter can determine what type of recycling is most adequate by using hand-held spectroscopic devices which can tell what type of fibre the garment is made of even if labels have been removed. These devices are seen as a key contributor to circularity at the sorting stage (Circle Economy and Fashion for Good, 2022) and will work alongside certification to channel end of life garments to the right recycler. Once the fibre type is identified, the garments are aggregated into the recycler category, with for example white 100% cotton garments destined for mechanical recycling and garments with 5% contamination to 95% cotton destined to chemical cellulose recycling. Those products can then be pre-processed to remove any unavoidable disruptors and shredded to fit the recycler's specifications. The input is then processed in the appropriate technology and made into fibres or yarn that replace the need for virgin fibres in the design of new products. The project's aim is to provide the best possible guidelines and support for the design of products that can travel smoothly and efficiently through this system to be recovered for recycled fibre production.

2. Cross-Sector Collaboration

2.1 Recyclers Advisory Board

Setting up an advisory board with a selected panel of recyclers anchors the project in the specific criteria for recyclability. Currently, much of the work that is done on educating designers and brands in terms of circularity is based on generic recommendations. When exploring the specific criteria for each recycler it becomes apparent that finer detail is key to enabling true circularity.

The recyclers integrated to the project represent a range of technologies and development stages, offering a holistic perspective of possible end of life trajectories for post-consumer garments. Mechanical recyclers of cotton and wool show the options for historic and well-established fibre to fibre recycling, whereas chemical recyclers of cellulosic fibres demonstrate an area in development but with solutions already at

scale. The thermo-mechanical polyester recycler included in the project opened the first ever at-scale textile to textile recycling machine during the project timeframe. And finally, a mixed fibres chemical recycler currently at pilot scale shows options for the future of the sector.

A challenge to acknowledge when working across this range of recycling stakeholders is that the different technologies are not all optimised to the same level, and it may appear as though some are much more efficient in terms of energy and water use than others. While there is a difference between mechanical and chemical processes, the maturity of the technology must be taken into account and allowances for progress with wider take-up must be made. The restrictions for input to each of these processes also vary. Chemical processes generally accept more contamination than mechanical processes making them look favourable to brands designing for circularity. While the chemical process allows for the extraction of contaminants, the process to break the material down takes more energy and chemical inputs than a mechanical process which retains all contaminants in the recycled output. This points to the need for a concerted effort amongst recycling stakeholders to realise the vision for textiles to cascade from low impact processes to more comprehensive deconstruction in successive garment lifecycles. In this model the different recycling technologies don't compete but complete each other.

2.2 Brand Participation

Circularity principles need to be adopted across the full value chain. However, it can sometimes be difficult for brands in the fashion sector to see the value of design for recycling as the end of life of the garments they produce is often beyond their control or horizon. The project builds on networks of proactive fashion companies which see circularity as an essential part of their sustainability commitments.

Participants in this research have provided valuable perspectives on the types of products in their ranges which can be designed for recyclability and what challenges persist when operating this shift. By participating in workshops as cohorts of brands, they have generously contributed to the progression of circular design strategies. Increasing knowledge of circularity in the industry will come through more brands allocating time to training such as that offered in the QC project, understanding what methods and language are most adequate to onboard key stakeholders in part of the insights from this work. Part of the impact and legacy of this project lies in the onboarding of brands which hold the keys to an industry-wide transition to circularity. The connections between the organisations involved in this collaboration is designed to extend beyond the project timeframe.

2.3 WRAP Perspective

The Waste and Resources Action Programme is a UK non-profit working towards sustainability and circularity in a range of sectors. With the Textiles 2030 Roadmap, the organisation is galvanising the fashion industry to achieve net-zero targets in the UK. Textiles 2030 is a voluntary agreement to change practices and move towards sustainability through design for circularity, new business models, closing the loop on materials, and encouraging consumer behaviour change. WRAP's involvement in the Quantifying Circularity project stems from the development of the Textiles 2030 Footprint Calculator. This tool offers a simplified LCA method to support brands in assessing and amending their impacts through a review of their fibre use across their full product range, and the modelling of the effects of improvement strategies on their carbon, water, and energy impacts. The calculation of the impact savings afforded by design for recycling will expand the footprint calculator work with a focus on circularity and carbon calculation. The approach provided by WRAP contributes to making the guidelines for recycling specific and truly understanding the quantified implications of different trajectories at the end of life.

3. Quantifying Circularity

3.1 Workshops to Apply Design for Recycling

The project is structured around four workshops taking place in various UK locations offering more accessible opportunities to brands near their headquarters. At the time of writing, three of the four events have taken place. Plymouth, London, and Kettering saw each four or five brands joining for a full day of learning and work on the topic of circularity. A final workshop in Manchester will close this programme of in-person events. Insights on the most effective communication approaches and best prompts to encourage creativity in the redesign activity were taken on after each iteration and included in the design of the following session.

Each workshop followed a similar pattern by introducing participants to the notions and imperatives of design for recycling, showing successful case studies of brands having taken on such an approach as inspiration. The brands worked in groups amongst themselves to get in-depth perspectives on the products brought to the table. Working through the step-by-step redesign activity with three garments in turn led to seeing the different challenges based on various types of garments. A final round of presentations by each participant group allowed us to see the range of challenges across brands. While some garments were deemed impossible to redesign without compromising the brand's sales, other redesigns were seen as very easy switches that could be taken on almost immediately with no price increase or big changes to the product style. In multiple cases, brands realised that while the products they had brought to the workshop, presenting what they saw as an interesting challenge to address, were too difficult to design for recycling, the lessons they learned during the day could apply to other products in their range that could be 'easy wins'. Overall, the participants left feeling empowered to change the way they design to enable more circularity in their ranges.

Figure 1. Quantifying Circularity workshop in London.

3.2 Practical Guidelines for Brands

A key tool for the workshop activities was a practical guide for design for recycling: the three-step recycler identifier. The approach functions on the basis of a redesign exercise (Ellen MacArthur Foundation and IDEO, 2017), where an existing product is taken as a starting point and improvements are considered to make a circular version of it. A key criteria of a redesign challenge is that the key characteristics of the original product such as functionality, aesthetics, and price point should be maintained so that the redesigned version can truly replace the purchase of the original 'unsustainable' product. This means that the designers taking part in the activity need to aptly balance the requirements of recyclers with the product's specifications.

Figure 2. The Quantifying Circularity worksheets guiding workshop participants through the three-step recycler identification process.

The first step to this approach is to identify the garment's main fibre type, this then directs the designer towards the most likely recycler. For example, if a product is mainly made of cotton, they will want to consider either cotton mechanical recycling or cellulose chemical recycling as possible end-of-life options. Once this has been defined, then designers can take a closer look at the specific parameters of the intended recycler. A set of 'recycler parameter' sheets is available as part of the toolkit, each detailing precisely the tolerances for fibre blends, trims, print or coatings for a given recycler. The designers can then identify what disruptors are currently part of the existing garment and discuss how they could be swapped out for alternatives that do not impact the recycling process or simply be removed from the product's design. As an increment from current generic circularity guidelines the instructions are specific to the recyclers involved in the project was created for brands to follow. This allows us to see how features such as prints or trims will impact recycling to various levels.

4. Case Studies of Design for Recycling

4.1 Overview of Case Studies

In each of the three industry-facing workshops which structured the Quantifying Circularity project, the brand attendees were asked to bring three garments from their range. These could be bestsellers or high-volume products that could have a strong impact when redesigned, or more challenging products that represent a key offer from their brand. Alongside the physical product, detailed spec-sheets were provided so that as much information as possible could be gathered on the baseline products. The products that were redesigned ranged from waterproof jackets to wool jumpers, from children fancy-dress to baby pyjamas. A smaller selection of products also represented home-wear ranges. A wide range of product types and recyclability challenges were thus covered.

The redesigned garments form a collection of 32 exemplars showing challenges and opportunities for design for recycling. This collection forms the basis of the analysis presented here. Of the 32 garments reviewed, six were identified as possibly recycled in a thermo-mechanical polyester recycling process, six were seen as destined to both mechanical and chemical cellulose recycling, three as only chemical cellulose recycling, one for wool mechanical recycling, and sixteen could not be attributed to a recycling technology without significant design changes which may affect the product's market value. In the proportion of these latter products, the main reason for their non-recyclability was the main fabric composition, either due to a blend of fibres belonging to different recycling systems (such as cotton and polyester for example), or due to the presence of a large proportion of elastane which is a barrier to all recycling processes. Hard trims such as zips or buttons were identified as disruptors in sixteen garments across all recycling categories, fusing was a disruptor in nine garments, and print was identified as an issue in five garments. This sample thus shows the relevance of various tips for redesigning challenges for recycling.

4.2 Key Challenges in Garment Redesign

The review of the garment redesign case studies provides key lessons that apply across product types when designing for recycling. These must be addressed as a priority and solutions to minimise these disruptors or develop recycling systems to accommodate them must be explored. The challenges laid out here relate specifically to physical components in product design.

Signature sustainable fibres are not recyclable.

Several of the garments brought to the workshops were front-runner products, representing the brand's most forward approach to sustainable design and thus using low-impact fibres or alternatives to cotton and polyester. These fibres often become an important part of a brands identity, for example with linen or bamboo viscose products being a sign of quality and sustainability in the customer's eye. However, as the recycling sector is still in development, the current focus is on fibres that represent a majority share of the market. Thus viscose-like fibres and bast fibres, while not technically impossible to recycle, will not be accepted by any recycler for the foreseeable future. The challenge to brands is then to balance sustainable design with the choice of alternative fibres, and circularity which focuses on more common resources.

Removing trims makes the product less attractive.

Removing disruptors to recycling formed the basis of the garment redesign, yet in some cases, removing these elements can collide with the product's identity or functionality. Fusing for example, can be easily be reconsidered with no visible changes to the user, but for elements like pocket zips, removing them would diminish the product's functionality, meaning that the redesigned version would not fully replace the functional unit of the original version. The baseline for a redesign exercise is that the product that is

redesigned should fully replace the original version. If there are discrepancies in terms of look, functionality, or price point, them it is likely that the customer will fulfil their need at their expected budget point with another product and dismiss the sustainably redesigned option.

Stretch is a challenge across a wide range of products.

It is widely known that elastane is a strong disruptor for all recycling technologies (Östlund et al., 2017). While it will end up as waste in chemical recycling processes, in mechanical processes, it is a contaminant that negatively affect the output. Yet, stretch is a key characteristic for comfort and elastane is used both as a fibre blend across the base fabric or in trims such as cuffs and waist band elastics. There are currently no alternatives which can be used to provide the same effect without limiting recyclability. In a few of the garment redesigns, the use of elastane was argued as a key contributor to longevity, removing it potentially leading to the garment being disposed of much earlier than if there is some elastane. This connects to the overall discussion on finding a balance between performance and recyclability.

4.3 Systemic Challenges for Circularity

Alongside the issues identified in products themselves, the process of redesigning garments brought up challenges that relate to recycling systems. These will need to be addressed and clarified in tandem with physical redesigns.

Recycler timelines are varied and changing.

Sector-wide circularity will mean that designers will need to integrate the requirements of a range of recycling technologies in their products. The Quantifying Circularity project is one of many endeavours to make these requirements available to decision makers. However, even within the short timeframe of the project, it was noticed that recycler parameters change and need revisions as the technology is tested and scaled. This means that guidelines need to be regularly updated and that the role of mediators between recyclers and brands such as the CTF is key.

In parallel to timeline within a specific recycler's technology development, the difference in development speed between different recyclers also needs to be considered. The policy for certification of recyclability by the Circular Textile Foundation is that garments should abide by the parameters of recyclers that already function at scale and can handle end-of-life garments today. However, many of the solutions for recycling more complex products are currently just on the horizon. The technology has been tested in lab and/or pilot scale, but investment to scale for large quantities is still lagging. The assumption amongst experts is that the clothing designed today will only be collected as a non-re-wearable waste garment in several years, allowing time for the recycling landscape to evolve in the meantime. However, design recommendations today must stick to what is known about available technology and assumptions could have negative effects.

Recycled outputs are not recyclable in turn.

A circular textile economy aims to decouple the production of products from the extraction of virgin resources, effectively using existing materials in infinite loops of recycling. There is much ground to cover before this vision becomes reality, and one challenge is that the output of some of the most promising recycling processes is not currently recyclable itself. For instance, when recycling cotton in a chemical process, the output is a regenerated cellulose similar to viscose. Currently, viscose will not be accepted as input by cellulose recyclers. While the technology and approach of recyclers may evolve in the future, this means that the product of this recycling process will not in turn be recycled which is a challenge to true circularity.

5. Conclusions

5.1 Removing Disruptors and Providing Recyclable Alternatives

A key part of designing for recycling lies in the removal of disruptors. These can take the form of zips, buttons, fusing or sewing thread which is in a different material to the base fabric of the garment and thus acts as a contaminant to the recycled output. Discussion between brands and recycling experts in the Quantifying Circularity workshops led to realise that in some cases, heavy disruptors such as zips or elasticated wastes could not be designed out without impacting the value of the garment. Thus, recommendations to remove trims need to take account of the garment's specifications and functionality. While it must be acknowledged that not all trims are equal, and different redesign strategies may apply, there is also a need for more detail on what can be addressed in pre-processing would support better circular design. The Quantifying Circularity project focuses on product design, but improvements and innovation can also happen in the overall logistics for the sorting and preparation of textile waste. Efficiency of removing some necessary trims could support a more balanced compromise between recyclability and functionality. The library of circular trims developed by the CTF offers a product-based response to this challenge. While not all functions can be performed by trims that are suitable for recycling, selecting lighter elements such as buttons or zips in the same material as the base fabric (generally possible with polyester) can highly increase product recyclability. More research and development is needed in this sector to develop sturdy trims that abide by recycler and sorter parameters. The same goes for elastane, the availability of stretch fibres and elastic trims compatible with polyester and/or cellulosic recycling would be a breakthrough to achieve high product specifications without compromising on circularity.

5.2 Communication Across Actors

Circularity is inherently highly collaborative as all actors from across the sector need to communicate to facilitate the flow of resources. The insights concerning the physical and systemic challenges to recycling presented in this paper are useful to a range of fashion stakeholders from designers to recyclers and policymakers. Working across design research, business support, and environmental engineering in this project has provided a holistic view of recyclability challenges, moving between the hyper-specific level of disruptors, to the general questions relating to systems and logistics. The guidelines and a step-by-step process for designers to follow are framed by this three-pronged vision for circularity. This approach provides designers with clear steps to apply to each product they design in order to enable its future recycling. The next steps for the project are to better frame the benefits of design for recycling over the entire range of a brand's products. Working more closely with WRAP in this next phase, carbon calculations that quantify the assumed benefits of circularity will support a wider change in the industry.

About the Authors:

Laetitia Forst is a circular textile design research associate at the University of the Arts London. She completed her PhD in 2020 on the subject of Textile Design for Disassembly as a circular design strategy. Since then, she has been involved in a range of projects addressing the challenges of sustainability and circularity for the fashion and textiles industry. She is interested in bridging the gap between design and scientific understandings of next gen materials.

Kate Goldsworthy is Chair of Circular Design & Innovation and Co-Director of the Centre for Circular Design, based at Chelsea College of Arts. Her core research interests are designing for sustainability, the circular economy and material innovation within textile and fashion contexts. Her methods are transdisciplinary & practice-led, with a focus on fibre-to-fibre recovery and new finishing technologies. This includes more sustainable production systems for the textile industry, and pioneering design solutions for the recycling and recovery of both synthetic polymers and bio-based materials.

Tim Cross has 30 years of experience in garment manufacturing. In the last 5 years, he's been focused on supporting fibre to fibre recycling systems, specifically for post-consumer textiles, as Director of Project Plan B, a thermomechanical textile polyester recycler, in the UK. His work at the Circular Textiles Foundation sees him leading the adoption of circular principles and practices by multiple brands and retailers across the UK.

Jenny Valarino has over 20 years of experience in garment design across womenswear, menswear, and childrenswear. Her experience spans high street to high-end fashion, and her expertise exists across the entire product life cycle. As Head of Circular Design at the Circular Textiles Foundation, Jenny collaborates on circular design solutions to reduce clothing impact. Passionate about using design to tackle industry challenges, she is dedicated to driving change through innovative solutions.

Padouk Fielding brings over 12 years of experience in partnership development and project management, working across multiple sectors, from international development to circular fashion innovation. As Head of Partnerships at the Circular Textiles Foundation, Padouk builds impactful and lasting relationships with brands on their journey to circularity. Padouk is dedicated to driving positive change and firmly believes in the power of strong relationships and collective action.

DOI: 10.63442/EULK1530

KEYWORDS | ARCTIC PRODUCT DESIGN, ARCTIC GLASS DESIGN, SNOW GLASS, DESIGN EDUCATION, SUSTAINABILITY

ABSTRACT | One of the key challenges for the future of Arctic design is considering the highly sensitive environment and culture in the Arctic regions. The problem is how to design products in a more sustainable way in the Arctic context. To achieve this, designers need education, skills, and support to create socially and environmentally responsible products (Lofthouse, 2017). Arctic design creates products, services, and systems addressing the unique environmental conditions of the Arctic regions. It centers on a commitment to sustainability and a deep respect for the delicate Arctic environment (Häkkilä & Johansson, 2018, p.33). This examination contributes to the broader discussion on sustainable systems design, particularly tackling challenges posed by climate change.

This study delves into the specifics of Arctic product design, exploring the intersection of nature-based solutions in the potential of snow glass development. The study contributes to the conference's overarching theme, envisioning a harmonious synergy between human creativity and the resilience and opportunities of the Arctic ecosystem. The focus is on designing products within the Arctic context, emphasizing the importance of sustainable design practices and the role of students in shaping the future of Arctic product design.

Firstly, the University of Lapland´s Art and Design students (n=184) were surveyed from 2021 to 2023, aiming to understand their insights on Arctic product design and potential future directions. Results show how these products embody authenticity and responsibility through a profound appreciation for nature and sustainable materials. Nature's conditions are an important part of Arctic product design, where Arctic materials such as snow can be used in different stages of the design process. In the second part, Arctic glass design was explored, emphasizing its potential for integration with sustainable materials. *Arctic glass design is a specific field within the realm of art and design that focuses on the innovative application of glass, incorporating distinctive characteristics and elements related to the Arctic.* The study unveiled numerous possibilities to incorporate, e.g., snow into the glass design process. Thirdly, respondents' insights were gathered on the use, features, distinctions, challenges, opportunities, and definition of an innovative glassblowing technique, snow glass. These perspectives improve understanding when using snow in Arctic glass design. *Snow glass is defined here as a type of glass that is shaped and manipulated in different ways with snow during the hot glass working process.* The term does not, therefore, refer to the aesthetic qualities of glass, such as aiming to resemble the appearance of snow.

The findings reveal that perceptions of Arctic product design are strongly associated with nature and emphasize sustainable and responsible qualities integrated with durable and functional designs. To develop Arctic product design, we need to sustain Arctic materials for the future. Therefore, when aiming for sustainable Arctic product design, it is essential to minimize climate impact, ensure resource efficiency, respect cultural aspects, and meet demands for environmentally responsible products. Applying Arctic materials such as snow in suitable product design processes can meet these demands. This study sparks ongoing dialogue, promoting further investigation into the possibilities of snow glass.

Sustainable Arctic Product Design

One of the key challenges for the future of Arctic design is considering the highly sensitive environment and culture in the Arctic regions. The problem is how to design products in a more sustainable way in the Arctic context.

Arctic product design adjusts contributions to the unique environmental aspects of the Arctic, striving to develop resilient, sustainable and culturally fitting solutions.

One way to affect the future of a more sustainable design is through design education. This study underscores the significance of sustainable design practices in the Arctic, with a particular emphasis on students playing a crucial role in shaping the future of Arctic product design.

The exploration of nature-based solutions aligns with the broader theme of envisioning a harmonious synergy between human creativity and the resilience of the Arctic ecosystem.

1. Reindeer antlers pressed on hot glass form a supportive structure for the fragile Arctic flower. Glass design symbolizes the connection with nature. Kannatella (*Cherish*), design by Milla Johansson (2023).

Arctic Product Design: A User Study with Design Students

Students' perspectives enrich the viewpoint, align with future visions and foster a more inclusive and forward-thinking approach to Arctic product design. University of Lapland´s Art and Design students (*n=184*) were surveyed from 2021 to 2023 to understand their insights on Arctic product design.

"In the future, sustainable development and recycling should be considered in Arctic product design. When utilizing raw materials from nature, consideration should be given to their availability also in the future." A design student's response.

Respondents emphasize the use of natural materials and sustainable manufacturing methods in Arctic product design. Nature's conditions are an important part of Arctic product design where Arctic materials such as snow can be used in different stages of the design process. Snow's unique qualities contribute to various stages of the Arctic product design process and serve as a source of inspiration for creative and sustainable product designs.

2. Glassblowing mold can be refined by examining the shape with snow. Design by Milla Johansson (2024).

Arctic Glass Design

Arctic glass design, as a facet of Arctic product design, is intricately linked and grounded to the overall research areas of the University of Lapland. Arctic glass design has been examined through diverse perspectives in various design student projects during 2020-2024.

Arctic glass design is a specific field within the realm of art and design that focuses on the innovative application of glass, incorporating distinctive characteristics and elements related to the Arctic.

Sustainable Arctic materials, uniquely linked to the region, are responsibly sourced, produced and utilized with features like renewability and recyclability, contributing to the creation of environmentally friendly products.

This versatile study explores the opportunities and concretizes the topic with the Arctic glass design case, where design students collaborate with artisan students.

3. Snow forms distinctive surface patterns on glass. The potential of snow glass in artistic works is clear, but it might also be suitable for small series products. Kaltio, design by Milla Johansson (2023).

Snow Glass

The potential of incorporating snow into glass design within the Arctic context, offers an intriguing intersection of unique and experimental technique linked to Northern nature. Variables such as air and surface temperatures, moisture levels and snow crystal shapes impact snow texture and overall quality and are crucial considerations in snow glass design. This research aims to initiate a discourse regarding the categorization of snow glass as a novel and distinctive glass technique.

Snow glass is defined here as a type of glass, which is shaped and manipulated in different ways with snow during the hot glass working process.

Water typically creates crackled patterns to glass, but contrasting imprints arise when compared to those made by snow. Furthermore, unlike water, snow shape can be controlled and formed into a specific, detailed form repeatedly.

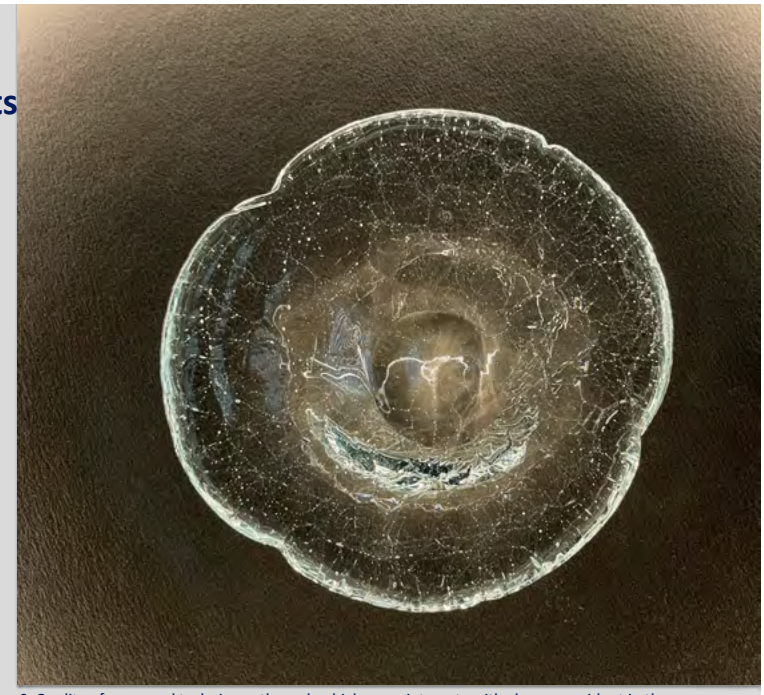
4. Snow glass creates vivid and unique shadows. Here, the term “snow glass” does not refer to the aesthetic qualities of glass, such as aiming to resemble the appearance of snow. Design by Netta Kandelin (2023).

Snow Glass: A User Study with Design Students

Empirical data was collected to integrate snow into glass design by examining trends, challenges, and opportunities to lay the groundwork for further exploration. Hands-on experiences were facilitated through practical design sessions where tests were done with snow to provide insights into the creative potential of snow in glass design.

Snow can be used in several stages of the glass design process, in diverse manners:
- creating ideas and finding shape;
- prototyping and mold making;
- user testing;
- glass manufacturing process.

Aspects to consider when making snow glass:
- quality of snow, influenced by various elements; temperature, humidity, texture and structure
- quality of glass; temperature and thickness;
- time and timing; duration and stage of contact between snow and glass;
- movement; controlling the interaction between glass and snow in different ways;
- finishing; snow effects are either retained or smoothed through glass reheating.



5. Different pattern effects can be achieved by controlling the technique of applying snow to hot glass. The traces can vary to be e.g. lichen-like or sequin-like. Design by Milla Johansson (2023).

Glassblowing with Snow: A User Study with Experienced Participants

Thirdly, a supportive survey was conducted for artisan students and glassblowers who had experimented glassblowing with snow. The aim was to inquire their experiences regarding:
- exploring perspectives on snow glass qualities;
- distinctions from other glass types;
- potential challenges or opportunities for the future of snow glass.

With a limited sample size, the results offer preliminary insights to spark discussion. Overall, respondents employed snow in various glassblowing techniques:
- both within and outside the glass;
- by sprinkling snow onto the glass piece;
- pressing or embedding objects into snow;
- incorporating snow within blown pieces;
- using snow as a mold.

Overall, snow glass is portrayed as an intriguing approach to glass design, offering visual appeal and potential symbolic significance.

6. Quality of snow and techniques through which snow interacts with glass are evident in the characteristics of glass. Powder snow markings. Design by Netta Kandelin (2023).

Discussion

Nature plays a crucial role in sustainable Arctic product design, requiring minimal climate impact, efficient resource utilization, cultural respect and environmental responsibility. The overarching goal is to create ecological products tailored for Arctic environments while considering user needs and product quality. Engaging design students in research activities parallel with ongoing courses benefits both education and research.

Snow emerges as a key Arctic material offering unique properties conducive to design innovation, particularly in glass design. Snow's versatility in design processes, as an alternative to environmentally harmful materials, highlights its potential for more sustainable product development.

Snow possesses unique qualities, allowing the creation of designs that might be unattainable with other substances. Moreover, snow glass signifies a harmonious union of natural materials and contemporary design practices, representing a fusion of tradition, innovation, and sustainability, paving the way for future explorations in Arctic design.

7. Reindeer antler and snow as mold parts. Arctic product design can contribute to sustainable development while maintaining cultural authenticity with locally sourced materials and eco-friendly methods.

Future Perspectives

The future of sustainable Arctic product design hinges on navigating the distinctive challenges posed by the region's delicate environment and culture. It must prioritize cultural sensitivity and environmental issues with resource scarcity.

The discourse surrounding Arctic glass design underscores the significance of further exploration in this area. Snow emerges as a promising yet underexplored medium in glass design, offering unique capabilities and distinct qualities.

We advocate for the development and examination of Arctic product design through the lens of Arctic glass design with particularly the snow glass technique. This study serves as a catalyst for ongoing dialogue, paving the way for continued exploration into the possibilities of snow glass.

8. Snow glass has captivating opportunities to create unique shapes, patterns and surfaces. Kaltio, design by Milla Johansson (2023).

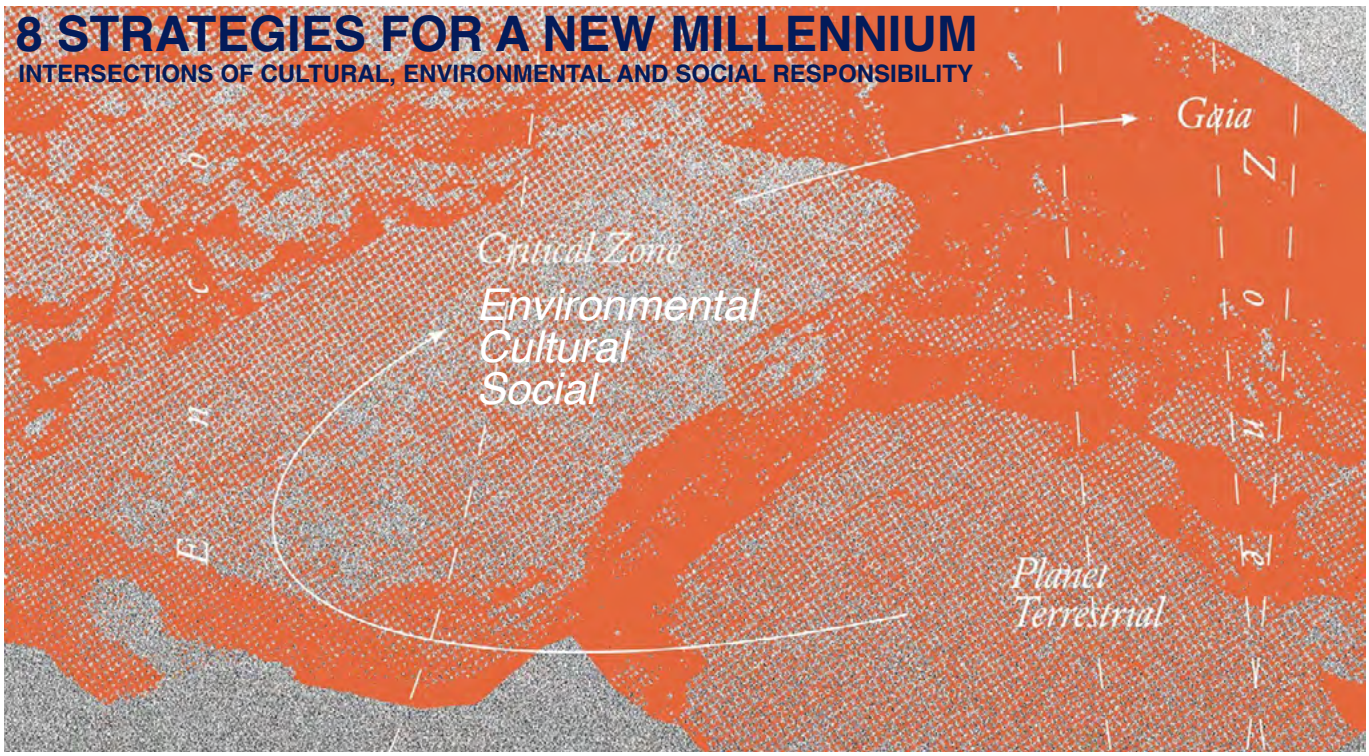
DOI: 10.63442/PIHQ9542

KEYWORDS | RESPONSIBILITY, HYBRID ECOLOGIES, NATURAL SYSTEMS

ABSTRACT | Confluences of Cultural, Environmental and Social Responsibility

Introduction: We present our proposal for the upcoming conference, entitled “8 Strategies for the New Millennium.”



As we stand on the brink of an era defined by rapid technological advancements, global shifts, and unprecedented environmental challenges, our presentation aims to share 8 intentional strategies that prioritize shared responsibility and accountability over the current emphasis on innovation and disruption.

Remedial Design Strategies: Recognizing the limitations of an exclusive focus on technological innovation, our proposed eight strategies advocate a design methodology embracing natural systems and temporalities that extend from immediate concerns to geological timescales. Simultaneously, these strategies consider ethnographic time and social practices, emphasizing communal well-being.
Significance of Research: Backed by extensive research and analysis, our insights promise to significantly contribute to the conference theme, offering a nuanced perspective on navigating the contemporary landscape.
Objective: Our primary objective is to provide an actionable blueprint for individuals and organizations to positively contribute to the evolving design landscape of the new millennium. Focused on eight strategic pillars encapsulating responsibility, adaptability, and agency, our presentation aims to equip participants with insightful tools for shaping a collective future.

Structure of the Presentation:
Introduction to the New Millennium Landscape: We will set the stage by outlining key characteristics and challenges of the new millennium, providing a contextual foundation for understanding the presented strategies.
Overview of the 8 Strategies: A brief overview will precede a detailed exploration of each strategy, creating anticipation for the insights to be shared during the presentation.
Exploration of Each Strategy: Detailed exploration of each strategy will highlight its significance, practical applications, and real-world success stories. The presentation will incorporate professional work from our studio, as well as , and relevant research and case studies by colleagues and students from the institution where I serve as department head.
Open Dialogue and Networking: Allocating time for open dialogue and networking opportunities will allow participants to share experiences, pose questions, and build connections. This collaborative exchange may lead to potential institutional crossover and collaborations.
Conclusion: The presentation aims to be thought-provoking and action-oriented, resonating with the audience to foster a collaborative and forward-thinking mindset. We look forward to contributing to the conference discussions and inspiring a collective vision for a shared future.

* (NB: The slide deck includes animations and audio-visual content which would prove helpful in appreciating the dynamics and intricacies of the final presentation which we intend to submit upon your acceptance and/or approval of our submission. We are more than willing to resend the presentation in Keynote Format for your comprehensive review.)
**While the original plan was to present this topic as an academic paper, several professional deadlines before the year’s end were given precedence.

2 _ NON BINARY ECOLOGIES

AGRONICA _ TERRITORY FOR THE NEW ECONOMY
ANDREA BRANZI _ DOMUS ACADEMY

Branzi's work reanimates the long tradition of using the urban project as a social and cultural critique — of seeing urban design as an opportunity not simply to illustrate a "vision" but also to demystify and critically describe ongoing social problems. In this sense Branzi's wortically engaged and politically literate delineation of the power structures, forces and flows shaping contemporary urbanism; and in the past four decades he has articulated a remarkably consistent critique of the failings — social, cultural, intellectual, also economic, environmental and aesthetic — of laissez-faire development and of the realpolitik assumptions of much design and planning.

8 STRATEGIES FOR A NEW MILLENNIUM
2 _ NON BINARY ECOLOGIES

A generation of contemporary urbanists — ranging from Stan Allen and James Corner to Alex Wall to Alejandro Zaera-Polo — has drawn from Branzi's intellectual commitments. Still more recently, Pier Vittorio Aureli and Martino Tattara's "Stop-City" project directly references Branzi's use of non-figurative urban projection as a kind of social and political critique.

Branzi's projects have also informed contemporary attention to such diverse topics as animalia, indeterminacy and genericity.

8 STRATEGIES FOR A NEW MILLENNIUM
2 _ NON BINARY ECOLOGIES

Branzi's "weak work" maintains its critical and projective relevance for a new generation of urbanists. His longstanding call for the development of what he defines as weak urban forms and non-figural fields — forms and fields that are flexible, mobile, open to change — influenced the formulation of landscape urbanism over a decade ago and promises to animate the emerging discussions of ecological urbanism. And his projective and polemic propositions illuminate the possibilities for agrarian urbanism.

HouseEurope!

Goal

HouseEurope! is a citizens' initiative for an EU-legislation that boosts the renovation of existing buildings and stops their demolition driven by speculation

The Speculation Issue

Today, buildings are treated as investments rather than spaces for people to live. Due to financial speculation, millions of square meters sit empty and ruin, or they are being demolished and replaced: from functioning family homes to abandoned industrial and office spaces. This practice creates social and environmental problems. People are left without livable spaces and resources are unnecessarily strained for new building construction.
While the public eye is focused on areas such as mobility and energy, the building sector plays a significant role in the problems we face today. The building industry accounts for 38% of global CO2 emissions. All the parties involved – from the real estate sector to architects to the con- struction industry – profoundly influence our environment and the fabric of our societies.

Join, Support, Sign

You rent an apartment? You own a building? You care about the environment? You work in the building sector? Almost everyone is or will be affected by speculative real estate practices and the harm they cause. Because here's the deal: potentially every building is up for demolition! In fact, speculation fuels demolition and new construction. This comes with a loss of homes, a loss of jobs, and a loss of energy.
You can make a difference – put an end to this practice and make a change in reality! With your support, your voice, and your signature we can push for regulations that recognize and protect the value of existing buildings. But this is not just about materials and energy; it is also about the values we hold as a society. By activating buildings that have been abandoned, we will pave the way for a livable future – for ourselves, our children and all future generations.
Status: Currently we are in the process of drafting our legislative proposal. Sign up for the newsletter and receive updates on the initiative and a reminder when the signature period starts.

ADAPTIVE CITIES: TEMPORARY INTERVENTIONS & FLEXIBLE STREET FURNITURE DESIGN.

Péter István Varga*[a]

a VPI Concrete Ltd., Budapest, Hungary
* vpi@vpi.hu

DOI: 10.63442/DDRR5773

KEYWORDS | STREET FURNITURE DESIGN, PUBLIC SPACE, TEMPORARY URBAN INTERVENTIONS, TACTICAL URBANISM

ABSTRACT | If we examine the processes defining the city from the perspective of activities taking place in the city (such as transportation, public space use, leisure, tourism, etc.) and not from the physical characteristics (building stock, road network, terrain, etc.), we get an extremely variable, fluid picture that changes quickly in time and space. In the city, we see an ocean of fluctuating activities. This fluctuation and change can often be very fast, activities intensify, appear, or even disappear within a few years. A few years ago, the electric scooter was almost unknown, today, it is a defining part of the micro-mobility toolkit. But the same is true for the increasing presence of urban sports activities or the change in the intensity of cycling according to the seasons and the weather. The change in tourism due to climate change can be included here. Change is constantly present, and the needs associated with it also arise with constantly changing intensity. How can we respond to this? What can be expected in the future?

Currently, about 57% of the world's population is urban, meaning that for every second person, the majority of their daily activities are related to some city. The city has become our way of life, our "natural" habitat. And we rightly expect our habitat to be adaptable to our needs, to adapt to activities, needs, or even changes in seasons and climate. What tools do we have for this?

In my presentation, I focus on temporary urban interventions and flexible street furniture, deliberately narrowing down the topic of adaptive cities. Through the examples of temporary interventions, the changing needs of urban activities can be well examined while also presenting the possibilities and tasks of design in street furniture design in an environment where changing usage needs appear. These changing needs are increasingly colliding with inflexible urban systems and infrastructures, often generating strong conflicts (cycling vs car driving vs. pedestrian traffic; parking vs. green space; weekday/weekend vs. working time/ leisure time; tourism vs. locality, etc.). In my presentation, through a current case study (Valyó Quay project in Budapest) along with a few examples from the international context (Supermanzana Barcelona), I present the city-shaping possibilities of temporary interventions and the changing needs appearing in cities. Among these, highlighting cycling, I present street furniture systems from our design studio, where the basic principle of the design concept was adaptability to changing needs (VELÓ and MONÓ bicycle storage systems; LENA bicycle lane separator). These products were invited to the Dutch Design Week in 2023, where they made a successful debut in the Mobility Expo section.

The message of my presentation is dual:

1. Traditional urban planning tools are now inadequate for handling the rapidly changing needs and phenomena that arise in cities. We need tools and systems that allow space for dynamically changing activities in the city, i.e., they are flexible and adaptable.
2. This also poses new challenges for street furniture design: we need a design mindset and public furniture solutions that can handle the rapid changes in needs and uses in public spaces.

The question of liveable cities

55% of the world's population resides in urban areas in 2018
and expected to increase to 68% by 2050*

The city is our "natural" habitat

**Should we adapt to the cities
or the city should adapt to us?**

* Published by the Population Division of the United Nations Department of Economic and Social Affairs (UN DESA), 2018

CONCLUSION

1. Traditional urban planning tools are inadequate for handling rapid changes. Flexible and adaptive tools needed.

2. New challenges for street furniture design.

NEW CHALLENGES FOR STREET FURNITURE DESIGN

- based on urban processes and activities
- temporary and/or periodic usage
- adaptability and flexibility
- quick to change

P/REFERENCES OF DESIGN

PUTTING THE “VOCATION” IN VOCATIONAL DESIGN EDUCATION.

Astrid Lubsen[a], Irene Kamp*[a]

a Amsterdam University of Applied Sciences, Communication and Multimedia programme, The Netherlands
* i.kamp@hva.nl

DOI: 10.63442/RQBS5026

KEYWORDS | INNER DEVELOPMENT GOALS, DIGITAL DESIGN, DESIGN EDUCATION, ECOLOGICAL AWARENESS

ABSTRACT | In this era of important and monumental societal challenges, the role of designers is evolving, necessitating a profound reimagining of design education. Our (inter)active session aims to ignite a collaborative exploration into what design education should do differently to cultivate the “ideal” designer—one equipped to address global challenges and one that is intrinsically motivated. The primary objective of the workshop is to collectively and creatively construct a tangible “image” or model of the ideal design education that empowers designers for transformative global impact and instills in them a sense of calling to take meaningful action.

1. Introduction

Communication and Multimedia Design (CMD) is a bachelor-level design education programme at the Amsterdam University of Applied Sciences (AUAS). At CMD, we aim to address urgent, complex societal challenges such as the climate crisis, growing inequality, and accessibility issues in healthcare by educating changemakers. We believe that our students could be changemakers and skilled and engaged digital designers capable of making meaningful contributions to these complex societal challenges.

To effectively address these complex issues, alongside creative, systemic approaches and knowledge, "changemaker" skills are required. Design education is particularly suited to educate changemakers because some of the necessary affective inner skills, as defined by the Inner Development Goals1, such as empathy and creativity, are already embedded in the curricula. However, other crucial skills such as self-awareness, a sense of connection to a larger whole, and global, environmental, and cultural awareness are not yet addressed at CMD. The first version of this workshop was conducted with colleagues from similar digital design education programmes in the Netherlands (see image 1 for an impression) and proved that these skills were lacking in their curricula as well.

In this workshop, we aim to further explore, in collaboration with participants, which inner skills are essential for contributing to complex societal challenges and are currently lacking or insufficiently addressed in (design) education.

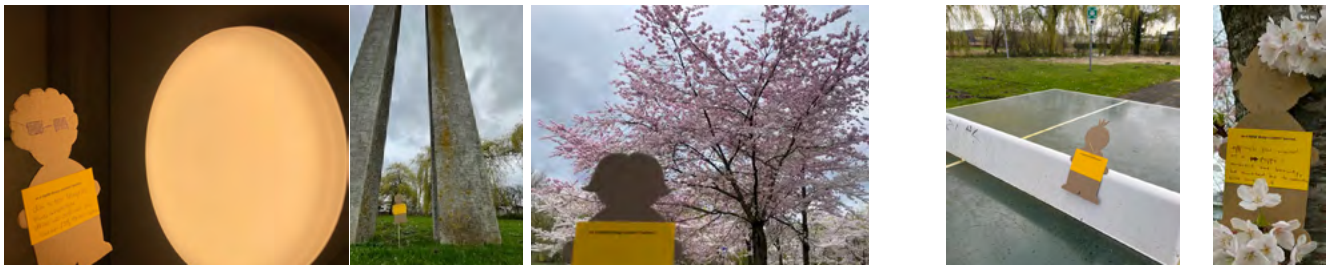

Figure 1. Impression of the outcomes from a previously conducted workshop.

2. Objective and Schedule

We believe this workshop is interesting for (digital) design educators and professionals who wish to contribute to imagining the future (digital) designer. The primary objective of the workshop is to construct, collectively and creatively, a tangible "image" or model of the future designer. Furthermore, we hope to outline its implications for the ideal design education that empowers designers for transformative global impact and instills a sense of calling to take meaningful action.

In this workshop, walking is a key component of our activities. We believe that the value of movement is in enhancing creativity, fostering open dialogue, and deepening connections among individuals. By incorporating walking into our workshop, we aim to create a dynamic and engaging environment that stimulates both the body and the mind. However, we will only proceed with walking activities when *every* participant can take part.

We have compiled the following schedule:

- Introduction [10 min]
- “Wandertalk” (walk guided with questions and provoking statements to discuss while walking) [45 min.]
- Collecting insights from walk [30 min.]
- Final summary [5 min.]

In the event of bad weather or participants being unable to partake in the walk, we created the following alternative programme:

- Introduction [10 min]
- Collective imagining [10 min.]
- Discussing in small groups the new role of designers and how design education should change – prepare the presentation. [30 min.]
- Break [5 min.]
- Presentation to group [30 min.]
- Final summary [5 min.]

MATERIALS DIALOGUES: MATERIALS DESIGN FOR SUSTAINABLE SYSTEMS, NAVIGATING CONTEMPORARY MATERIALS DESIGN CULTURE.

Sofia Soledad Duarte Poblete*[a]

a Politecnico di Milano, Design Department, Italy
* sofiasoledad.duarte@polimi.it

DOI: 10.63442/LRFS9770

KEYWORDS | MATERIALS DESIGNER, PROFESSIONAL PRACTICE, ENVIRONMENTAL SUSTAINABILITY, DESIGN COMPANIES

ABSTRACT | In various design domains, such as industrial, product, and fashion design, the role and importance of materials is undeniable (Ashby & Johnson, 2014; Karana et al., 2014; Pedgley et al., 2021). However, designers' exploration of material attributes and impacts has often been partial, contributing to resource depletion, waste production, and environmental damage (Vezzoli, 2018). Recognising the imperative for a more profound sensitivity and understanding of materials in the current context, this workshop centres on materials designers as crucial figures in addressing these challenges (Clèries & Rognoli, 2021). Despite their essential role, their professional identity remains emergent and under-recognised, compounded by a lack of consensus on fundamental skills for future materials designers.

1. Introduction

This workshop seeks to crystallise the concept of the materials designer, elevating its recognition as a distinct profession. It aims to foster dialogue, engaging participants in reimagining materials design practices for our complex systems. Furthermore, it will bring the 'Emerging materials for transition framework,' providing a context of novel materials and practices for environmental sustainability and circularity in materials design. Attendees, whether designers, researchers, or makers with an affinity for materials design, will collaborate to understand the materials designer's role, skills, and worldview, addressing the challenges of sustainable production and consumption systems.

2. Planned Activities and Expected Outcomes

In this 90-minute workshop, we aim to unite researchers interested in exploring the next generation of materials designers. It will serve as a platform for stimulating discussions, presentations, and brainstorming sessions on future lines of professional practice in materials design. Emerging materials and processes have garnered attention, but their effective contribution to accelerating the transition to sustainable systems remains unclear. The session will commence with a theoretical overview, setting the stage for an intense debate on the evolving role of materials designers amidst contemporary production and consumption trends. We expect 15 participants.

Table 1. Proposed organisation and activities of the workshop.

Minutes	Activity	Presenter	Tools
10	Welcome: presentation, workshop aims, research context, schedule and roles	Organiser	Slides/presentations
10	Warm-up: Participant introductions	Participants	---
10	Overview: Materials Design Field and the professional practice	Organiser	Slides/presentations
10	'Emerging materials for transition framework'		
5	Short break		
10	Material Designers in companies - Case study	Organiser	Slides/presentations
15	Small group discussions about the role of materials designers in companies. Type of companies. Skills. Role	Participants	Miro Boards Post-its and papers
15	Presentations and discussion.		
05	Conclusions and remarks	Organiser	

3. Target Audience

The workshop is for Cumulus conference participants interested in materials and design, emerging materials, materials-related issues, production, and environmental sustainability in design solutions for industry. It is especially suited for those interested in co-designing a professional figure with a vision of design and materials as a driver of innovation. It will draw on the expertise of the 'MaDe/Trans' research group from Politecnico di Milano.

4. Equipment and Space

The workshop will be in a flexible space to support active, collaborative interaction among individuals and virtual tools. Participants should use laptops for accessing Miro Boards, and paper and post-its should be available.

5. Potential Outputs

"Material Dialogues" is designed as a dynamic forum to advance the discourse in materials design, challenging traditional perceptions of materials in design practice. The workshop aims: (1) to co-define the necessary skills to develop as a professional material designer for environmental sustainability; (2) to bring together researchers; (3) to establish consideration of the current state of materials design as a design area; (4) to understand how to enrich the profession and how to give it more recognition by industry. Critical insights will be synthesised in a report/publication encapsulating recommendations for the design community.

P/REFERENCES OF DESIGN

DESIGNING THE WILDERNESS FOR YOUR P(A)LATE: A JOURNEY INTO SUSTAINABLE LIVING THROUGH FORAGING.

Zsófia Márta Németh*[a]

a Moholy-Nagy University of Art and Design, Budapest, Hungary
* sofia.nemeth@gmail.com

DOI: 10.63442/VABW7730

KEYWORDS | FORAGING, SUSTAINABILITY, GASTRONOMY, REWILDING, EXPERIMENTAL LEARNING

ABSTRACT | “Designing the Wilderness for Your P(a)late” offers a 90-minute workshop for a dozen participants, reintroducing the art of foraging and sustainable living practices. Those who are participating explore the ecological significance of wild plants, envisioning their roles in future gastronomy. Through hands-on activities and collaborative learning, participants unlock the potential of edible plants for nutrition and culinary innovation. Emphasizing proximity and provenance, the workshop fosters a deeper connection to nature and promotes eco-responsible practices. By embracing ancestral wisdom and integrating wild plants into daily life, participants contribute to a more harmonious relationship between humanity and the natural world.

1. Workshop

In an era where the natural world often feels distant from our daily lives, the art of foraging stands as a beacon of traditional wisdom waiting to be rediscovered. "Designing the Wilderness for Your P(a)late" offers a unique opportunity for a dozen participants to embark on a 90-minute journey back to our roots, where wild plants weren't just supplements but integral parts of our existence. This workshop aims to reintroduce the lost art of foraging to a modern audience, emphasizing sustainable living practices and the importance of reconnecting with nature.

The resurgence of interest in locally sourced ingredients within culinary circles speaks volumes about our changing relationship with food. Michelin-starred chefs are leading the charge, venturing into nearby forests and fields to handpick ingredients for their masterpieces. This shift underscores a deeper understanding of the importance of proximity and provenance in haute cuisine, paving the way for a more sustainable and eco-conscious approach to gastronomy.

But it's not just about haute cuisine; it's about recognizing the ecological significance of edible plants within our ecosystems. As we struggle with the environmental consequences of industrial agriculture, edible wild plants are emerging as beacons of hope. Nutrient-rich, ecologically sustainable, and universally accessible, they offer a tantalizing glimpse into a more harmonious relationship between humanity and nature.

Through speculative design methodologies, participants in the workshop embark on a journey of exploration and imagination. They delve into the botanical intricacies of indigenous plant species, pondering their potential roles in a future where sustainable nutrition is paramount. Collaborative exercises spark creativity as participants envisions new food products and advocacy strategies centered around these wild plants.

The workshop isn't just about theoretical knowledge; it's about hands-on learning and multisensory experiences. Participants engage in experimental activities designed to unlock the hidden potential of edible plants, learning to identify them safely in nature and incorporate them into their daily lives. From practical culinary applications to medicinal uses, each plant offers a wealth of possibilities waiting to be discovered.

With a focus on experiential learning, the workshop accommodates diverse learning styles and levels of expertise. Small group discussions foster collaboration and mutual learning, ensuring that participants leave with a deeper understanding of foraging and its implications for sustainable living.

About the Authors:

Zsófia Márta Németh, a PhD student at MOME, explores the interplay between edible wild plants and nature connectivity in the Balaton Highlands. She explores navigating environmental pressures in tourism-driven areas, striving for scenarios where both nature and society mutually benefit.

P/REFERENCES OF DESIGN

WET WET WET FLUID: A COLLABORATIVE JOURNEY THROUGH ECOSYSTEMIC RIVER NARRATIVES.

Katarzyna Anosowicz*[a]

a The Aleksander Zelwerowicz National Academy of Dramatic Art in Warsaw, Poland
* anosowicz@gmail.com

DOI: 10.63442/DBQI8390

KEYWORDS | ENVIRONMENT-CENTERED-DESIGN, ECOLOGICAL EMPATHY, COLLABORATIVE VIDEO STORYTELLING, MORE-THAN-HUMAN PERSPECTIVES, INTERACTIVE GAMEPLAY

ABSTRACT | The Format X on “Wet Wet Wet Fluid” presents an interactive game aimed at exploring the dynamics of river ecosystems beyond the traditional human-centric narratives. The game’s objective is to foster ecological empathy and a deeper understanding of river ecosystems by engaging participants in creating and sharing video narratives from the perspectives of various ecosystem actants. By using video storytelling and integrating speculative design principles, the game encourages players to assume roles of diverse ecosystem actants, such as living entities, inanimate elements, and abstract concepts, promoting an understanding of each actant’s unique perspective and role. The gameplay involves continuous interaction and narrative building, where participants can add their stories to a collective narrative, reflecting the dynamic and interconnected nature of ecosystems. Initially launched in a group workshop format, it transitions into an ongoing installation open to all, encouraging contributions that respond to the current state of the river ecosystem. The game’s design, based on non-human perspectives and fiction storytelling, allows for the creation of a layered and interconnected series of stories. “Wet Wet Wet Fluid” culminates in a narrative mosaic, showcasing the diversity and interconnectedness of ecosystem members, and encouraging players to appreciate the complex web of relationships within more-than-human ecologies. The outcome is a collective awakening to the importance of inclusive and responsible environmental stewardship. Conclusively, the game offers a novel platform for engaging with ecological narratives, bridging the gap between human and non-human entities and promoting a more harmonious coexistence through ecological education and empathy.

1. Track

Posters, Slide Decks, Workshops, Format X – Taming Entropy: Systems Design for Climate and Change.

2. Objective

'Wet Wet Wet Fluid' is an innovative interactive game designed to explore the intricate dynamics of river ecosystems, moving beyond the conventional human-centered narrative. It aims to foster ecological empathy and deepen understanding by engaging a diverse range of participants in creating and sharing video narratives from the perspectives of various ecosystem actants, fostering ongoing participation and contribution.

3. Methodology

Employing video storytelling as its core mechanism, 'Wet Wet Wet' integrates speculative design principles to engage participants creatively and empathetically with ecological challenges. Participants, playing individually or in groups, are encouraged to assume roles representing diverse ecosystem actants, including living entities like water, fish, and plants, inanimate elements such as stones, and abstract concepts like pollution or conservation efforts. This approach allows participants to step into the 'shoes' of different elements within the ecosystem, promoting a deeper understanding of each actant's unique perspective and role. The use of event and action cards, depicting various ecological scenarios, guides the narrative development, allowing for the creation of videos that embody the actants' experiences and reactions in the ecosystem.

4. Gameplay

The game facilitates continuous interaction and narrative building, where participants can view existing video narratives and add their own stories, reacting to or expanding upon previous narratives. It begins with a short group workshop format, where initial rounds are carried out by a few small groups, each given 15 minutes for their recordings and responses in each round. After recording, these narratives are added to a looped stream, creating a collective circular statement. After this phase, the game transitions into an installation open for participation to all conference attendees, both on-site and online. In this ongoing format, each participant can contribute their part in response to the current state of the 'river' through their chosen actant and the specific challenge they face. Participants view the current state of the river and draw cards that include perspectives of the actant, archetype, action, and artefact, which they then use as the basis for their contribution to the story. The cards designed for the game are based on the author's research into non-human perspectives and fiction storytelling.

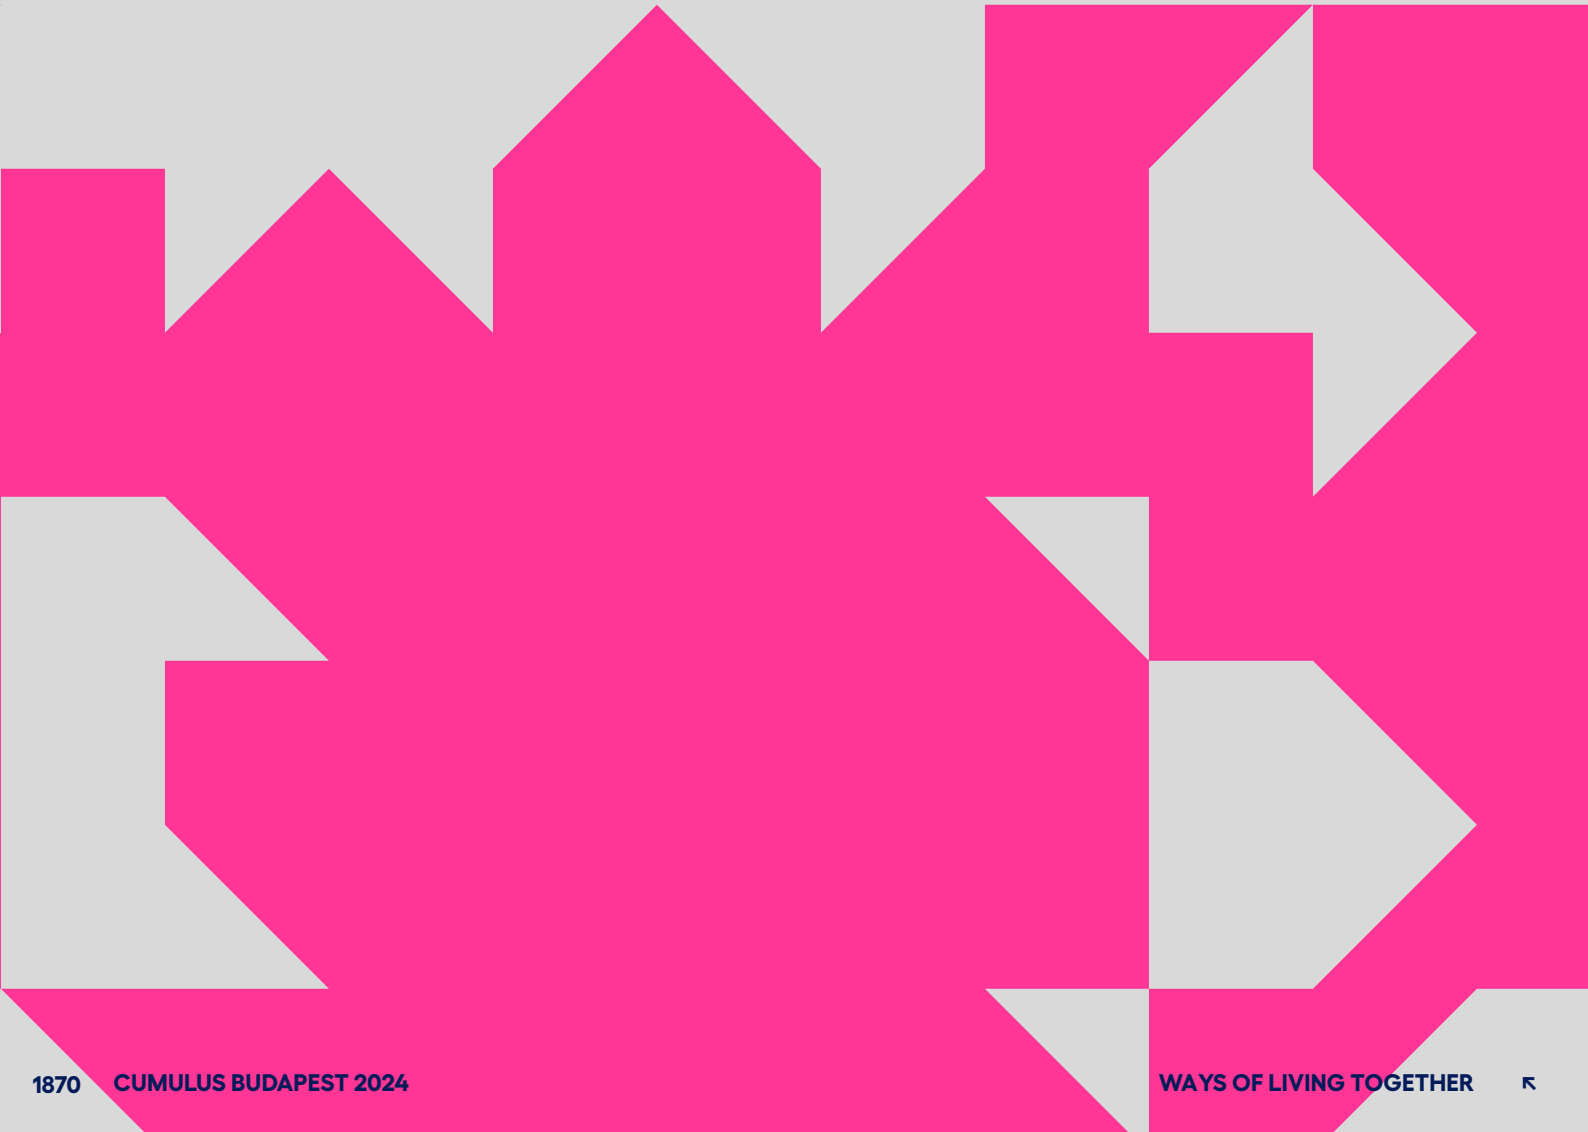
Every hour, a new state of the river is presented, and then, the selected submissions are integrated into the next round of the river's state. This creates a layered and interconnected series of stories, fostering a rich tapestry of ecological perspectives. The fluid format of the game, where new narratives can be added at any point, mirrors the dynamic and interconnected nature of ecosystems.

5. Outcome and Impact

'Wet Wet Wet Fluid' culminates in an intricate narrative mosaic that showcases the diversity and interconnectedness of ecosystem members. Players experience the river ecosystem through various non-human lenses, gaining a deeper appreciation for the complex web of relationships that define more-than-human ecologies. The game challenges participants to rethink their roles within these systems and fosters an understanding of the ecological implications of human activities. The outcome is a collective awakening to the need for more inclusive and responsible environmental stewardship.

6. Conclusion

'Wet Wet Wet Fluid' offers an innovative platform for engaging with ecological narratives in a collaborative and evolving manner. Utilizing video storytelling as a tool for ecological education and empathy, the game bridges the gap between human and non-human entities, paving the way for more harmonious coexistence. It represents a step towards a more inclusive, responsible, and ecologically conscious approach to living and design.



About the Author:

Katarzyna Anosowicz is a Service Designer, UX Researcher, and Innovation Strategist with a distinctive track record in developing the CX division at Player, a leading VOD platform by TVN Warner Bros Discovery. She established Player Labs and has successfully led over 100 projects that deepened immersive narrative experiences in streaming films and series. In her capacity at WBD in Poland, she conducts workshops aimed at redefining future media landscapes, prioritizing community engagement, and ecosystemic sensitivity. Educated with a Master's in Psychology and a postgraduate in Service Design from SWPS Warsaw, she is now completing a Master's in Theatre Studies at the Academy of Theatre in Warsaw, focusing on performative arts. Additionally, she is a recent graduate of Futures Studies & Strategic Foresight at the Copenhagen Institute for Futures Studies and will soon be lecturing on Critical Futures, Speculative Design, and Design Fiction at SWPS University. Her work is dedicated to advancing social and gender justice through speculative design. She is constantly developing her methodology centered around feminist futures, performative presence, and speculative design, aimed at analyzing spatiotemporal ecologies and fostering social and environmental change. Her passion lies in existential, total, and post-feminist theatre. She resides and works in Berlin.

WAYS OF LIVING TOGETHER

Design as a multifaceted discipline, is intensely intertwined with the fabric of society, shaping our environments in which we live and interact. As we move further into the 21st century, the role of design in facing systemic global and local social issues has even become more important. In this track, design's contributions to tackle pressing systemic global and local social issues were explored through addressing the various ways communities can coexist while exploring the different actors' networks, systems and roles.

The presented papers focused on topics related to urban co-habitation and impactful community work. We received methodological contributions such as explorations of scenario building and service design's potential contributions to placemaking, new methods for collaborative design research for neighborhood communities or social innovation in a post-industrial redevelopment. Design futuring approaches like projective provotype design were conceptualized and tested with communities to build alternative approaches to smart city methodologies. Also, case studies were presented, for instance, focusing on Safe School Zones, the CultiRider, a moving community space creating intercultural connections, Empowering Experiential Education in Design, a case study related to spontaneous design or the Evolution of Typography in Delhi's Historic Architectural Monuments, a research analysis which explores the development of typography and cultural influences on different buildings of India's capital.

Other works opened debates around issues of equity and diversity by overviewing gender-sensitive products or by discussing the opportunities of breaking down the stigma of medical abortion through the approaches of communication design. Also, the topic of equity and justice was debated in relation to public library design – and how it differs in different parts of the world – as well as the topic of evoking agency through ecological citizenship. Through navigating the potential of participatory practices, design-based processes and the borders between research and activism, this track opened up for future discussions, reflections and experimentations regarding different ways of living.

KEYWORDS | CITIZEN(S), DESIGN, ECOLOGICAL CITIZENS, COMMUNITIES & NETWORKS, PARTICIPATORY DESIGN

ABSTRACT | Design (as a practice) encompasses; appropriate, contextual, and strategic interventions empowering new ways of living together. In current times of; climate change, biodiversity loss and pollution, design has a role to play. This triple planetary crisis threatens ecosystems at a global scale, necessitating contextual approaches. We (the public) are used to being designed 'to or for', with common terminology referring to people as users and consumers, not 'citizens'. Citizens are already becoming involved in 'Public Interest Technologies', a contextual design field akin to democracy and politics. Cross-disciplinary practices nurture new approaches to collectively design 'with' people, enabling public agency for sustainable action. Design propositions are not always initiated by designers, or even simply organisations, but created by people in-the-field.

Ecological Citizen(s) (EC) is an approach (and project) to create autonomy/agency and sustainable actions within contemporary times (Phillips, et al., 2022). Ecological Citizenship is a design approach intent on catalysing/inspiring/invoking a 'citizen relationship' with our natural world. We focus on citizenship as a practice rather than a 'status distinction' as it concerns the agency to mutually benefit others and the planet through sustainable means.

This positioning article includes; historic and contemporary insights, literature, up-to-date practice-based examples/projects, experiments, and proposals. It advocates for designing proposals to catalyse citizens' agency, supported by appropriate technological outputs. We define a clear distinction between 'design for citizenship' and citizen positioning, a post-participatory perspective for design. Our research question unpicks: What are the attributes and positive benchmarks of design, as a means of evoking agency through Ecological Citizenship?

The audience are not only designers, but leaders in; social innovation, social decision making, design for equity, civic engagement, communities, DIY movements and more. Our Ecological Citizen(s) framework; supports individuals, organisations, businesses to make more positive choices, impacting the planet we inhabit and are reliant upon for all life. The convergence of; the triple planetary crisis, Ecological Citizenship, public interest technologies and designing for citizen agency, offers new modalities of ways we 'live together'.

1. Introduction

This work navigates emerging domains of; design and citizenship, within the context of their interdependencies (Weber, 2010). It responds to rising typologies of work unclassified by; Action Design (Sein, et al., 2011), Participatory Design (Spinuzzi, 2005), or Co-Design (Sanders, et al., 2008) and is itself post-participatory. This nuance might seem academic, but it concerns the balances of; agency, autonomy, power, and is a catalyst for transition. Agency is the "capacity to imagine alternative possibilities", it is critical to this position as it enables agents to have 'choice' (Emirbayer, et al., 1998, p.962). The framework's purpose is to; map projects, comprehend gaps, navigate opportunities, unpick existing examples, build new models of design, and manoeuvre the creation of citizen-led briefs in this space. The design objectives of the provision of agency substantially impact conventional 'participation' and are seen as attendance without a limited voice.

Participation is "the action or state of taking part in something" rather than directing, conceiving or co-ordinating something (Merriam-Webster, 2024). Authors frame and include; historic and current literature, contemporary practice examples, projects and experiments that offer autonomy, intent on enabling citizens (thus fertilising societies), as a contemporary design position.

We navigate the intricate post-participatory terrain, harnessing design-based processes, and the potent influence of activism… all impacting 'ways we live together'. We re-align; citizenship, acts of citizenship and citizen-led design. The work documents a cross-collaborative multi-domain literature review, defining what 'citizenship' is, within design frameworks (Stephens, 2010). Our audience is creative practitioners, designers, and protagonists that desire to nurture autonomy, within interested parties they engage with and those that have, to date, not engaged (or been unable to).

Currently with Ireland considering giving nature 'Human Rights' (Luyken, 2023), governments considering 'rights for nature' (Watts, 2024), and Brazil pioneering its indigenous voice through government parliamentary representation (Phillips, 2023), it calls to action new modes of citizen voice and agency. We classify; what a citizen is (from a design perspective), alongside examples of Ecological Citizenship with our research question;

> *What are the attributes and positive benchmarks of designing with 'Ecological Citizen(s)', to create and enable acts of 'Ecological Citizenship' (EC) for more sustainable futures?*

We are in times of massive change with; austerity (Anstead, 2018), Brexit (Zoega, et al., 2018), the cost-of-living crisis (Patrick, et al., 2022) and the triple planetary crisis (climate change, biodiversity loss and pollution) – and design has a role to play (Passarelli, et al., 2021). The emerging field of sustainable futures (Nižetić, et al., 2020) offers the means to explore 'preferable worlds' (Jokinen, et al., 2022), for design practices that can help navigate climate change and community (hyper-local) responses. We also see benchmarks as a standard by which other activities are measured – a yardstick of how projects could/should be done, highlighting core merits required for Ecological Citizenship.

This contribution identifies various opportunities for living and creating together. The definition of Ecological Citizenship (EC) is "accessible activities and skills which establish sustainable practice(s) and/or address ecological inequalities. Unsustainable practices (and consequences) are not constrained to individual countries, single industries, or discrete societies" (Phillips, et al., 2023, p.265). An example of Ecological Citizen Design was, My Naturewatch (NW), The NW project (mynaturewatch.net) was designed by the Interaction Research Studio, with engagements led by The Royal College of Art Design Products programme (Phillips, et al., 2022).

The NW project featured a trail camera using; distributed design instructions, off-the-shelf tech found in schools and education, required no tools or specialist equipment to make, was repairable, and created interactions that catalysed new behaviours (Phillips, et al., 2022). NW embodies inclusive design in the

digital age, as the activity engages a wide demographic community and can be used by all. It cultivated the audience's inquiry into the natural world(s) and built on something preexisting yet was more financially accessible than its contemporaries. It was not created for a specific age group.

After deployment with wide audiences (more than three million people) it fostered and enabled 'Ecological Citizenship', as some interested parties; rewilded their gardens, captured evidence for council action, documented for scientific purposes, ecological explorations, and engagement with new audiences (Phillips, et al., 2020). NW enabled; interactions, rewilding, training schemes, youth advocacy, design-for-repair, re-skilling etc. Audiences often commented "they made it" even though they assembled it, so there was a deep sense of ownership and pride in creations. One of the defining points was the agency of use that it gave (Phillips, et al., 2020, p2110). It was brave not to have a highly controlled 'use case', as it opened a life outside the design team. This unintentionally provided a grounded legacy and appropriation by alternative audiences.

This example helps frame nuances and starts to define the design space we are cultivating. We navigate; our lens of 'citizen', agency in designing with citizens, designing citizenship, and our climate, and examples of Ecological Citizenship and how it can positively impact the way we live. Within the work we navigate two tracks of design work that rarely communicate; Track 1 Sustainable Design, Track 2 Co-Design all framed around Our Lens of Citizen.

1.1 Our Lens of 'Citizen'

The term citizen is an equalising word, it carries with it the activism of Aristotle's definition "a citizen is one who rules and is ruled in turn" (Kerber, 1997, p.834). Major social issues such as the status of "immigrants, aboriginal peoples, refugees, diasporic groups, environmental injustices, and homelessness have increasingly been expressed through the language of rights and obligations, and citizenship" (Isin, et al., 2002, p.1). Traditional definitions of citizenship are 'nation-bound', for example the UK government defines it as "confirming British nationality or applying for the Right of Abode" relating to individuals' residential status and working legalisation (GOV.UK. 2022); (GOV.UK. 2018). There is also a difference between citizenship and cultural peer-mandated scenarios. For example; in the 2022 World Cup Japanese football fans were renowned for cleaning-up stadiums after matches (Adil, 2022). Berlin residents are 'obliged' to clear snow from footpaths in front of their properties (Winterdienst BEST, 2023). Finally, in Australia municipal BBQ's are rigorously cleaned by individuals after use (Dumas, 2014). Prior examples are either culturally based, legislatively driven, or mandated by community peers.

Our lens goes against those traditional views, we believe that a citizen is empowered, accessible to all, has autonomy and acts for themselves and others. We (the public) are used to being designed 'to or for', with common terminology referring to people as users and consumers, not 'citizens' (Alexander, et al., 2022). The "concept of sustainable citizenship and its normative responsibility claim on all societal actors and institutions" is the main difference between a citizen and consumer and that we should have agency over things that impact us (Micheletti, et al., 2014, p.203).

We view citizenship as a practice, an optional right of passage that benefits individuals, the ecosystem and those around them. Citizens are becoming more engaged in elements that impact them; for example, Public Interest Technologies involve building 'with' not 'for', enabling people to have a voice in matters that impact them (Abbas, 2021). Our definition is contemporary, not reliant on geopolitical, nation-based citizenship, i.e., not framed by Home Office mandates. Our view of 'Citizen' is "claimed, enacted and performed" (Arruda, et al., 2020, p.59).

In the early curriculum for the Scouts, Lord Baden-Powell shares their view of citizenship as "Every scout ought to prepare [themselves] to be a good citizen of [their] country and of the World" (Baden-Powell, et al., 2005, p.213). I.e., highlighting the need for citizenship to protect species and environments. As Citizens, "we must develop a sense of belonging in community, cultivate relationships with one another, help heal each other, and collectively build the world that will cease to make philanthropy necessary" (Alexander, et

al., 2022, p27). Buckminster Fuller refers to Our little Spaceship Earth that is “only eight thousand miles in diameter, which is almost a negligible dimension in the great vastness of space. Our energy-supplying mother-ship, the Sun is ninety-two million miles away” (Fuller, 2008, p.15). And later highlights that “When it is realised by society that wealth is as much as everybody's is the air and sunlight, it no longer will be rated as a personal handout for anyone to accept a high standard of living in the form of an annual research and development fellowship” (Fuller, 2008, p42). Fuller illuminates that all citizens must preserve spaceship earth, i.e., we are all responsible for our role in it.

As sustainable citizens hold different “expectations about ‘good citizenship’ and whether they believe that individuals can be politically efficacious and important agents of change” in the field of sustainability (Micheletti, et al., 2014, p.203). Gandhi’s conception of citizenship is largely one concept: “Swaraj” or self-rule. In Gandhi's vision, self-rule means that “everyone is [their] own ruler,” and is a self-realised individual (Shani, 2011, p.660). A contemporary example is ‘Clean Up Svalbard’ a coastal waste-removal program (created by the governor of Svalbard) in coordination with the Association of Arctic Expedition Cruise Operators (AECO). Cruise tourists who visit sites, have responsibilities to keep it clean (Ocean Wide, 2023).

We unite these perspectives, in that citizens should also have accessible autonomy over sustainable and ecological practices that can positively (or negatively) impact them or their communities/surroundings. Agency is defined “the sense of control that you feel in your life, your capacity to influence your own thoughts and behaviour, and have faith in your ability to handle a wide range of tasks and situations” (Davidr, 2021). More deeply autonomy is access to have choice, regardless of financially ‘rich’ or time ‘rich’ backgrounds. Citizen “voice is an integral part of agency, positioning development and democracy. Both highlight opportunities and obstacles – social, institutional, and normative – that agency therefore helps in interrogating on conditions for participation” (Bifulco, 2013, p.176). We acknowledge their complexities, but (here) we do not cover subsequent issues of; design ethics or design justice. We believe that designing interventions for pro-active citizenship inspires agency and whilst interlinked with safeguarding and ethics, we cannot cover them in depth.

A particularly salient example of this empowered agency, or ‘commoning’ (Hewitt, et al., 2020), and working for the common good is found in the Norwegian practice called ‘dugnad’ (Simon, et al., 2019). Dugnad as a cultural practice is embedded in Norwegian culture with origins in small farming communities, where people were historically dependent on each other. Simon et al., defines dugnad as an in-person event with a set time frame that involves all age groups of a community uniting to tackle a specific local issue, such as a spring clean of local park or raising money for local sports team: a “cultural practice that creates an environment that nurtures prosocial and cooperative activities” (2019, p.815). The dugnad usually ends with a social gathering and is a prosocial behaviour (Simon, et al., 2019), thus creating social connection within the community. Although dugnad is voluntary (Simon, et al., 2019), it differs from the British understanding of ‘voluntary work’ (Waikayi, et al., 2012) in the sense that dugnad is undertaken for mutual support and benefit (Furunes, 2022). Similar practices of mutual support are found in rural farming communities globally (Furunes, 2022).

1.2 Our Frame of the ‘Designer’s Role’

Designers strategically intervene with ‘materials of our time’. The 1950s was the ‘age of oil’, with booming plastic and chemical production (Murphy, et al., 2011). In the ‘age of the craftsman’ Chippendale was a skilled furniture designer and maker (Kimball, et al., 1929). They pioneered the concept of publishing an “archive of furniture designs” for business marketing purposes, entitled The Cabinet-Maker’s Director, (1754), “including every piece of movable furniture a modern household might need, in different styles” (Chippendale). Openly sharing designs, in a time of non-existent Intellectual property constraint or legislation, was pioneering.

Currently we are going through the ‘age of soil’, progressing regenerative practices that are sustainably and ecologically deployed, strategically building on economic structures and paradigms. Noted economist John Maynard Keynes's epithet was "it's easier to ship recipes than cakes and biscuits", subsequently

inspiring the open-source movement, questioning wasteful manufacturing paradigms (Galilee. 2018). Open-source technologies moved us through an age of access encouraging 'citizen designers' (Resnick, 2016) and opened new perspectives on design responsibility (Heller, et al., 2003).

Our current contextual material(s) are; digital, appropriate-ness, contextual situations, and a mix of traditional or green technologies. We are now entering the age of 'the citizen' with the designer's role providing autonomy. Our current material, (we frame) is the means to create, sustainable intent as we simply cannot 'sustain' the same approaches and relationships with the natural world. In Design, When Everybody Designs (Manzini, 2015) postulates about the more contemporary approaches to designing 'with' not 'for' people exploring; 1) What and how should experienced designers act, in a society in which all persons, individual and collective, are concerned with the design? 2) What might be the reasons and the developments of design culture to promote social innovation? (2015).

2. 'Citizen Design' (Track 1)

Citizen design operates within a multifaceted context, heavily influenced by the Ladder of Citizen Participation proposed by Arnstein (1969). This model illustrates a spectrum of citizen involvement, ranging from low levels of tokenism to high levels of empowerment and control. At its core, citizen design thrives in the upper rungs of this ladder, particularly through mechanisms like citizens' assemblies and economic forums (Schwab, 2020). These platforms serve as catalysts for deliberative democracy, where citizens actively participate in decision-making processes, transcending the traditional limitations of representative democracy. Unlike conventional political systems, citizens' assemblies are designed to be apolitical, fostering an environment where diverse voices converge to address societal issues.

These assemblies frame questions collaboratively (Wilson, 2020), ensuring that discussions encapsulate multifaceted perspectives and concerns, thereby enabling inclusive and well-rounded deliberations. A citizens' assembly embodies the essence of participatory democracy. It is a representative group of individuals, randomly selected to deliberate on specific issues affecting society (Westminster City Council, 2023). Operating independently from political affiliations, these assemblies are tasked with critically analysing complex problems and proposing viable solutions. Their processes prioritise inclusivity, often employing deliberative methodologies to ensure that all voices are heard and considered. The emphasis lies not only on the participatory nature of the process but also on the potential openness of its outcomes, which are designed to be reflective of collective input rather than predetermined agendas.

In contrast to mere community action models, citizen design surpasses localised efforts by engaging a wider array of stakeholders in co-designing the future of Public Interest Technologies (PITs) (Abbas, 2021). This concept embraces 'Defuse Design' principles advocated by Ezio Manzini, promoting designs that empower and enable individuals to actively participate in shaping their environments. An example of this approach is seen in the Medellin Cable Car Project, where the inclusion of citizen input was pivotal to its success. Conversely, Brazil's failed attempt (at emulating the Cable Car Project) highlights the repercussions of excluding citizens from design processes (Santos, 2023). This stark contrast underscores the significance of citizen involvement in the success of design initiatives, setting citizen design apart from conventional approaches to community action (British Council, 2020).

2.1 Citizen Design 01 *Skateistan (skateistan.org)*

Award-winning NGO, driving a global movement in skateboarding and creative learning. *Skateistan* creates spaces where young people can learn, play, and shape their futures. Their model builds skateboarding infrastructure and schools all over the world, delivers programs and equipment, and facilitates a network of over 800 social-skate projects with funding and resources. By focusing on at-risk, BIPOC and migrant communities, they promote inclusivity, diversity, resilience, and autonomy. *Skateistan* stretches across humanity, and anybody can be a citizen. *Skateistan* has five education facilities with state-of-the-art skateparks, across Afghanistan, South Africa, and Cambodia, in some areas where learning amongst young

girls is outlawed. *Skateistan* concerns creating confidence and agency rather than just an object or service… It inspires a curriculum for life. It inspires agency as it brings choice learning, access and a safe space that builds trust, outside of conventional structures.

2.2 Citizen Design 02 *InHouse Records (inhouserecords.org)*

Having been awarded countless international and national social design and entrepreneurship awards, *InHouse* is a record label with a proven track record of creating positive change for society. Having operated in and out of UK prisons across the South East of England since 2017, the label reduces the recidivism rate and is a rehabilitative record label for change. Their work in prisons exponentially increases positive behaviour [428%] and their impact on life outside is crystallised by a re-offending rate that is less than 1%. Working with Her Majesty's Prison & Probation Service and the Ministry of Justice, they look to bring change in the most challenging circumstances. It is specifically interested in building a metaphorical 'brotherhood' through music that enables people with an established and positive return post-penal system. A grounded technological platform that enables change, not only through connections but skills, development, and business lessons. Connected citizens with new skills, new networks, new opportunities, and an economy to work in. The agency it brings to its community is vast through; learning, skills, a contemporary curriculum, and tools for individuals or for clients to share through mentorship.

2.3 Citizen Design 03 *Fixperts (fixperts.org)*

Fixperts is a learning programme uniting 'fixers' with people and filmmakers, creating accessible narratives that can be publicly shared. Conceived and run by Forth *(wegoforth.org)* – a community interest company built by award-winning researchers, designers and educators who believe in the power of creativity as a tool for social change. The premise is simple: help fix a challenge, create a film, and share the process. It is intent on equipping future change makers to build the next generation of inventors and dreamers, encouraging contemporary and traditional skills. Each Fixperts project is made real by prototyping offering social connection. It employs a wide range of materials, skills, and technologies. The exceptional power of the project is rooted in the human connections between *Fixperts* and Fix Partner. The curriculum / engagement platform enables new methods; insights that can be broadcast providing both opportunities that can scale and impacts that are local. It not only encourages learning and skills development but provides agency in those that use it, can build off it, and see it as a medium to navigate the world of fixing.

2.4 Citizen Design 04 *Empowerment Plan (empowermentplan.org)*

Empowerment Plan (EP) was about designing jobs that keep people warm and develop their skills. Born out of the celebrated Detroit Soup (Admin, 2023). EP is a working economy, upskilling, training, and development of safer communities. The product is a coat, designed to keep the homeless population of Detroit warm and provide jobs/skills to those communities. The founder committed to hiring parents from shelters across Detroit to manufacture the coats helping families break the vicious cycle of poverty and become financially secure. The Empowerment Plan has evolved into an internationally recognized workforce development organisation. By pairing full-time employment with a wide range of supportive services, they have helped dozens of individuals achieve financial stability and independence for the whole family.

The *Empowerment Plan* creates significant economic impact by serving as a stepping stone out of poverty into a state of stability. The core of their work stems from their intensive two-year employment model, focused on providing job readiness training and support services to their workforce. The model has enabled every single person to move out of shelters within the first 90 days of working with them. It provides a bridge to financial stability, agency for choice and is a true example of citizen design. It also has a circular vision that enables its employees to grow and be developed within its core business.

3. 'Ecological Citizen(s) Design' (Track 2)

In Ecologism, Smith asserts that "citizenship refers to the framework of complex interlocking relations which exist between obligations and entitlements, in any legal and moral system" (1998, p.98). The argument continues that Ecological Citizenship means that "humans need to exercise caution before embarking on any project which is likely to have the possibility of adverse effects on the ecosystems" that it operates within (Smith, 1998, p.99). Ecological Citizenship "displaces the human species from the central position that it has always had" (Smith, 1998, p.99). This approach of considering potential impacts upon your surrounding peers, ecological systems, and environments, is pivotal to Ecological Citizenship. We should not be reliant on 'acts of kindness' to navigate our burgeoning planetary crisis, but think about how we build it into systems, enabling all to make better choices.

In Ecological Justice, Weston, et al., state "human rights advocates, champion the ecological rights of future generations", i.e., our human rights and ecological justice are intertwined (2012, p.251). Simply put "our societies [and] descendants depend on achieving ecological justice for future generations" (Weston, et al., 2012, p.43). I.e., we must protect future generations through Ecological Citizenship. It also feeds into lifelong learning as Ecological Citizenship holds an "important role in social change toward sustainable development, achieving economic, social, and environmental balance through informed, cooperative, and participative citizens" (Monte, et al., 2021, p.1).

We define Ecological Citizens 'touchpoints' as interaction points where appropriate and considerate technologies can be applied to assist people in their daily lives. Due to the complexity of these situations, they are not merely 'products' in their traditional sense, but are physical, digital or system interactions. The imperative element of Ecological Citizenship is designing 'with' and not for 'for', i.e., the touchpoints give agency enabling parties to make choices. We see it as an opportunity for how design (as a discipline) can be cultivated with / within societies. This design frame purely concerns the act of Ecological Citizenship for the betterment of many, designed and created 'with', but also constantly driven by positive ecological and regenerative outputs.

4. Citizen to Ecological Citizen(s)

Co-design practices work with people in collaborative ways, being open about elements. We refer to this as 'Citizen Design'; it is inclusive, accessible, affordable, and appropriate. Ecological Design has deep considerations for the impact to the ecological surroundings and ramifications (Todd, *et al.,* 2003). Ecological Citizenship encompasses Ecological Design as it cannot exist without 'Citizen Design', as you are a citizen of the ecological environment you live within. EC projects are differentiated not only in their process but also their execution. These EC stages (Figure 1.) include;

1. **Towards Citizenship |** They map existing assets (primarily) looking for alternatives, cross-disciplinary regenerative potential in concepts, under the bracket of 'with' not 'for' citizens.
2. **Ecological Positive Action |** Build upon non-extractive or have neutral impact(s), with sustainable intent.
3. **Collective Autonomy |** Their inception is supported to achieve individual autonomy that (in time) can translate into group / collective autonomy / agency.

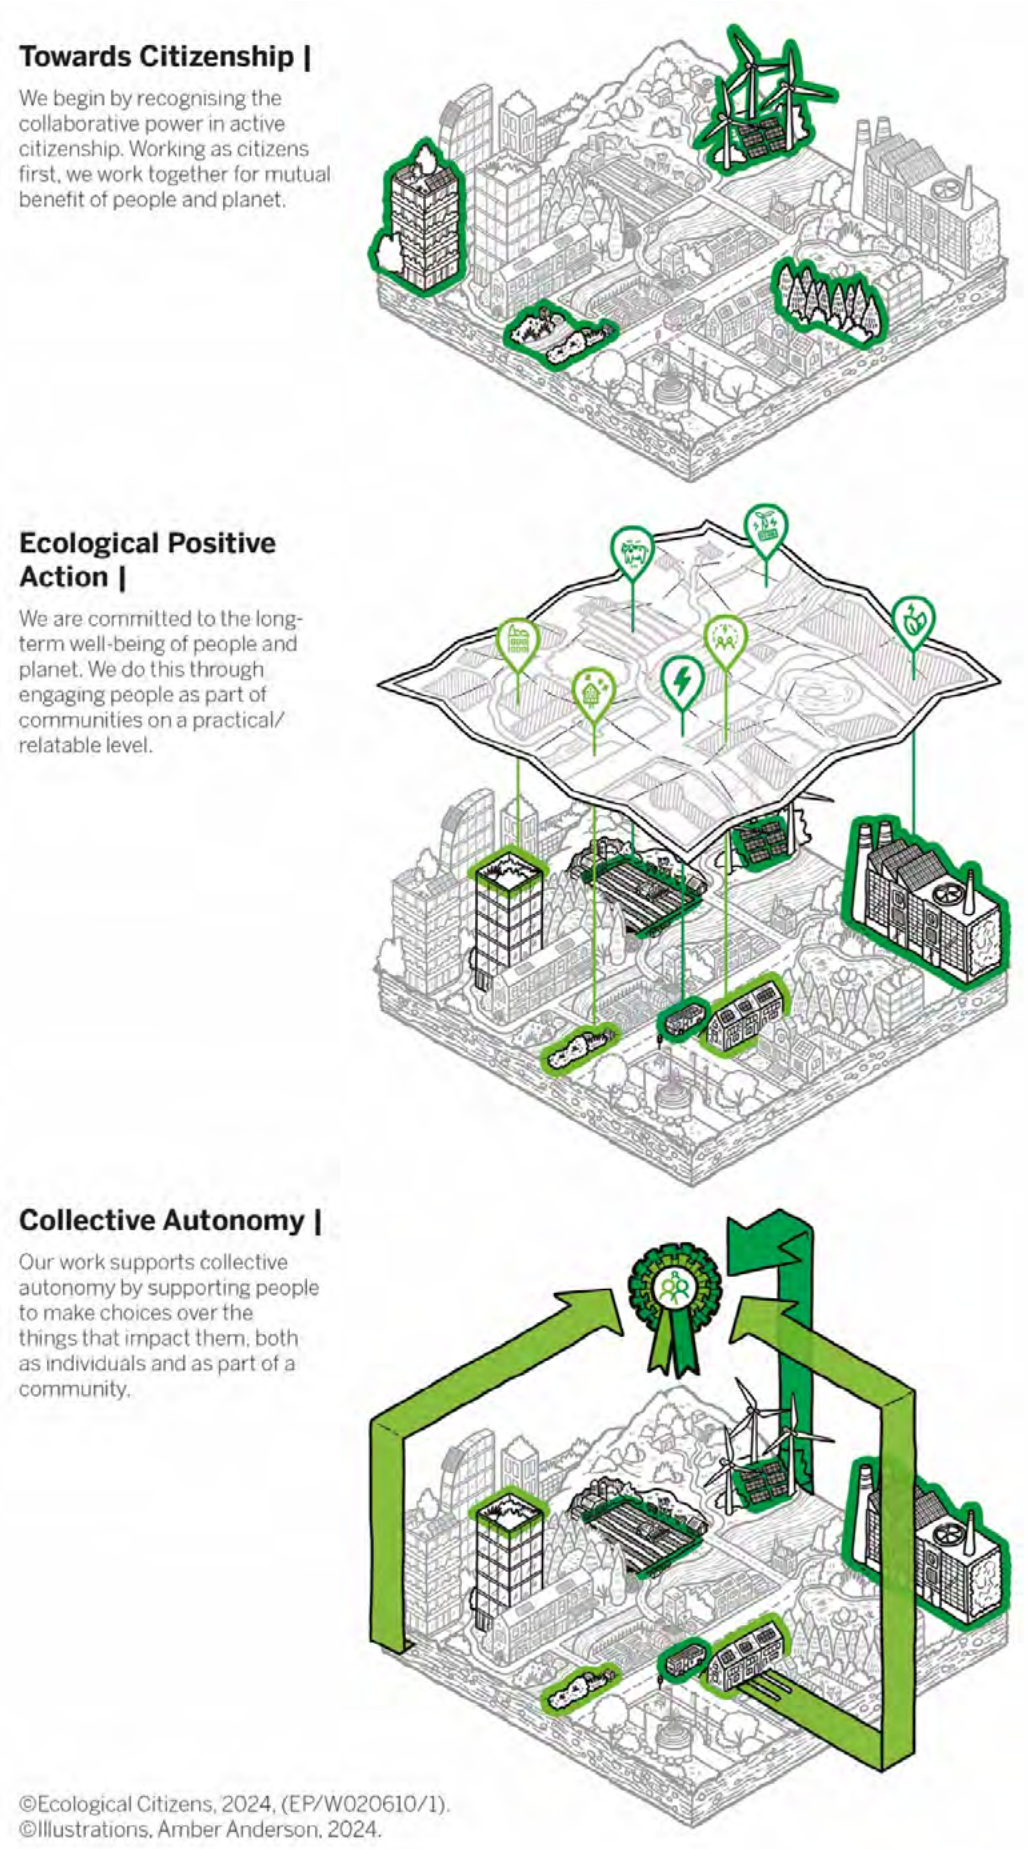

Figure 1. The steps toward Ecological Citizenship; 1) cultivating sustainable intent for ecological positive action 2) mapping existing assets, and finally 3) collective autonomy to supporting choice making over elements that impact on people.

EC projects are ethically completed, leveraging participatory design. Ideally EC projects have a life of their own creating: accountability, scaling potential and are (mostly) reproducible, if context, culture, and appropriateness allow. The following examples (01-04) are international and not solely from 'design start points', but they all end with 'designed interventions'.

4.1 Ecological Citizen 01 *Grangemead*

Grangemead offers emergency respite and daycare for learning disabled adults in East Sussex. Culture Shift brokered a connection between East Sussex County Council Adult Social Services and the University of Brighton (Community 21) to lead a three-way partnership to develop the outdoor space. They created the design for the garden in collaboration with staff (design professionals) and supported clients. Culture Shift's role was to support and evaluate the co-design process, capturing outcomes, impact, and learning (Culture shift, 2017). The multi-purpose space included: a wildlife pond, an outdoor kitchen, moveable and accessible planting boxes, a garden gallery, and a maker space.

The process was created and physically 'made' with citizens through their onsite maker space. It provided open agency over the space, upskilled clients and leveraged the use of local materials. It fostered sustainable intent through linking food growth and health in every sense with its outdoor kitchen. Elements of the *Grangemead* garden were also constructed from materials within the boundaries of the outdoor space. For example, using hand mined clay (whilst digging the foundations) that were fired in ground kilns and turned into working ceramic vessels for the kitchen. Graphical imagery was designed and deployed by residents using a pressure washer creating 'semi-permanent graffiti' etched into the gardens paving.

The intent was cultivated not only in what people could get from the space, but also what the space could provide to the clients and surrounding citizens, who lived nearby. This was evident in the projects approaches to biodiversity in the area, bringing autonomy and overall responsibility to those parties involved. *Grangemead* also shifted a boundary as conventionally these 'garden' typologies of are created and run by councils, whereas this was created by and with the citizens that occupy it.

4.2 Ecological Citizen 02 *Vertical University (VU) (belt-project.org)*

A collective organisation where the indigenous farmers are the teachers. The idea of The VU is simple. It is a "living classroom" of sorts, in the form of a 25,000-foot continuous vertical forest corridor stretching from Koshi Tappu (220 feet), Nepal's largest aquatic bird sanctuary, to Mt. Kanchenjunga (28,169 feet), the world's third tallest peak. It is a means to teach and conserve the 6,600 flowering plant species, 800 bird species and 180 mammals that are found in eastern Nepal. In a mountainous country like Nepal, where there is exceptional biological, climatic, and cultural diversity, from the tropical plains to the alpine Himalayas (Admin, 2018). The 'professors' of the VU may not have a Ph.D., but as indigenous farmers, they possess intricate, intergenerational knowledge about local fauna and flora, critical for Nepal's youth to attain.

The VU deepens place-based skills in sustainable technology, craft, and medicinal plants, and seeks to conserve and activate local knowledge while also creating sustainable livelihood opportunities. The outputs include; a curriculum, interdisciplinary learning, new economy, agency over the place and skills to nurture the opportunity. The VU explores new place-based economics that not only sustains the residential youth, but also the neighboring biodiversity. The VU is intent on creating: more sustainable communities, new job roles, citizen-led responsibilities, and contextually appropriate sustainable processes for local communities. The institution was created with the vision to improve a small community the sustainable intent has enabled many more parallel institutions across the Nepalese mountain ranges to thrive and prosper.

4.3 Ecological Citizen 03 *Nashulai (nashulai.com)*

Located in the Maasai Mara, Kenya. Notably, it is the first Maasai conservancy in the Maasai Mara to be created, governed, and managed by the people whose ancestors have inhabited that beautiful land for centuries, understand it intimately, and have sustained themselves, and their cattle herds, in harmony with the natural cycle of this globally important ecosystem. They are the first Maasai Conservancy in the Maasai Mara, living in sustainable symbiosis with wildlife for centuries. This is the opposite of traditional conservation models, where local people are displaced from their land. The "ethical grounds for displacement, whether pursued in the name of a larger national interest or a general social good, have always been specious" (Shahabuddin, *et al.,* 2014, p.8).

To counter that process in Maasai territories they talk about conservation refugees and conservation apartheid, where vast tracts of land are set aside for wildlife (and high-end tourism). Instead of leaving their land, they set out to band together and form their own conservancy. In the very genesis of this model there is a profound commitment from people most impacted to push back against a norm and mobilise to achieve positive change. The communities were desperate to see their community-led conservation process work. They were committed to making a more biodiverse sustainable wilderness for their children and future generations. That project will take years to come to fruition and is a true testament of long-term sustainable intent built 'with' communities / citizens not 'for'.

4.4 Ecological Citizen 04 *CLIMAVORE (climavore.org)*

A long-term project envisioning seasons of food production and consumption that react to human-induced climatic events and landscape alterations. CLIMAVORE critically questions the geopolitical implications behind the making of climate alterations and the pressures they enforce on humans and non-humans alike. Established on the intertidal zone at Bayfield, CLIMAVORE: On Tidal Zones explores the environmental effects of aquaculture and reacts to the changing shores of Portree, Isle of Skye. Each day at low tide, the installation emerges from the sea and functions as a dining table for humans, with free tastings of recipes featuring ocean cleaners: seaweeds, oysters, clams, and mussels. At high tide, the installation works as an underwater oyster table. The installation was activated by *Cooking Sections* (2023) in collaboration with local stakeholders, residents, politicians, and researchers. Over breakfast, lunch, or dinner (according to local tides), performative meals featured a series of CLIMAVORE ingredients responding to environmental challenges of Scottish waters. The project engaged with local restaurants that removed farmed salmon off their menu and introduced a CLIMAVORE dish instead. The outputs opened discourse with politicians, was place-based, provided dialogue and agency. CLIMAVORE's sustainable intent focused on catalyzing others to deeply consider their food, environment and how / when we should consider local communities. The interconnected approach of; redesigning local menus as food is something that binds us all, leveraging place-based intervention and centering the focus around 'inter-tidal zones' are something that will (in time) impact us all.

5. Conclusion

The work frames, navigates and positions; What are the attributes and positive benchmarks of designing with 'Ecological Citizen(s)', to create and enable acts of 'Ecological Citizenship'? Example projects were/are intent on creating autonomy as a practice. We are exceptionally aware of the complexities within this space for example; austerity (Helm, 2023), access to data (Mankin, 2024), access to sustainable means (United Nations, 2023), affluence (Gates, 2023), and this design space is exponentially complex, interconnected, and contextual. The examples have sustainable intent within different fields of; cultivating change, sustainable practices, and inclusion. The contexts are not a 'fix all' and brings into question: How is the work of design constitutively different when performed by 'non-designers'?

Within the space, it is cultivating the true means of how this can be achieved without compromising quality outputs. For example, understanding cost, production, and infrastructure challenges with the confidence of knowing a design process and that failure might unlock potential, i.e., prototyping. EC is ultimately bound by 'the bits in between' linking systems, processes, and elements. Traditional models try to mitigate impacts; carbon offsetting, recycling etc. is 'sustaining' the same behaviour and is contentious (Ghussain, 2023). The article's framework seeks to question: How is it benefiting the surrounding environment? From the onset. This moves design practice to a place where 'sustainable intent' is inclusive and accessible by all, creating situations where people have autonomy, agency and a clear steer on issues that impact their surrounding environment, peers, families, and multi-species.

6. Future Work

The positioning of this work cultivated, and provokes:

1. RQ; What should the balance be between our rights, responsibilities, and autonomy?
2. RQ; What are the wider impacts of citizens sharing their 'ecological impacts' and positive outputs publically?
3. Design opportunity: What are the 'future job centres' and career trajectories we can nurture over-time?
4. Design opportunity: Curriculum creation to nurture, foster and enable Ecological Citizenship, building and supporting future skills.

About the Authors:

The Ecological Citizen(s) is a cross-RCA research network led by Dr. Rob Phillips, with Professor Sharon Baurley, and Tom Simmonds, in partnership with Professor Sarah West of the Stockholm Environment Institute (SEI) at the University of York, and Professor Alec Shepley of the Faculty of Arts, Science and Technology at Wrexham Glyndŵr University, and partners from industry, third sector, NGO. Ecological Citizens is a Digital Economy Network+ project funded by the UKRI Digital Economy Programme, that is focused on digital interventions that would create 'the conditions to make change' towards a sustainable post-industrial society.

P/REFERENCES OF DESIGN

GENERATING DESIGN BRIEFS BASED ON THE ANALYSIS OF WORKPLACE ARTIFACTS INVENTED BY INDUSTRIAL WORKERS: TOWARDS ADDRESSING GAPS OF CONTEXT AND SCOPE IN THE STUDY OF SPONTANEOUS DESIGN.

KEYWORDS | APPROPRIATION, DESIGN RESEARCH METHODS, MANUFACTURING, SPONTANEOUS DESIGN

ABSTRACT | Research on spontaneous design presents a gap of context and a gap of scope. By 'gap of context' we refer to the territory of human workplaces, which are rich in examples of worker inventiveness, but still comparatively unexplored by design research. By 'gap of scope' we refer to how existing studies of spontaneous design have served to document, categorise, and understand design processes made by non-designers, but have fallen short on translating this knowledge into practical advice or tools for professional design practice. We present an initial approach to start addressing those gaps. First, through fieldwork in 11 industrial units in various sectors (textile, ceramics, metallurgy…), we identified and analysed 205 spontaneous design examples made by industrial workers. After analysing these artifacts, we generated design briefs, which were answered by the research team and iterated upon based on feedback from the representatives of the industrial units, as well as industrial workers. To understand whether the principles distilled from the analysis of spontaneous designs could be efficiently communicated to designers not involved in the initial research phase, we presented the same design briefs to design students as well as to design professionals, who presented their design concepts. In total, the process resulted in 15 design concepts. Through an analysis of the process and the resulting design concepts, we discuss the advantages and disadvantages of this approach, while also identifying future courses of action to continue addressing the gaps of context and scope.

1. Introduction

A metallic coat hanger being used as a TV antenna is an example of *spontaneous design*, a term defined by Loschiavo dos Santos (2000, p. 2) as "a creative practice of finding working solutions applicable to solve concrete problems, in a context of severe lack of resources". The term more often than not refers to tangible artifacts which are created by non-designers. A sign of the prevalence of this phenomenon is that it has popular terms in different languages to describe it, such as *gambiarra* (Brazil), *desenrascanço* (Portugal), *klugde* (USA), *jugaad* (India), among others.

Scholarly, the term finds home in the area of 'appropriation' research, which accommodates scholars from design, human-computer interaction, innovation studies and science and technology studies (Kohtala et al., 2020). Scholars working around appropriation are interested in understanding how non-designers create and appropriate products, including digital technology. These actions are also called *adhocism* (Jencks & Silver, 2013), *design-in-use* (Wakkary & Maestri, 2008), amongst others, or just simply *appropriation* (Akrich, 1998).

Understanding the coexisting discourses and terms around the same phenomenon, Kohtala and colleagues (2020) sought to create a unifying taxonomy. This was a significant advancement to unify and advance knowledge in this field. Another recent contribution to the field has been the call for more 'biographies of artifacts and practices' (Hyysalo et al., 2019). The authors suggested that the analysis of design-in-use would be much more informing than current analyses if it would not just focus on the artifact as it is found by the researchers, but also seek to understand its biography through strings of studies. This would allow understanding why the artefact emerged, how it changed, what functions it served in a certain context, or how it relates to how other artefacts evolved. Despite these important contributions to the field, we argue that there is still research needed in order for design to be able to operationalise the knowledge gained from studying this phenomenon. There have been attempts of defining guidelines for design that promotes or supports appropriation (Dix, 2007; Dourish, 2003; Sanders, 2006), but we are lacking research that connects the analysis of spontaneous design examples and converts it into actionable knowledge for design practice. To this we call a 'gap of scope', i.e. so far, the existing knowledge has not found its way into tools and/or information that design practitioners can use.

Furthermore, we also note a gap of context. Research on spontaneous design has mostly focused on 'snap shot' studies (Hyysalo et al., 2019) of certain environments, like domestic (Boufleur, 2013; de Bozzi & Oroza, 2002; Wakkary & Maestri, 2008) or public spaces (Boufleur, 2013; Suri & Ideo, 2005), as well as in certain domains, like healthcare (Storni, 2010) or disability (Hirsch et al., 2000; Jacobson & Pirinen, 2007). Despite signals that blue-collar workers appropriate and create their own tools (Cross, 2012; Juravich, 2017; Narimoto et al., 2020; Zhou et al., 2011; Zuboff, 1989), this is still untapped territory for design research.

However, this context of work is highly relevant for design for different reasons: 1) historically, designers have placed significant efforts in improving working conditions through workplace design (Myerson et al., 2010), which can benefit from methods that help designers understand workers' unmet needs, 2) historically, there have been tensions in the introduction of technology-led change in workplaces (Zuboff, 1989), which can be mediated by designers, and 3) currently, there are growing calls to improve working conditions for blue-collar workers, namely in Europe, where a group of experts has proposed to make Europe the "centre of gravity for good quality jobs", starting with manufacturing and engaging in human-centred design, which requires an understanding of current working conditions, challenges and opportunities (European Commission, Directorate-General for Research and Innovation, Unit G.1 et al., 2023).

Analysing spontaneous design in shopfloors could give us an understanding of how workers appropriate their workplace and this analysis could be used as a proxy to understand unmet needs, i.e., the reasons why workers appropriate tools, and the purposes thereof, can help us understand latent needs, for instance in ergonomics. Additionally, since participatory design with industrial workers is highly

challenging (Ardito et al., 2014), studying spontaneous design examples could provide a complement, or even an alternative, albeit necessarily less rich than direct interaction with workers.

In this paper, we present how we have tried to address the gaps in scope and context which we described above by proposing a design research process that draws from the analysis of spontaneous design examples to inform design briefs. Our concern was not so much on delivering prototypes to address issues on industrial shopfloors, as it was to test a method of generating design briefs based on the study of spontaneous design and ascertain whether they would be actionable by design practitioners. Although some phases of the research happened simultaneously (e.g., phases 6, 7 and 8), for the sake of readability, we present this process in chronological order of events (Figure 1), from fieldwork to assessment of design concepts, finishing with suggestions for future work.

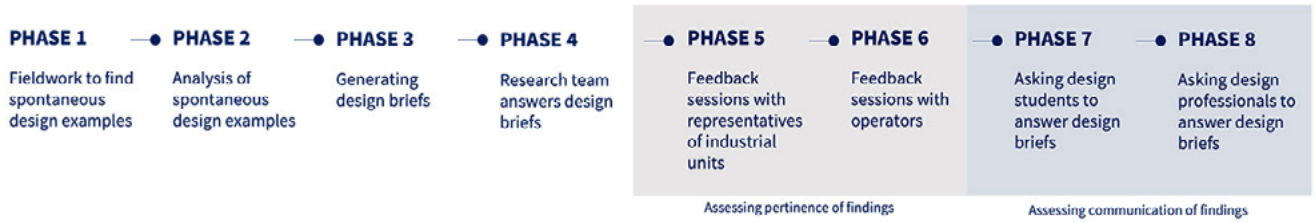

Figure 1. Phases of the research process described in the paper.

2. Building Knowledge from the Analysis of Spontaneous Design

During 2023, we visited eleven industrial units in Portugal working in the sectors of lighting, ceramics, textiles, metallurgy, polymer mould and injection, woodworking and cardboard packaging. During these visits, through factory tours using free non-participant observation and contextual inquiry, we documented examples of appropriation in the workplace by industrial workers. Figure 2 shows seven examples of spontaneous designs we found: A) adaptation to organize tools; B) Protection from machine; C) Tool handle made with tape glue; D) Levers fixed with cork stoppers; E) Tool designed to clean woven wool made from tape glue and rosemary sticks; F) Workbench with secured belongings and personal messages; G) New labels added to machine.

Each example of artifact (205 examples found in total) was catalogued according to Akrich's (1998) four categories of appropriation – *displacement*, *adaptation*, *extension*, *detour* – and analysed for function and underlying motivation for its creation. The photographic dataset of these spontaneous design examples was released in open source (containing the 696 photographs which were authorised by the industrial units for dissemination) (Correia de Barros et al., 2023). Each photograph in the dataset is accompanied by metadata categorising the type of appropriation, the purpose of the object, a description of the object (for alternative reading), the industrial sector, and the country of origin.

The main purposes we found in the sample of spontaneous designs were converted into four design briefs (Figure 3), the requirements of which were also extracted from characteristics of spontaneous designs we found in our research. A fifth brief was added in response to a direct need from one of the industrial units that were visited (Brief #5).

Figure 2. Examples of spontaneous designs found during research.

BRIEF #1

Design a solution to organize and display tools and/or materials on an industrial shopfloor environment.

It should:

- Fit a minimum of 20 tools/materials
- Have a space for each individual tool/material
- Allow the display all tools/materials at once
- Allow to hold tool/material in place if needed
- Allow for easy identification of each tool/material
- Allow labelling with user or sector name
- Provide enough space for approach and use (i.e., to easily remove or place tool/material) from different angles
- Be steady
- Be sturdy

BRIEF #2

Design a way to add information to industrial machinery to reduce errors in interaction and to protect users interacting with the machine.

It should:

- Allow for information augmentation through superimposed layers
- Allow to direct user's attention to certain details
- Allow to mark desired/safe states of machine
- Allow colour coding if needed
- Allow to use text, numbers, icons or bespoke symbols/drawings
- Allow easy removal/replacement

BRIEF #3

Design a way to protect users' hands when interacting with hand tools.

It should:

- Be comfortable
- Be portable
- Enable labelling with user or sector name
- Be adjustable to different hand tools
- Be adjustable to different hand sizes
- Be quick to place and remove
- Allow tool extension for hard-to-reach places

BRIEF #4

Design a way to protect users from particles/objects projected by working machines.

It should:

- Be adjustable in size
- Allow for flexible ways of attachment to different machines
- Be robust
- Allow to be locked in position
- Allow see through
- Allow labelling with user or sector name

BRIEF #5

Design a way for continuous cleansing of conveyor belts.

It should:

- Be adjustable in size
- Allow for flexible ways of attachment to different machines
- Be robust
- Allow to be locked in position
- Allow see through
- Allow labelling with user or sector name

Figure 3. Design briefs.

3. Designing Based on Knowledge from Spontaneous Design

During this phase, the research team worked on design concepts to answer the briefs. Figure 4 shows examples of concepts generated by the research team: A) a modular device for tool organization, which can be combined in groups of four to become table foot elevators; B) a 3D printed flexible and modular element that can be attached to different types of machinery to protect workers; C) a rod system to create storage space underneath workbenches; D) a digital tool to quantify existing material leftovers to encourage reuse and design with those materials; E) a universal tool handle.

While developing the design concepts, we led design feedback sessions with representatives of the industrial units, followed by similar sessions with shopfloor operators. A minimum of three elements from the research team was always present at the sessions. The sessions were not recorded – researchers took handwritten notes, including verbatim transcriptions when deemed relevant, and took photographs of participants' interactions with the prototypes.

Figure 4. Examples of design concepts created by the research team.

3.1 Feedback from Representatives of Industrial Units

We held sessions with nine representatives of eight of the eleven industrial units for feedback on the design concepts. The representatives varied in role, from factory directors to production engineers. The sessions were held in meeting rooms at the industrial units or online, during which the research team presented the designed concepts in paper and in tangible prototypes. During the sessions, the representatives of the industrial units commented on each concept. In the end of the session they were asked to rate the design concepts by highlighting those which they thought had more potential and/or were more useful considering their knowledge of industrial shopfloors.

The representatives of the industrial units validated some concepts, discarded others and offered ideas either to improve the concepts they were presented with or to create new ones. As an example, on the first session, one of the representatives of the industrial units looked at concept B (Figure 4) and imagined it at a different scale, suggesting that, if much larger, this element could be used as a mat for maintenance workers who often need to operate while lying on the floor and, while doing so, would welcome a way to keep their tools, screws and bolts at hand. Surprisingly for the research team, concept A's (Figure 4) secondary function as a table foot elevator was much appreciated by most representatives of the industrial units. What began as an optional function became desired as the primary one. After these feedback sessions we analysed the preferences of our participants, and continued working on the higher-ranked design concepts only: A, B and E (Figure 4).

3.2 Feedback from Shopfloor Operators

We conducted another round of feedback sessions to design concepts A, B and E. This time these sessions were held with operators of five industrial units (11 operators in total) and took place on the industrial units' shopfloors. Again, researchers presented printed images of the concepts and tangible prototypes. Without being asked to do so, most operators began manipulating the prototypes and experimenting them in their workstations and with their tools (Figure 5). This enabled operators to discover drawbacks in the design concepts as well as opportunities for application, for refinement and even new applications.

Regarding concept E, operators gave detailed suggestions on how the mouth of the device should be redesigned to accommodate different tools (e.g., from a metal file to a toothbrush), as well as how the material of the handle should be thought to absorb impact. Operators also found a new use for concept B as a tool organiser, which could be attached to the side of the workbench (Figure 5, second picture from the left) and hold the tools they use more often. Concept A used up horizontal space and this, for the workers, was a negative aspect of the design, since they often need as much free horizontal space as possible to do their work. Their new adaptation of concept B would also avoid frequent opening and closing of the tool drawer, which is what they currently do.

Upon request, the 3D CAD files of the design concepts were shared with the industrial units where these operators worked, so that they could print and use some prototypes there.

The feedback of industrial unit representatives and operators sometimes was similar, for instance, when referring to the need to keep as much clean space on workbenches as possible. However, there were also differences in the possibilities that were anticipated by each group when interacting with the prototypes. This seems to have been influenced by location: while industrial unit representatives were interacting with the prototypes in meeting rooms, operators interacted with the prototypes on the shopfloor and invariably looked around to see possibilities for the objects, and tried them out, which led to the identification of some barriers, but also to some new possibilities for the prototypes to better address their needs.

Figure 5. Photographs from the feedback sessions with operators.

4. Testing Knowledge Translation

As seen so far, the design process conducted by the research team resulted in two design concepts which appealed to operators. In order to understand how other designers not involved in the research and analysis of the spontaneous design examples would respond to the design briefs, we launched a challenge to design students, as well as a challenge to two design professionals who had no prior connection with the research team.

4.1 Design Briefs to Students

Through a partnership with the Polytechnic of Viana do Castelo (IPVC), the research team proposed a design challenge to first year students of the school's MSc in Design. The students were divided into five groups and each group received a different design brief (Figure 3). The students were given no examples of the spontaneous designs found by the research team in order to isolate the effect of having access to that information. Because not all students had visual or conceptual references of industrial shopfloors or machinery, we searched online for images of industrial environments to help students build mood boards with the following terms for each brief: Brief #1: tool organizer in workbenches; Brief #2: buttons in industrial machinery; Brief #3: industrial hand tools; Brief #4: industrial machine protection; Brief #5: cleaning conveyor belts.

Students worked on the design briefs for six weeks. One member of the research team was present at the launch of the challenge, on week four for a first presentation of the groups and feedback, and on week six when students presented the final designs. At the end of the presentation session, the researcher revealed examples of spontaneous designs found during fieldwork and how they were analysed.

Although the students were able to advance on the design concepts, they were concerned that they might be lacking relevant information from the field, since we did not share the fieldwork data with them. The presence of one of our researchers at certain points in the process was reassuring in the sense that students were able to clarify their doubts with a person who, in this case, was a subject matter expert.

Figure 6. Photos of prototypes and drawings made by students to answer the design briefs.

4.2 Design Briefs to Professionals

To understand whether there would be any differences between giving the design briefs to design students or to professionals, we sought to hire design professionals with no prior connection with the research team to answer the briefs. Answering the briefs consisted in delivering a sketch of a design concept. Similarly to Weingarten and colleagues (2020), we tried to recruit individual designers from freelance platforms. We scanned three platforms (Behance, Fiverr and Upwork) for professional services in product design and concept design from any location, who would speak English. We considered that the portfolio quality was generally higher in Behance, and so we decided for that platform. In the project, we had a budget limitation of 500€ per designer, but we understood this was not enough to reach the best-selling professionals, so we sacrificed the sample size and we used a budget of 1.000€ instead. We then took the five design briefs and we used the website random.org to attribute the briefs. We invited two designers to answer the briefs. Having no answer, we invited another two. In the end, only one designer answered and accepted to do the job. This designer got brief #2 (Figure 3).

Seeing that it was difficult to hire independent designers through this platform, and seeing that the sample was drastically reduced, the team agreed to use the remaining budget to try and hire a design studio. This would enable a comparison of approach between an individual assignment and a group assignment. We made a list of design companies operating in Portugal, and randomly selected between a list of three. The first invited company declined and the second accepted the job. This company got brief #1 (Figure 3).

The individual designer and the design company were asked to work on the design briefs independently and were not required to validate their process with the design team. However, as with the students, both felt the need for clarification and validation with the research team. The individual designer prepared a Miro board, which was shared with the research team, with the phases of research, insights/opportunities, and ideation. Throughout the process, the designer asked for comments on the work to help steer the design process. The company delivered a first file with a series of sketches as the design concept evolved, asking for feedback from the research team. The file also contained a section with questions that the company felt lacked answers which would help them improve the adequacy of their design concept to the brief. The company had doubts related to the type of industrial environment they should consider and tools in use at that environment, as well as other questions related to scale (e.g., how many users, how many factory sectors should be considered, what size would be reasonable for the artefact). The company considered that the brief alone was not enough for a good product development process.

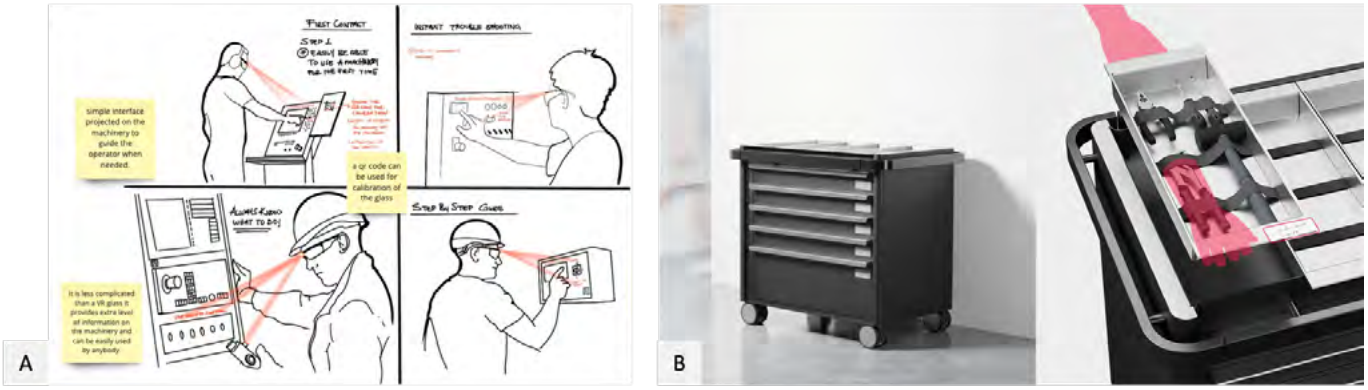

Figure 7. Design concepts by professional designers: A) Glasses answering Brief #2; B) Storage unit answering Brief #1.

5. Discussion, Conclusions and Future Work

As shown by other authors (e.g., Storni, 2010; Wakkary & Maestri, 2008), appropriation in general and spontaneous design in particular not only show in contexts of socioeconomic disadvantage, but in other contexts as well. In the case of this paper, we can also consider the notion of 'lack of resources' forwarded by Loschiavo dos Santos (2000) as time- or effort-bound, i.e., one may be impelled to engage in spontaneous design because one needs to find a working solution with some urgency, or because one does not think that asking others to provide a working solution (e.g., a supervisor on a production line) will be worth the effort. In any case, we have a person who is confronted with a problem to solve and who looks around for available resources to understand how to solve the problem most efficiently in terms of components used, time spent, and how effective the solution will be in answering the problem. In this sense, it becomes clear that the context of work is prone to these kinds of situations and, therefore, to the emergence of spontaneous design. We found multiple examples in single visits to eleven factories in Portugal, thus trying to contribute to closing the gap of context, which is often leaving the realm of work out from spontaneous design research. We hope that this research can contribute to a future 'string of studies' (Hyysalo et al., 2019) which can shed light on how processes of appropriation at work unfold, and how design research and practice can learn from them.

On the other hand, looking at examples shown in Figure 2, they seem to point towards flaws in design. For instance, a machine which requires new labels so that users can operate it denotes a product design process that was not ideal – maybe the original labels came off, maybe they were in a language that users did not understand, maybe there were no original labels, maybe the words in the labels did not have correspondence to users' jargon. There are many possible explanations, but there is an unequivocal sense that the original design did not fully meet its goals. Studying these kinds of artefacts is, therefore, a way of identifying unmet needs, as well as opportunities for better workplace design. Another way in which the research of spontaneous design examples can support design practice is to try to abstract from the concrete examples onto general needs. This is what we tried to do to address the gap of scope. We sought to do it in our research by analysing the functions served by the spontaneous design examples, the way in which they were built, and the motivations that seemed to lay behind the initiative to create the spontaneous design itself. In so doing, we understood, for instance, that often industrial workers engaged in spontaneous design because they wanted to improve ergonomics and safety at work. By analysing which characteristics improve ergonomics for workers compared to pre-existing conditions, we were able to extract general principles. Once we had these general principles, we formulated them as design briefs with which we created experiments among the team, as well as with untrained and trained designers.

Although in some cases the design concepts answering the briefs were similar (for instance, the research team and the students developed similar tool handles for Brief #3), in other cases, the approaches were quite different. For example, to answer Brief #1 (organise and display tools), students and design professionals designed their concepts based on large surfaces which could expose tools, while the research team developed a much smaller object which was designed to hold tools in almost radial format. This difference might have been due to simply different ways of thinking and approaching problems, as it might have been influenced on researchers' side by having witnessed that space is precious on an industrial shopfloor, and so artefacts should minimise the space they occupy. This reflection around space did not come until we saw external designers' concepts and it led us to thinking that maybe this should have been one of the requirements in Brief #1.

We also noted that both design students and design professionals commented that they struggled with not having any other information than the brief. Despite this lack of information, they were still able to answer the briefs and, as noted in the paragraph above, sometimes developing similar design concepts to those of the research team. All external designers knew that the research team was in possession of rich data from the field and would have preferred to have access to it. In our analysis, despite the lack of confidence that this lack of information imposed on design students and practitioners, they were still able to operationalise the principles extracted from the analysis of spontaneous design examples into new design concepts.

As future work, we would like to present these design concepts to representatives of industrial units and industrial workers to get feedback on perceived usefulness. The only significant difference we found between trained and untrained designers in answering the briefs, was that trained designers were better in formulating exactly which further information they would like to have had access to in order to improve the quality of their deliverables. In other words, they seemed more confident in identifying what they did not know.

So far, we have understood that the information we abstracted from the analysis of spontaneous design examples was enough to generate briefs which could be answered by trained and untrained external designers. As future work, we should bring the design concepts generated by students and by design professionals to the workers for feedback to learn about their perceived usefulness. Future work should also address optimal ways of conveying information to designers who were not part of fieldwork, so that design briefs become less generic and more nuanced as to reflect the specificities encountered by researchers in the real-world.

A strength of our research is that it seems to be the first in documenting, categorising and making the examples of spontaneous design available to the design research community. In this sense, although it does not yet allow a vision into biographies of these artifacts (Hyysalo et al., 2019), it can contribute to the strings of studies which can help close the gap of context in the study of spontaneous design. Our research also seems to be the first in seeking to extract design principles from spontaneous design examples to inform design practice. However, the research also has limitations. Reflecting back on the process, we understand that it would have been useful to have collected more structured feedback data to the design briefs from industrial representatives and from operators. We also did not have metrics for design quality with which we could compare work delivered by the research team, the trained designers, and the untrained ones – the fact that we obtained similar design concepts, or not very advanced ones, raises questions about the quality of the design process. This should be investigated further.

Finally, while the research was planned to resort to freelance platforms, following examples from prior research, we were faced with two issues. First, when writing the project research proposal we asked for a budget to hire five professional designers which, by the time we got to this phase of the research was already evidently insufficient – from five planned designers, we could only hire two. Second, the research team reflected about whether, by using freelance platforms, we were supporting design practitioners or rather taking advantage of – or enforcing – a system of precarious working conditions for designers.

About the Authors:

Ana Correia de Barros is a senior design researcher and head of the human-centred design at Fraunhofer Portugal AICOS. Ana's research revolves around inclusive and spontaneous design.

Inês Magalhães is a product designer and contributed to this work while doing her MSc at Fraunhofer Portugal AICOS around spontaneous design at work.

Catarina Correia is a communication designer and design researcher who contributed to this work while affiliated with Fraunhofer Portugal AICOS. Catarina interest in areas such as design and identity, design and emotion, social innovation, user-centred design, and inclusive design.

Rúben Moutinho is an industrial designer and a researcher within the human-centred design department at Fraunhofer Portugal AICOS.

Acknowledgements: This work was conducted with the financial support of the Portuguese Foundation for Science and Technology (FCT), under grant agreement no. 2022.01777.PTDC (Project Craft). The authors would like to thank the support of all the industrial units who generously opened their doors so that we could conduct our research, as well as to all the participants in the research: shopfloor operators, industrial unit representatives, design students, and professional designers.

ABSTRACT | “Listening to the Shipyards” is an engaging self-guided walking tour that combines ten sound design capsules and two augmented reality (AR) visual experiences to explore Nantes’ industrial heritage, the end-result of a 3-year research project into design for social innovation (DSI). The tour centers on a former shipyard undergoing rapid transformation and disappearing from the city’s landscape and provides a unique perspective on Nantes’ post-industrial landscape, offering insights to both locals and visitors alike. Following extensive field studies, students uncovered varying and contested redevelopment objectives among civic stakeholders and historians. As the area in question transitioned into a more traditional urban setting, conflicting goals emerged between: cultural actors that were the first to invest the abandoned industrial buildings for large, rowdy and public events; the syndicated union representatives deeply affected by the closure of the industrial base and resentful of its recreational re-use; and the city authorities aspiring to repurpose the area for residential, educational, and creative industry mixed-use. In an effort to mitigate dissensus around a shared vision, a proposal for an immersive sonic walking tour was presented to and endorsed by Nantes’ tourism agency, the Voyage à Nantes. This paper delves into how social innovation and digital design played a crucial role in identifying common objectives and fostering dialogue and collaboration among stakeholders with strongly divergent interests. As part of the Innov’Art 2 research project by the Institut Français d’Argentine, “Listening to the Shipyards” (À l’écoute des chantiers) contributed to the Voyage à Nantes 2022, providing a meaningful exploration of the city’s evolving identity.

1. Introduction

1.1 Design for Social Innovation

Design for Social Innovation (DSI) has emerged as a dynamic field that seeks to deploy the creative potential of design to address complex social challenges and drive positive change within communities. Rooted in principles of collaboration, inclusivity, and sustainability, DSI emphasizes the importance of engaging stakeholders in the design process to co-create innovative solutions that are contextually relevant and impactful (Manzini 2014, Manzini & Coad 2015).

At the core of DSI lies the concept of Participatory Design (PD), a collaborative approach that places stakeholders and community members at the center of the design process. By actively involving stakeholders in decision-making and problem-solving, participatory design tries to ensure that design interventions are responsive to the needs, aspirations, and lived experiences of those they seek to serve. (Bason 2010, Andersen & Mosleh 2021) This not only enhances the relevance and effectiveness of design outcomes but also fosters a sense of ownership and empowerment among participants. PD also recognizes that stakeholders working towards "changing situations into preferred ones" are designing (Simon 1996) and have legitimacy in the design process.

Murray et al. (2010: 4-5) highlighted four critical characteristics of the new social economy facilitated by Digital Social Innovation (DSI), which are evident in this three-year project: the extensive utilization of distributed networks for maintaining and managing relationships, supported by broadband, mobile, and other communication technologies; the diminishing distinction between the roles of producers and consumers; a focus on collaboration, along with ongoing interactions, care, and maintenance, as opposed to singular acts of consumption; and a significant emphasis on underlying values and missions.

According to Manzini (2014), this project is an example of top-down, incremental innovation, since it is driven by designers and experts to achieve systemic, institutional innovation for socially sustainable development. In this case-study, we apply participatory design principles (Chick 2012) demonstrating these approaches in the pursuit of design for social innovation, showing how PD helps mitigate and structure dissensus among partners in an industrial heritage project.

> "The codesign process takes place de facto, thanks to the interactions that are not only uncoordinated but can even be conflictual." (Manzini, 2015: 50)

1.2 Innov'ART2

The Innov'Art2 cooperation program of the Ministry of Foreign Affairs, led by the French Institute of Argentina, was launched in July 2019 to develop academic, scientific, and artistic exchanges between French and Argentine universities. Our Innov'Art 2 project was part of a bilateral cooperation project between our design school's two graduate programs and two Argentine universities (and their departments of Social Communication in San Juan and Architecture in Tucuman) thematically centered around design's response to urban trauma. Each partner addressed a local issue with a shared methodology, and the French context addressed the shipyard closure in 1986, the termination of its 60,000 strong workforces, and the significant urban decline brought about by the loss of the industrial city's primary employer. This project situates itself within the broader context of international cooperation, and it underscores the global significance of addressing industrial heritage challenges and fostering interdisciplinary collaborations in urban design and heritage conservation.

1.3 Ile de Nantes and Its Post-Industrial Context

We explored the intricate interplay between industrial heritage preservation, urban redevelopment, and cultural revitalization in the new Quartier de la Création on the Island of Nantes. Against the backdrop of the island's industrial past, characterized by the presence of notable establishments like the Alstom engine factory and Dubigeon shipyards, our research delves into the multifaceted efforts aimed at preserving industrial-historical traces while fostering contemporary urban vibrancy, and the conflicts that can arise from its urban redevelopment. (Charles & als. 2016, Rapetti 2019, Renard 2018)

Central to our inquiry is an examination of the strategic decisions made by Nantes' public actors since the 1980s, which have shaped the island's landscape and identity. Emphasizing the significance of industrial heritage preservation and valorization within urban development master plans, we analyze the transformation of the Ile de Nantes into a dynamic extension of the historic city center, characterized by its dense urban fabric and burgeoning cultural scene.

Figure 1. Boat launch in the heyday of the Nantes Dubigeons shipyard. Image courtesy of the MHT.

This paper also scrutinizes the roles played by various stakeholders, ranging from governmental bodies like SAMOA and Nantes Métropole, to cultural institutions such as Stereolux, Maison des Hommes et des Techniques, and Le Voyage à Nantes, to historic preservation researchers and associations. Through case studies and empirical data, we explore how these stakeholders collaborate - and sometimes resist each other when goals diverge - to engage with the community, enhance industrial heritage appreciation, and promote tourism development.

Furthermore, this case-study sheds light on the participatory nature of heritage conservation efforts, exemplified by workshops involving representatives from academic, cultural, and governmental spheres. By examining the outcomes of such collaborative endeavors, we elucidate the challenges and opportunities inherent in the preservation, valorization, and appropriation of post-industrial urban areas, showing *how DSI can help mitigate and structure dissensus among partners in an industrial heritage project.*

2. Methodology: Multi-Phase Fieldwork and Iterative Development Phases

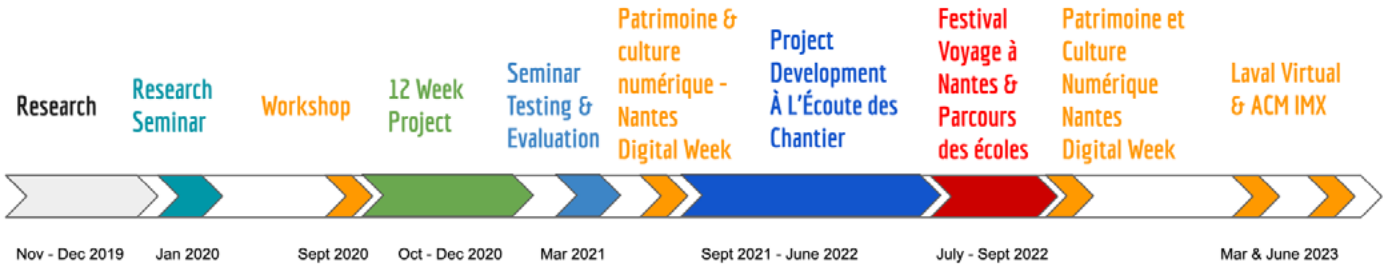

Figure 2. Project timeline from 2019 to 2023: field research seminars and participatory design workshops led to a studio course for initial design propositions, followed by nine months of production. Note: gaps are due to Covid19 lock-downs. "A l'écoute des chantiers" was launched in July 2022, and is still deployed.

2.1 Phase 1: Initial Fieldwork in Fall 2019

The initial phase of our fieldwork centered on identifying and conducting interviews with key stakeholders involved in the redevelopment of Nantes' industrial heritage. The lead researchers engaged in comprehensive interviews and site visits to delve into the area's history, map out the stakeholder networks, and clarify their goals, challenges, and any points of contention with other involved parties. These detailed interviews were crucial in pinpointing the major entities driving the redevelopment efforts on the island, culminating in the compilation of a network of essential stakeholders presented in Table 1. Drawing on Mitchell et al. (1997), we concentrated on stakeholder classes with significant influence and/or legitimate interest in the industrial heritage and urban redevelopment of Nantes, specifically focusing on Dominant, Dependent, and Definitive stakeholders. (Krupa et al. 2022) This group comprises individuals from agencies responsible for the area's redevelopment, maintenance, preservation, and enhancement (including DPARC, Samoa, and VAN), as well as civic actors engaged in historic preservation (such as MHT and Nantes University).

Table 1. Expert interviews by Innov'Art 2 research team leaders.

May 2019	SAMOA - Hangar 32 - Interview of International project manager + Commented tour of Ile de Nantes, Creation District	SAMOA, a publicly funded organization, oversees the redevelopment of the Ile de Nantes. Initially working with Dominique Perrault (architect of the Bibliothèque Nationale de France) in 1995 and later replaced by Alexandre Chemetoff who submitted the master plan after a participatory design phase.
	Director, Maison des Hommes et Techniques (MHT) - Parc des Chantiers - Commented tour of the naval industry museum	The MHT was established by a collective of former shipyard builders and workers, with its headquarters situated on the ground floor of the former Dubigeons administration building. Since its inception, the organization has undergone minimal changes. There is a strong opposition between the redevelopment goals of MHT, Samoa, Voyage à Nantes and Nantes Métropole on the notions of industrial heritage of a post-industrial site. Significant archives are located in the few remaining structures.
Dec. 2019	Director, Historic Preservation Departement, Nantes Municipality (DPARC)	Historic Preservation has forged strong connections with residents and broader civil society, encompassing concepts of architectural heritage, cultural heritage, and industrial heritage, documenting not only from public archives but also from private sources such as industries, businesses, and personal archives, cataloged within the Nantes Patrimonia website.

	Project Manager, Le Voyage à Nantes (VAN)	The VAN is a private organization that serves as Nantes' official tourism bureau and runs a large number of services and cultural events for the metropolitan area, including the maintenance of the Parc des Chantiers (PdC), a privately-run public-owned public park on the former shipyard of the Ile de Nantes. PdC is the place for festivals, cultural, sportives and leisures activities, and is a very well known leisure parc, with difficulties depending on its temporality, notably between the public nuissances and safety of its nightlife and recently-arrived local residents.
	President of the association of industrial heritage of Nantes	1985-86 : Closing of the factories on Ile de Nantes – Alstom, Dubigeons Shipyard. 1993 - 1995 : creation of the industrial historic preservation association Conflits between the first tabula rasa redevelopment plan (Perrault) and historians and union representatives in a socialist city. Chemetoff's subsequent plan is for a city rebuilt without erasing its industrial remains[1].
	Vice-President, Nantes University	The relocation of port activities to Saint Nazaire, orchestrated by Nantes' town hall and the Chamber of Commerce & Industry, marked a pivotal moment in the city's industrial landscape. As shipyard closures ensued, deindustrialization exerted profound effects on both blue-collar employment and indirectly impacted service jobs in Nantes. The election of JM Ayraud, a socialist mayor, in 1989 heralded a period of significant urban transformation. The ZAC de la Madeleine project, initiated from 1990 to 1995, saw the establishment of the Civic and Convention Center, setting the stage for the subsequent replication of this urban renewal model on the Ile of Nantes from 1995 to 2000. Key public-private entities like SAMOA, along with urban planning figures like Alexandre Chemetoff (succeeding Perrault), spearheaded efforts to reimagine the city's urban fabric, particularly around public spaces. Central to this vision was the preservation of Nantes' industrial port heritage, manifesting in the repurposing of vacated urban spaces by the town hall. The cultural and creative industries found fertile ground in refurbished old factories characterized by their distinctive metal and glass frames, symbolizing Nantes' economic rejuvenation. Question: Does Nantes' resilience come from the modernity of urban heritage policies and has been driven by cultural and artistic production? Recommendation: Insist on the relevance of heritage issues with the general public to find a link between the different actors of the Parc des Chantiers (MHT, VAN, NM, SAMOA, University of Nantes).

Our initial interviews uncovered some conflict among essential civic stakeholders, each with differing visions for the area's redevelopment. Each party clearly articulated their perspective, legitimacy, and stakes in the redevelopment process, and identified allies and points of tension with other parties. The MHT advocated for a renovation that would honor the historical integrity of the shipyard's remaining structures. In contrast, organizations such as VAN and cultural entities like Les Machines, Stereolux, and Trempolino aimed to infuse the space with vibrancy and cultural significance. DPARC and Nantes University found themselves navigating a middle path, striving to balance the preservation of the site's industrial legacy with the practical ambitions of fostering a dynamic, multifunctional community. A notable contention arose over the acknowledgement of other stakeholders' needs and ambitions, with highly polarized stakeholders and newer entrants to the redevelopment discussion often perceived as lacking legitimacy by others. This issue seemed disconnected from the actual influence or authority of the institutions involved.

[1] https://www.cilac.com/definition-histoire

2.2 Phase 2: Research Seminar: M1 level students, Jan. 2020

At the école de design, graduate research projects frequently serve as practical learning experiences, and the Innov'Art2 project was aligned with this educational approach. Tasked with exploring Nantes University's research question on public perception regarding the area's redevelopment, a weeklong research seminar was organized. During this seminar, 24 first-year Masters students engaged in comprehensive research of a specific area. Their goal was to assess its present condition and explore potential redevelopment strategies that prioritize social innovation. This involved conducting interviews with both the general public and local businesses. The students were divided into five teams, with each team assigned to delve into one of the five identified challenges, analyzing their findings accordingly:

- **Challenges**: Addressing nuisances, public space dynamics, noise, waste management, disorderliness, and criminal activities.
- **Heritage and Identity**: Exploring aspects related to industrial heritage, cultural identity, museum development, and nostalgia.
- **Community and Economy**: Delving into topics concerning urban economy, revitalization efforts, urban planning strategies, and the overarching master plan.
- **Cultural and Creative Revitalization**: Investigating the appropriation of industrial heritage by cultural and creative enterprises.
- **Patterns of Use**: Analyzing usage patterns ranging from informal to formal, spontaneous to planned activities within the designated area.

The comprehensive territory diagnosis revealed a significant gap between the current perceived state of the neighborhood and the sustainable development and cultural aspirations held by civic stakeholders and the local community. The neighborhood's minimalist high-tech architecture and deserted appearance, frequently exacerbated by ongoing construction, was highlighted, especially during the Covid lockdowns, which limited business operations to only essential services. This insight provided a foundation for future strategies aimed at bridging this gap and fostering a redevelopment process that aligns with the community's needs and aspirations. A longer student project was planned with a participatory design workshop to kick it off.

2.3 Phase 3: Participatory Kick-Off Workshop - M2 Level Students, September 2020

> "Conversation among individuals and groups who set design initiatives rolling at the networks' nodes of the networks they are part of: a social conversation in which actors interacts in different ways (from collaborating to conflicting) and at different times (in real time or off line)." (Manzini, 2015: 49)

With the student's fieldwork identifying and confirming public divergence with the civic actor's redevelopment objectives, a 12-week prospective design project was initiated with a four-hour participatory workshop that brought together graduate students and key civic stakeholders concerned with the preservation, valorization, planning, and tourism development of urban post-industrial heritage. The following "neutral" brief clearly identified every stakeholder's role and legitimacy in the discussion:

> "Since the 1980s, Nantes has prioritized the preservation and modernization of its industrial heritage as a key component of urban redevelopment. The west of Nantes Island, historically home to heavy industries like the Alstom engine factory and Dubigeon shipyards, has been targeted for development. City actors have chosen to maintain traces of Nantes' industrial past within the island's landscape, reflecting its role as a commercial and industrial port. This commitment to heritage preservation is evident in development master plans.

> Today, Nantes Island serves as an extension of the historic city center, characterized by urban density and a diverse array of services. Cultural activities, driven by creative industries and tourism, thrive on the island. Institutions like the Maison des Hommes et des Techniques, housed within the Ateliers des Chantiers Navals buildings, offer museum spaces to showcase the history of Nantes' shipyards. Le Voyage à Nantes manages public spaces like Chantiers Park, while SAMOA oversees urban planning and shares responsibility for Quartier de la Création with Nantes Métropole. The Heritage and Archaeology Department engages users through co-construction efforts via patrimonia.nantes.fr. The University of Nantes contributes to industrial heritage enhancement by investing in Hall 6, while Stereolux and Scopitone play vital roles in the cultural industries of Chantiers Park."

The workshop sought to establish a consensus regarding the challenges identified by various stake-holders during the area's redevelopment process, and identify potential solutions to be further developed by first-year master's degree students in the Care and Digital Design programs. Experts participating in this workshop included representatives from the following institutions: Maison des Hommes et des Techniques (MHT), Stereolux (major cultural venue), University of Nantes, Historical Preservation Department of the city of Nantes (DPARC), SAMOA, Le Voyage à Nantes (VAN), Territorial Management Direction of Nantes Métropole, Care Design and Digital Design Lab directors, course leaders and workshop facilitators.

Figure 3. Stakeholders collaborating during the first project's kick-off workshop (during Covid19) in one of the renovated industrial buildings managed by Nantes University.

Figure 4. Four resulting goals from the participative design workshop: reinforcing community ties, valorizing industrial heritage, mapping the new neighborhood, and opening up the MHT and the former shipyard's history to visitors.

The kick-off event took place in a spacious, repurposed industrial building, ideal for accommodating large groups while adhering to the social distancing guidelines in place following two significant Covid lockdowns. This event served as a crucial psychological break for participants, offering relief from extended periods of social isolation. Additionally, it acted as a catalyst for re-establishing communication among civic stakeholders, particularly between the MHT and the VAN, who had stopped working with each other. This "thawing" of relations led to making the VAN the leading partner in subsequent phases of the project, seeing its potential as the social lubricant to enable the MHT's cooperation with the VAN.

2.4 Phase 4: Developing Preliminary Concepts and Augmented Reality Experiences

Since InnovART'2 expected a creative production as its final deliverable, the students were separated into two interdisciplinary projects from October to December 2020. "design fiction" and "Innov-AR" with Digital and Centrale engineering masters' students. The first project named "design fiction" involving Care and Digital masters' students was a low-tech approach to imagine alternative solutions to persistent problems with the new neighborhood, while "innov-AR" was an augmented reality exploration to visualize the industrial structures that had disappeared from the area. At this stage, the projects' focus was less on structuring dissensus in Digital Social Innovation (DSI) perspectives and more on crafting unified deliverables for presentation at the conclusion of the three-year research project.

The "Design Fiction" project aimed to create alternative yet pragmatic scenarios for urban development that would enhance community engagement and preserve historical integrity. Seeking consensus rather than design fiction's usually provocation function, it involved five interdisciplinary design teams, each tackling specific objectives: creating new communal spaces on the esplanade, designing night-time illumination for the esplanade's pathways, developing a low-tech method for exploring Nantes' industrial past, devising innovative approaches to sharing industrial heritage culture, and crafting a sound design experience to celebrate industrial heritage. The project that garnered significant acclaim from both the VAN and MHT (who monitored the student projects) was a sound design walking tour (Fig. 5) that narrated the former shipyard's history, and initiated the final round of design production.

Figure 5. Images of the initial student proposal for a circular sound design walking tour on the grounds of the former shipyard.

The “Inno-AR” project consisted of five teams, each developing an Augmented Reality (AR) application designed to visually resurrect industrial structures in Nantes that had long since disappeared. These interactive smartphone applications allowed users to explore massive historical structures such as the Transborder Bridge, dismantled in 1958, and the Calle des Sous-marins, demolished in 1985. Other projects included an AR experience of the Quai des Armements, highlighting the collective bartering strike of 1955, and Boatlaunch 2, which showcased the Scandinavia ferry. Launched in 1981, the Scandinavia ferry was the largest ever constructed in Nantes and led to financial difficulties due to the scale of investment in equipment. Another application brought to life Boatlaunch 3, featuring the Grue Titan Jaune (1954) and Le Brissac (1960-61), highlighting a period when Nantes' shipbuilding industry was at its zenith.

Figure 6. Initial student proposal for the former Transborder (ferry) bridge in augmented reality on the existing bridge.

Two augmented reality projects stood out for their exceptional execution and were thus chosen for inclusion in the final walking tour project: The Transborder Bridge and the Brissac ferry featured on the Boatlaunch 3.

Due to the VAN’s encouragement, a funding request was drafted to create a walking tour with augmented reality experience for inclusion into the Voyage a Nantes summer festival, and as the proposal was winding

its way through budget comittees, another research seminar was launched to test the five low-tech “design fiction” proposals.

2.5 Phase 5: Research Methodology Seminar - Industrial Heritage, Cultural Industries and Social Appropriation - Parc des Chantiers – M1 Level Students

First-year masters design students developed research tools and deployed testing protocols like semi-directive interviews, SWOT, 5W’s + H, spider net, PESTEL, and stake-holder maps for the five design proposals in a one-week research seminar. The user testing methods deployed in field investigations included: *Interviews* (Bystanders, Professionals, Spider net), *Discreet Observer Design Ethnography* (QR code interactions, Line pathway, Sound testing), and *Mapping* (Empathy map, Commerce mapping).

Below (Tables 2-4) are screenshots of the user tests of students’ initial sound design walking tour concept; however, the final project’s user interactions, pathway, media choices and narrative design approach are very different from those proposed by the initial student project, since the mandate extended beyond the initial area to encompass the green line pathway of the Ile de Nantes over several kilometers. The test did serve to validate user interactions with QR codes and develop design questions for the final applications to consider and/or resolve.

Table 2. Examples of mapping field investigations for the initial student concept of the walking tour.

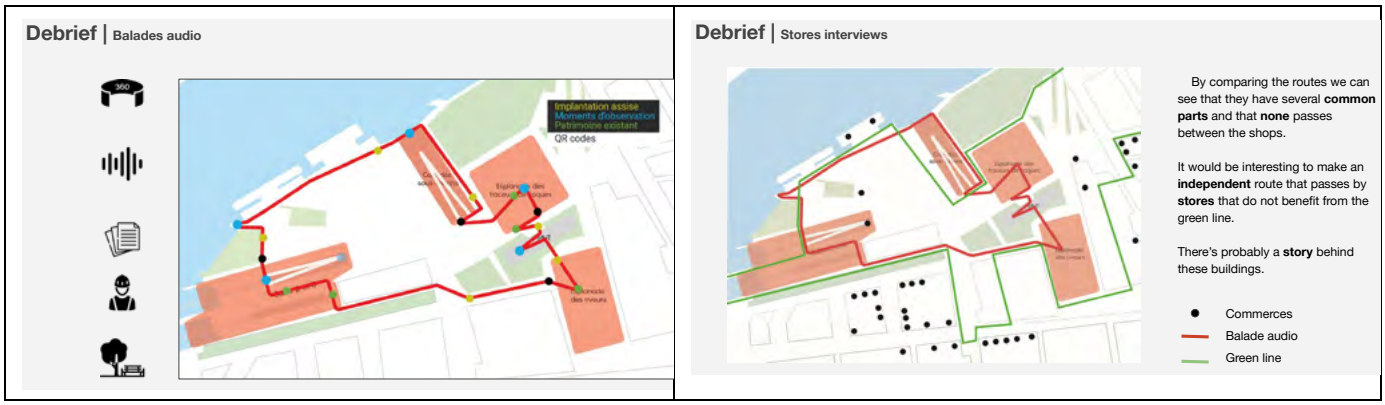

Table 3. Results of interviews with a wide variety of park visitors and local store owners.

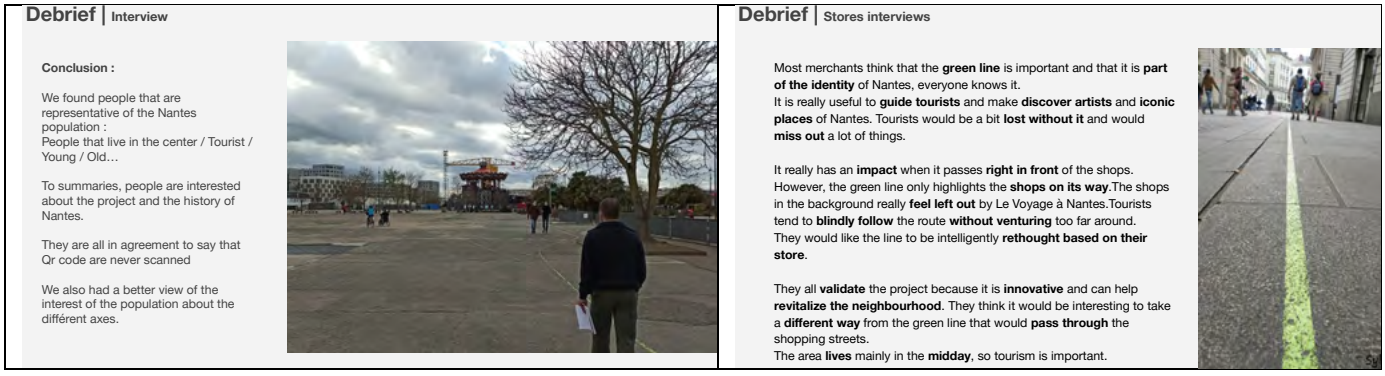

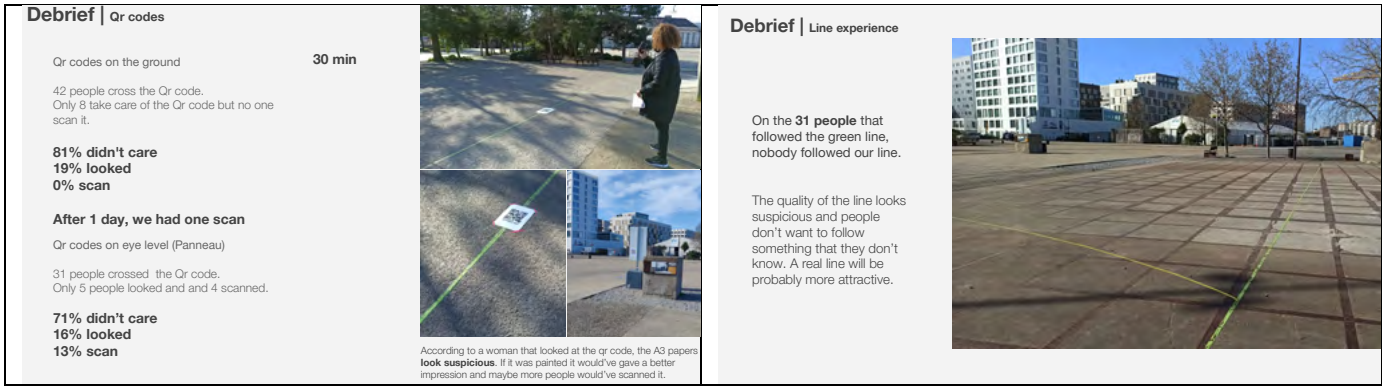

Table 4: Testing student design concepts of the walking tour through guerrilla design ethnography.

The user tests brought forth design questions for walking tour design team:

- **What sounds would be played**? Sound tools? Machinery? Long track? Ambient background vocals? Speech vocals? Ambient music? Always the same ones?
- **Route type**? Is it safe ? What's the distance ? Changes from time to time ? Public transportation ? Why not connect with the green line ?
- **Will people be interested**? Is the app accessible to everyone? Is it free (+ ad-free)?
- **What type of graphics**? Digital only? Flyer with information? Static signs?
- **Will it be eco-friendly**? Why paint such big QR codes? Eco paint? Merge QR code with green line?

The PESTEL Analysis of the sonic walking tout identified the following issues:

- **Politics**: Valorise the historical heritage of the city. Remember the obstacles Nantes had to surpass.
  Link with the Popular past of the city.
- **Economics**: Valorize the empty space with more or less 0 expenses. Bring peoples to roam the streets, and to use the proximity commerces by doing so.
- **Sociology**: Giving a good reason for people to go outside after Covid. Giving a better understanding of the context on which the city is built.
- **Technology**: 360° Photography to immerse in the past. Use of Qr code to materialize marks.
- **Environment**: No environmental dimensions, non- organic paint.
- **Legal**: Authorization for putting QR codes and putting signaletics. Rights to use the sounds and pictures.

Its SWOT Analysis identified the following issues: **Strength :** Immersion in the history of Les Chantiers Navals; **Opportunity :** Using new senses to discover Les Chantiers Navals; **Threat :** Area is dangerous at night. Not understandable without the app; and **Weakness :** Will people take time to download an app for visiting a small place like Les Chantiers?

2.6 Phase 6: Development of the Final Application: *A l'écoute des chantiers*

Once the proposal for an immersive walking tour with sound design capsules and augmented reality experiences was pitched to the VAN, they commissioned *A l'écoute des chantiers* (Listening to the shipyards) for Voyage à Nantes 2022 summer festival. This would be a smartphone app for "accidental tourists" that would stumble across its signage and for artistic patrons who followed the summer art festival. Once the project received funding for its development from Nantes Metropole, the Digital and Care design students whose proposal had been retained continued developing the project into their final year at the school. In all, 35 students, 8 instructors, 10 external partners, a software developer and three external designers were involved in its production. The archives of the Historic Preservation Department (DPARC)

and Maison des Hommes & des Techniques (MHT) were to serve for its scientific grounding, and therefore, the VAN assured that the funding request made its way through the bureaucracy.

With the VAN, MHT and DPARC each laying out their ideas for points of interest for the tour and for the sound design capsules, quite a bit of negotiating was needed to bring their number down to a manageable size. MHT wanted exclusive focus on shipbuilding and union history, while the DPARC and VAN wanted to extend the visit to the tourist hotspots beyond the shipyard, like the grey Titan Crane and banana hangar on Nantes' former merchant port. The walking tour grew to include areas beyond the former shipyard, starting at the St. Anne Bridge and following the Voyage à Nantes famous painted green line all the way to the docks (Quai des Antilles).

Figure 7. Redefined walking tour beyond the former shipyard to other touristic venues on the Ile de Nantes.

Finally, ten sound design capsules were designed and carefully crafted, incorporating archival footage, interviews with former shipyard workers, and ambient industrial sounds. These capsules were produced in MP3 format to ensure both efficiency, frugality and longevity, and are accessible via an iOS and Android applications, as well as on the web[2] and on patrimonia.nantes.fr. Additionally, two augmented reality experiences were integrated into the applications, allowing for an immersive exploration of the content. Geolocation features, when enabled, and navigation through ArcGIS Storymap further enhance the visitor's experience. The applications were developed using Unity.

To meet the Voyage à Nantes festival opening deadline of July 2, a narrative designer, a graphic designer and sound designer were enlisted, recognizing the time constraints and urgency of the task at hand.

[2] https://alecoutedeschantiers.lecolededesign.com

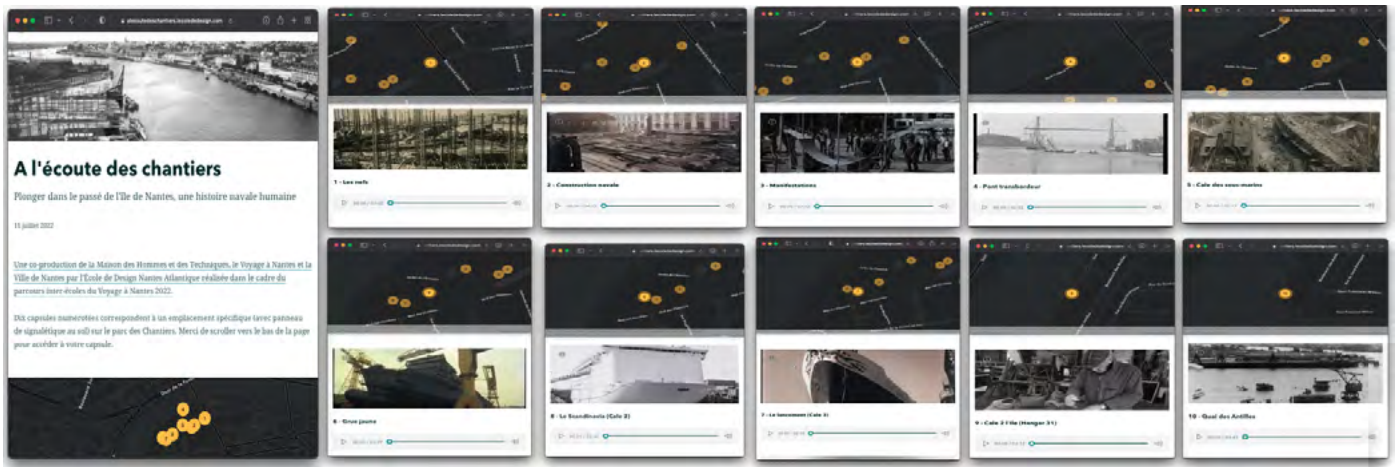

Figure 8. Ten sound design capsules were created to tell the story of the shipyard through the eyes of its workers using interviews, industrial ambient sounds and historic video soundtracks.

Figure 9. Vinyl signage installed for visitors and tourists to scan with their smartphone.

The signage, printed on tar-backed anti-skid yellow vinyl, was selected to endure Nantes' sweltering summers and heavy winter rainfall. Installed in June 2022, the signage remains in active service. Despite limited engagement with the students' initial QR code field tests, participation in the official Voyage à Nantes program, along with professional printing and installation, yielded much more satisfactory outcomes. The walking tour, initiated via the signage's QR codes, attracted over 2500 visitor sessions in July and August 2022.

The project is still in use as of 2024 and can be accessed at the following website: https://alecoutedeschantiers.lecolededesign.com.

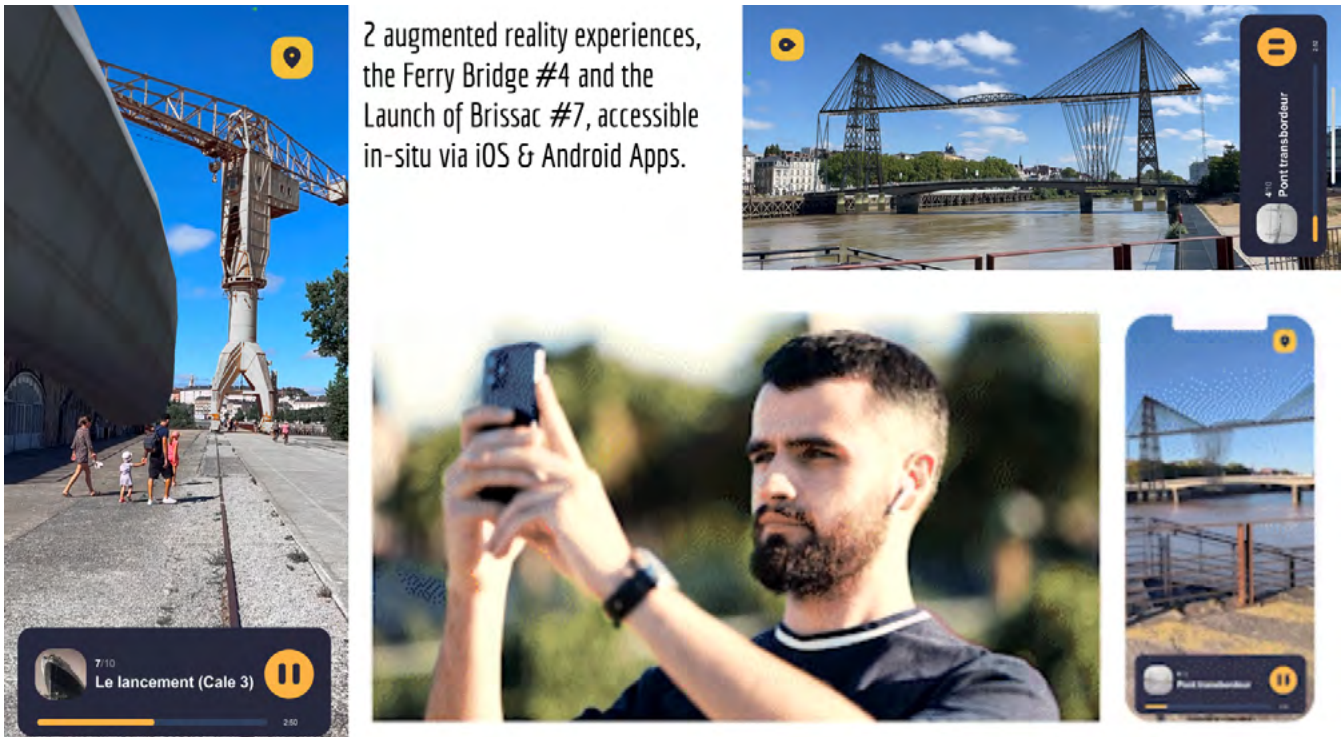

Figure 10. The two augmented reality (AR) experiences available through the iOS and Android apps when onsite.

3. Discussion

Voyage à Nantes (VAN) and the Historic Preservation Department (DPARC) recognized the potential of developing a walking tour application to enhance heritage exploration in the city. Understanding the significance of such an initiative, they jointly approached Nantes Métropole to request funding for the project, emphasizing the benefits of leveraging technology and sharing of historical archives to offer residents and visitors an engaging and informative experience of Nantes' rich historical and industrial heritage.

One of the project's most compelling features lay in its capacity to facilitate collaboration among diverse cultural and civic actors in the city, each with their own perspectives and objectives. By bringing together VAN, renowned for its innovative cultural endeavors, and the Maison des Hommes et des Techniques (MHT), focused on preserving Nantes' industrial heritage, the project aimed to reconcile previously opposing stakeholders under a unified purpose. Despite MHT's steadfast commitment to preserving the area solely as a historic testament to its industrial past, rather than for tourism or recreational purposes, this collaboration marked a significant stride in aligning efforts toward the common goal of enhancing Nantes' industrial heritage and its cultural vitality.

For DPARC and VAN, supporting this initiative held significant allure. Beyond the evident benefits of enriching tourism and cultural offerings in the city, the project presented a distinct opportunity to foster synergy between VAN and MHT. This involved integrating the MHT museum into the Voyage à Nantes summer event, effectively expanding its accessibility during previously closed periods in July, August, and weekends. This collaborative endeavor not only enhanced the content and reach of the walking tour application but also underscored Nantes' commitment to nurturing partnerships and collective efforts aimed at community betterment and a deeper understanding of its industrial heritage.

Despite being the primary sponsors of the immersive walking tour, VAN and DPARC consciously minimized their overt influence on the project, mindful of MHT's sensitivity and reluctance towards tourist-centric approaches to industrial history. To this end, measures were taken to maintain the appearance of impartiality. For instance, while DPARC held the full ArcGIS development license, the ArcGIS Storymap web

application was accessed through the school's DNS server, appearing neutral in its accessibility. Similarly, the augmented reality apps were released under the school's license on iOS and Android App Stores, rather than under the VAN, DPARC, or Nantes Métropole's licenses. Although this arrangement posed no significant issues due to the apps being free, contractual terms stipulated the delivery of the full source code and media files to DPARC.

In instances where production meetings encountered roadblocks due to strategic disagreements, concerted efforts were made to find common ground. Several meetings involving school representatives, VAN, and DPARC were convened to navigate forward despite MHT's dissenting stance. Strategies were devised to present negotiations in a manner acceptable to MHT, ensuring progress towards project common objectives while respecting diverse viewpoints as much as possible.

4. Conclusion

In summary, the three-year design process for this project exemplifies a solutions-oriented DSI project. Beyond creating a mere digital artifact, the project served as a platform for engaging diverse stakeholders in collaborative decision-making. By carefully incorporating their perspectives and insights, the design process structured dissensus among civic stakeholders towards a common goal — in this case, a valorization of the industrial heritage for tourists, residents and cultural patrons — and promoted a sense of ownership, collaboration and empowerment within the stakeholders.

Through this multi-phase participatory approach, the project not only addressed the tangible need for heritage mediation for tourists and residents, but also facilitated social cohesion and collective action by its most invested civic actors. What started as a project to get once hostile parties to share their respective archives and know-how towards a common goal has had long-lasting beneficial effects for ongoing collaborations between the MHT and the VAN, bringing much more traffic to the MHT, and visibility for Nantes' industrial and union heritage. In essence, by embracing principles of DSI, the project's lasting impact lies in the unity it has cultivated among once-divergent stakeholders, in shaping the future of Nantes' cultural landscape.

KEYWORDS | EDUCATIONAL SPACES, LIBRARY, EQUITABLE AND JUST ENVIRONMENTS, CO-DESIGN, PARTICIPATORY PLANNING

ABSTRACT | How can the design of educational spaces be changed? How can new strategies be rethought, implemented and influenced to transform educational environments into more equitable and just spaces? In recent years, there has been a gradual reassessment of the design of educational environments to better align with the dynamic changes in contemporary society. The needs arising from the COVID-19 pandemic reinforced the need to renovate educational spaces. In this process, it has been crucial to critically reassess and challenge the paradigms that have governed the design of schools for the past two centuries, particularly in conventional classrooms. The meticulous arrangement of desks in a control grid, with students seated side by side and facing the teacher, reflects an outdated model that fails to meet current educational demands. In addition to schools, various institutions contribute to an urban network aimed at providing access to knowledge. Public and community libraries have undergone a notable transformation, shifting towards prioritizing education and cultivating positive learning experiences for their users. Some libraries serve as exemplars of innovative spatial restructuring and co-design processes, demonstrating the potential for reimagining them as dynamic programmatic spaces for diverse communities.

This article analyses the evolving role of libraries in the contemporary world through three case studies: the Oodi Central Library in Helsinki (ALA Architects), the Rio de Janeiro Park Library (Architect Glauco Campello and be.bo.), and the Library of the Sichuan Fine Arts Institute (Tanghua Architect & Associates). The goal is to examine the strategies and methodologies employed in these projects and to extract practical examples of design decisions that have elevated these libraries beyond mere book repositories, turning them into social agents for interaction between information, knowledge and community. The conclusion emphasizes the emergent need to redefine educational spaces as places of memory and echoes of knowledge to dynamic hubs of circulation and knowledge creation. Public libraries are increasingly assuming a crucial role as community hubs, serving as social institutions that bring together people of all ages, backgrounds and intellectual perspectives. This paradigm shift should not only be reflected in the physical space but also in the collaborative processes that shape them. Similarly, school environments demand attention, with a growing urgency to integrate co-design practices that extend beyond the planning stages. Collective decision-making must encompass the definition of programs and guidelines prior to embarking on the design phase, ensuring that educational spaces truly meet the diverse needs and aspirations of their users.

1. Introduction

Over recent decades, a significant evolution has taken place in the design of educational environments, particularly in traditional settings such as schools. This shift has been towards prioritizing student-centred learning, which fosters active engagement in educational experiences. While classroom spaces have been extensively studied and experimented with to facilitate this approach, they are often perceived as overly structured. Consequently, there has been a trend towards utilizing the school library, which offers more flexible spatial features conducive to a variety of educational activities. The adaptability of library spaces allows for simultaneous usage by diverse individuals (Feinberg and Keller, 2010; Rankin, 2018, IFLA 2018; IFLA, 2022).

In addition to schools, various institutions including libraries and museums contribute to an urban network aimed at providing access to knowledge. It's crucial to reflect on how these spaces are being reimagined to better serve educational objectives, moving beyond mere aesthetics to consider the educational value of architectural design.

Public and community libraries, in particular, have undergone a notable transformation, shifting towards prioritizing education and cultivating positive learning experiences for users. This departure from their traditional role as mere resource repositories underscores the importance of actively contributing to enhancing learning outcomes for citizens. These libraries are now recognized as dynamic learning environments, with committed professionals and users engaging in an evolving educational atmosphere, a community's broader educational ecosystem (Krass et al., 2022; Feinberg and Keller, 2010).

These spaces play a vital role in the community by enhancing non-formal education, facilitating access to information, offering diverse learning materials, promoting digital literacy, and supporting lifelong learning. They significantly contribute to democratizing education, and ensuring accessibility to knowledge and educational opportunities for individuals from all backgrounds.

Despite decades of international research on the design of classroom learning environments, there's a gap in the literature regarding specific aspects related to the design of the public and community library learning environment. Lessons learned from these spaces can inform and enrich the design of educational environments to better align with the evolving needs of society.

This paper delves into the transformation of educational spaces, with a specific focus on public and community libraries. The goal is to comprehend how thoughtful design and new strategies can optimize these spaces, making them more equitable and supportive for all users. It discusses the adaptation of educational settings in recent years to align with contemporary society's changing dynamics, especially in the information and digital age. The paper emphasizes the significance of exploring the emerging network of educational infrastructures that complement traditional education, thereby fostering the development of essential life skills, facilitating continuous learning, and ensuring currency with knowledge.

Furthermore, the paper examines how public and community libraries have evolved into more open and equitable educational environments. While not exhaustive, it analyses a sample of three library sites located in Helsinki (Finland), Chongqing (China), and Rio de Janeiro (Brazil), showcasing them as examples of inclusive and dynamic educational spaces. This examination underscores the significance of context-sensitive design solutions and community engagement in creating environments that are equitable and just.

2. From Traditional Models to Contemporary Challenges

> “Let us start with the schools; if anything is to be done to 'reform' men, the first thing is to 'form' them.” (Bo Bardi, 1951)

In recent years, there has been a gradual reassessment of the design of educational environments to better align with the dynamic changes in contemporary society and in particular in the information/digital age (Harrison and Hutton, 2014).

The challenges exacerbated by the COVID-19 pandemic have underscored the urgency of updating educational spaces. The lockdown period has brought into clear view the disparity between traditional educational environments and the significant advancements in education made possible by technology, as well as the essential resources required to support them. The swift evolution of knowledge acquisition as shown the need to a more expansive perspective on the design of physical spaces. It is crucial to reconsider and question the traditional models that have guided the design of educational environments for the past two centuries, particularly within conventional settings.

During the 19th century, the transition from home-based to formal school learning, influenced by the hygiene movement vision, emphasized the importance of spacious, well-lit, and ventilated classrooms. It also recognized the significance of outdoor activities and the connection between physical health and cognitive development (Author, 2012). However, with the rise of mass public schooling in the 20th century, standardized strategies led to the emergence of structured, corridor-based school layouts, often referred to as the "factory model." This model prioritized passive knowledge transmission, uniformity, and conformity but no longer aligned with the evolving needs of contemporary education, that prioritize student-centred learning, critical thinking, and collaboration.

Advancements in educational research and psychology have enhanced the understanding of learning and development. While numerous theories exist regarding how people learn, there is a shared consensus regarding the significance of the social environment in which learning takes place (Calvo-sotelo, 2014). This environment involves numerous individuals, emphasizing the critical role of interaction and connectivity among learners. As the educational context continues to evolve, the spatial response must also adapt. This adaptation extends beyond the design of individual educational spaces to encompass the interaction and connectivity between spaces throughout the city and neighbourhood.

The swift progress of technology has fundamentally changed how we access information and engage in learning. Outdated educational models may fail to incorporate or leverage modern technology, impeding their effectiveness in preparing students for the digital age. These older models often lack inclusivity and fail to address the diverse needs of students from various backgrounds. In contrast, contemporary education places a strong emphasis on inclusivity, cultural sensitivity, and catering to diverse learning styles— qualities that outdated models may struggle to provide.

In this broader context, it is crucial to acknowledge that the future of education increasingly values non-formal education and underscores the importance of alternative environments in the educational ecosystem (Hoppers, 2006). This shift is viewed as a collective responsibility of the community.

Consequently, there is a need to explore various types of built spaces and urban/territorial areas, scrutinizing their potential to facilitate educational practices, disseminate knowledge, provide valuable educational opportunities.

As described by Trilla (1993), the interaction between education and the city unfold across three dimensions: the city as a context for education (learning in the city), the city as a means of education (learning with the city), and the city as an educational subject (learning about the city). This perspective prompts us to contemplate the architectural challenges and view the urban environment as a canvas for

multiple learning experiences. Consequently, public facilities, outdoor spaces, and the dynamic urban life itself are regarded as educational resources.

The physical learning environment extends beyond traditional school boundaries, including outdoor school grounds, neighbourhood surroundings, and the urban fabric. This broadened learning ecosystem incorporates multiple spaces designed to meet diverse educational needs across different age groups, benefiting not only students but also the broader community and families. This perspective encourages us to contemplate architectural challenges and view the urban environment as a place for diverse learning experiences.

In this context, public and community libraries emerge as crucial educational spaces, encouraging active participation in the creation of socially creative learning environments while emphasizing their integration within the urban community.

Over recent decades, there has been a notable transformation in the services and activities provided by public and community library buildings. The rapid evolution of digital technologies and the increased availability of online platforms for data sharing have reshaped the traditional role of printed books as the exclusive repository of knowledge and history. Today, various media and platforms share this responsibility and capacity alongside printed materials. Technology has become an indispensable tool for knowledge acquisition, leading to adaptations and diversification in the offerings, services, and spatial design of library buildings.

It has also been observed that innovative approaches to the design of public and community libraries often involve co-design processes. Through participatory planning and the collaborative creation, spaces are tailored to the needs and desires of users, especially for younger generations. In this way, libraries become catalysts for socialization and bottom-up activism. These examples offer valuable insights into shaping the educational spaces of the future, highlighting the potential of urban space to evolve into a vibrant and dynamic "macro-school."

3. Insights from Three Cases: Helsinki, Chongqing and Rio de Janeiro

The evolving role of public/community libraries is examined through three case studies: the Oodi Central Library (2018) in Helsinki (designed by ALA Architects), the Rio de Janeiro Library Parque Estadual (2014) (designed by Glauco Campello and be.bo.), and the Library of the Sichuan Fine Arts Institute (2009) (designed by Tanghua Architect & Associates) in Chongqing. The goal is to analyse design strategies employed in these projects, drawing practical insights from design decisions that have transformed these resources from mere repositories of book repositories into dynamic hubs for social interaction, information dissemination, and community engagement. Despite being situated in countries with very different socio-political and economic contexts, these case studies also illustrate how public institutions have utilised the architectural design process to foster more inclusive and egalitarian relationships within their communities.

- Oodi Central Library in Helsinki, Finland

A recent example of this transformation is the Oodi Library in Helsinki, Finland, designed by Office ALA Architects and opened in late 2018. However, the journey of this building began long before its completion, characterized by a participation process that engaged citizens and library users in the planning and design of new services and functions.

Figure 1. Oodi Library. Photo: by the author (2022).

According to Haavisto et al. (2017), important stakeholders involved in the construction of this library, the vision set forth by the City Council aimed to establish a library that the citizens would truly feel ownership of. To achieve this, they structured the Central Library planning project as a unique and inclusive city planning process. Unlike traditional approaches that merely solicit opinions through surveys, this initiative actively involved people in the planning process, fostering genuine engagement and collaboration.

> "Through the participatory budgeting project, Helsinki City Library acquired concrete directions from the citizens for what kind of public library services are anticipated and needed in the future Central Library. Also, by giving city residents, i.e., the owners of the libraries, a say in financial decision-making, Helsinki City Library fulfilled one of the public libraries' basic tasks as advancers of democracy. One of the workshop participants stated that it was actually great to see close-range democracy in action." (Haavisto et al., 2017, p.3)

An open international architecture competition was conducted to determine the design for the new Central Library. From the very beginning, transparency was maintained throughout the competition, allowing the public to review the proposals, provide feedback, and vote for their preferred designs. However, it's worth noting that while public opinion was taken into consideration, the ultimate decision rested with a jury, not solely on the public vote. Interestingly, the overall winner of the competition did not align with the top choice in the public voting. (Haavisto et al., 2017)

Another significant aspect of the project's strategy is its alignment with the new Finnish library policy, which emphasizes active user engagement rather than passive consumption. The new library offers a wide range of traditional services, spaces and amenities catering to various activities such as learning, work and leisure. Serving as a free and secure public space, it provides numerous opportunities for social interaction and networking, as well as access to books. The program includes a cinema, restaurant, lecture and workshop spaces, recording studios, gaming rooms, kitchens, 3D printing facilities, sewing spaces, meeting spaces, an amphitheatre, and also individual and group reading areas, and a book archive. According to Author (2022), the Oodi Library's diverse program serves different users, addressing diverse needs and expectations. The interior space design prioritizes accessibility, transparency and informality. It is open to

all, with glass partitions that can be easily isolated by curtains where compartmentalization is necessary. The layout encourages informal interaction, with work and meeting spaces integrated into circulation areas. Additionally, interior quality is enhanced using wood or carpeting, visual connections with the exterior, and comfortable furniture.

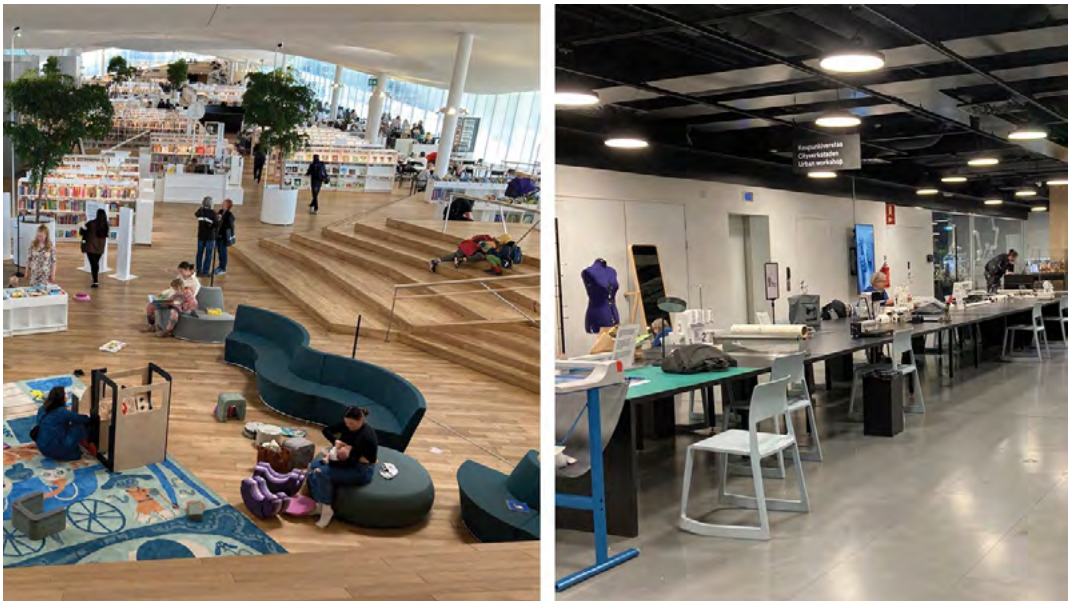

Figure 2. Interior Oodi Library. Photo: by the author (2022).

In urban context, the library forms an integral part of a cultural hub alongside the Helsinki Music Centre (LPR Architects, 2011), the Finlandia Auditorium (Alvar Aalto, 1971), Sanoma House (SARC Architects, 199), and the Kiasma Museum of Contemporary Art (Steven Holl, 1998), situated near Helsinki Central Station (Eliel Saarinen, 1919). Directly connected to the library building is the central square of this complex (Kansalaistori), creating a public space featuring sports facilities and hosting various activities such as fairs, performances and musical events. Functionally, the library's design encompasses three floors, each reflecting distinct but complementary programmes in alignment with the library's objectives. The ground floor serves as a reception area open to diverse uses, while the middle floor is dedicated to recreational, educational and community activities. At the top floor, the library offers a more traditional setting for reading and research. All floors are accessible to the public, with most spaces not requiring a library card for access. Additionally, many amenities are free to use, though reservations may be necessary through a dedicated app.

Figure 3. Aerial view Oodi Library. Photo: Baan, Iwan (2023). ALA Architects - https://ala.fi/work/helsinki-central-library/.

- Library of the Sichuan Fine Arts Institute in Chongqing, China

Shifting focus to another example, the Library of the Sichuan Fine Arts Institute, located in the city of Chongqing, situated in the province of Sichuan, in southwest China. This library serves as a part of the Sichuan Fine Arts Institute, a public university established in 1940. Renowned for its emphasis on local cultural traditions, the institute has fostered numerous generations of artists deeply rooted in regional artistic expressions. In recent years, the Institute has advocated the fusion of artistic creation with political endeavours and design practices geared toward local development, garnering global recognition for its research in this domain. Designed by the Chinese studio Tanghua Architect & Associates, the library's architectural project was completed in 2009.

Figure 4. Library of the Sichuan Fine Arts Institute. Photo: by the author (2023).

The campus is nestled within a conserved and enclosed green area situated in a former agricultural district on the western outskirts of the Chonqing urban landscape. Access to the Campus space is restricted and allowed solely for authorized people.

As per insights from the teaching community, meticulous measures were undertaken during the campus construction to minimize disruption to the native farming communities. These communities were allowed to retain their original residences and were entrusted with the upkeep of the college's verdant surroundings. Positioned at the nexus of the campus's residential and educational precincts, the library stands as a focal point, symbolizing the intersection of scholarly pursuits and communal living.

Figure 5. Aerial view Library of the Sichuan Fine Arts Institute. Photo: Chou, Mark (2022). [Online Photo Sphere]. googleearth https://shre.ink/8iWr .

The design of this building draws on regional heritage, taking inspiration from ubiquitous structures found in Chongqing, such as brickworks and warehouses. The architecture seeks to establish a meaningful dialogue with the preserved surroundings. Formally, the building is composed of a large compact volume that provides greater spatial flexibility and also pays homage and correlates with the traditional architectural compositions prevalent in the area.

The selection of materials is guided by constructive aspects, but also by reverence for historical significance. The exterior of the main structure is composed of green clay bricks, stacked from the roof to ground level, reminiscent of traditional crafts. Infused with pig iron, these bricks gradually change tone over time, demonstrating constant evolution. Internally, the concrete surfaces echo the exterior texture while asserting its distinct identity. Wooden elements adorn the staircases and facades, adding warmth and personality to the building. Overall, the library's aesthetics embody the essence of regional identity, celebrating Chongqing's cultural heritage.

Figure 6. Interior Library of the Sichuan Fine Arts Institute. Photo: by the author (2023).

The building is made up of a concrete shell that serves as both a roof and a peripheral wall. This element is strategically divided to introduce natural light into the interior of the building through openings along the ridge; strategic gaps that create uncovered interior courtyards and the sequence of windows on the sides that facilitate connectivity between the interior and exterior environments. Internally, the layout features mezzanines interconnected by a staircase that serves as a focal point, guiding visitors through the library. The public entrance hall is divided by an open café and this staircase, which not only functions as a path, but also offers seating and serves as a display area for books and works of art along its climb. Library opening hours are limited to the university community, from 9:30 am to 10 pm, Monday to Sunday. Below, we present the report of a student who frequents the library:

> "The school has set many seats by the windows, so when you are tired, you can look up and see the green trees and scenery of the school, which is very pleasant. Moreover, the overall design of the library has regional characteristics, including a lot of Chongqing culture, giving people an amiable feeling. I really like the way it looks. It is very similar to the attic and warehouse modelling and very quiet, but also gives a sense of knowledge of the treasure is hidden in it, which can stimulate my desire to explore". (Report from the student.)

- Parque Estadual Library in Rio de Janeiro, Brazil

The third case under examination is the Parque Estadual library (BPE) in Rio de Janeiro, Brazil. Established in 1873 by Pedro II, Brazil's last emperor prior to the republic's establishment, the former Public Library of the State of Rio de Janeiro has undergone significant transformations. It relocated multiple times and endured partial destruction of its building and collection due to a fire. However, it was completely remodelled and reopened as the Biblioteca Parque Estadual in March 2014.

Architect Glauco Campello led the remodelling project, who was also responsible for the library project at the end of the 1980s, under the guidance of anthropologist and then State Secretary for Culture and Deputy Governor Darcy Ribeiro. Campello's original aim was to draw in low-income youth to the library, a vision that persisted during the 2014 remodelling. For this recent renovation, the architect collaborated with be.bo., responsible for the interior design.

Figure 7. Aerial view Parque Estadual Library. Photo: Ferraz , Leonardo (2023). Aerial view [Online Photo]. Jornal Dia - https://odia.ig.com.br/rio-de-janeiro/2022/07/6443601-biblioteca-parque-estadual-no-centro-abre-inscricoes-para-colonia-de-ferias.html .

BPE is situated adjacent to a public square - Praça da República, near SAARA - Sociedade de Amigos das Adjacências da Rua da Alfândega (Society of Friends of the Adjacencies of Alfândega's Street), the city's largest open-air shopping centre. This bustling area is in the densely populated central district of Rio de Janeiro, situated near the central train station that connects to surrounding neighbourhoods and nearby cities.

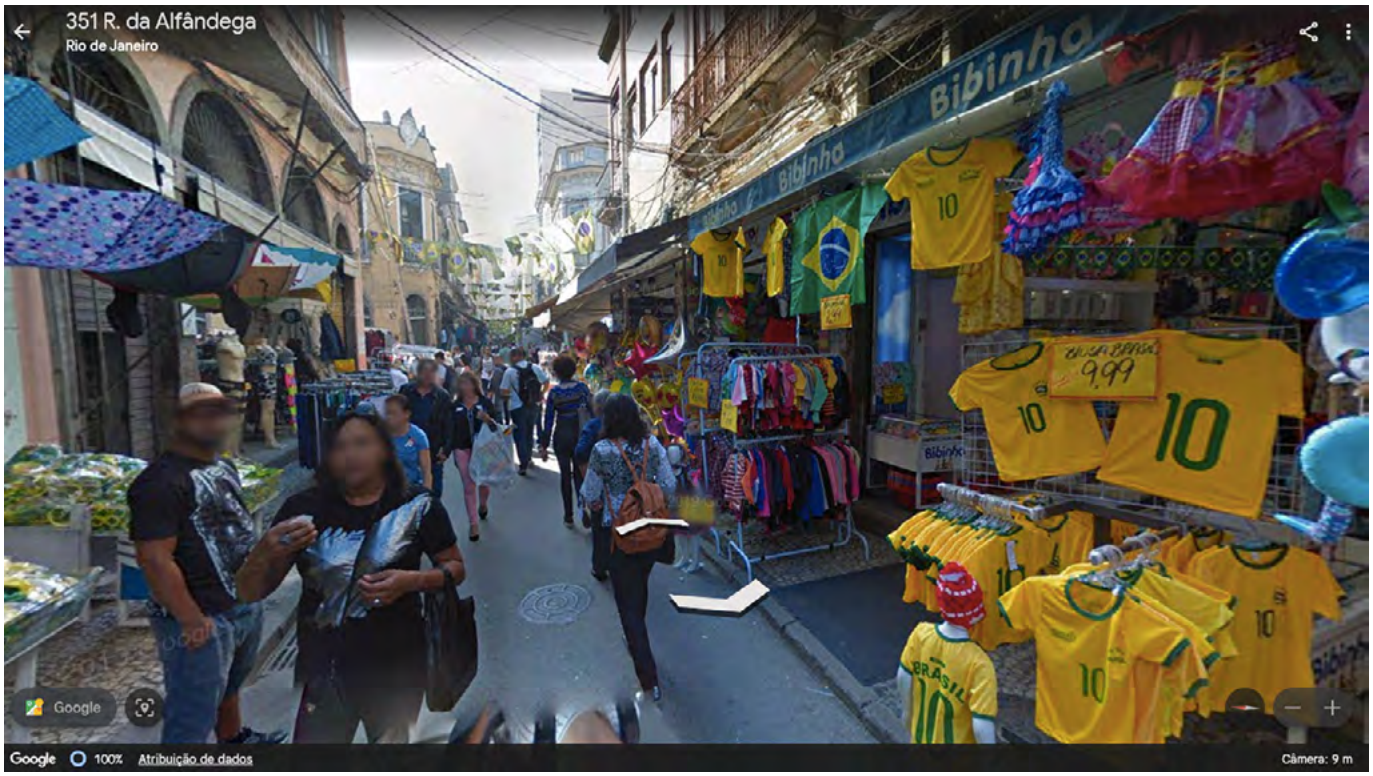

Figure 8. Saara. Photo: Screenshot (2024). Google Earth - https://shre.ink/8iWg .

The three-storey building, with one level partially submerged, is constructed using pre-cast exposed concrete components. During the refurbishment, the existing ramp was replaced with a staircase and lift, enhancing natural light and revealing the internal spaces. This adaptation also partitioned the ground floor into two areas, one more public and the other more private.

Important premises for the new design were defined by the promoters and served as a guide for the architects. these include creating meeting spaces, accommodating diversity, minimizing visual and socio-cultural access barriers, adopting an inclusive approach, offering various ways to use the space, reflecting the unique characteristics of the residents of Rio de Janeiro (Cariocas) engage with the environment and ensuring a clear understanding of the building layout.

In this way, during the remodelling project, there was a vision to create a substantial central span that would facilitate pedestrian movement between Avenida Presidente Vargas and the Saara popular market, transforming the library into an bustling urban thoroughfare. The architects imagined this intervention fostering greater openness and connectivity within the building, allowing it to serve as a hub for encounters. However, unlike the Oddi's Nordic case, this building is situated in an urban context plagued by security concerns, presenting an ambitious challenge. Given the prevalence of poverty and the growing homeless population in the vicinity, the ambitious goal of promoting fluid movement between the library and its surroundings proved unattainable. Consequently, all access points to the library are currently restricted, with limited physical interaction between the building and the urban space. It is also noteworthy that Praça da República, a nearby green space, faces similar public safety issues and is also a fenced public space.

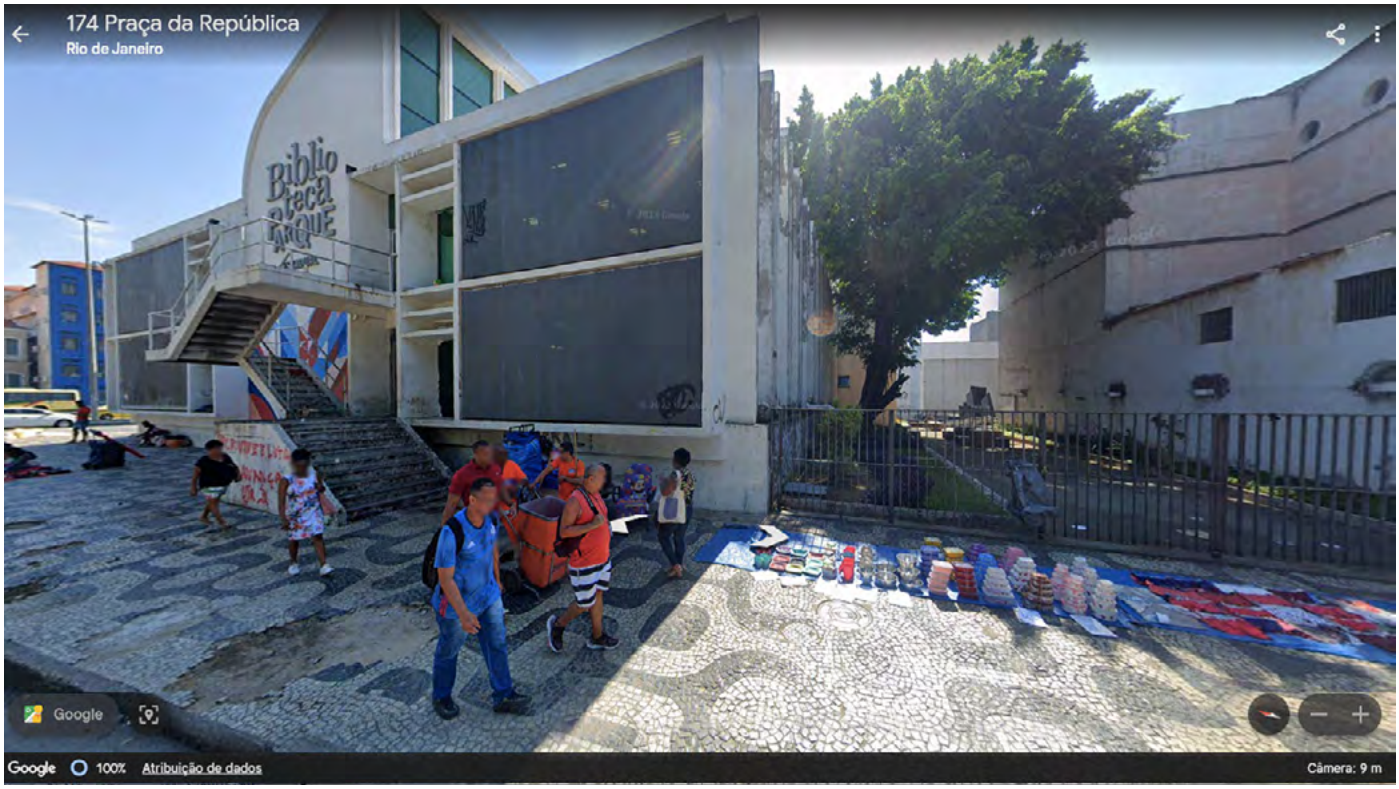

Figure 9. Parque Estadual Library. Photo: Screenshot (2024). Google Earth – https://shre.ink/8iWp .

While the building appears closed-off, it paradoxically serves as a vital cultural hub within the city. Surprisingly, its apparent isolation has become one of its most valuable attributes, transforming it into a secure refuge and oasis amidst the urban turmoil. This contradiction is illustrated in first-hand accounts shared by the employee and social mediator of the BPE, as documented by researcher De Souza (2017). One of these accounts recounts the experience of a homeless man who found solace within the library's walls. Having endured a troubled childhood and succumbed to drug addiction in adolescence, he eventually found himself living on the streets of downtown Rio de Janeiro. However, upon discovering the library, he found more than just a place of leisure; it became a shelter where he could escape the hardships of his reality. Here, he could unwind, watch movies, read books, engage with friends, and interact with the staff. Moreover, the library provided him with a sense of security and protection, offering respite from the allure of drug use. During the day, the library served as his haven, shielding him from the harsh realities of life on the streets.

Despite its location within an area characterized by socio-economic, precariousness and possessing considerably fewer resources compared to the other two examples (Oodi and Sichuan Fine Arts Institute Library), the BPE stands out as a dynamic and representative local community space. While the surrounding population grapples with extreme poverty, physical access and movement around the building are constrained. However, this limitation does not impede the flow of ideas or the democratic occupation of library spaces by diverse segments of society, representing various local expressions and cultures. Freedom and informality serve as vital compensatory factors for resources constraints. In the BPE, democracy is expressed through the fluidity and spontaneity of interactions fostered and accommodated by the library.

4. Conclusion

Social changes, technological advancements, and pedagogical shifts necessitate the reformulation of educational spaces. Embracing contemporary challenges that reflect broader cultural, political, and economic contexts moves beyond traditional models cantered on passive knowledge transmission. As defended in the “Reimagining our futures together: a new social contract for education” (UNESCO 2022),

this recognition acknowledges the diversity of educational approaches and, consequently, the spaces where they occur.

Libraries are essential venues for accessing knowledge, providing opportunities for non-formal education and lifelong education. They foster cultural development among individuals and social groups. As evidenced by the case studies, libraries play a pivotal role in fostering more equitable societies by ensuring access to and facilitating the sharing of knowledge across various domains. Consequently, the spaces that accommodate them must be devoid of any barriers, be they physical, technological or social (IFLA-UNESCO, 2022).

Analyses of case studies illustrates diverse approaches to designing educational spaces, underscoring that there are no universal solutions to the challenge of creating more equitable and just design. Each project reflects unique socio-political contexts, cultural values, and community needs, emphasizing the importance of context-sensitive design solutions. While the desire for a fairer life is universal, the paths to achieving it vary significantly. Designing for equity and justice in Finland differs from doing so in China or Brazil.

The future of education is anticipated to encompass multiple and diverse possibilities, offering a multitude of potential futures. Consequently, the design of educational spaces must also be adaptable to accommodate this variety. Their design should directly address the problem at hand rather than being a hollow response to a preconceived solution.

As such, socio-economic contexts and urban environments dictate the selection of technical solutions, tools and aesthetic vocabularies. In some cases, specific strategies may even appear contradictory. The solutions devised to promote greater equity and justice in the libraries studied diff and yield varied results. However, they do not shy away from confronting their unique challenges and seeking spatial enhancements to tangibly improve the lives of their users. While the desired values may be similar, the paths to achieving them and the reception of each proposal by society are diverse. The primary issues in each context are distinct, leading to different potential impacts for each project.

In Finland, participatory and co-design issues hold significant importance, whereas in Brazil, public safety concerns and the economic abyss between social classes create urgencent challenges, acting as barriers to the realization of fluid and freely accessible spaces. The precarious living conditions of a large part of the community surrounding the building, along with the need for secure shelter, overshadow any disruptive utilization program, such as the one proposed in Finland.

There is a lack of details concerning any participatory procedures in the development of the Library of the Sichuan Fine Arts Institute project. In contrast, access to information is considerably restricted when juxtaposed with the abundance and accessibility of data and user feedback available for the other two projects. What is perceived is that for the Chinese project, the path to establishing a connection with the community largely involved exploring the tectonic aspects of the building. Materials, forms, and existing visual references were used to forge connections with the surrounding community. The building's image served as a key attraction and link. Moreover, the seamless integration of space with the university environment and the surrounding green spaces made it a central gathering spot for the academic community.

In contrast, the Brazilian library establishes itself as a sanctuary, offering refuge and safety to the community. It connects with the community by presenting itself as a secure place, contrasting with the characteristics of its surroundings. This connection occurs through the provision of distinct services and spatial experiences rather than through continuity between the surroundings and the building.

Meanwhile, in Finland, the library is a continuum of an already well-ordered and qualified urban context. The library enhances and goes beyond the role of the city as an educational agent.

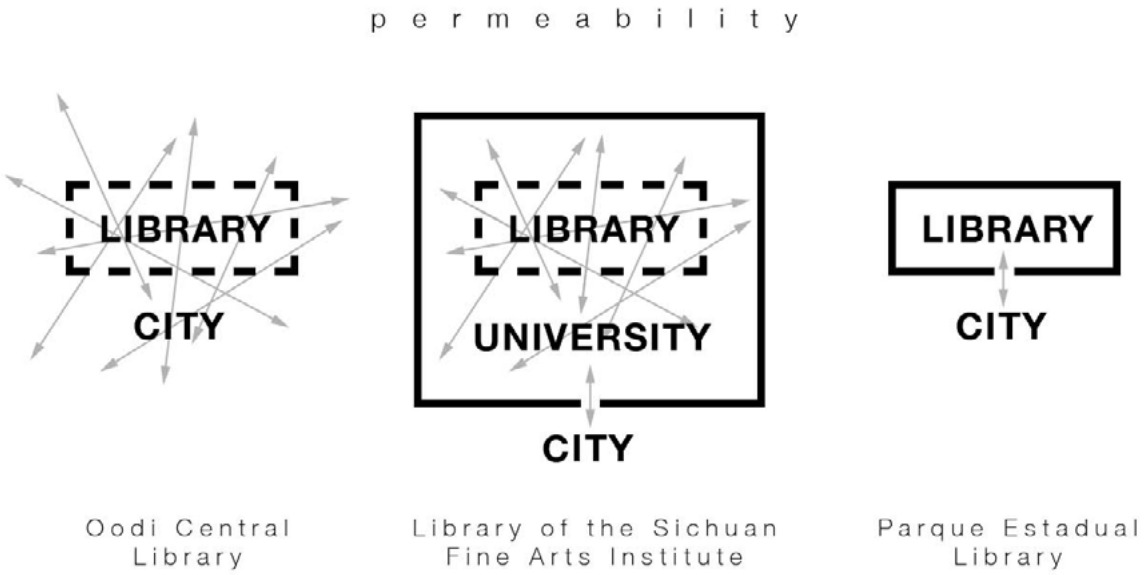

Figure 10. Permeability diagram. Image: by the author (2024).

Thus, what becomes evident is the lack of clear and unanimous points in terms of project strategies, form, or even pathways leading to the library's successful integration within the community. There is no common aesthetic, and public participation did not equally influence all three processes. Additionally, the freedom of movement varies across the projects.

On the other hand, all the studied buildings reveal how the functional program of a library has changed, how the space and range of activities have evolved, and how the community uses and seeks the library space for its other values, beyond just being a book repository.

Nevertheless, comparative analysis serves to recognise these nuances and exchange good practices. The experiences, successes and failures of others serve as starting points for reimagining and reshaping practices in each context toward creating more equitable and just educational environments.

The lesson learned is that educational spaces, whether formal or informal, must be engaging, comfortable, social and participatory to be effective. Successful educational space design involves meaningful community engagement and participation. Inclusive decision-making processes ensure that educational spaces truly reflect the needs and aspirations of their users, fostering a sense of ownership and belonging within the community. If designed to embrace diversity, exchange, and contextual needs, these spaces can truly serve communities and education. This means that the design goes beyond symbolism to become a tool for realizing social function, influencing how various social actors interact and engage with learning and teaching.

This underscores the urgent need to rethink libraries as educational spaces, shifting from repositories of knowledge to hubs of knowledge creation and circulation. Public libraries increasingly serve as vital community hubs, bringing together individuals of all ages, backgrounds, genders, and intellectual levels. This understanding should be reflected in both physical space and the generative processes shaping it, with a recognition of the importance of employing co-design tools to develop solutions that can drive social and urban change in the communities where these spaces are located.

Similar attention should be given to formal educational spaces, such as school buildings, where there is a growing demand for processes that extend beyond the design phase to incorporate co-design practices. Collective decisions should involve defining programmes and guidelines before design begins, with the socio-economic and political context of each place always guiding these actions.

The future of educational spaces lies in innovation, adaptability, and sustainability. Design solutions must anticipate and respond to emerging challenges, embrace technological advancements, and promote environmental awareness. By prioritizing holistic learning experiences, fostering community connections, and embracing diverse pedagogical approaches, educational spaces can serve as catalysts for social and cultural transformation.

KEYWORDS | GENDER-NEUTRAL DESIGN, INCLUSIVITY, SCOPING REVIEW, GENDER-SENSITIVE DESIGN FRAMEWORK, DESIGN CULTURE

ABSTRACT | This paper explores the evolving paradigm of gender-neutral products, a growing trend in product design, emphasising the lack of a shared understanding of their epistemological and ontological aspects. While researchers advocate for integrating gender neutrality in design practices to promote equality, achieving a consensus on defining and addressing these products remains challenging. We aim to provide a thorough overview of gender-neutral products through a scoping review methodology and the collection of a glossary of terms related to products without gender-specific connotations, outlining the semantical tensions among these. Our findings revealed that labelling practices impact product perception, thus influencing users. Affective attitudes, intricately tied to purchase intent, are shaped by aesthetic and functional perceptions. This exploration contributes to untangling the discourse around gender-neutral products through a gender-sensitive design framework. By advocating for a thoughtful and grounded approach to genderless design, our research seeks to encourage a design culture that challenges societal constraints and promotes the inclusivity of diverse identities.

1. Introduction

1.1 An Uprising Trend

A new category of products has gained a strong presence by challenging traditional gender norms: major brands and well-renowned designers have already adopted a neutral design approach to reach a broader audience, advocating for inclusivity and diversity (Esfahani, 2020). Moreover, scholars highlight the potential of non-gendered products, given their increasing popularity among consumers, who are increasingly prone to embrace them (Vieira, 2019).

Some scholars urge a shift towards a generation of products deprived of gender (Fugate & Phillips, 2010), while others cautiously advocate for a 'gender-tempered' design wave (Sandhu, 2021). More conservative and pragmatic views report gendered products as the lowest-risk option (Fugate & Phillips, 2010). Despite different positions, ubiquitous confusion about gender-neutral objects and their nature inundates the literature, potentially giving rise to unfounded statements and making the task of taking a stance seem like walking on quicksand. Numerous contradictions across publications exist. For instance, Vieira (2019) and Stilma (2010) interchange the terms 'gender-neutral1 and 1unisex1 to refer to counterparts of gendered products. On a similar view, Carpenter et al. (2005) use the word 'dual-sex' for gender-neutral brands, challenging the prevailing division between undifferentiated (i.e., without gender attributes) and androgynous (i.e., with feminine and masculine features) proposed by Bem (1981). Ehrnberger et al. (2012) imply that unisex products are susceptible to becoming aesthetically neutral, whilst Ludwig et al. (2016) declare them androgynous based on evidence of high levels of femininity and masculinity.

Domain experts broadly investigate gender perceptions and their impact on product design, education, and marketing. Still, specific guidelines on gender-neutral aesthetics and a shared glossary are lacking. We argue that the absence of a clear definition and categorisation of non-gendered products hinders the creation process, leading to unexpected and unpredictable consequences. Just as any competent chemist would not mislabel acids and bases, designers dealing with gender perceptions in products should be careful about confusing androgynous cues with gender-neutral ones, for instance. An unambiguous gender-based classification can serve as a foundation for making well-informed design decisions, preventing the unintentional marginalisation of individuals through design or the market failure of a product. Our research questions seek to analyse how the literature addresses non-gendered products, aiming to offer a comprehensive overview of this category and its implications for the design discipline and our society.

1.2 Gender Congruity to Foster Affective Attitudes

Despite the ongoing growth of the gender-neutral trend, resistance to gender neutrality is still nurtured by the need for gender congruity, i.e. the alignment between a product's gender connotations and the user's gender identity. For example, evidence suggests that male users are less receptive to products not targeted specifically for them than women and non-binary individuals (Avery, 2012; Fugate & Phillips, 2010). They are most likely to reject unisex-labelled products or those containing female connotations, fighting against any transformation of typically masculine cues (Avery, 2012; Ehrnberger et al., 2012; Esfahani, 2020).To preserve the male market share, Fugate and Phillips (2010) proposed relying solely on male cues, a solution that, in our view, may perpetuate the traditional gender hierarchy and fuel a masculinity culture not aligned with the social and cultural principles of the Sustainable Development Goals. Instead, Prochner (2018), from a feminist and queer perspective, advocated for gender-fair products by considering users' needs and adding diversity to design teams to increase the chances of all identities being represented. However, as an alternative to a reductionist view where men design for men and women design for women, the focus should be instead on a shared and widespread education on gender sensitivity.

It is undeniable that the preference for products not targeted at a specific social group is becoming more diffused across the entire gender spectrum, including the normative men-women binary (Canning, 2012). Still, the one-size-fits-all approach may be a long shot regarding market acceptance, potentially neglecting a significant portion of consumers based on gender. As part of the design community, we must carefully acknowledge and accommodate the diverse and wide range of femininities and masculinities. Tilburg et al. (2015) highlighted the role of affective attitude in increasing purchase intent, with a focus on products used for self-expression and with regard to gender considerations. They defined a positive affective attitude as the result of a seamless translation of the product's (gender) identity and as a trigger for aesthetic value and functionality perceptions. The practical translation of a product's embedded meaning relies on "error-free processing of stimuli" (Tilburg et al., 2015, p. 426), determined by how easily and quickly the user perceives and identifies themselves with the product, i.e. how efficiently the gender congruity phenomenon takes place. Our goal is to create tools that promote gender identity congruity across the gender spectrum by facilitating the relationship between non-conforming identities and products.

2. Methodology: A Scoping Review

The discussion around gender-sensitive products, and especially non-gendered products, is still ongoing and calls for a more in-depth investigation. When the state of a research topic urges further development, resourceful researchers can choose to conduct a scoping procedure to examine these less-researched topics (Arksey & O'Malley, 2005). Therefore, we adopted this methodological framework to make sense of and create a coherent structure of the data we extracted and collected for further analysis. A scoping review consists of five consecutive steps and a sixth optional step (ibid.):

1. Identifying the research question;
2. Identifying relevant studies;
3. Study selection;
4. Charting the data;
5. Collating, summarising, and reporting the results;
6. Expert consultation.

2.1 Identifying the Research Questions

Our research aimed to discover how non-gendered products are called in the literature. The significance and urge to answer this question lie in the importance for designers of all kinds to develop a sensitive language to enter and contribute to the conversation on design and gender issues (Van Boeijen, 2022). Our scope was to unveil gaps and contradictions in the literature and pave the way for a shared approach within the product design field.

2.2 Identifying Relevant Studies

The second step of the scoping review was "identifying primary studies (published and unpublished) and reviews suitable for answering the central research question" (Arksey & O'Malley, 2005, p. 10). The answer to our research inquiry should provide a general overview and common ground around non-gendered design and stir up the conversation about gender issues within the design community. Hence, we aimed at studies discussing genderless cues across different disciplines, focusing on product design. We relied on electronic databases, reference lists, and hand-searching to collect an insightful yet manageable data sample.

Table 1. Scopus search query history.

N. Step	Scopus Query String	N. Results	Collected (Yes/No)
1	TITLE-ABS-KEY ("genderless object*" OR "genderless product*" OR "neutral gender product*" OR "unisex product*" OR "non-gender trend" OR "unisex design" OR "genderless market")	15	N
2	TITLE-ABS-KEY(("genderless object*" OR "genderless product*" OR "neutral gender product*" OR "unisex product*"OR" non-gender trend" OR "unisex design" OR "genderless market" OR "gendered object*" OR "gendered product*" OR "gender typ*" OR "gendering cue*" OR "gender polarisation" OR "gender operationalisation" OR "gender suitab*" OR "gendering" OR "gender-based")) AND EXACTSRCTITLE ("Design Issues" OR "Design Studies" OR "CoDesign" OR "International Journal of Design" OR "Design Journal" OR "She Ji")	3	Y
3	TITLE-ABS-KEY (("unisex" OR "*gender*") AND ("industrial design" OR "product design"))	474	N
4	TITLE (("unisex" OR "*gender*") AND ("industrial design" OR "product design")) OR KEY (("unisex" OR "*gender*") AND ("industrial design" OR "product design")	109	Y

We conducted a query search with Scopus, introducing gender-related terminology gathered in Table 1. We began with a simple query, feeding non-gendered terms such as ‘unisex’ or ‘genderless’. However, our search yielded just a few publications, thus suggesting a literature gap. Consequently, we continued with a more thorough second search, extending the range of gender-related vocabulary and including as input some of the Scopus-indexed design-focused journals (i.e., Design Issues, Design Studies, CoDesign, International Journal of Design, Design Journal, She Ji). As a result, we collected a small but relevant data set of three publications, confirming the scarcity of publication in these design journals mentioning (i.e., in the title, abstract or keywords) non-gender-specific terminology.

Given the relatively low number of documents in our previous searches, we broadened our following query by looking for publications involving gendered and non-gender-specific design discussions. In addition, we juxtaposed the gender-derived terms with ‘industrial design’ and ‘product design’ to draw the focus towards literature dealing with design issues, discarding other knowledge fields out of our scope. As a result, we obtained a substantially broader group of data, which made evident the predominance of the discourse around gendered design over non-gendered design. After further limiting our scope, we gathered a data collection of 112 publications. Then, scouring through our publications sample, we extracted new words such as ‘sex-typed’, ‘masculine’, and ‘feminine’. We enhanced our data collection by looking at the reference lists and expanding the inventory of documents to be analysed to 126.

2.3 Study Selection

Starting with a list of 126 publications, we established selection criteria to narrow it down to a more insightful and topic-focused data set. We examined each title, abstract, and keyword and applied the following necessary conditions for further and more thorough analysis:

- The publication focused on a specific consumption product or a category of products;
- The publication discussed the influence of gender within the design discipline;
- The publication referenced the lack or presence of gender connotations within products and related processes, from creation to advertising.

The outcome consisted of a data sample of 64 documents, subdivided into 33 academic articles, 27 conference papers, three dissertations, and a technical report, all dating from 1981 to 2023. Figure 1 represents the sharp increase in publications about gender and product design over time.

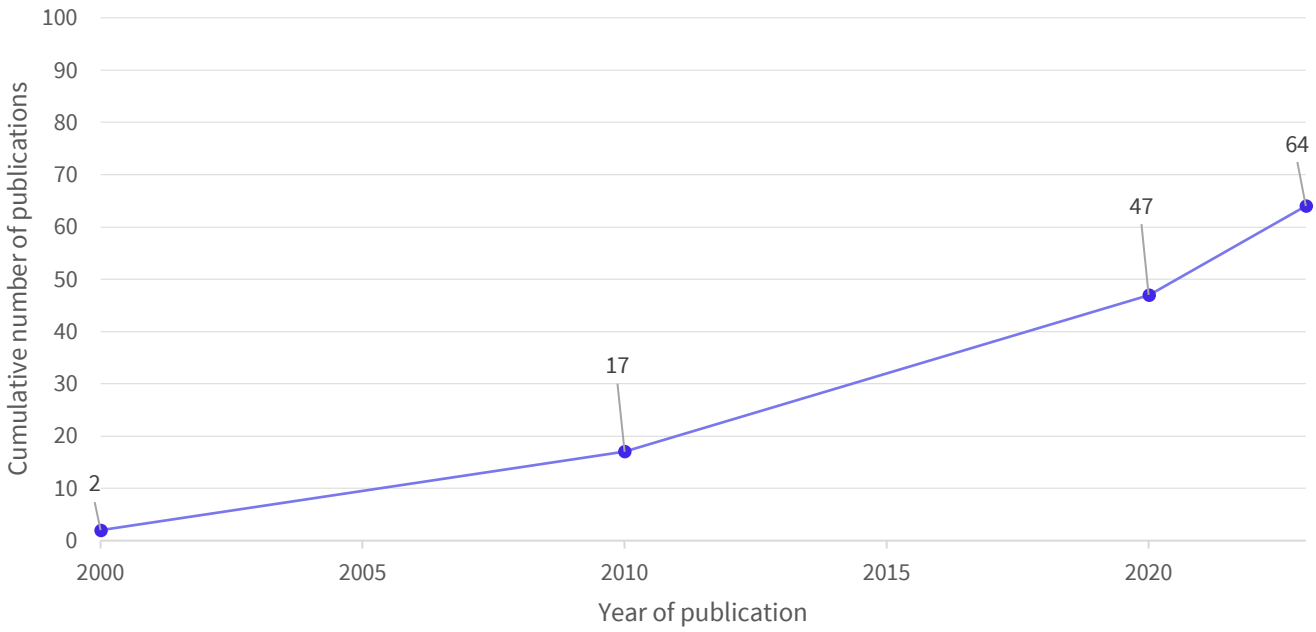

Figure 1. Graph displays the growth of publications related to non-gender-specific and gender-specific products. It indicates the cumulative number of publications for each decade until 2023.

2.4 Charting the Data

In charting the data gathered so far, we intended to create an organised and systematic structure that would enable us to identify emerging themes and patterns within the literature (Levac et al., 2010). Following the multiple-cycle-based coding process described by Saldaña (2013), we first arranged our data corpus aiming at specific gender categorisations of products. This way, we discovered a set of different clusters:

- Masculine, Feminine, Androgynous, or Undifferentiated;
- Masculine, Feminine, Gender-neutral, or Unisex;
- Female, Male, or Gender-neutral;
- Sex-typed or Cross-typed;
- Sex-congruent or Sex-incongruent;
- Non-gendered or Gendered.

The resulting sorting system gave us a clear insight into the various existing approaches to non-gender-specific products.

Next, we used our preliminary category system as a starting point for finding out specific terms and their potential synonyms. We created a glossary of 38 terms found in 42 documents referring to non-traditional gendered products and their inherent processes, continuously updating it during our scoping procedure. We reduced the glossary count to 16 by grouping semantically identical terms (e.g., 'gender neutral', 'neutral gender', and 'gender-neutral') to simplify our analysis. Moreover, some of our initial terms were re-categorised as 'gender-sensitive practices' widely employed by designers and other stakeholders, such as advertisers (i.e. 'universal design', 'pluralist design', 'transparent approach', 'mute gender', 'neutral design', 'de-gendering', 'gender-bending', and 'gender contamination').

2.5 Collating, Summarising and Reporting the Results

The concluding phase of our scoping review involved synthesising and identifying thematic and conceptual categories for our glossary. Our analysis of gender-neutral products extended beyond establishing clear categories and delved into their respective attributes and interconnected processes. We created a framework, the Gender-Sensitive Design Framework, that outlines the interpretation of the overall findings. We built our framework on three pivotal pillars, each connected to a different product outcome in terms of gender traits and acceptance. These pillars are the product's attributes, the product's alignment with the user's gender identity, and the product's response to social expectations. Our framework can assist designers and practitioners in assigning or removing gender attributes from products while raising awareness of such complexities.

3. Findings

3.1 A Non-Gender-Specific Glossary

By approaching our work through the scoping review methodology, we identified contradictions and tensions across our data corpus and gained a glance at the gender-based climate in product design over the past decades. This section unveils the literature's wide variety of gendered vocabulary, emphasising the prevailing terminology.

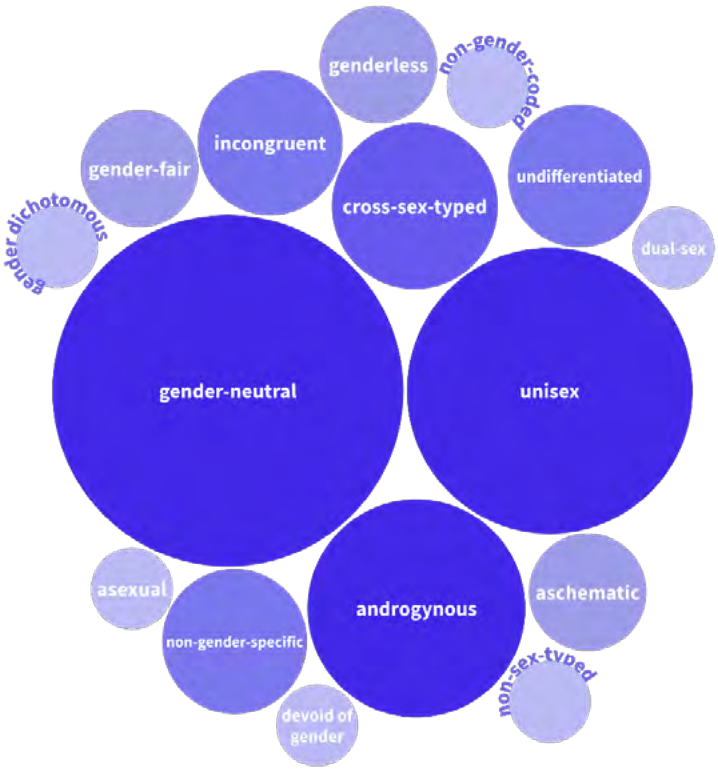

Figure 2. The Word Cloud displays the most common keywords in the literature. ‘Gender-neutral’, ‘unisex’, and ‘androgynous’ are the most frequent, represented by the most prominent circles. The size of each circle is directly proportional to the occurrence of each keyword per number of publications.

From our scoping review, we assembled a collection of 16 words symbolising and conveying non-conventional gendered attributes. Our findings revealed a preference for a small group of terms, illustrated in Figure 2, and three of them arose as predominant for sorting products from a non-gender-specific perspective: ‘gender-neutral’, ‘unisex’, and ‘androgynous’. We observed that the defining aspect is whether

gender-specific aesthetic connotations are present or absent. However, in the case of unisex products, concerns about gender biases affecting usability emerged as well.

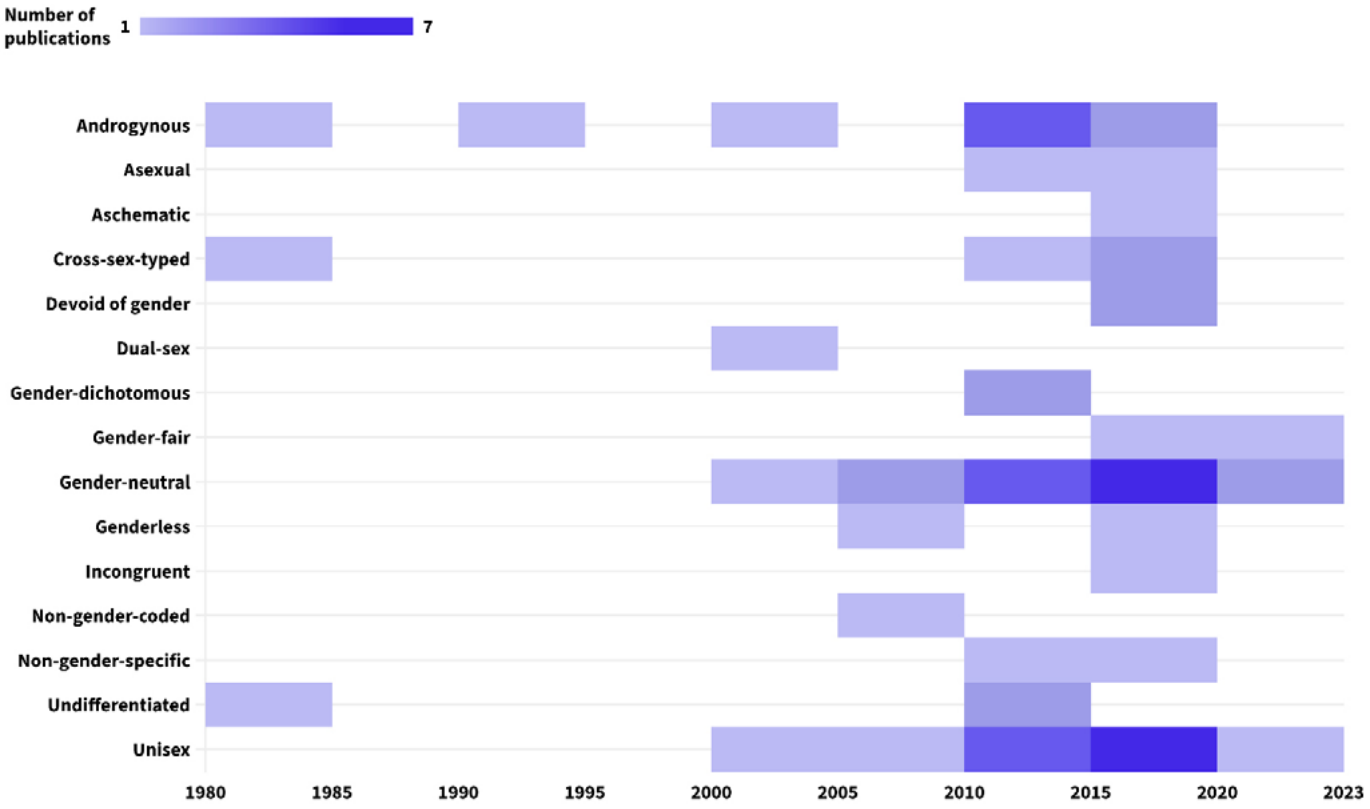

Figure 3. The graph illustrates the emergence and prevalence of non-gender-specific terminology across time, with darker hues representing a higher number of publications containing a particular term.

By analysing the historical evolution of terminology describing artefacts with no specific gender (Figure 3), we discovered how certain terms consistently appear across time while others became obscure and how newer terms have gained popularity in recent years. The aforementioned widespread categories (i.e., androgynous, unisex, and gender-neutral) have proven persistent since their first appearance and have become widely diffused ever since, with androgynous being the most enduring. On the other hand, we hypothesised that due to an explicitly binary cue, ‘dual-sex’ did not stick within the discourse on non-gender-specific products. The remaining terms, such as 'devoid of gender', ‘gender-fair’, or ‘incongruent’, encompass a broader range of meanings, providing little information on the specific gender connotations they convey, which might justify their lower frequency.

Our findings revealed that both androgynous and gender-neutral associations are well-defined and can be easily identified regarding aesthetic values and gender connotations. They are depicted as an unmistakable and straightforward dichotomy, where binary gender cues are either constantly present or missing. On the other hand, unisex products appear to exist somewhere in between. Unisex products target both men and women, resembling androgynous products yet displaying a genderless and anonymous formal language that is similar to gender-neutral products. If we aim to provide a comprehensive framework for characterising products within the controversial and complex topic of gender, we suggest letting go of ambiguous terms. Next, we delve into the aforementioned predominant terms (i.e., ‘gender-neutral’, ‘unisex’, and ‘androgynous’).

Gender-Neutral: With No Masculine and No Feminine Attributes

A gender-neutral product is described in the literature as “devoid of gender” (Prochner, 2018, p. 243) or ‘genderless’ (Bardzell, 2010; Vieira, 2019), i.e. neither masculine nor feminine (Oudshoorn et al., 2002;

Stilma, 2010; Vieira, 2019). Moreover, when referring to gender traits, we intend more than mere aesthetic appearance. Oudshoorn et al. (2002) implicitly suggested that functionality that does not distinguish between men's and women's capabilities is also gender-neutral. However, Stilma (2006) has expressed certain scepticism, claiming that achieving complete and pure gender neutrality is unattainable and criticising it as an approach for potentially safeguarding hegemonic masculinity.

A more realistic and conservative approach towards gender-neutral products could consist of minimising gender differences rather than eliminating them to target both men and women equally. According to Esfahani (2020), this solution might nevertheless generate the risk of reinforcing traditional feminine and masculine values based on stereotypical norms and biased ideologies. Supporting this viewpoint, Kaygan (2014) drew attention to the fact that normative masculinity and femininity still surface in objects presented as gender-neutral. A product's attributes should be considered neutral "where the gender of design is invisible" (Esfahani, 2020, p. 825), as demonstrated in Figure 4. In addition, as anticipated, some authors have briefly referred to the term 'undifferentiated' to address those products that lack a well-defined gender identity (Fugate & Phillips, 2010; Tilburg et al., 2015).

Figure 4. Georganics bamboo toothbrush embodies gender neutrality. The product's function is indifferent to gender, and we do not identify specific stereotypical gender cues. The toothbrush is available in different colour options to appeal to a broader audience. Photo by Toa Heftiba on Unsplash.

Many scholars have investigated the social implications of gender-neutral design, and it is a widespread stance that gender-neutral products can play a significant role in advancing the cause of gender equality (Oudshoorn et al., 2002; Prochner, 2018; Spain, 1995; Stilma, 2010; Vieira, 2019; Vorvoreanu et al., 2019). Their design strives to eliminate traditional roles based on what socio-cultural norms dictate as appropriate and take down ill gender stereotypes (Prochner, 2018; Spain, 1995; Stilma, 2010). Contrary to what we might expect from a categorical and unique solution, gender neutrality can open a broader range of behaviours and characteristics (Avery, 2012) and serve as a valuable asset to the unified and inclusive design cause that refuses the exclusion of non-conforming identities and bodies (Canlı, 2018).

Unisex: With Feminine, Masculine, and Neutral Attributes

The category of unisex products is often challenging due to its ambiguous nature. Drake & Radford (2018) outlined that the primary scope of unisex design is to provide an alternative and separate version from the men's and women's categories. In this respect, they can be considered equivalent to androgynous products, as they target both men and women, allowing for an alternative and more flexible range of behaviours (Ludwig et al., 2016). In addition, Carpenter et al. (2005) introduced the term 'dual-sex' to refer to products that carry both-gender-specific connotations. However, it may not have gained widespread acceptance as it implies a gender division rather than promoting unity like 'unisex' aims to do.

Figure 5. Prototype of a unisex ski boot designed by students from the Luleå University of Technology. The authors categorised it as unisex for its lack of traditional feminine or masculine colours and its versatility in sizing (Öhrling et al., 2018).

Regarding aesthetic aspects, the general approach to unisex design is to unify the choice of colours and shapes to fit everyone's preferences (Esfahani, 2020), as exemplified in Figure 5. In addition, to convey the perception of unisex through product representation, there is a common tendency to display it on both men and women (Rasmussen & Petersen, 2011). Ehrnberger et al. (2012) pointed out that choosing pale and bland aesthetics to appeal to a broader audience may be counterproductive and lead to a weakened product identity with low quality in terms of aesthetic value.

Our findings revealed more concerning drawbacks of unisex design. G. J. M. Read et al. (2022) discovered how developing unisex Personal Protective Equipment (PPE), primarily designed around the standard Western male body, can negatively affect women's performance, potentially endangering their lives. We could state that the key to successful, conscious, and thoughtful unisex design is to blend many preferences while acknowledging gender differences strictly in terms of biological and ergonomic requirements (Drake & Radford, 2018).

Androgynous: With Masculine and Feminine Attributes

Despite some authors drawing similarities between androgyny and gender neutrality (Carpenter et al., 2005), most agree to disagree. Androgynous-designed products are distinctive for evoking augmented perceptions of femininity and masculinity, enhanced by their unambiguous, simultaneous, and equitable representation of typically male and female traits (Bem, 1981; Ludwig et al., 2016; Tilburg et al., 2015).

Figure 6. E-bike Tour Pro Wave by Advanced® CC BY-ND 4.0 DEED. The e-bike embodies both traditionally masculine and feminine cues. In terms of morphology, the open frame geometry has historically been related to female riders, whereas, in terms of formal design language, the aesthetic attributes (e.g., colour, shapes, and finishes) can be identified as masculine.

From a social perspective, and just like gender neutrality, androgyny contributes to transcending traditional gender boundaries (Avery, 2012; Drake & Radford, 2018) and “is associated with a larger repertoire of behavioural options” (Tilburg et al., 2015, p. 427). Furthermore, researchers like Blythe and Monk (2002) advocated for an ‘androgynous society’ with no inequitable division of labour, urging product designers to challenge established patterns of gender roles, particularly those related to the domestic environment. For example, Fugate and Phillips (2010) exposed the microwave's case, which shifted from an undifferentiated to an androgynous product after the alignment of men's and women's lifestyles, with women increasingly joining the workforce. They also exemplified how toothpaste went from masculine to androgynous after being associated with cosmetic aspects, which were more commonly related to women in the past. In Figure 6, we present an example of a product embodying an androgynous character. The e-bike represented is constituted by a wave frame, historically associated with female riders (Wong & Wu, 2010), and an overall masculine aesthetics characterised by dark colours and primary sharp shapes, hence coupling traditionally masculine and feminine attributes.

3.2 Existing Gender-Based Categorisation

After identifying how the literature addresses non-gendered products according to their distinctive traits and gender character, we looked at the bigger picture by investigating how these products are typically categorised and grouped.

Eriksson & Jerregård (2010) opposed non-gender-coded toys to gender-labelled toys, and Prochner (2018) polarised gendered design and design with no gender. While one might assume that all products not explicitly labelled as gendered fall into the category of non-gendered, this simplistic dichotomy falls short of grasping the nuanced aspects of identifying and conferring gender identity onto products. The term ‘non-gendered’ suggests that an object lacks gender cues and is not embedded with masculine or feminine attributes. Supporting that viewpoint, Ehrnberger et al. (2012) defined non-gender-specific categories as those not specifically targeted at a particular gender identity or whose function does not rely on the gender attributes of the user. However, the debate appears to be more complex.

On a more in-depth exploration of gender perceptions, Bem (1981) navigated the concept of ‘sex congruity’, referring to the alignment between an individual's sex identity and an external stimuli's gender markers. Extending this taxonomy to consumption products, Drake & Radford (2018) identified ‘sex congruity’ when a product aligns with stereotypical expectations and ‘sex incongruity’ when it deviates from the user's socially or self-assigned gender identity.

Shifting the focus to the inherent gender associations of individuals, Bem (1981) enhanced her contribution with a four-category framework according to the level of femininity or masculinity conveyed:

- ‘Sex-typed’ (i.e. male with high levels of masculinity and female with high levels of femininity);
- ‘Cross-sex-typed’ (i.e. male with high levels of femininity and female with high levels of masculinity);
- ‘Androgynous’ (i.e. high levels of masculinity and high levels of femininity);
- ‘Undifferentiated’ (i.e. low levels of masculinity and low levels of femininity).

Therefore, products displaying high levels of femininity or masculinity with little ambiguity are considered ‘sex-typed’ and defined as feminine or masculine (Fugate & Phillips, 2010). Moreover, we could argue that ‘cross-sex-typed’ products are born as the result of actively seeking sex incongruity. On the other hand, ‘androgynous’ products can represent both spectrums of gender simultaneously, nevertheless following pre-established stereotypes (Fugate & Phillips, 2010; Ludwig et al., 2016). Last, ‘undifferentiated’ products are impermeable to social impositions and expectations of gender behaviour and preferences and deprived of any typically feminine or masculine connotation (Fugate & Phillips, 2010; Tilburg et al., 2015). Nevertheless, discerning between androgynous and undifferentiated products—the latter being a less diffused term analogous to gender-neutral—from one another remains somewhat unclear.

3.3 Gender-Sensitive Design Practices

Designers should establish a specific design strategy based on the direction for translating, perceiving, and interpreting gender characteristics in products. During the scoping process for new product alternatives that disrupt gendered design, we identified a group of widespread design approaches to re-thinking conventional methods. The gender-sensitive techniques collected can be employed to react to unjustifiably gendered products or as a first approach to creating gender-fair designs. As per Figure 7, we clustered them into ‘cue-free design’, ‘gender-shift design’, and ‘flexible design’.

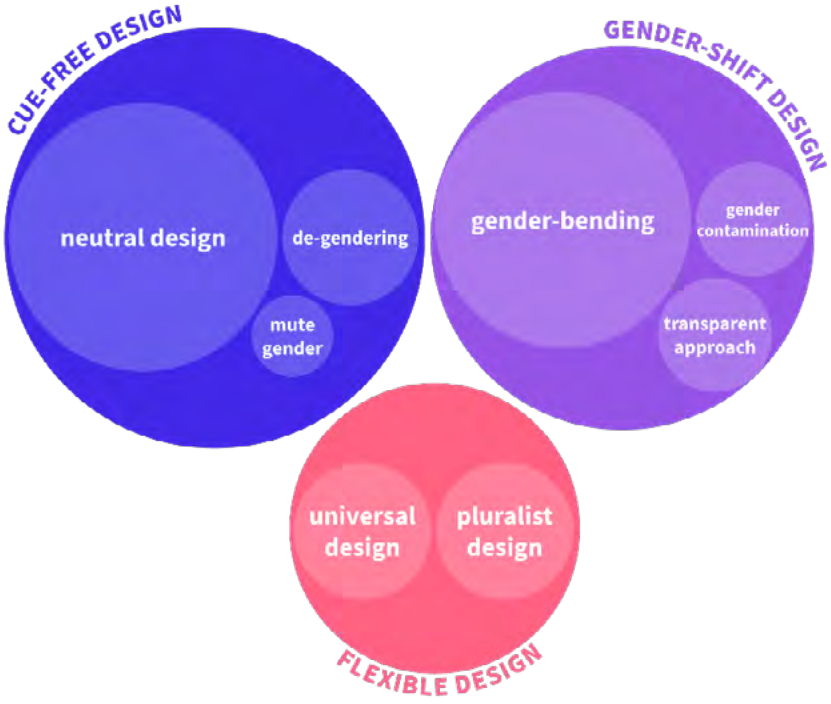

Figure 7. The three clusters contain specific practices challenging gendered design. The circle area size depends on the prevalence within the literature, assigning greater areas to the most widespread practices.

Cue-Free Design

When the goal is creating gender-neutral products free from gender markers, earlier research suggested ‘de-genderising’ or ‘re-genderising’ their attributes (Stuteville, 1971, as cited in Fugate & Phillips, 2010) or designing cue-free products. In certain instances, when an object is perceived as illicitly gendered, the unconscious response is to ‘mute gender’, i.e. ignore any gender connotations (Drake & Radford, 2018). However, de-constructing a design archetype takes time to unfold.

Our research revealed that the specific cultural lens applied throughout the design process influences the promotion of diversity. DaMaren & Olechowski (2022) emphasised that an open-culture environment fosters inclusivity more than a closed-group culture. De-gendering practices provide a second chance to start from scratch, bringing into the fold those usually neglected—women and non-binary—and assembling more diverse design teams, enhancing creativity (ibid.).

Figure 8. Unisex wristwatch Once Again by Swatch. Photo by the authors (2024).

The idea of 'neutrality' in design is pivotal in the conversation on de-gendering practices. Vieira (2019) claimed that neutral design can meet multiple personalities and needs, aligning with gender-neutral and unisex outcomes. However, it likely leads to anonymous aesthetics with no character (Prochner, 2018), typical of unisex products. Furthermore, colours and shapes are commonly referred to as neutral (Rajapakse et al., 2012; Rasmussen & Petersen, 2011) when we cannot identify traditional gender associations (Canlı, 2018). For instance, Ehrnberger et al. (2012) exemplified this approach by referring to the wristwatch Once Again by Swatch (Figure 8), whose function—timekeeping—is indifferent to gender and whose appearance is aesthetically neutral. Nevertheless, it is essential to acknowledge that apparently neutral things can contain cultural and social biases. This is necessary to avoid propagating traditional and prevailing stereotypes with a new uniform solution that takes a single standard pattern as a rule, e.g. white colour as the neutral option in Western cultures (Öhrling et al., 2018).

Gender-Shift Design

'Gender-shift' practices are intended to focus solely on connecting with men and women, not considering the non-normative gender identities. Hence, we believe this approach requires an evolution towards including alternative realities.

One of these practices is 'gender-bending', where a typically masculine or feminine typed product is reversed in its formal language to match the opposite sex's (Avery, 2012). Gender-bending unlocks the experimentation with self-expression and the exploration of "new understandings of gender through humour and provocation in design" (Prochner, 2018, p. 161), disobeying normative constrictions (Canlı, 2018). Figure 9 depicts an illustrative example of gender-bending.

'Gender contamination' emerged as another term indicating the appropriation of typically feminine or masculine brands by the opposite sex. The gender contamination phenomenon gives rise to products imbued with opposite gender cues to attract a broader public (Avery, 2012). It is worth noting that, statistically, women are more inclined towards gender contamination than men, who often feel threatened and perceive their gender schema performances as affected (ibid.). The term 'gender contamination' itself conveys a negative connotation, viewing gender inclusivity as an invasion rather than positive progress towards gender equality. In response, a more transparent approach proposes addressing gender blending practices without stigmatising marginalised identities, connecting with men and women and drawing inspiration from women's needs (Enga & Diana, 2019). We acknowledge that the ever-changing social and cultural gender matrix requires a comprehensive approach that addresses the needs of both women and non-binary individuals.

Figure 9. Students from the Luleå University of Technology re-designed weight training equipment with a 'Gender-bending' approach, challenging gender stereotypes at gyms. The degree of stereotypical feminine cues increases as the weight increases (Öhrling et al., 2018).

Flexible Design

We have coined the ‘flexible design’ category as a collection of design practices that understand gender as blind, meaning that the primary objective is to include everyone, regardless of gender identity. Universal design (Figure 10), for example, challenges normativity through a zero-tolerance to discriminating markers (Öhrling et al., 2018) and by designing artefacts that “are more equitable, intuitive, and thoughtful in anticipating collective and individual needs” (Vostral & McDonagh, 2010, p. 114). On the other hand, pluralist design disputes the idea of artefacts adhering “to a single, totalising, and universal point of view” (Bardzell, 2010, p. 1305). Bardzell (2010) explained how pluralism focuses on cultural differences, promotes constructive interaction with diversity, and utilises marginalised elements as resources for design solutions. In other words, this approach aims to create a more inclusive design that benefits from diversity rather than ignoring it.

4. Discussion

Here, we present the interpretation of our findings and offer a conceptual and holistic Gender-Sensitive Design Framework to help navigate gender considerations throughout the product design process. As a disclaimer, our research faced some limitations. Firstly, due to limited time and resources, the sixth step of the scoping review procedure (i.e., the validation and further insights from an external domain expert) is missing (Arksey & O'Malley, 2005; Levac et al., 2010). Moreover, a more in-depth literature review by collecting a more significant number of publications could have provided more soundly proven results. However, we are confident that our work provides a reasonable overview of our main focus on non-gender-specific products.

4.1 Interpretative Framework of the Finding: Advancing Gender Sensitivity in Design

To guide the discussion and our interpretation of the results, we developed a comprehensive gender characterisation framework, namely the Gender-Sensitive Design Framework (Figure 11), to shed light on the dilemma of gender product vocabulary. We argue that products can be systematically classified considering three critical aspects: the product's gender attributes, its alignment with the user's gender identity, and its response to societal gender expectations.

Product's Attributes

Products' aesthetic and functional values highly depend on their gender character, and vice versa. Our research revealed three subcategories that suggest non-traditional gender-related implications: ‘gender-neutral’, ‘androgynous’, and ‘unisex’. However, the term 'unisex' proved quite ambiguous, displaying a neutral design but being associated with androgynous cues and potentially leading to dangerous inequalities (G. Read et al., 2022). For this reason, we propose a more straightforward and updated division which distinguishes between ‘androgynous’, ‘gender-neutral’, and ‘gender-specific’.

Our research uncovered how tangible traits (i.e. form, colours, shapes, and finishes) are crucial in embedding gender meanings into objects. A specific colour choice can drastically change gender perceptions of products since we attach values to aesthetic features based on personal experience, preferences, and socio-cultural biases. An androgynous product blends high levels of typically feminine and masculine cues (Tilburg et al., 2015). On the opposite perspective, gender-neutral products should not express any stereotypical constructs of femininity or masculinity, targeting a broader audience rather than the limited gender binary.

Product's Alignment with the User's Gender Identity

The gender characterisation of products is intrinsically linked to the user seeking self-expression (Oudshoorn et al., 2002; Prochner, 2014; Rasmussen & Petersen, 2011). The interpretation of a product's gender can dramatically change once it enters the ‘naïve realm’ (Prochner, 2014), where the reasoning, motivations, and justifications behind every design choice are not always explicitly communicated to users. Therefore, products serve as a means for self-expression (Oudshoorn et al., 2002; Prochner, 2014; Rasmussen & Petersen, 2011), and users have the power to change their gender script through creativity and critical thinking (Avery, 2012; Prochner, 2014). However, misaligning gender connotations can hinder the re-interpretation process (Bem, 1981; Tilburg et al., 2015). The synchronisation between self-identity and product gender character can either be a seamless and smooth activity or a challenging and unattainable task. A congruent product will instantly pair with the target user's gender identity, whereas an incongruent item will result in utter frustration and unfulfillment (Bem, 1981).

Tilburg et al. (2015) introduced the concept of positive affective attitude as a determining factor in encouraging gender congruity between individuals and products. However, experts emphasised how particular social groups—generally males—are more rigid than others regarding openness to alternative gender associations (Avery, 2012; Ehrnberger et al., 2012; Esfahani, 2020) and, therefore, tend to be prioritised over those who are more flexible. By considering gender congruity within the Gender-Sensitive Design Framework, we aim to extend a positive affective attitude across the whole gender spectrum and seek to manoeuvre the possible resistance from dominant groups without neglecting others.

Product's Response to Societal Expectations

The dynamic system built around products leverages the interaction among users, objects, and socio-cultural considerations. Gender associations are imbued and instilled in us since birth based on historic social standards, cultural beliefs, and doctrines. Individuals are expected to follow the predefined path regarding their socially assigned roles and identity. These associations are not exclusively found within the human dimension but are also transferred onto objects. Technology is often influenced by biased gender assumptions about the appropriate behaviour for specific social groups (Whalen, 2000).

When responding to societal expectations, products fall into a specific categorisation depending on the extent to which they follow predetermined rules. A sex-typed product represents normative constraints of what is socially accepted as masculine or feminine. Conversely, a cross-sex-typed product willingly challenges societal rules by defying the established meanings of femininity or masculinity. Last, a non-sex-typed product ignores any relation to traditional concepts of femininity and masculinity, exploring the whole spectrum of gender.

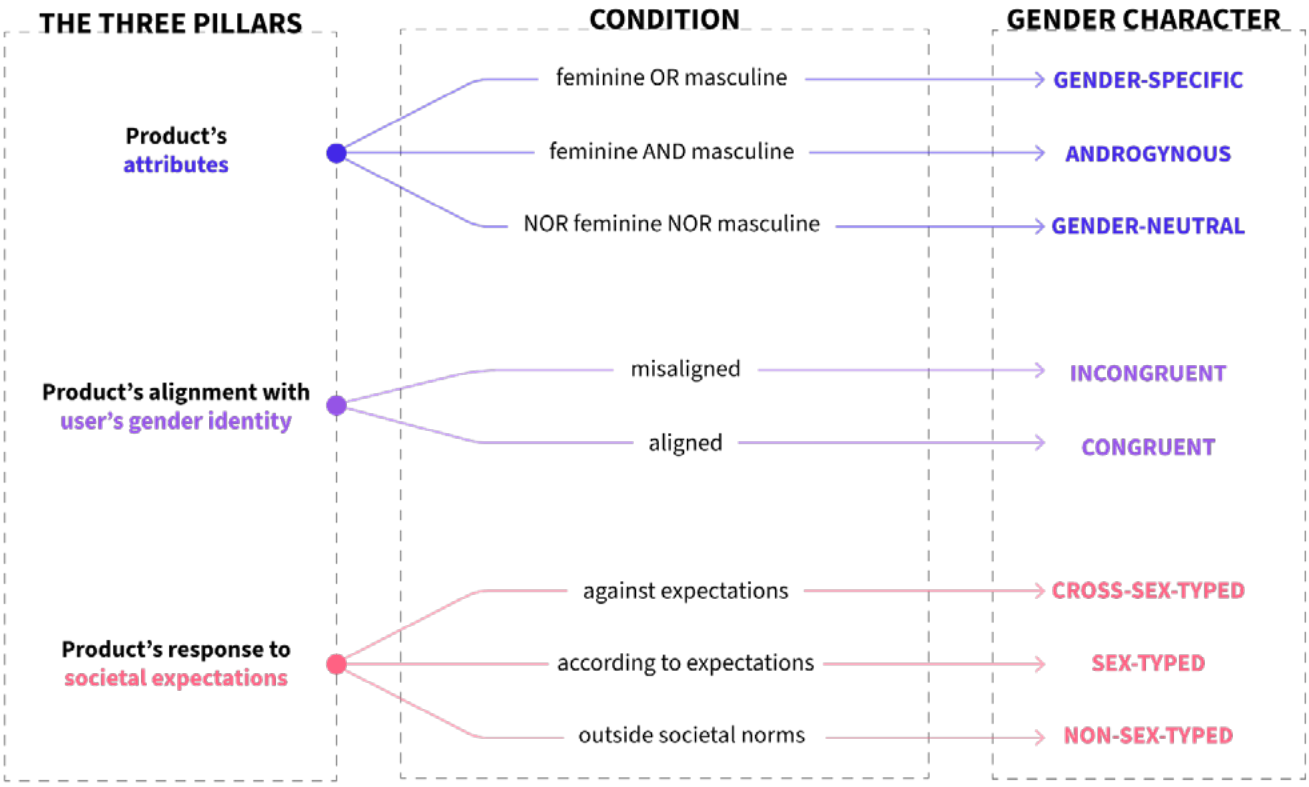

Figure 11. Conceptual Framework for Gender-Sensitive Design. Each pillar is connected to the predominant gender-related terms from our analysis.

4.2 Framework Application to the Design Process

Designers possess the skills and ability to shape “the initial forms, functions and meaning of objects” (Oudshoorn et al., 2002, p. 417). Their perceptions can directly influence the aesthetical value that designed objects evoke. However, designers often project their assumptions, experiences, and biases onto products, drifting away from an inclusive approach (Ehrnberger et al., 2012).

Our framework offers designers insights to make informed choices on gender-sensitive issues. We advise proactively implementing our framework from the beginning of the design journey. We argue that defining and understanding the context and empathising with the target user's needs and desires is essential for a successful outcome. Only after identifying the social and cultural context and the user's demands based on their gender identity can designers start defining the product's general requirements and attributes. A second approach to our framework could involve challenging already designed products and validating their compliance and coherence within the three pivotal pillars (i.e., attributes, alignment with the user's gender identity, and response to societal expectations). By proposing these two approaches, we aim to guide designers through a comprehensive process, ensuring gender sensitivity from the initial stages of design conception to the evaluation of existing products.

Table 2. Design strategies evaluated through the Gender-Sensitive Design framework.

Gender-sensitive design strategy	Product's attributes	Product's alignment with user's gender identity	Product's response to social expectations
Cue-free design	Gender-neutral	Congruent	Non-sex-typed
Gender-shift design	Androgynous	Congruent/Incongruent	Cross-sex-typed
Flexible design	Gender-neutral/Androgynous	Congruent	Non-sex-typed

The Gender-Sensitive Design Framework provides a new perspective for analysing the previously introduced gender-sensitive design approaches and assessing their influence on product outcomes within the context of the three main pillars (Table 2). These emerging design practices aim to promote gender sensitivity in product design and development, each taking a unique approach. First, cue-free design favours gender-neutral products to empower users to express themselves freely without subscribing to traditional gender rules. Furthermore, gender-shift methods intentionally include cross-sex-typed features, creating an androgynous mixture that may align or conflict with users' gender identities, hence making visible the invisible and taking down barriers to gender equality (Ehrnberger et al., 2012). Finally, incorporating flexible design practices that are non-sex-typed provides a safe and inclusive environment for users to explore and express their gender identity.

5. Conclusion and Future Research

Our research results in a deeper understanding of how non-gender-specific products and their distinctive features are addressed within the design discipline. We unveiled contradictions regarding the terminology and classification of these products, proposing a standardised and concise organisation that will hopefully pave the way for a more gender-sensitive design culture. Designers are called to get involved in and kindle the conversation surrounding gender issues, take a step towards bringing to life profitable products in terms of revenues and improving life conditions, and navigate the environmental and social realms thoughtfully and respectfully. As design professionals, we bear the ethical agency and responsibility of creating artefacts engineered to disrupt, challenge, and reshape unfair, unwritten cultural and social rules. A detailed analysis and visual research should be conducted on non-gendered product categories to identify their varying environmental and social implications based on their material, aesthetic, and morphological differences

KEYWORDS | COMMUNICATION DESIGN, PARTICIPATIVE DESIGN, DESIGN ACTIVISM, STIGMA, MEDICAL ABORTION

ABSTRACT | Medical abortion, is a safe and effective method for terminating pregnancies. Despite its widespread use and legal availability in many countries, stigma and misinformation persist, hindering access and comprehensive understanding. Stigma related to abortion can have significant consequences: it can discourage individuals from seeking safe and legal healthcare options, leading to potential health risks. Therefore, addressing this stigma is critical to ensuring the well-being and autonomy of individuals seeking medical abortion.

One of the most powerful tools that can be used to help break down these ideological barriers is communication design: it is crucial in shaping societal debates and influencing public views on complex, contemporary issues. It serves as a vital medium for disseminating information, presenting options, and evoking emotions. When dealing with sensitive and intricate subjects like abortion, the intersection between ethical considerations and design research and practices becomes evident.

This paper presents a project for a communication campaign on medical abortion created through a participatory design process which saw, in addition to the figure of the designer, the participation of stakeholders, activists, individuals with personal experiences of medical abortion, anthropologists, experts in reproductive health and users. The idea behind the project is to move away from the standard narrative on these issues, exploiting the language of animated communication to convey information on the topic in a clear, engaging, empathetic and effective way. The collaborative and user-centered approach of the project highlights the potential for communication design to create meaningful change in public perception and policy surrounding reproductive health.

1. Introduction

Abortion is a simple medical intervention that can be effectively managed by a wide range of healthcare providers using medications or a surgical procedure. In the first twelve weeks of pregnancy, medical abortion can also be safely self-managed by the pregnant person outside of a healthcare facility (e.g., at home), in whole or in part (WHO, 2021). Despite being a common healthcare practice, it also constitutes one of the leading causes, if not performed safely, of maternal deaths and morbidity. Each year, approximately 73 million induced abortions occur worldwide (Bearak et al., 2020), and 4.7–13.2% of maternal deaths can be attributed to unsafe abortions: in developed regions, it is estimated that 30 women die per 100,000 unsafe abortions. In developing regions, this number rises to 220 deaths per 100,000 unsafe abortions (Say et al., 2014).

The lack of access to safe, affordable, timely, and respectful abortion care, along with the stigma associated with abortion, jeopardizes the physical and mental well-being of women throughout their lifetimes. Therefore, access to safe abortion is a fundamental component of sexual and reproductive health and rights. It is a complex issue that concerns public health, a fundamental human right, and a valid indicator of social and gender inequalities (Torrisi, 2023).

Despite the legalization of abortion in most Western countries between the mid-1960s and the mid-1970s, the legitimacy of the practice in hospital settings has not become a point of agreement among all social parties, and even less so, societies in which abortion has been legalized have been affected by processes of full moral legitimation of the practice (Lalli, 2013). Although abortion is now a universally recognized practice (Boltanski, 2007), it continues to be the focus of heated debates involving political, moral, social, and religious spheres; the discussions on the topic often oscillate between indignation and tolerance (Ferrero, 2021).

This is mainly due to the fact that, as philosopher Chiara Lalli writes, “many issues are concentrated around abortion: nature, pain, the conception of women, the morality of manipulations, the inexhaustible discussion on the status of the embryo, motherhood as destiny or as the only true desire of women” (Lalli, 2013, p.34).

The social stigmatization of abortion is a societal phenomenon that varies depending on the country and culture; it is constructed and reproduced locally through different paths. In the article “Conceptualising abortion stigma,” the authors propose a definition of abortion stigma as a negative attribute attributed to women seeking to terminate a pregnancy that marks them, internally or externally, as inferior to the ideals of femininity. Choosing to avoid a specific birth, counters the prevailing view of women as perpetual life-givers and asserts women's moral autonomy in a way that can be deeply threatening (Kumar, Hessini, and Mitchell, 2009).

The stigma built around abortion is not only a tactic of activism for pro-life advocates; it is also enabled, and sometimes perpetuated, by the discourse of those who declare themselves pro-choice. At best, the dominant messages of abortion rights advocates - that abortion is a woman's choice and that reproductive rights are a legacy of enlightenment liberalism - remain silent on the issue of abortion stigma. At worst, the political and activist work of abortion rights advocates reinforces the idea, shared by patients who have had abortions, their supporters, healthcare providers, and the general public, that abortion is shameful and frightening (Ludlow, 2012). Therefore, although abortion is now a common, tested, and safe procedure, attitudes towards it, accompanied by propaganda and hostility from the pro-life movement, increase the stigma surrounding it. These negative attitudes have an impact on the lives and mental health of both those seeking abortion and those providing it.

In this highly stigmatized space, communication design plays a key role: communicative artifacts on the topic convey messages of great importance, both obviously for the theme addressed, and because in many cases the audience consists of individuals who find themselves in a condition of fear, uncertainty, and loneliness. When the narrative surrounding abortion changes, the possibility of a new mentality and different behaviors towards individuals facing voluntary pregnancy termination will arise. Where politics

imposes restrictions on the most private aspects of women's lives, design has the opportunity and the tools to address the imperfect system, increase awareness, and make urgent the need for a more diversified political system.

Starting from these premises, how can the design and communication tools available to the designer be decisive in de-stigmatizing the narrative surrounding abortion? What are the factors contributing to the realization of a communication project on these issues that can be defined as ethical and fair? An attempt to answer these questions is proposed through the story of a participatory communication campaign on medical abortion project carried out for the NGO IPPF (International Planned Parenthood Federation). One of the most important objectives of the campaign presented in the following paragraphs, in addition to the informative one, is precisely to subvert, through communication, hostile narratives, build a network of individuals whose testimonies help eradicate the stigma of abortion, and activate a new generation of politically engaged supporters.

To achieve this, the working methodology, based on a participatory design process articulated in six phases, involved a plurality of actors, including designers, experts on the subject, activists, and target users. The articulated and complex participatory design process has proven to be the fundamental key to constructing communication capable of engaging and informing the audience without instilling fear and feelings of guilt.

2. Participatory Design: Context and Tools

The involvement of end users in the design process has undergone significant and profound evolution in the field of design over the past sixty years. Participatory design is characterized as an approach to involve users in the design phase; thus, participatory design is seen as a way to address the unattainable design challenge of fully anticipating or imagining the use of a product, service, or communicative artifact before actual use occurs by people (Redström, 2008).

The approach to design by designers has changed radically over the years. There has been a shift from a total focus on designed artifacts and their functions to usability, through various methods of user testing, studying their usage, and involving potential users in the design process (Ehn, 2008). Examples of such approaches range from user-centered design focused on use and usability, as in User Centered Design (Ritter et al., 2014; Chilana et al., 2015; Gasson, 1999; Norman and Draper, 1986), to contextual design focused on the context of use (Holtzblatt and Beyer, 1997; Wixon et al., 1990), to contemporary experience design approaches focused on creating user experience (Sanders and Dandavate, 1999; Sikorski and Garnik, 2010; Quiñones and Rusu, 2019).

User-centered design, which originated in North America in response to usability issues in interaction with information systems, represented the first attempt to shift focus from technologies to people. From this point onwards, ordinary people have increasingly gained space and different roles in the design process. Since the 1990s, UCD has evolved, especially following the results obtained from its application in research and design projects, it has expanded its goals, developed new user study techniques, and changed the perspective through which to guide the user's role in the design process (Rizzo, 2009).

The most recent approach is that of co-design, which is based on the active participation of people as designers through intensive workshops with participants, focusing on visual activities and direct manipulation. For these activities, co-design develops specific toolkits based on pre-determined objectives. Therefore these tools differ from those used in participatory design which can be identified in interviews, focus groups, and questionnaires. All these approaches somehow seek to meet the challenge of anticipating, or at least predicting, and designing for use before it actually takes place – design for use before use. (Redström 2008).

Participatory design, which is the methodology used for the production process of this campaign, is placed in this design context with particular attention to people participating in the design process as active users. Studying what people think, what they do, the uses they manifest, and especially how they narrate what they have experienced, allows understanding experiences and placing this knowledge at the basis of generating design ideas.

Since the 1970s, design has felt the need to observe people and their behaviors more closely, placing them in their context. In this initial phase, which saw the field of application mainly in home informatics, the observation talked about was a one-way activity: the designer was the observer, while the user was only the object of observation. Subsequently, this strongly asymmetric relationship between active observer and passive observed was questioned. It was realized that relationships with the context, given their complexity, could not be understood without some form of active involvement of the user. This reflection led to the definition of a new user figure: the user as an "expert actor." That is, as an active subject and bearer of knowledge that only he, thanks to his direct experience, can truly have. User experience as a new field of analysis, and the design experiments based on this, thus became a much-debated topic in the design community (Manzini, 2009).

The tradition of participatory design (Bjerknes, Ehn, and Kyng 1987); (P. Ehn 2006) has been to ensure that end users of a product or design service are involved in the design; it has its roots in movements for the democratization of work in Scandinavian countries. In the 1970s, participation and joint decision-making became important factors in relation to jobs and the introduction of new technologies. Participatory design began from the simple point of view that those involved in using a product should have a say in the design process. A political belief that did not anticipate consensus, but also controversies and conflicts around an emerging design object. Therefore, participatory design sided with weak stakeholders in terms of resources (typically local unions) and developed project strategies for their effectiveness and legitimate participation (Ehn, 2008). The Norwegian Union of Iron and Metal Workers (NJW) initiated one of the first participate design projects in collaboration with researchers from the Norwegian Computing Center from 1970 to 1973. The goal was to involve workers in designing a computer-based planning and control system for their workplace. A plan was devised, based on a participatory approach and inclusion of workers' knowledge, with various activities for unions, including work groups to discuss and find solutions through action programs, evaluations of existing information systems, and proposals for change. Researchers participated with conferences and support in developing project outcomes. In addition, educational material was developed, in the form of a textbook, to support these activities (Van der Velden and Mörtberg, 2015).

Building on these early experiences, the subsequent decades saw the creation of numerous tools aimed at capturing the motivations and meanings behind people's actions in their context. The designer first became an observer and then a mediator, capable of interpreting people's active narratives. Today, in participatory design, in addition to the already mentioned standard tools, a series of remote collaboration tools made available by web technologies and open and peer-to-peer architectures (P2P) are also used. All these tools are increasingly being used to test the initial hypotheses of a project. To allow the involved actors to map the space of possibilities and verify the existence of alternative hypotheses. As is quite evident, their use, if done consistently, implies a profound innovation in the design process. But not only that. It also implies, and above all, a profound change in the role of designers (Manzini, 2009).

A complementary reason for using the participatory methodology, and in the long run probably the strongest motivation for its use in many contexts, has been to ensure that existing skills could be valued and all useful resources used in the design processes. In summary, it could be said that two types of values strategically guide participatory design. One is the social and rational idea of democracy as a value that leads to considering the conditions for adequate and legitimate user participation. The other value could be described as the importance of involving the "tacit knowledge" of participants in the design process, not just their formal and explicit competence.

In the following paragraphs, it will be illustrate how, through a participatory design process that involved a large number of expert actors and target users, a communication campaign on the topic of medical abortion was designed.

3. The Campaign: Abortion Pills

The idea behind the communication campaign commissioned by the non-governmental organization IPPF is to create an international digital informational campaign on the topic of medical abortion. The purpose is to communicate medical practice-related information to users, departing from standard narratives on the topic, through the effective and captivating language of animation.

As anticipated in the introduction, the issues surrounding the topic of voluntary termination of pregnancy are delicate, and often the communication built around them is influenced by political, cultural, religious, and social suggestions. Aggressive communication on the subject can lead to terrible consequences.

The central theme of the campaign is medical abortion in all its complexity: history, global usage, medical procedures, information on support networks, explanation of the procedure and bodily reactions after administration, and an overview of how it works in different parts of the world. All these topics create a comprehensive narrative, which, starting from historical references on the use of misoprostol, the drug used in combination with mifepristone is used in the medical abortion procedure, initially used as a medicine to treat gastric ulcers and then informally used as an abortifacient drug, offers an overview not only of the purely clinical aspect of the procedure but also, and above all, of the support network and psychological aspects of facing a voluntary termination of pregnancy.

Due to the presence of medical, psychological, legislative, and civic-related themes, the support of a plurality of actors was fundamental. Indeed, at the project's core, it was decided to integrate the normal workflow of producing a standard communication campaign with a participatory design process that involved collaboration between various figures internal and external to the NGO: in addition to the designer, anthropologists, copywriters, activists, target users, and experts in abortion practices from a medical and legislative perspective also collaborated on the project. These different actors worked synergistically throughout the project, contributing to different phases of the project according to their expertise.

The target audience chosen to work on is young adults, including people aged between 25 and 40 years old: research has shown that the highest percentages of voluntary pregnancy termination mainly occur in this age group. From the analysis conducted on personas, it emerged that the target primarily seeks information on social media using smartphones; therefore, two social media platforms were chosen for distributing the campaign: TikTok for the younger age group (25-32) and Instagram for the older age group (33-40). Both social media platforms, despite presenting different characteristics and purposes, share common elements, the most macroscopic of which is the use of video to communicate, whether it be a reel, a story, or a live stream.

The choice of distribution platforms influenced the definition of the campaign's output type; specifically, based on the typical consumption pattern of these social media, a series of short vertical format videos were chosen. The vertical format is conditioned by the choice of smartphones, allowing the video to be viewed in full screen, since these social media platforms currently do not allow for rotating the viewing mode. The choice to make a series of short videos, in total ten videos were made with a duration varying between one and two minutes, rather than a single video is dictated by several factors: firstly, for ease of viewing, single-topic consumption is simpler and more manageable than a long single video; secondly, given the increasingly reduced attention spans and the shrinking space dedicated to learning a subject (Iotti 2020), the brief single video is certainly more appealing to the identified target.

The concept behind these videos is to create ten individual stories, each on a specific theme, with a beginning and an end, but ensuring that these ten elements are linked by the style of the illustrations and

the character of animations. In practice, each video is conceived as a micro theme within the macro theme of medical abortion: it can be viewed individually without following a specific order, but when put together with all the others, it forms a complete picture on the topic. The style of illustrations, typographic choices, and color palette constitute the distinctive character of the campaign: although the subject brings to mind a decidedly "medical" cold color palette often seen in campaigns on similar topics, the desire to position oneself in a certain contrast with what already exists is manifested precisely by the chromatic, font, and representation choices, as will be illustrated in the following paragraph.

4. Methodology

The production of this campaign involved six phases of work (Fig.1) , which saw the involvement of various actors and the use of multiple design tools and methodologies depending on the needs presented by each stage of the project. All contributions from the professionals involved, alongside the work of the designer, significantly contributed to the development of the project in every aspect: thanks to the variety of skills brought to the table, it was possible to enrich the design process with contributions that offered a composite view from different perspectives.

Among the figures involved, the work of anthropologists, experts in voluntary termination of pregnancy, copywriters, and communication consultants led to the production of the scripts for the ten videos; the synergy of these figures ensured that the narrative was always positive and as clear and effective as possible. Interviews with activists, who are already involved in communicating information, testimonies, and resources on the topic through various means, building important support networks in the area, were crucial in the concept phase to steer the project in the right direction. Finally, focus groups and questionnaires provided the opportunity to test the artifacts and correct some images and words to ensure that the concept expressed by the voiceover was represented in the best possible way.

Although the campaign was primarily designed for the Italian territory, an English version was also produced and then subtitled in six other languages. The internationality of the campaign provided an opportunity to create moments of comparison and focus groups for participatory design both in Italy and abroad, in this case within the European territory.

The design methodology involved pre-production, production, and post-production phases accompanied by three phases of participatory design: each production phase corresponded to a feedback phase, focus groups, and comments that led to the next phase.

Below, we will outline the main co-design phases grouped into three paragraphs, each of which presents two work phases that coincide with the three production steps of the project.

4.1 Step 1: Interviews + Pre-Production

Starting from the brief provided by the client, the first phase of the project addressed the pre-production and the narrative construction. The work began with exploratory discussions between the NGO consultants, who were responsible for the scriptwriting, and the designer, who produced concepts, schematic illustrations, storyboards, and style frames. The initial discussions served to deepen the understanding of the topic, identify potential strengths and weaknesses of the project through the SWOT analysis, define the number and the characteristics of the project outputs, identify the target audience, and select the main distribution platforms.

From these early creative moments, it was decided to initiate an open dialogue with a broader audience of potential users and abortion activists. Through two days of interviews, conducted before the definition of the project concept, forty-eight people, including activists and potential user-viewers, expressed ideas, feelings, fears, and desires regarding the project brief. This involvement was immediately very useful and appreciated by both sides. In this way, stakeholders had the opportunity, in the initial phase of the project, to gain an "outside" perspective from a group of people working in the field, the activists, who provided a very broad and knowledgeable view on the topic, collecting references and materials useful for a more effective understanding. The viewpoint of some potential campaign viewers was also very useful, both to capture their expectations and to understand the level of knowledge about the topic among the audience: this ensured the use of a scientific language understandable even to a non-specialized audience. From the involvement of the activists, moreover, a relationship of openness and the possibility of sharing and sponsoring the campaign on their channels immediately emerged. This factor also proved to be very important because it ensured a first part of the campaign's promotion free of charge and widespread through different media including various social, web, and print.

The collection of these numerous inputs led to the definition of a creative and strategic concept: the style chosen for the campaign is two-dimensional vector illustration, characterized by a pop color palette; characters are depicted with skin and hair colors completely outside of normality to avoid any association with races and ethnicities and to distance themselves from any stereotypes of women and femininity narrated in mainstream communication artifacts (Fig.2). The script avoids direct dialogue and features a lively female voice-over; in the early stages of the project, voices generated with artificial intelligence tools are used to allow for quick audio and text modifications after feedback and focus group stages with the target users. The production of storyboards progresses in the direction of the concept, with nothing directly referencing the medical environment (such as internal organs, fetuses, surgery, etc.), but everything is abstracted into highly dynamic and colorful animated geometries.

4.2 Step 2: Collaborative Review + Production

The pre-production phase was followed by a verification and feedback phase on the produced material (Phase 3): consultants, experts in abortion practices, and activists had the opportunity, through online work-sharing tools, to comment on the texts and storyboards, identifying inaccuracies, unclear elements, or potentially ambiguous aspects. This review was very important to refine the texts and perfect the storyboards, allowing for a smoother transition to the next phase, avoiding excessive changes during production, which would have been much more problematic to implement.

The fourth phase corresponds to the production phase of the animated artifacts. The workflow is organized into two production blocks, each comprising five videos, allowing for an initial review between consultants and the client of the first five, while the production of the second block takes place, followed by modifications during the review of the second block of five video. The production phase first involved preparing assets for animation and then the animation process for the ten videos. Although the animated artifacts can be viewed individually, they all share the same style and dynamics to give a unique and recognizable character to the entire campaign. The chosen animation technique is 2D because, from the initial interviews, it was found to be the closest animation tecnique to the chosen target audience.

4.3 Step 3: Focus Group + Post-Production

After the production phase of the artifacts and an initial internal review within the stakeholder group, a survey is circulated online with the dual objective of gathering information on the perception of abortion by a broad, non-specialized audience and recruiting volunteers within the target demographic to participate in focus groups. With approximately 500 responses to the survey, 100 participants are selected, further divided into ten groups; each group of ten individuals participates in a focus group. The online focus groups are organized on different days, with each group presented with a combination of three videos, divided into overarching topics, along with a questionnaire to be completed for each video.

From the focus group sessions, a wealth of data emerges, systematically organized through questionnaire responses, providing valuable feedback on the campaign. The focus groups are generally successful, with users giving positive feedback on the comprehensibility, engagement, and aesthetics of the animated products. The most significant finding is that at the end of viewing, medical abortion is perceived by viewers for what it actually is: a medical procedure one is free to choose. Questionnaires completed during the focus groups and verbal testimonies reveal that the video narratives are perceived as rigorous and impartial, yet the colorful and positive imagery, divergent from stereotypes on the topic, elicit positive reactions from viewers.

The main areas for improvement involve minor text modifications, the choice of one word or verb over another, or the use of a complete word rather than an abbreviated acronym. This fifth phase represents a crucial juncture for the project: it allows for necessary text modifications and yields a more reasoned and comprehensible version of the videos.

Following subsequent revisions after the focus groups, the project enters the final phase of work before the campaign launch: post-production. Since the artifacts are entirely digital, without live-action imagery, post-production primarily involves recording the final speaker in both Italian and English, performed by a professional, and finalizing the audio mix with the new speaker for all videos.

During this phase, distribution and promotion strategies for the campaign materials are also defined, including video launch plans, creation of social media profiles and corresponding editorial plans, marketing and communication strategies, and plans for engaging the audience through stories, interviews, and live testimonials.

5. Conclusions

In conclusion, the project presented in this paper has shed light on the potential of communication design in addressing highly complex and delicate issues. It has been demonstrated how participatory approaches can help to break down the stigma surrounding medical abortion. By actively involving stakeholders and the target audience throughout the design process, a campaign has been developed that not only educates and informs the public on the topic in a transversal manner, but also promotes empathy, understanding, and solidarity.

It is well-known that designers wield powerful design and communication tools; they can steer their work towards an ethical dimension of the profession by serving the community. This practice should not be entirely subservient to the commercial logic of consumerist society but should rediscover project areas relevant to improving human life quality and redefine new priorities in the scale of professional values. To achieve this, the designer cannot act alone in project development. Storytelling designed for a campaign alone cannot change a segment of society's view on a particular issue, but when integrated into a participatory project, it can be enriched, refined, and shaped around people, thereby becoming effective and engaging.

Throughout all stages of work, complexities related to addressing sensitive issues concerning abortion were encountered. The participation of various actors in different parts of the project ensured that the campaign reflected diverse perspectives, conveying real experiences and collective sentiments. It has already emerged from the data collected following the focus groups that initiating participatory design from the early stages of work has brought tangible benefits in all subsequent phases, making the workflow more agile and effective. By approaching creative work with inclusivity, accessibility, and openness in design decisions, an effort was made to create a campaign that resonates with a wide audience, challenging misconceptions and prevailing stereotypes on the topic.

The main difficulties encountered in the development of the pre-production and production phase were mainly linked to the use of terminology and the updating of the legislative rules that regulate the subject in the various countries of the world. The final text of the videos has seen many revisions, both to make the text understandable to non-specialist users and to ensure inclusive and positive language. Furthermore, some rules have changed in a few weeks and this has made it necessary to remove some scenes and add new ones.

At the time of writing this paper, the last phase of the project, the sixth, has been completed, and the campaign launch is awaited in the coming weeks. It will be crucial to conclude the work with an evaluation phase, where the actual results of the campaign can be determined: assessing its effectiveness and impact, both in terms of changing attitudes and behaviors related to medical abortion and reducing stigma within communities and healthcare systems.

Furthermore, this project serves as a good starting point for envisioning future research to evaluate the scalability and adaptability of participatory design approaches in addressing other complex issues on similar themes, where stigma prevents an informal view on the subject, thus contributing to the broader discourse on the role of communication design in promoting social change and equity in public health.

KEYWORDS | DESIGN THINKING, VALUE SENSITIVE DESIGN, SYSTEMS THINKING

ABSTRACT | The Value Sensitive Design Thinking model (VSDT) is a hybrid conceptual model proposed in this research paper. It integrates the Design Thinking (DT) and Value Sensitive Design (VSD) frameworks by adopting a Systems Thinking (ST) perspective. DT is a human-centered design approach that emphasizes users' needs through empathy, ideation, prototyping and testing. VSD focuses on discovering and addressing value tensions that arise in complex design scenarios. With this proposed hybrid approach, we address some of the shortcomings of the two frameworks, by viewing their differences as an opportunity for VSDT to be informed and complemented by both. VSDT relies on a systemic perspective for uncovering relationships, feedback loops and emergent properties of systems which, for which and within which we design. We argue that both DT and VSD are systemic in nature, albeit implicitly. By making the importance of ST more explicit, DT and VSD can be combined using ST as a common ground. Based on the fundamentals of systems theory, our suggested model expands upon the current knowledge and toolkits of these two frameworks. We suggest a structured approach for VSDT as a design process, with defined stages and tools, achieved through a comparative analysis and integration of DT and VSD. The potential of VSDT in addressing complex issues is discussed, especially in relation to abstract concepts such as wellbeing, sustainability, and ethics. Finally, we explore the applicability of VSDT offering guidance for researchers and design practitioners who might incorporate our model into their practices.

1. Introduction

The world is confronted with a multitude of complex issues in all aspects of life, from the global challenges of our era to the intricacies of individual wellbeing and societal progress. These are often characterized as “wicked problems” (Coyne, 2005; Rittel & Webber, 1973), as their complexity makes them unresolvable using traditional epistemological and analytical approaches relying on a modernist/positivist view, which has been the mainstream way of thinking in the western world for the last two centuries. Our position is that most of these wicked problems are in fact challenges that are the result of human action. They are the consequences (whether intended or unintended) of planned and goal-oriented human action. Design, in the broad sense of the word, as the creation of plans for new things, plays a pivotal role in this. The role of design in contributing to the onset of the Anthropocene has gained mainstream momentum in recent years (Chan, 2018), although it has been recognised throughout the modern history of the design discipline. A design mindset is often presented as a useful approach to tackling wicked problems for people who design referring both to professional designers and to people of other professions who end up designing/planning, such as policy-makers, managers, and engineers. Various tools and methods have been developed to assist designers in doing so. This paper focuses on two design approaches related to tackling complex issues: Design Thinking and Value Sensitive Design.

Design Thinking (DT) is a human-centered design methodology that emphasizes understanding user needs through empathy, redefinition of problems, ideation, prototyping and testing. Its origins can be traced back to the 1950s and 60s, stemming from research on design methods. It encompasses an effort to lay out “designerly ways of knowing and thinking” (Cross, 1982, 2012), meaning tools, methods and mental models that designers typically use in their practice. Over the years, DT has proven to be adaptable to various contexts, making it relevant not only in design but also in other fields, embracing the zeitgeist of each era. Its capacity in dealing with complex issues and wicked problems has been noted (Buchanan, 1992; Cross, 1982; Matthews et al., 2023), and its application extends beyond design domains.

Value Sensitive Design (VSD), on the other hand, is an approach to design that puts values in the forefront of the design process. Similarly to DT, it offers a methodology with three stages of conceptual, empirical, and technical investigations (Friedman et al., 2008), supplemented by a rich set of methodological tools (Friedman et al., 2017). With its roots in technology development and human-computer interaction (HCI), over the years VSD has matured and has proven itself as a versatile design tool in various use cases across the broader design discipline. VSD, as a tool for taking values into account in design, is faced with what is arguably one of the most complex issues of design; the question of design ethics (Fenn & Hobbs, 2015; Sweeting, 2018).

We recognize the significance of both these design approaches in advancing design and empowering designers with new tools, however both have received varied valid criticism. In this paper, we claim that a Systems Thinking approach both to VSD and DT can help alleviate some of the issues highlighted by such criticism. We present our case for synthesizing VSD and DT into a new hybrid model we call Value Sensitive Design Thinking (VSDT), building upon foundations of Systems Thinking and systems theory.

2. DT and VSD Explored

Design Thinking (DT) has become increasingly popular in management and business over the past two decades. It is often pitched as a corporate tool for harnessing innovation and creativity. Several flavours of DT have been proposed (Dam & Siang, 2020), which are typically intended for individuals in leadership and management roles rather than design professionals. According to a relevant literature review (Micheli et al., 2019, p. 131), the most notable of these applied models of design thinking are IDEO’s design thinking approach (Kelley & Littman, 2001), d.school’s 5-step design thinking process (Hasso Plattner Institute of Design, 2010) and IBM’s Enterprise Design Thinking (Lucena et al., 2017). This has led to a fork/schism in the design thinking discourse, one maintaining its roots in design process, practice and academic design research/theory, and another embracing its business-oriented direction. Some argue that there are three or

four types of design thinking (Dell'Era et al., 2020; Love, 2021), but for the intents of this paper, we focus on this diptych approach of academic/designerly design thinking versus a technocratic/managerial Design Thinking (see Cross, 2023).

Corporate Design Thinking indicates design processes and methods to be used by non-designers, such as managers, consultants, and educators. It aims to help companies design better products, gain a competitive advantage, and increase business revenue, prioritising efficiency, scalability, and business outcomes (Liedtka, 2018). Designerly thinking, on the other hand, is a practice-based approach to problem-solving, making sense of things, and developing new knowledge. It is rooted in understanding design practice and establishing itself as a discipline focused on solving problems and improving people's wellbeing. The two concepts, design thinking and designerly thinking, have different focuses, but they also influence each other. The design community cannot ignore the interrelatedness of these two fields (Laursen & Haase, 2019).

Despite its widespread adoption, Design Thinking faces several criticisms (Kolko, 2018). First, it tends to oversimplify complex challenges by focusing solely on users' experiences without considering the situational context dynamics. Furthermore, corporate Design Thinking lacks a clear theoretical foundation, leading critics to view it as superficial compared to its academic / designerly theory-based counterpart (Johansson-Sköldberg et al., 2013). Design Thinking seems to foster homogenous solutionism in the form of a one-size-fits-all managerial toolkit (Woudhuysen, 2011) based on a western philosophical perspective (Gordley-Smith & Hackett, 2023). DT seems to be emphasizing a checkbox mentality, iteration and rapid prototyping that appeals as a go-to tool for innovation (Hernández-Ramírez, 2018), at the expense of diverse perspectives, meaningful empathizing, and consideration for social systems (Lee, 2021). DT, portrayed as a tool that can offer a competitive advantage to companies, can lead to situations where the ethical considerations and societal impacts of the solutions and ideas generated is overlooked (or at least not prioritized), potentially contributing to unintended and/or unanticipated consequences (Parvin & Pollock, 2020).

In the grand scheme of things, design tools like Design Thinking, intended for non-designers, are valuable in that they provide a more accessible and practical approach to design that can be applied by a wider range of people. However, these tools often oversimplify complex design issues and prioritize efficiency and scalability over empathy and reflection. On the other hand, designerly thinking provides a more comprehensive and nuanced approach to design, but it can be criticized for being too abstract and out-of-sync with practical realities of designing for the modern era. Nevertheless, we believe that these two directions of DT have the capacity to complement each other, and knowledge and tools from both should be used in design undogmatically.

Value Sensitive Design, on the other hand, is a widely recognized framework for integrating ethics in the design process of technology. Despite its widespread use, VSD has faced several criticisms. One major concern is the lack of a normative, ethical commitment, making it challenging to justify the implementation of values in design (Manders-Huits & Zimmer, 2009). Additionally, VSD has been criticized for its "positivist problem," which presupposes a connection between the design and use contexts (Albrechtslund, 2007). Furthermore, VSD's lack of commitment to a specific ethical philosophy has led to the proposal of complementary theories and approaches, such as virtue ethics (Reijers & Gordijn, 2019), norms-based approaches (Martin et al., 2023), and procedural ethics fostering wellbeing (Cenci & Cawthorne, 2020).

The criticisms of VSD's theoretical grounding could be interpreted as indicators of crucial ontological issues within the framework. However, we interpret them as an indicator that VSD has the ability to take in new ideas and alternative approaches both to its theory and to its methodologies, making it easily adaptable to new needs. As such, VSD as a framework is meant to be flexible and open to change, which allows it to grow and evolve over time. The incorporation of various theories as ethical lenses is a good example of how VSD can be adapted to address complex design challenges.

2.1 DT and Complex World Issues

Researchers have investigated the application of design thinking in diverse domains dealing with complex issues such as improving well-being and sustainability. Dorst and Tietz (2011) explore an original approach to analysis within the context of design for social wellbeing, aiming to enrich the traditional focus on the creative and generative elements of design thinking. ElSayary (2023) investigates the impact of incorporating design thinking processes in interdisciplinary courses to improve students' wellbeing, employing a modified PERMA-PH model. Thomas et al. (2020) explore the application of design thinking techniques in addressing organizational factors and individual needs to improve the wellbeing of residents, yet the effectiveness of these approaches in complex organizational contexts remains uncertain. Kreitzer et al. (2019) discuss the integration of design thinking and systems thinking to develop strategies for addressing stress and burnout among health professionals, highlighting the potential synergy but also the complexities in implementation. Buhl et al. (2019) explore the potential of design thinking in promoting sustainability-oriented innovation development. By examining key principles of design thinking and proposing a research framework, the research highlights the applicability of design thinking in addressing complex socio-ecological problems and driving sustainable innovation. Shapira et al. (2017) examine the integration of design thinking and strategic sustainable development to achieve more strategic and sustainable outcomes. Through action research and expert feedback, their study proposes a prototype for Sustainable Design Thinking (SDT) aimed at addressing complex socio-ecological challenges. Wilkerson and Trellevik (2021) present a combined methodology that integrates design thinking with systems mapping to improve problem definition in sustainability-oriented innovation processes. By employing systems mapping in problem definition, the study aims to provide a holistic understanding of sustainability challenges and enhance empathetic design thinking approaches. Kagan et al. (2020) analyze the potentials and limitations of design thinking in sustainability jams through an in-depth case study. They explore how design thinking, when applied within sustainability jams, can generate solutions for sustainable futures. However, the study also identifies limitations such as user-orientation and insufficient complexity, suggesting directions for improving the effectiveness of sustainability jams in addressing complicated sustainability problems. While these studies emphasize the potential benefits of DT for complex global issues, challenges still arise regarding the subjective interpretation of values and the scalability of interventions throughout the design process.

2.2 VSD and Complex World Issues

Furthermore, various researchers have attempted to address ethical implications and plural values in technological development within the field of Value Sensitive Design (VSD). In their work, Friedman and Kahn (2000) introduce VSD to assess the ethical implications of augmented reality (AR). They examine seven core values—psychological well-being, physical well-being, privacy, deception, informed consent, ownership and property, and trust—in the context of AR. Additionally, they outline their application of VSD to AR technology focused on natural environments. Ballard et al. (2019) introduce Judgment Call, a game for industry product teams to surface ethical concerns using VSD and design fiction, demonstrating its effectiveness in considering technology from multiple perspectives. Cenci and Cawthorne (2020) discuss the challenges of integrating ethical ideals and values in high-tech product design, proposing refining VSD with a capability-based procedural approach to ethics, highlighting the need for a more resilient ethical framework. Mok and Hyysalo (2018) illustrate how conflicting values involved in advancing solar photovoltaics in heritage can be addressed using the VSD framework, emphasizing the importance of finding a working compromise among conflicting values. B. Barn and R. Barn (2016) introduce a refinement of the Value-sensitive Action-reflection model used in co-design to address the tension between values and resilience, acknowledging the ambiguity created during the co-design process and its impact on resilience building. Cawthorne and Cenci (2019) describe the application of VSD methods to the technological development of a specific drone platform, demonstrating how VSD can be used to develop ethical drones but also highlighting the complexity of balancing human welfare and environmental sustainability. Through a VSD approach, Prieto et al. (2023) investigate how technology can support doctoral students' progress, well-being, and persistence, revealing promising insights but also underscoring the need for effective evaluative frameworks. Finally, Ishmaev et al. (2023) focus on ethical design frameworks for self-

sovereign identity (SSI) solutions, presenting a case study of VSD applied to the uNLock medical credential sharing platform. They evaluate VSD's applicability and quality, revealing challenges such as “value branching” in SSI solutions and the need for context-specific evaluative frameworks in ethical design. While all these studies offer valuable insights, they fall short in fully assessing the validity of all components of the VSD approach in practice, conveying the need for a systematic approach that includes tools for stakeholders to reflect on their own values during the design process.

2.3 DT and VSD Tools

Both DT and VSD offer a rich toolbox of methods that can be used in the design process, each tailored for a particular design stage (Friedman et al., 2017; Friedman & Hendry, 2019; Hasso Plattner Institute of Design, 2018; IDEO, 2003; Lewrick et al., 2020; Liedtka & Ogilvie, 2017). DT has a set of tools for each design stage. Some of the most widespread are: 30 shapes, What? How? Why?, Use Scenarios, How Could We, Route Map, Powers of 10, 2x2 Matrix, Point of View (POV), Five “Whys?”, Affinity Diagrams, Interviews aimed at Empathy, Interviews with Extreme Users, Photo Diary, Card Sorting, User Personas, Fly on the Wall, 6-3-5, Questions “How could we...”, Brainstorming, I like it - I would like it - What if, Prototyping for Empathy, Wizard of Oz prototyping, and Video Prototyping (Hasso Plattner Institute of Design, 2018; IDEO, 2003; Lewrick et al., 2020). VSD’s tools include: Stakeholder Analysis, Stakeholder Tokens, Value Source Analysis, Co-evolution of Technology and Social Structure, Value Scenario, Value Sketch, Value-oriented Semi-structured Interview, Scalable Information Dimensions, Value-oriented Coding Manual, Value-oriented Mockup, Prototype or Field Deployment, Ethnographically Informed Inquiry regarding Values and Technology, Model for Informed Consent Online, Value Dams and Flows, Value Sensitive Action-Reflection Model, Multi-lifespan timeline, Multi-lifespan co-design, and Envisioning Cards (Friedman & Hendry, 2019)

Comparing some indicative tools from the two frameworks (see Table 1) will help us decide which toolboxes to recommend for practical application of our new model. Tools of DT and VSD each complement the respective framework and attempt to fulfil its goals. More specifically, DT tools are more focused on the user and their experiences, while VSD tools are centered around the values of different stakeholders. However, both sets of tools share a common goal of understanding and addressing complex design scenarios. Their complementarity allows for the creation of hybrid tools in the intersection of both, that take into account both the user's needs and the values of diverse stakeholders.

Table 1. Comparative presentation of DT and VSD tools. Sources: 1) Hasso Plattner Institute of Design (2018), 2) IDEO (2003), 3 Lewrick et al. (2020), 4) Friedman and Hendry (2019).

Design Thinking tools	Value Sensitive Design tools	Comparison
Journey map (1)	Value Scenario (4)	Both of these tools build a narrative of the user journey, as a means to gain insight on the contexts of use of the design in question.
Five Whys (2)	Scalable Information Dimensions (4)	In these tools, a series of prying questions are used as a method to peel through the layers of complexity and understand core issues pertaining to the design context.
Interviews for empathy (1)	Value-oriented Semi-structured Interview (4)	Interviewing is a common tool for involving users and other stakeholders in the design process, used by both VSD and DT. In each of these cases, the orientation of the interview is being steered to better serve the needs of each methodology.
Card sorting (2)	Envisioning Cards (4)	Physical tools are often useful for the design process. Cards, in this case, offer a tactile, versatile and gamified method to steer the design process. Tools involving cards and other props can be used either during user research or as tools for the designers.
Prototyping for empathy (1)	Value-oriented Mockup, Prototype or Field Deployment (4)	Rapid prototyping of ideas is invaluable for gaining quick insight that can uncover aspects that could not be foreseen just with interviews and drawings of concepts.
Stakeholder map (3)	Stakeholder Analysis (4)	Having a clear overview of the involved stakeholders in a design project is a crucial step and both methodologies use such tools to map the design context and pin-point direct and indirect stakeholders.
Empathy map (3)	Value Source Analysis (4)	Both methodologies employ tools that specialize in a specific aspect that they focus on; empathy for DT and values for VSD. Such analyses at the early stages of a design process are critical both for gaining insight on the project itself, and for steering the next steps of the design process effectively, picking tools and methods that best fit the situation.

3. Systems Thinking for Design

Systems Thinking (ST) is a well-established way of understanding and analyzing complex systems and their interactions (Checkland, 1999; Kim, 1999; Meadows & Wright, 2011). It is a perspective that views the world as a set of interconnected systems, rather than as a collection of individual parts, based on the principles of systems theories such as the general systems theory, complex systems and second-order cybernetics (Laszlo, 1972; Luhmann et al., 2013; Thurner et al., 2018). ST posits that all systems, whether natural or human-made, share certain fundamental characteristics, such as interconnectedness, feedback loops, and emergence. By utilizing various tools and methods, like system mapping, causal loop diagrams, and system dynamics modeling, to analyze and understand complex systems, ST offers an alternative perspective to approaching and tackling wicked problems (Wang & Song, 2023; Zellner & Campbell, 2015).

ST and systems theory have found application in the field of design, offering a comprehensive approach to understanding and addressing complex design issues (Banathy, 1996; Johnson et al., 2010; Norman & Stappers, 2015), leading to the proposal of approaches such as systems oriented design (Sevaldson, 2013) and systemic design (Jones, 2014, 2020; Peruccio, 2017). Academic platforms dedicated to exploring the relationship between ST and design, such as the Systemic Design Association and their annual Relating Systems Thinking and Design Symposium, alongside the rich bibliography on the topic indicate that this combination has proven compatible with and helpful for the design discipline. By adopting a systems perspective, the interconnectedness and interdependencies between various stakeholders, systems, and

contexts become more easily detectable. Understanding the importance of a complex systems perspective for ensuring better design outcomes has been recognized as a necessity for ensuring better outcomes for the world (Escobar, 2018).

Following a similar line of thought, the integration of ST and DT is an existing idea that has been suggested by several academics (Buchanan, 2019; Jonas, 2018; Li, 2002; Mononen, 2017; Pourdehnad et al., 2011b, 2011a) and has been operationalized in design practice (Pohl et al., 2020; Sevaldson, 2019). This combination offers the key benefit of balancing analysis and synthesis for effective problem-solving. Design thinking is used for generating new ideas and solutions through experimentation, iteration, and prototyping, while systems thinking focuses on the importance of understanding the system and its interactions as a whole. These combined benefits have been identified and harnessed by the Design Council, proponents of the Double Diamond design thinking tool (Design Council, 2019; Elmansy, 2021), in their most recent publications on systemic design (Design Council, 2021; Design Council & The Point People, 2021).

Furthermore, a systemic approach appears to be a valid approach for gaining stronger insight on one of the most complex philosophical issues of humanity; that of ethics (Tuan & Shaw, 2016). The field of design ethics deals with the ethical implications of design, both pertaining to its outcomes and to design as a process. A systemic perspective to design ethics offers a promising new direction for design (Pappas, 2023), especially considering design as a discipline that is faced with wicked problems (Sweeting, 2018). VSD, as one of the most impactful methodologies of design ethics (Donia & Shaw, 2021), can benefit from such a systemic perspective. Such an integration has been hinted at in previous works (Pappas, 2023; Umbrello & Gambelin, 2023) but has not been fully implemented yet.

A systemic approach, as offered by ST, seems to have a significant impact in giving design a new holistic perspective and equipping it with tools for tackling complex issues and wicked problems that it often faces. We have indicated that DT and VSD, separately, can have benefits from such an approach. The integration of DT and VSD is a new idea that has been framed as a “design thinking perspective on human rights'' (van Zeeland-van der Holst, 2023). Taking all this into consideration, and in order to address the limitations of DT and VSD, we propose the integration of these two frameworks through a ST perspective. Such an approach can equip designers with tools to better understand the complex relationships and feedback loops that exist within the systems in hand. Potential unintended consequences can be better anticipated, and more informed decisions about the trade-offs and value tensions that arise in complex design scenarios can be made (Miller et al., 2007).

4. VSDT: A Hybrid Conceptual Model

In this section, we present the Value-Sensitive Design Thinking (VSDT) model, our proposal for a hybrid conceptual model that integrates the Design Thinking and Value Sensitive Design approaches based on a Systems Thinking perspective (Figure 1). The design process that led to the development of the VSDT model started with the comparative analysis and critique presented above. It was then followed by brainstorming sessions amongst our research team, in order to conceptualize the direction which VSDT should follow. As a starting point, we view the following points as main principles of VSDT, which also act as design requirements for our proposed model.

- Communication - VSDT should emphasize effective communication between all stakeholders throughout the design process. This includes fostering empathy and understanding of diversity. The designer gets a facilitator role in the design process.
- Documentation - VSDT should recognize the importance of documenting the design process, such as research findings, design decisions, justifying the rationale and decision-making processes behind those decisions.
- Iterative process - VSDT should adopt an iterative design process based on user feedback and emerging insights as the design process progresses. The design process should not be rigid, but

flexible and responsive to these new insights, seeking better understanding towards achieving good design outcomes.

- Systemic approach - VSDT should be based on a systems perspective that acknowledges relationships, feedback loops, interconnectedness and emergence in the design process and the complex systems involved.
- Focus on values - VSDT should consider values and value tensions throughout the design process, ensuring that the final design outcomes align with the stakeholders' diverse conceptualization of ethical values, offering an ethically balanced and acceptable outcome, while potential unintended consequences are better anticipated.
- Human-centered and Humanity-centered approach - VSDT should focus on understanding and addressing the needs and wants of users and other stakeholders, while at the same time adopting a humanity-centered perspective that considers the broader social, cultural, and environmental contexts within which the design is situated.
- Collaborative mindset - VSDT should promote a collaborative mindset that encourages everyone involved to work together throughout the design process, building upon co-design and participatory design practices.

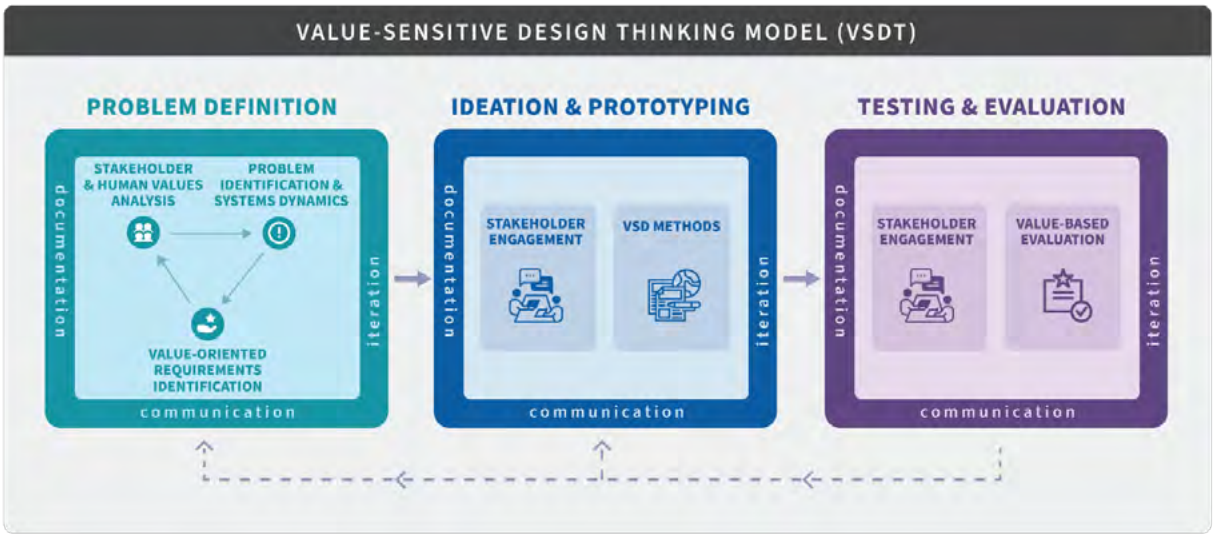

Figure 1. The VSDT conceptual model.

The suggested structure of the VSDT model, resulting from the previous insight and design requirements, involves the following design phases:

1. Problem Definition
   - Clearly articulate the design problem, understanding context, end users, and stakeholders.
   - Identify and prioritize human values as part of the design brief, considering cultural and ethical dimensions
   - Identify value-oriented user requirements

2. Ideation and Prototyping
   - Engage in ideation and rapid prototyping. / participatory elements
   - Extend ideation and prototyping techniques to visualize and test ethical considerations within the design, iteratively refining the integration of ethical principles.
   - Involve stakeholders for comprehensive insights.
   - Implement an iterative design process, adapting to evolving needs and dynamics while continually refining the integration of ethical principles.

3. Testing and Evaluation
    - Involve stakeholders and end users in a value-based evaluation process.
    - Document design decisions and ethical integrations.
    - Communicate the process and outcomes to stakeholders.
    - Continuously evaluate and iterate based on feedback.

Subsequently, we examine each phase of the model in greater detail, developing the VSDT model by offering practical guidance on how to apply it, through indicative examples of how designers can combine the tools that these two approaches have already used. The rationale behind providing the recommended combinations of Value-Sensitive Design (VSD) and Design Thinking (DT) tools lies in their complementary nature and their ability to address different aspects of the design process, while prioritizing ethical considerations and stakeholder values. In order to achieve a systemic perspective, we posit that it is a prerequisite for each combination to take into consideration both the users and stakeholders, and the broader design context, as per the design requirements mentioned above.

4.1 Problem Definition

During the initial phase of Problem definition, thorough analysis is conducted by engaging with stakeholders directly to identify their needs and human values at play. Through grounding problem definition in stakeholder perspectives, systemic analysis, and value-driven criteria, designers can acquire a deeper understanding of the wider context within which the issues are situated. Furthermore, understanding systems dynamics allows designers to better comprehend the interdependencies and complexities present in the problem space. Finally, value-oriented requirements identification ensures that the design process is consistent with the overarching goals and values of stakeholders.

Practical Examples:

- Stakeholder Analysis (VSD) paired with Point of View (DT)
  Designers begin by conducting a stakeholder analysis to identify all parties affected by a proposed design solution.Then, they make use of the Point of View tool to empathize more deeply with users and stakeholders, understanding their needs, desires, and concerns. After gaining an understanding of the wide range of stakeholders and their values, designers can inform the identification of value-oriented requirements.

- Stakeholder Analysis (VSD) and User Personas (DT)
  Designers start by conducting stakeholder analysis to identify key individuals or groups affected by the design. Then, they can create User personas based on the Stakeholder Analysis in order to develop a deeper understanding of the diverse needs, values, and perspectives present within the stakeholder community.

- Stakeholder Tokens (VSD) with Affinity Diagrams (DT)
  Designers use Stakeholder Tokens as a versatile toolkit for identifying stakeholders and their interactions. These tokens are then used in sessions of Affinity Diagrams where stakeholders collectively group and categorize their concerns, aspirations, and values regarding the system's functionalities and features. Through this process, designers can gain insights into the diverse perspectives and priorities of stakeholders and ensure that the design process is grounded in the real-world needs and values of those impacted by the system.

4.2 Ideation and Prototyping

In the ideation and prototyping phase, designers collaborate closely with stakeholders to generate and refine potential solutions iteratively. This participatory approach ensures that diverse perspectives are incorporated into the design process, leading to more inclusive and contextually relevant solutions.

Moreover, VSD methods are integrated into ideation and prototyping techniques to incorporate ethical considerations from the outset. Thus, designers can visualize and test the implications of design decisions on various stakeholders. This process allows for the refinement of systems ensuring that the final solution is ethically sound.

Practical Examples:

- Value Sketch (VSD) integrated with Prototyping for Empathy (DT)
  Value sketches can be used to visually represent design concepts while also taking into account ethical considerations and values. Then, Prototyping for Empathy can be used to create tangible prototypes that allow stakeholders to experience and interact with the design firsthand. By combining those tools, designers can elicit feedback from stakeholders on the ethical implications of design decisions, leading to a better understanding of value trade-offs and preferences.

- Brainstorming (DT) paired with Value Dams and Flows (VSD)
  During the ideation phase, designers facilitate Brainstorming sessions where multidisciplinary teams generate innovative ideas and solutions. Afterwards, they use the Value Dams and Flows method to make design decisions in terms of value tensions. Value tensions may arise when different conceptualizations of values or their design implications conflict among the various stakeholders. Once a tension has been identified, designers have the option to investigate it or report it for further consideration later in the design process.

- Multi-lifespan Co-design (VSD) alongside Bodystorming (DT)
  Designers apply the Multi-lifespan Co-design approach, which considers the long-term implications of technology across multiple generations, involving stakeholders. After gaining insights from this participatory process, designers can then conduct Bodystorming sessions as a roleplaying technique among researchers. By integrating these tools, designers can explore how different value perspectives evolve over time, ensuring that the resulting design solutions are sustainable and culturally sensitive across generations.

- Envisioning Cards (VSD) with Fly on the Wall (DT)
  Designers use Envisioning Cards to depict future scenarios and demonstrate how the proposed design aligns with different stakeholder values and societal goals. This tool acts as an initiator for participatory ideation sessions, prompting designers and stakeholders to imagine and discuss potential features, functionalities, and implications. Additionally, designers can adopt a Fly on the Wall approach, observing users' interactions and reactions on the proposed designs, especially pertaining to the issues identified by the envisioning cards.

4.3 Testing and Evaluation

In the phase of Testing and Evaluation, stakeholders and end users actively engage in a value-based assessment of the proposed design. This participatory process ensures that the opinions of those affected by the design are heard and taken into account. Designers can identify areas of strength, weakness, and improvement that are in line with the values and broader goals of stakeholders by prioritizing value-driven criteria. Through this ongoing engagement and iterative refinement, designers can ensure that the proposed design solutions are ethically and socially responsible. In the VSDT framework, we suggest that the iterative evaluation process should continue until the system meets the predefined value-oriented requirements, and stakeholders are satisfied with the design outcomes.

Practical Examples:

- Prototyping for Empathy (DT) paired with Ethnographically Informed Inquiry on Values and Technology (VSD), followed up by a Cognitive Walkthrough
  Designers simulate user tasks and scenarios using the Prototyping for Empathy tool. Then they employ the Ethnographically Informed Inquiry on Values and Technology method to collect data about emergent complex relationships between various stakeholders. Additionally, designers use the Cognitive walkthrough method (Wharton et al., 1994), following step-by-step procedures and interacting with the prototypes as users would, in order to understand the cognitive processes involved in task completion. Based on the findings from both the Ethnographically Informed Inquiry on Values and Technology and the Cognitive walkthrough, designers iteratively refine the prototypes to address identified cognitive barriers and improve the overall user experience. Design adjustments are made to streamline task flows, enhance clarity and comprehension, and reduce cognitive load on users.

- Value-oriented Mockup, Prototype, or Field Deployment (VSD) paired with In-Person Focus Groups, followed up by a Think-Aloud Protocol
  Designers create mockups, prototypes, or deploy the system in real-world settings using the Value-oriented Mockup, Prototype, or Field Deployment method, focusing on incorporating value-oriented design features and addressing stakeholder values and ethical considerations. Additionally, they moderate in-person focus group sessions with a diverse group of stakeholders who represent different perspectives and interests relevant to the project. During these sessions, participants are presented with the Value-oriented mockups, prototypes, or the deployed system and engage in group discussions, facilitated by a moderator, to share their opinions, insights, and suggestions. Finally, designers organize Usability testing sessions following the Think-Aloud Protocol (Jääskeläinen, 2010), where participants are asked to verbalize their thoughts, feelings, and reactions as they interact with the prototypes.

5. Discussion

VSDT can benefit from the examination of its applicability in real-world use cases. As we have pointed out, VSDT is geared towards complex socio-technological challenges, some examples of which would be the design of equitable healthcare systems, the introduction of inclusive educational technologies, urban sustainability, social media and online community design, and so on. Future research into the practical applicability of the VSDT model must be conducted, with the aim to evaluate the model's performance in such practical settings, comparing its outcomes to those achieved through more typical DT and VSD approaches. To achieve this, potential users of VSDT should be identified and included in further testing and validation of the model. A comparative empirical analysis and field research between VSDT and other competing and/or complementary design frameworks should also be conducted, in order to further assess VSDT's capacity to deal with real world issues. During these further studies, values and value tensions that might arise should also be explicitly investigated and recorded. These further investigations and use cases will demonstrate the versatility of the VSDT model and its potential for application in diverse contexts.

The integration of the systemic thinking perspective is implemented in all of the key phases of the Value-Sensitive Design Thinking (VSDT) model. In defining the problem, understanding users, and prioritizing ethical values of stakeholders, designers are prompted to adopt a holistic viewpoint, recognizing the complex relationships, feedback loops, and potential emergent properties of systems. During ideation consideration of interconnected ideas is encouraged, while prototyping extends beyond visualizing concepts to actively integrating and testing ethical considerations iteratively. Stakeholder engagement emphasizes insights that transcend individual preferences exploring greater impacts, especially in relation to abstract concepts such as wellbeing, sustainability, and ethics. The iterative evaluation process ensures that design outcomes align with the broader context and ethical principles based on stakeholder feedback. Our research indicates that the Documentation - Communication - Iteration tripartite proposed throughout

the design process can significantly enhance the efficacy of VSDT as a tool for addressing the challenges of conflicting, dynamically changing, and ambiguous values encountered when designing systems for humanitarian, social, and environmental change and innovation.

Furthermore, while DT and VSD are tools that envision to be applicable to design as widely as possible, being global frameworks of design, the ability of both to be informed by varied design and philosophical theories, and to accommodate local, situational and cultural sensibilities is a feature that we believe is passed on to VSDT. To further enhance the responsiveness of VSDT towards such questions of locality and inclusion, VSDT can be informed by relevant approaches such as defuturing (Fry, 2020), pluriversal design (Escobar, 2018) and design justice (Costanza-Chock, 2020). We also recognize that VSDT could further benefit from the inclusion of non-western philosophies and from the examination of values beyond their typical human-centredness towards more-than-human perspectives, as a point for further development and expansion VSDT's philosophical foundation in the future.

6. Conclusions

The Value Sensitive Design Thinking framework advances the field of design by integrating Design Thinking and Value Sensitive Design through a Systems Thinking perspective. This approach equips designers with a tool for addressing complex socio-technological challenges, by prioritizing stakeholder values and fostering a collaborative mindset. Grounded on the design theories of DT, VSD and systems theory, the VSDT model remains adaptable and versatile for practical application in diverse contexts, demonstrating its potential to promote more responsible and sustainable design outcomes. The versatility of the VSDT model and its ability to accommodate local or regional preferences of design creates a capacity for more inclusive, contextually relevant and ethical design outcomes.

Future research should continue to further enhance VSDT's theoretical grounding, to explore the effectiveness of VSDT in real-world design scenarios, to evaluate its strength compared to other design tools and frameworks, and to refine the recommended combinations of DT and VSD tools. Still, the current state of the VSDT framework already offers a valuable resource for designers and researchers alike, becoming an available tool for designers dealing with complexity. As the design profession continues to evolve and confront complex challenges, the VSDT model stands as a testament to the potential of interdisciplinary collaboration and shared understanding in promoting more responsible and sustainable design outcomes, through the adaptation of existing and well-established methodologies for the needs of today and tomorrow.

About the Authors:

Rafail Andrianos Pappas is a PhD candidate and researcher in the Department of Product and Systems Design Engineering at the University of the Aegean, studying issues of theories and methods of ethics in/of design through a systemic lens.

Katerina Malisova is a PhD candidate in the Department of Product and Systems Design Engineering at the University of the Aegean. Her research is related to the contribution of sustainable interactions in shaping humane technologies that promote user wellbeing.

Modestos Stavrakis is an Assistant Professor in Interaction Design within the Department of Product and Systems Design Engineering, and an Adjunct Professor at the Hellenic Open University, leading the Informatics and Multimedia master's course. His research focuses on interaction design, user experience, design theory / methodologies, wearable systems design, tangible interaction, assistive technologies, digital media design, and digital arts.

Spyros Bofylatos is a Tutor (Research) in the Design Products MA and an executive director of the European Academy of Design. He has worked in various research projects dealing with design as an agent of change. His research sprawls around design for sustainability, craft, material driven design and social innovation.

KEYWORDS | DESIGN RESEARCH, SMART URBAN FUTURES, PROJECTIVE RESEARCH, HUMAN-CENTRED DESIGN

ABSTRACT | This study describes projective provotype design, a novel method for design research which helps address the shortfall between bottom-up, community-centred approaches and the top-down, technology-centred approaches typical of smart city design. As such, projective provotype design utilises the unique knowledge tradition of human-centred design to generate a neighbourhood community's preferences for their smart urban futures and, subsequently, communicates these preferences to a design audience in a manner that is informative, thought provoking and if necessary capable of challenging existing assumptions. Towards this outcome, the study utlises the method of design ethnography to outline key theoretical concerns that impacted the design of the method. This outline is followed by a reflective narrative attesting to the relevance of the method in the applied contexts of co-design project with community members of Westbury, an urban neighbourhood in Johannesburg, South Africa. While the unique method of projective provotype design suggests a robust strategy for the design of smart urban places, responding to the theme of 'ways of living together' the study further suggest how projective provotype design, and design research methods with similar intentions, provide an alternative role for human-centred design; one that bypasses the limitation of human-centred design current emphasis on users, and product development to instead focus on communities and futures research.

1. Introduction

Human-centred design (HCD) has over the last 50 years made significant contributions to the design and implementation of technology into the social world. Of late, HCD practices that leverage human experience to optimise consumption and commercial advantage have become the foci of timeous critique, with numerous voices calling for more nuanced, systemic views of design to emerge (van Velsen, et al., 2022) outside the dominant paradigm of neo-liberal agenda (Escobar, 2018). In this paper, these themes, and a revaluation of HCD are addressed in the context of smart urban futures.

In urban communities in the Global South, tensions emerge between macro-forces of change such as mass urbanisation, rapidly increasing populations, economic stagnation, and climate change (Khatoun & Zeadally, 2016, p. 46); that for many the city remains a colonial construct; and the emergence of technological concepts such as smart cities, and the Industrial Revolution 4.0, which have the potential to improve or worsen these communities' urban futures. Following Fry's recognition of the critical importance of design in constituting a viable future for humanity (2019, p. 159), this paper takes the position that emergent smart urban technologies have the potential to contribute positively to urban transformation in the cities of the Global South. However, for this transformation to occur, it is critical that the design and subsequent implementation of these technologies is considered from the social perspectives of the communities that will live with, and within them.

Smart urban technologies within the construct of Smart Cites are typically conceptualised from the perspective of 'top-down' implementation closely associated with technically inspired innovation and entrepreneurship (Kitchin, 2014, p. 131). There is a growing body of literature and practices that critiques the framing of smart cities as purely technological sites, while offering an alternative 'bottom-up' or citizen-led approach (Cardullo, et al., 2019, p. 55).[1] Problematically, as bottom-up smart city design (SCD) primarily addresses the needs of citizens, interventions can clash with city planning and organisation and ignore the brute reality of macro-forces such as national politics, global economics, and climate concerns (Walravens, 2016, p. 131). The result is that multiple bottom-up projects may occur across a city without any shared goals and potentially conflicting with city planning, each other.

The limitations of an overtly human-centric approach are not unique to bottom-up SCD. In design fields fundamentally concerned with objects and services, a societal agenda is associated with the paradigm of HCD an interrelated set of philosophical, epistemological, and methodological approaches geared towards a consideration of the people who perceive, interpret, use, and live with designed artefacts (Krippendorff, 2000, p. 4). In a similar manner to the relationship between bottom-up and top-down SCD, HCD evolved from, and in contrast to a predominant technological-centred (Giacomin, 2014, p. 607) mindset emphasising technical novelty and performance. However, as evident in its conceptual centrality in fields, such as user-experience, industrial, and service design, HCD has become a dominant design mindset both in terms of practice and education.

While, HCD has proven highly effective for enabling design-led transformation to occur, it is not immune to criticism. First, while HCD often claims to understand and respond to the lived experience of people, in practice HCD is often characterised by poor application and understanding of ethnographic methods (Baskerville & Myers, 2015, p. 28). Second, while advocating a people-first mantra, HCD practices are often deployed towards the manipulation of end-user's emotions and motivations for purely economic concerns. These neo-liberal practices often come at the cost of local knowledge, practices, and culture (Escobar, 2018). Third, HCD's emphasis on human experience as the primary criteria for evaluating the validity of design has become a growing concern as the harrowing effects of climate change become apparent (Russel & Lyndon, 2020, p. 3). Fourth, outside of objects and services deployed in limited user-contexts, HCD struggles to adequately address complex, large-scale systemic problems (Mani-Kandt, 2021). In the

[1] Contributing design fields include urban informatics (McCullough, 2015), community informatics (Day, 2011) and blended spaces design (Benyon, 2014).

remainder of this paper, 'bottom-up' is understood as a HCD approach to SCD, while top-down SCD while highly technological in outlook (Fernández-Añez, 2016, p. 163) also includes priorities such as planning (Dustdar, et al., 2017, p. 249), and delivering services at scale (Khatoun & Zeadally, 2016, pp. 46-47).

Within this broad framing of the relationship between bottom-up SCD, top-down SCD, HCD and technology-centred design, the aim of this paper is to contribute a rich description of an enacted, novel design research method referred to hence forth as projective provotype design (PPD). The intention of PPD is to reflect both a human-centric sensitisation of the aspirational needs of an urban Johannesburg community regarding smart urban technology deployment in their neighbourhood places, and a subsequent meaningful communication of these aspirations to a range of professional designers involved or likely to involved in the design of digitally infused urban environments. In this manner, this research following Walravens' suggestion that focusing on either bottom-up or top-down approaches seldom results in change (2016, p. 132) adopts instead a complementary strategy in which the understandings of HCD inquiry has the potential to inform top-down SCD.

2. Related Work

This strategy is informed by Fry's (2017, p. 175) conceptualisation of metrofitting, which can be understood as utilising "design fictions" grounded in "real imperatives" orientated towards "thinking and projecting with a longer view of the city". Importantly, Metrofitting's design fictions are not directed towards solutioning but rather for anticipating future states and conditions in a relatable and non-abstract manner (Fry, 2017, p. 181). As such, fictional activities of metrofitting are not predictive but rather aim to evoke, through creative design, "discussion, correction, and strategic evaluation", with the primary purpose to "identify the needs and opportunity for redirective urban action" (Fry, 2017, p. 176). From a theoretical position, metrofitting engages with the unsustainable structure of our human world and engages with concerns such as "climate change, population pressures, geopolitical instabilities, resource stress, and social and individual technology linked cultural transformations" (Fry, 2017, p. vii) to inform material, operational and socio-cultural relationships. Within this broader agenda, this study utilises the methodological concerns of metrofitting more narrowly to anticipate the preferable social technology-linked cultural transformations that the inclusion of smart urban technologies may bring into an urban community.

In the metrofitting literature (Fry, 2017), 'design fictions' is applied in a very generic sense to describe creative, material projections representing alternative conceptualisations of being in the world. Furthermore, Fry tends to focus on the theoretical rationale for metrofitting and does not directly detail particular methods for application. Consequently, to think and project with a longer view of the city, this study incorporates the speculative approach of projective research (Geldof & Janssens, 2014; De Figueiredo, 2017). Projective research refers to a set of related research practices that employ design fictions or 'provotypes' to inquire into "putative and contingent" future states to "reach for tomorrow's worlds today" (Morrison, 2018, p. 125). Central to projective research is the notion of anticipation (De Smet & Janssens, 2016, p. 2762) and is typically applied in the context of systemic changes (economic, environmental, social) in order not only to "learn from the future'" but to also to recognize "important points of attention" and reflect on "directions for change" (Geldof & Janssens, 2014, p. 8). Projective research differentiates itself from typical discursive approaches in two fundamental ways.[2] First, its speculations are informed by data and facts, as well as design's capacity to operate "in conditions of complexity, uncertainty, and dynamics of continuous transformations that involve people and their environment" (De Smet & Janssens, 2016, p. 2763). Second, projective research employs a transformative mindset that indicates both a hope that things can be different, as well as the nature of change that needs to occur to bring about the desired change (De Smet & Janssens, 2016, p. 2765). Synthesizing, the above referenced texts, and other notable descriptions (Lindley, et al., 2014; Morrison, 2018; Hunt, 2019) the principles of projective research are reflected in Table 1.

[2] Typical discursive approaches include speculative design and design fiction.

Table 1. The principles of projective research.

1.	Maintains an anticipatory focus placed on real imperatives, which are framed through knowledge pertaining to data and facts.
2.	Anticipatory outcomes are generated as fictional provotypes that allow people to make sense of and give significance to their environments.
3.	Involves timeframes with a longer view but within touching distance of the present.
4.	Explicates the value and nature of transformation.
5.	Final provotypes communicate future scenarios, research findings, and suggested occurrences that lead to the envisioned future.
6.	Applies the persuasive abilities of design fictions to communicate directly to routine design audiences.

3. Methodology

The method of the study is Baskerville and Myers's (2015) Design Ethnography (DE) that advocates an interventionist and engaged approach to participating with people in the field to study the process and contexts of design. Consequently, DE moves beyond observation to respond iteratively and creatively in settings "where people are designing artefacts, producing artefacts, or introducing artefacts into a social and cultural context" (Baskerville & Myers, 2015, p. 29). In this manner, DE extends traditional ethnography as it is concerned not only with a description of situations, but also acts of synthesis and intervention that are recognised as contributing not only to improved understanding of peoples' life-worlds but to also explore their potential reaction to new situations (Baskerville & Myers, 2015, p. 27). While DE is primarily utilised in the field of Information Systems, this study, informed by Kilbourn's (2013, p. 69) description of design ethnography in Design Anthropology, applied three primary 'action' phases. Phase 1: Rigour refers to the conceptual framing of the proposed PPD method. Phase 2: Relevance describes the practical application of PPD in co-design workshop involving community members from Westbury, an urban neighbourhood in Johannesburg. Phase 3: Reflection critically reviews the previous two phases to establish whether the proposed method of PPD had achieved its intended goals or if further amendments and 'relevancy' evaluations were required. During the study these three phases were iterated in cycles over the course of four full day co-design workshops involving 26 participants in total. The criterion for selecting participants was that they were residents of or work in Westbury.

4. Limitations of This Study

This study is primarily concerned with the methodological development of PPD as an approach to bridging bottom-up and top-down SCD, and ultimately provide an alternative consideration of the role of HCD. As such, it primarily reflects the authors experience of the design practice. While the community is introduced to provide context, the intention of this DE is not to provide an ethnographic study of the community. Rather, the DE suggest how the proposed PPD method is capable, within the context of a design agenda, to generate and communicate an appropriate ethnographic understanding of a community aspirational relationship to an emergent technology.

5. Co-projecting with the Westbury Community

Westbury a densely populated, economically deprived suburb in close proximity to the Johannesburg City Centre. The suburb is a result of Apartheid era racial segregation during which the neighbourhood was

allocated to 'Coloured' residents, who were forcible moved there from other areas.[3] The community remains predominantly Coloured. The urban landscape of Westbury is characterised by small standalone properties and multiple multi-storey flats, includes parks, sports fields, a library, a large community hall and a youth recreational centre. However, many of the buildings and open land are characterised by urban degradation. There are numerous social problems that characterise Westbury. Foremost is its long history of criminal and gang-related activities (Klug, 2016, p. 58), organised around control of the drug trade. Westbury, like many communities in South Africa, is affected by high youth, and a strong distrust of government initiatives (Klug, 2016, p. 58).

5.1 Projective Provotype Design

The primary objectives of PPD are twofold. The first relates to the eliciting of insights relevant to a community's preferences for the future smart neighbourhood places, through a range of co-design research activities. The second objective is to communicate the generated insights effectively to practitioners working in technological contexts related to smart urban design. As such PPD is not concerned with technical plausibility nor city-wide solutions. Rather, its focus is neighbourhood placemaking. Accordingly, the design of the PPD consisted of two key phases. The first phase consisted of four co-design workshops involving neighbourhood participants, while the second phase involved the design of a projective research provotype. The essential connection between the two phases is that the ethnographic insights and understanding gained in the first phase directly informed the design considerations of the second.

5.2 The Co-Design Workshops

The co-design workshop primarily employed the design research method of generative tools (Visser, et al., 2005, p. 4). In generative tools, participants apply art and design techniques to creatively reflect on their experience of a given context. These generative activities are constructed with the belief that experiences are often determined by latent needs or tacit knowledge, which are often difficult to directly express verbally and consequently difficult to obtain from conventional research techniques. From a theoretical perspective, the three activities of the co-design workshop were guided by Inayatullah's (2008, pp. 7-8) conceptualisations of futures as inherently connected to the present and past.

Technique 1: Inquiry into the Past
The first two activities of the workshops focused on past and present contexts and were applied to both generate contextual data descriptive of the community, their activities, and technological environments, and to sensitise participants and researchers to each other and the research project. Technique 1 was conceptualised as an introduction for the participants to the more detailed activities of the following two techniques.

The critical activities of Technique 1 are outlined below.

1. Secondary research on the history of the subject neighbourhood is conducted, which is then synthesised and presented to participants;
2. Participants provide feedback, clarifying or adding aspects to the historical analysis.

In the workshops, Technique 1 was a devised as a digital timeline showing key historical activities as annotated images and supported with an oral explanation. The timeline was also presented schematically on a large print, which participants could write on and, thereby, edit and add content.

[3] In South Africa 'Coloured' inoffensively refers to a distinct racial group with a mixed-race heritage.

Technique 2: Inquiry into the Present
For the second technique, the intention was to elicit participants' everyday experiences of their environments, both physical and digital.

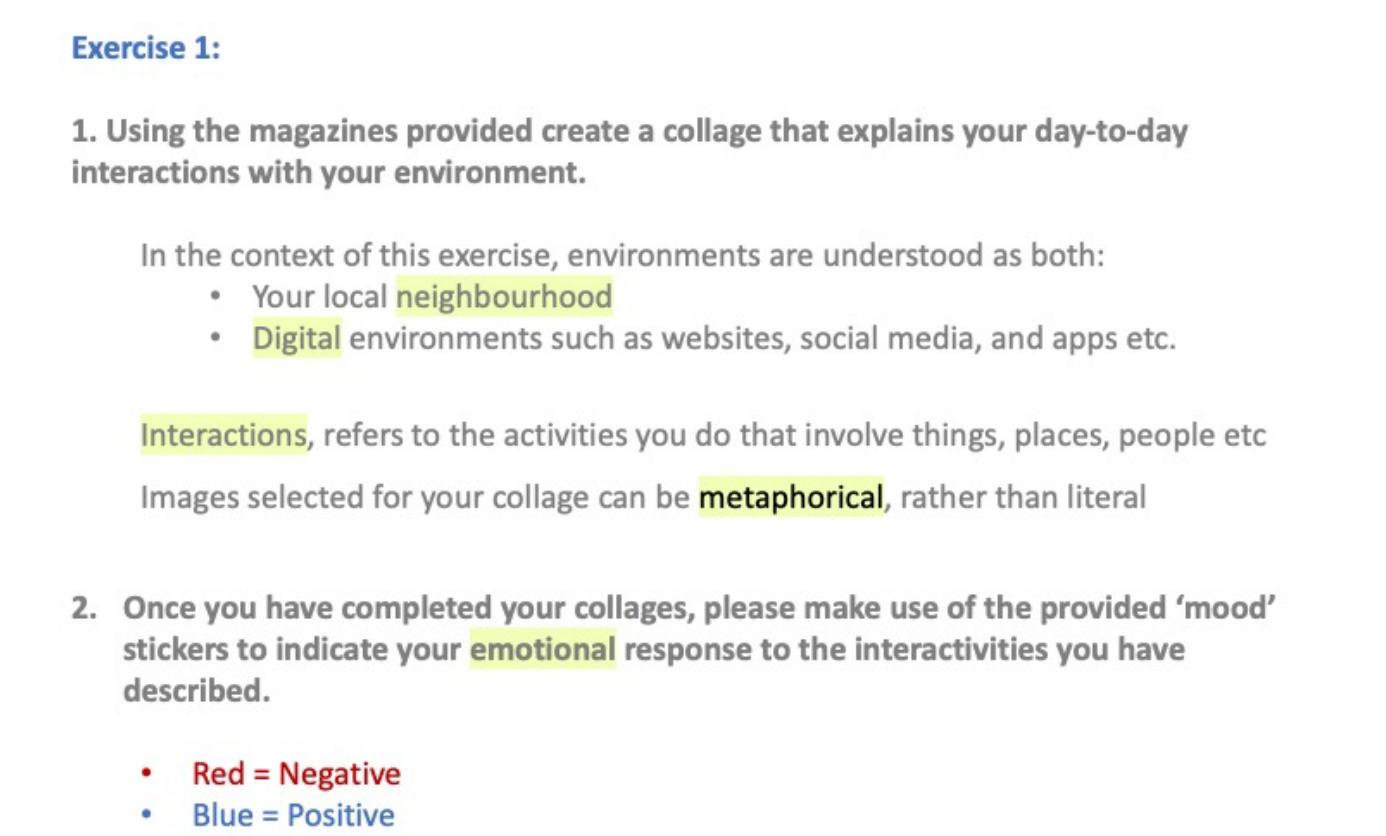

Figure 1. Participant brief for Technique 2. (all images T Fenn, 2023).

As described in Figure 1, and exemplified in Figure 2, the primary requirement for Technique 2 was for participants to create a collage reflecting their experience of their surrounding socio-technological environments. The purpose of the activity is three-fold. First, as earlier indicated, it sensitised participants to their urban and digital environments allowing them to become at ease with both creative activities and discussing their work. Second, to elicit a rich understanding of participants' everyday experiences of their 'on' and 'off-line' environments. Lastly, the exploration of present-day experience was an essential element for juxtaposing potential future experiences, the focus of the third technique (Kilbourn, 2013, p. 76).

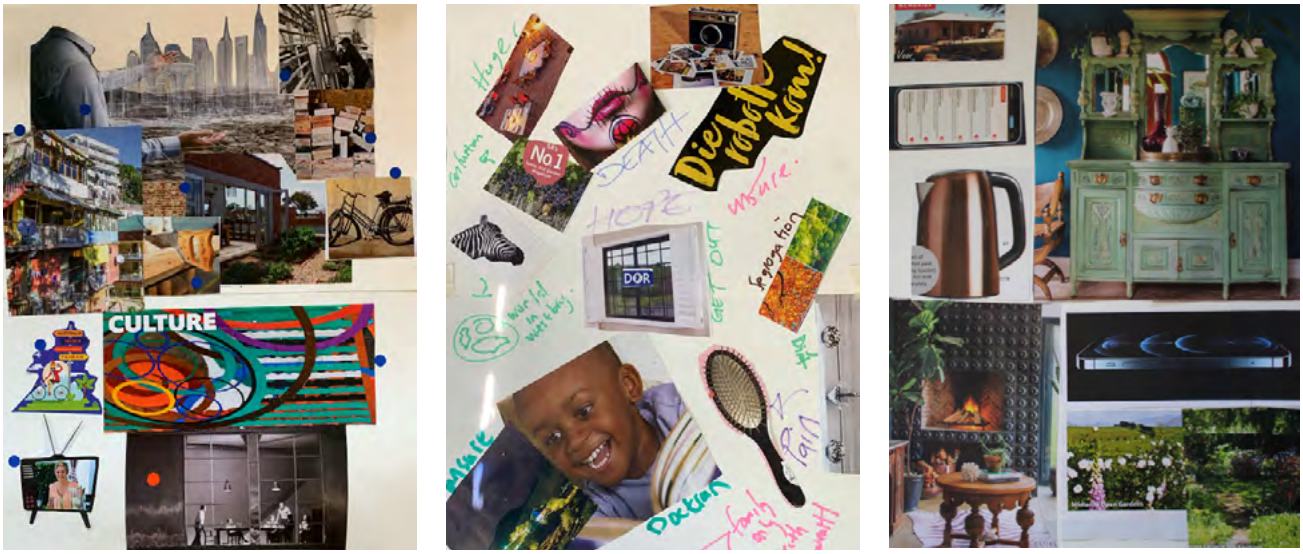

Figure 2. Three examples of participant collages.

In Technique 2, the involved acts of making and reflections on the making, facilitated very natural and unguarded accounts by the participants of their everyday neighbourhood experiences. The oral narratives encouraged other participants to add further details.

Technique 3: Mapping the Future

Technique 3 involved participants using generative techniques to imagine, model, and articulate everyday activities within a prescribed context of a future neighbourhood place.

The design requirements of Technique 3 were the following:

1. Ensure communities participate in creatively articulating their preference for their neighbourhood places;
2. Informed by Dörrenbächer, et al.'s (2020) positive utopian approach, focus was placed on the positive impact smart urban technologies could have on neighbourhood places;
3. Recognition that smart urban neighbourhood places are fictional spaces and accordingly are represented as design fictions, set in long-term futures;
4. Articulations of futures are developed to highlight everyday activities in line with several conceptualisations of placemaking (Benyon, 2014, p. 33; McCullough, 2005, p. 57).

In support of these requirements, Candy and Dunagan's (2017, p. 149) Experiential Futures Ladder (EFL) approach to scenario development was implemented. The EFL consists of four phases described below.

First, the Setting defines the scope or context of an inquiry into futures taking the form of a generic image of the future. The Setting for Technique 3 is the participating community's neighbourhood in a future setting, which in the workshops was conceptualised as 'New Westbury 2072'. Ideally, the projected context should be set far enough away from the present to break with the community's normative expectations for their near future but not too far into the future as to break entirely with plausibility, particularly from the perspective of involving technological-orientated speculation.

Second, the Scenario describes the future of the Setting, highlighting specific "narrative proposition and sequence of events" (Candy & Dunagan, 2017, p. 148).

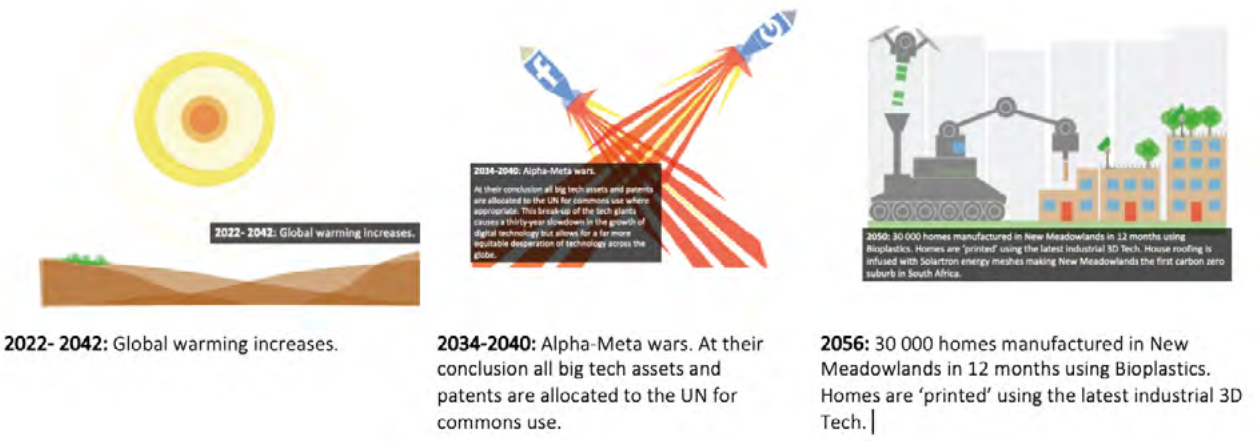

Figure 3. Three of the 18 visuals form the Westbury Scenario.

Figure 3 illustrates a section of the scenario for the New Westbury 2072 project, which continues the motif of the timeline used in Technique 1 to imply a direct continuum with the 'real' past of the suburb. The following narrative concepts informed the Scenario. First, this future is impacted by the primary macro forces of climate change and intensified urbanisation. However, the Scenario suggests these issues are resolvable as inferred by the 'emergent' green technologies of printable buildings, highly effective solar power, and progressive governance. Second, the rationale as to why Westbury can be redeveloped is suggested through the financial windfall of platinum mining, responsible governance, and construction ability. Third, the narrative is primarily focused on technological and political change and purposefully does not address social impact. The intention is that the participants will provide these aspects. Fourth, elements, like the 'Alpha-Meta' wars and the tank-like house 3-D printer are purposely fantastical to reinforce the alternative reality and, remove any continuum with the reality of the present.

Third, the Situation ensures that the techno-spatial concerns of smart technologies are focused within the larger context of the Scenario. In terms of the New Westbury 2072 project, the Situation was articulated as follows. First, as presented in Figure 4, the Scenario was extended into a description of a fictional city-wide design initiative, which involves 'citizen design teams' leveraging emergent technologies in the co-creation of their neighbourhoods. These technologies include the highly speculative, for example, 3-D printing of buildings, in combination with other plausible smart technologies. The presentation and accompanying discussion highlighted in lay terms the resulting behaviours afforded by these technologies.

Figure 4. Three of the visual describing smart urban place.

The second aspect of the situation was the design brief (Figure 5) that outlined the fictional role of the participants, as citizen-designers in 2062.

Figure 5. Design instructions for the fictional project.

The Stuff phase involves the generative design activity undertaken by the participants in response to the brief presented in the Situation. In this manner, participants create design fictions suggestive of their preferences for their neighbourhood futures. In the Westbury workshops, participants worked in groups of six and were supplied with materials and tools. Overall, all groups coped well with the technical aspect of the task and created detailed artefacts (see Figure 6).

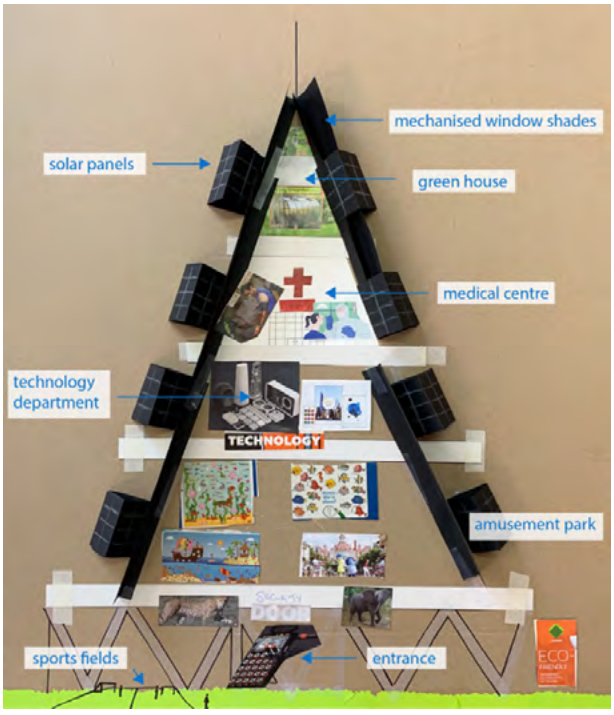

Figure 6. One group's cardboard model solution for the site.

On completion, groups were asked to explain the places they had designed, Overall, groups produced in-depth and detailed explanations of their models, enjoyed the task, and engaged with the design activity within the Scenario setting of the brief.

Synthesis of data sets into design frameworks

For both, Technique 2 and 3, the participants oral explanations were recorded, transcribed, and qualitatively analysed using ATLAS.ti software (2022). As depicted in Figure 7, during the analysis, data was first organised in primary categories of the Present and the Future, derived respectively from Technique 2 and Technique 3. Thereafter, secondary categories were coded in two seven data sets conceptualised in terms of Hassenzahl's Three-level Hierarchy of Needs (2010, pp. 12, 44), and Engeström's (2001) consideration of activity as embedded in social practices. Lastly, following Benyon (2014, pp. 4, 5), the seven data sets were considered as thematic structuring agents orientating a fluid highly complex system rather than as a 'rigid' analytical deconstruction.

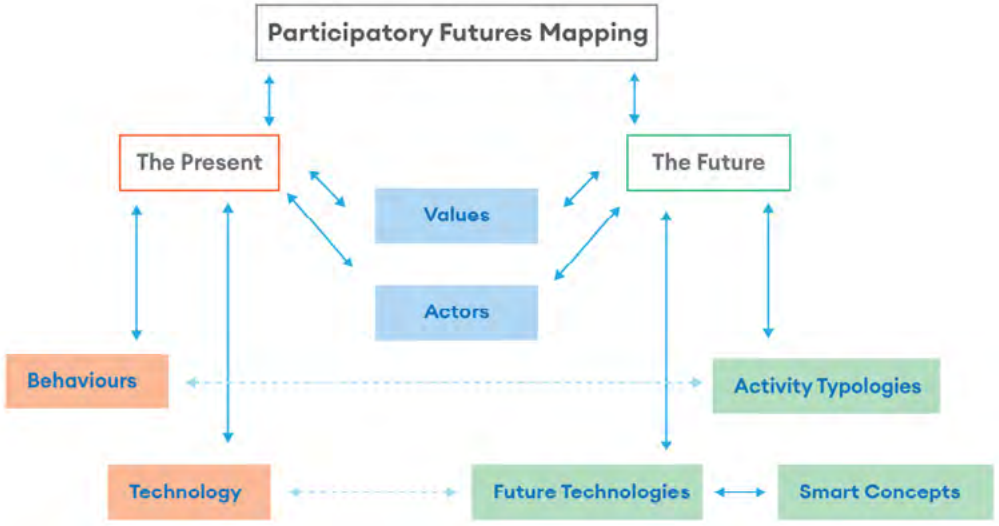

Figure 7. Model of the Westbury coding model indicating the seven subcategories. 'Participatory Futures Mapping' refers collectively to three techniques of the co-design workshop.

In the Westbury project, the seven data sets were creatively synthesised into a series of six design schemas (Figures 8-13), which reflected the key insights generated from the co-design workshops and consequently formed the conceptual foundation for the second phase of the PPD. The notion of design schemas is comparable to Alexander et al.'s (1977) design patterns, articulating the fundamentals of a type of design solution rather than a specific implementation of a solution. These design schemas while directly emerging from the data are projective and ultimately fallible considerations of how best to act.

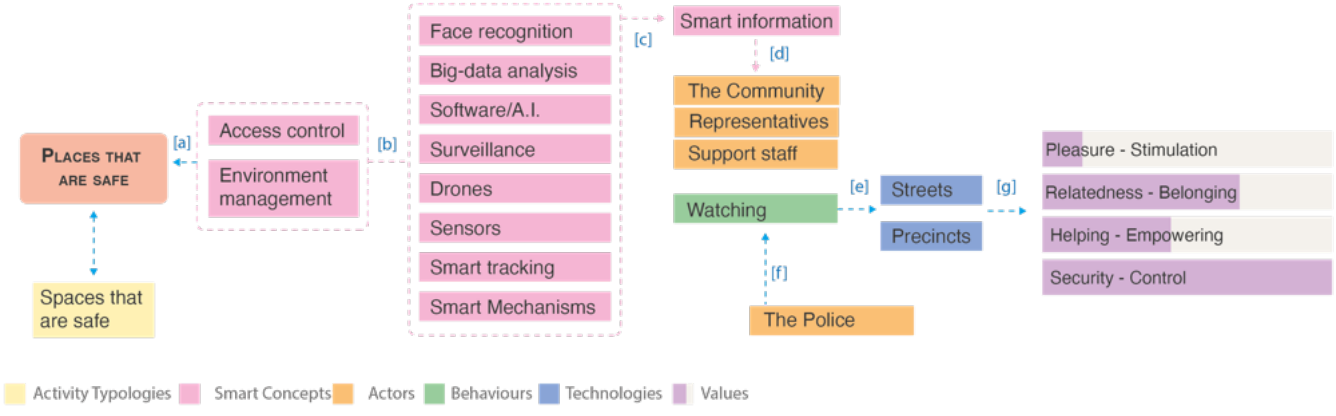

Figure 8. Design schema 1: *Places that are safe* are created through [a] controlling access and environmental management. Towards these outcomes, [b] smart surveillance networks [c] support community [d] representatives to monitor public neighbourhood spaces such as [e] streets, parks, and precincts, and if necessary, enact a response [f].

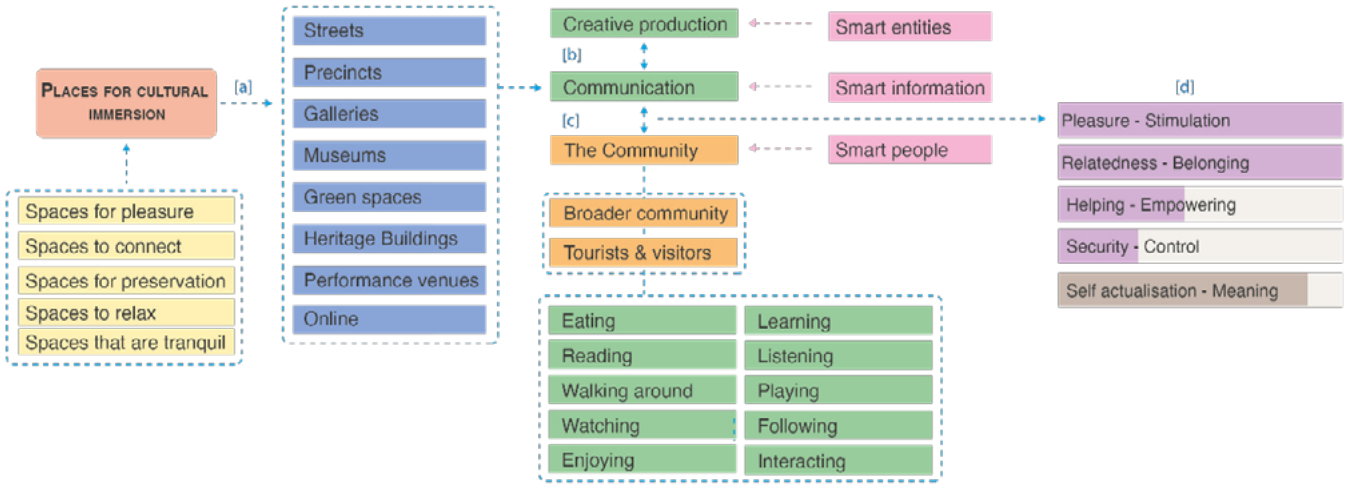

Figure 9. Design schema 2: *Places for cultural immersion* include typologies such as [a] streets, heritage sites, museums, art galleries, parks, and performance venues, as well as online environments. Locally generated creative productions [b] strengthens the community's shared identity as well as [c] attracting visitors and tourists. Cultural immersion allows for the community to experience [d] a more meaningful, pleasurable, and engaging environment.

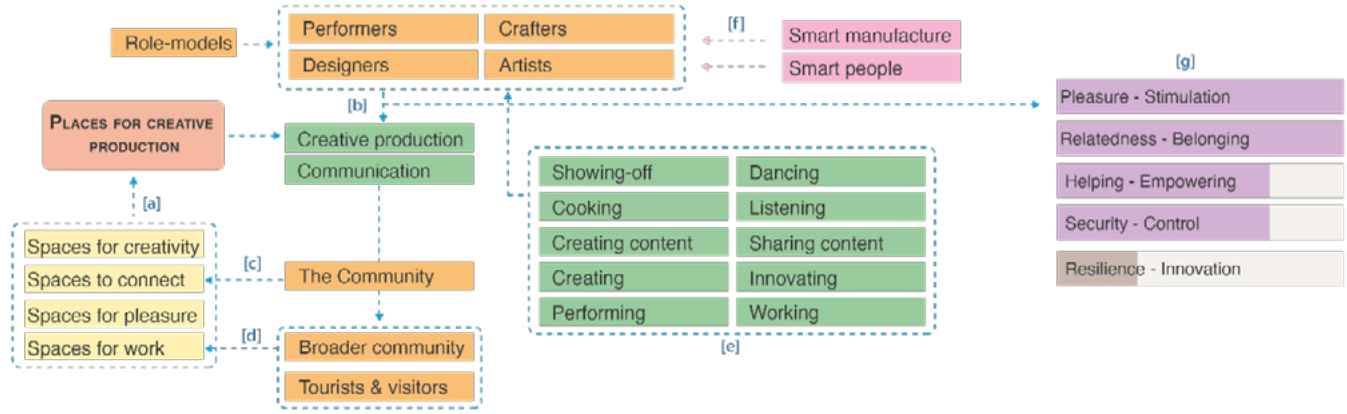

Figure 10. Design schema 3: Spaces for creating stimulating, pleasure, and connection [a] converge in *places for creative production*. In these places, performers, designers, crafters, and artists [b] produce content that engages both [c] the local community and [d] visitors. Cultural production is enhanced by [f] smart manufacturing abilities. However, cultural production is a [f] smart capacity that beyond the individual's pleasure in the act of creativity builds resilient and innovative communities [e].

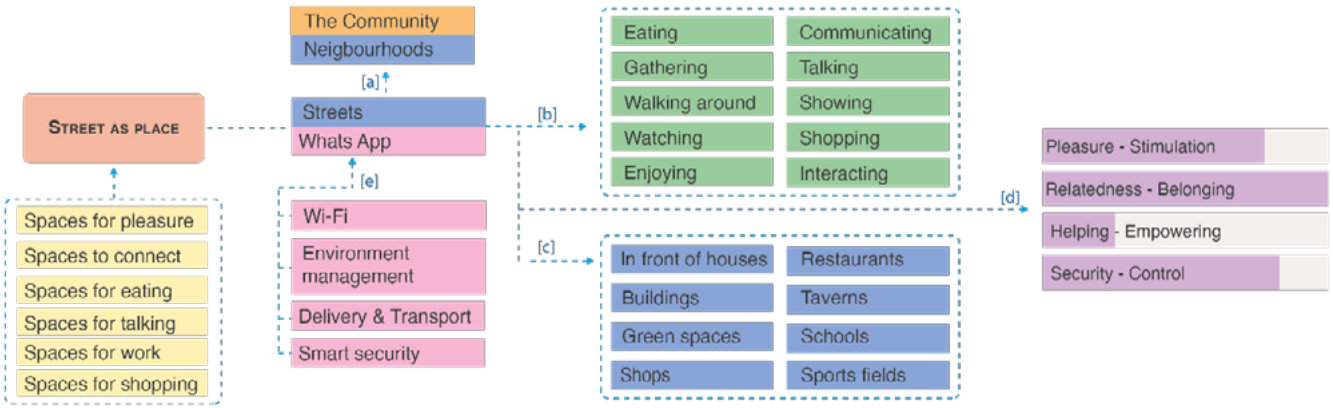

Figure 11. Design schema 4: *Street as space* recognises that the [a] primary neighbourhood place is the street, which has physical and digital layers. Accordingly, the street is the site of a wide range of social exchanges [b] linking to other parochial-public spaces [c]. In the community, the street is a place to enjoy and connect with others [d] (but can also be dangerous). Smart technologies [e] provide the opportunity to lessen the threatening aspects while ambiently enhancing the positives.

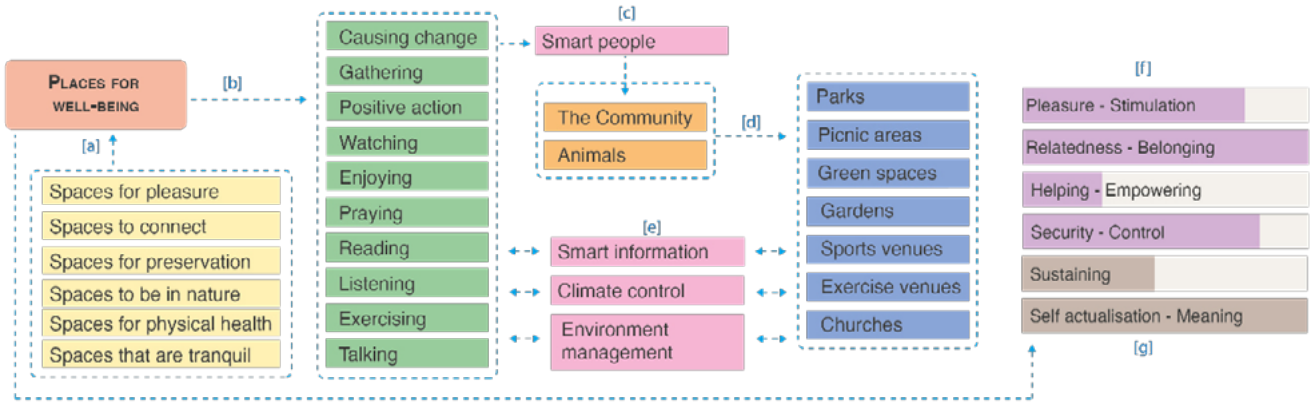

Figure 12. Design schema 5: *Places for well-being* are [a] tranquil spaces, often in nature, that focus on physical and mental health. In these spaces, a wide range of activities occurs, including [b] exercising, talking, praying, reading and interacting with nature [d]. In these spaces, individuals seek to connect more meaningfully with their experiences of the world [g], seeking to sustain both mind and body [f]. Places for well-being are supported by ambient smart technologies that ensure a tranquil and well-managed environment [e].

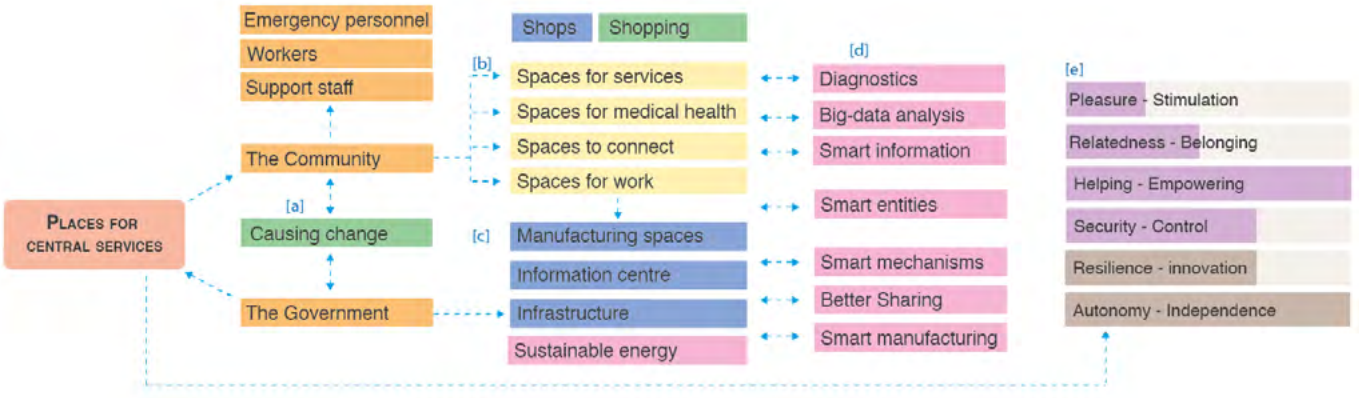

Figure 13. Design schema 6: *Places for central services* are partnerships between [a] Government and communities with the aim to deliver smart, accessible, and accountable services. Key aspects of these services are [b] health and [c] energy, which have the potential to be supported by [d] smart diagnostics and energy grids. Collectively, these services would directly improve the quality of life for residents as well as lessen their reliance on municipal infrastructure [e].

5.3 The Projective Research Phase

Responding to the fundamental principles of projective research, set out in Table 1, the second phase of PPD involved the design of a provotype. This phase focused on two key communicative aspects fundamental to discursive design, namely, the message-form and message-content (Tharp & Tharp, 2018, p. 166). Respectively, the message-content embodied in the provotype responded to the six design schemas, while the message-form focused on the mode of product rhetoric – the communicating, packaging, and presenting of the message-content.

For the message-content, the initial rounds of ideation indexed the design schemas as well as referencing fundamental placemaking design principles (Kent, 2012, p. 117). Once I was satisfied with the range of ideas, I began to consider how I could integrate the various ideas into the provotype. Here, I aimed to emphasise interconnected neighbourhood places within an encapsulating urban context, and ultimately communicate a systemic sense of Westbury. This intention, coupled with the insight that street space was the essential neighbourhood place for the Westbury community, led me to focus on producing a streetscape as the central illustrative image. The future-time of the provotype was set at 2052, 30-years from the year of the workshops. In terms of message-form, I intended for final provotype to be easily distributable, both in terms of product and cost. I also required it to have a strong visual impact and to have a tangible quality, to be something architects or designers would hopefully stick up on the walls of their

offices. Consequently, due to the horizontal nature of the streetscape, I opted for the format of a leporello concertina book displaying on one-side an extended streetscape of Westbury in 2052, and, on the other, a fictitious research report with written narrative, citations, reference list and technical diagrams (see Figures 14-16). In this text, I presented a set of 'community values' and six 'design frames'. These link directly to the six design schemas and the Values that emerged during the analysis of the workshops. The written narrative explained how each design frame played out systemically in the context of the suburb, city, and regional legislation of a future 2052.

Figure 15. The provotype's streetscape (1200mm x 220mm). See Appendix A, Figure A for enlarged diagram. Image: T Fenn, 2023.

Figure 16. The provotype's 'research' report. See Appendix A, Figure B for enlarged sections. Image: T Fenn, 2023.

Figure 17. Outer (L) and inner (R) cover sleeves of the provotype. The text on the cover describes the research project and acknowledges the input of each participant. Image: T Fenn, 2023.

On completion, the provotype, was presented for feedback in two sessions. The first involved a sample of participants from the workshops, who were guided through the analyses and design activities. The consensus was the provotype accurately reflected the aspirations of the community for their future neighbourhood places. However, one key insight from the sessions was that any given technology should not be completely autonomous, but should be ultimately controlled by a human, preferably a member of the community.

The second feedback session involved five design 'experts' with professional and academic knowledge of smart urban design, urban design or digital ecosystems design. Each expert was interviewed separately and was provided with the provotype to examine before the interviews took place. From the analysis of the interviews, seven key themes emerged.

Theme 1: Plausible Futures
All five experts identified the provotype as a fictional, futures representation of an existing neighbourhood. They identified the presented fiction as plausible and, as such, potentially achievable.

Theme 2: Correspondence
It was evident to the experts that the provotype corresponded to a preferred future of a neighbourhood community. This was indicated both in terms of a sense of historical and existing community identity, as well as a shared vision for the future.

Theme 3: Emphasises on the role of smart urban places
The notion that the provotype was particularly concerned with articulating the potential roles that smart urban technologies could play in the everyday experiences of neighbourhood places was clear.

Theme 4: A primary aim of generating discourse
Experts recognised that the provotype was not attempting to communicate literal and implementable design product concepts, but rather was discursive, raising issues, stimulating, and guiding thinking and challenging assumptions as well as provoking critical reflection and creative imagining.

> "It's a very focused, very stimulating fresh view on, which makes people rethink their assumptions about what they do, as designers in relation to a city". (D.E 'C')

Theme 5: Conceptual openness
The conceptual openness of the provotype was noted. This theme reflects that, while the provotype was highly detailed in terms of its storytelling, the illustrative and written details were primarily foregrounding a set of abstract concepts in the 'logic' of an imagined 'reality'. Crucially, however, the abstract concepts could be applied in numerous, different ways.

> "It's your experience of the fiction that makes it so compelling. It's getting lost in it. That bottom level of detail is so important… Because getting lost in it is when is when I can start to take ownership of what I see in it". (D.E 'B').

Theme 6: Direct contribution of principles and values specific to Westbury
Experts recognised that, while the visual and written content of the provotype provided a range of potentially useful design concepts, the primary message-content communicated was the six design strategies and four key Values.

Theme 7: Contributed an example of traceable synthesis
The provotype was described as contributing a 'traceable synthesis', referring to the value of making the connection between generated concepts and the research that informed their conceptualisation explicit, so that they, and the larger design proposition could be critiqued.

6. Discussion

In the context of urban futures, neighbourhoods are likely to be extensively mediated by digital technologies. As Dourish and Bell (2007, p. 15) remind us, space is organized both physically and culturally, and "cultural understandings provide a frame for encountering space as meaningful and coherent". Consequently, while the dawning age of the smart urbanity suggests significant approaches for managing the predicted hyper-growth of urban cities, there is also a strong chance that purely technologically orientated or 'one-solution for all cities' implementation of these technologies may lead to an exacerbation of poor urban conditions, particularly for the citizens of cities in the Global South, which have historically been excluded from having a representative voice in the development of the spaces they inhabit.

Responding to these concerns, PPD provides a relevant example of how design research practices can be applied to co-anticipate with urban communities their preferences for their smart urban futures and

potentially other metrofitting concerns. The three techniques employed in the co-design workshop enabled a rich and meaningful sharing of experiences by the participants. Including community members was valuable as their involvement directly guided the subsequent design of the Westbury 2052 provotype, and ultimately its communication to the design experts. For the participants, their involvement in the project was often transformative on a personal level. In this regard, two strong themes emerged from participant's feedback on of the workshops. First, as exemplified in the following quote, they highlighted the framing of 'futures' as undetermined and open to multiple outcomes which they potential could influence, as a significant realisation. Second, participants often felt a strong appreciation for been included in a discussion on the futures of Westbury. This appreciation ranged from those who felt that the community should be key stakeholder in all municipal planning to others who were just relieved to be part of a stimulating exercise and not have to spend another day in the lull of unemployment.

> "I think we need to know where we come from in order to know where we are going, so we know what we want- to better in our communities, to know what we have had before, and what we haven't had. This is now an opportunity for us to decide and choose what we actually want for our future (community participant)."

From the design perspective of gaining a better understanding of the suburb, the six design schemas articulate a range of nuanced considerations capable of positively impacting the urban design of Westbury. While a full discussion of each schema is not within the scope of this paper, it is evident that a key desire of the community is to overcome the failings of the state and municipality in terms of basic service delivery. This is seen clearly in the need for better security, employment, infrastructure, and health services. While the community viewed emerging digital technologies as important for transcending their current conditions, it was insightful to recognise that they identified these technologies as deployed preferentially by and for the community, rather than at the unit of the discrete individual user.

Beyond the usefulness of the three techniques for generating ethnographic understandings in line with Inayatullah's (2008, pp. 7-8) conceptualisations of futures as inherently connected to the present and past, combing the explicit flow of research findings from the workshop phase into the projective research phase, ensuring that 'data and facts' fundamental for anticipating futures has a strong ethnographic quality. As such, this approach contributes a novel practice in an emerging field of projective research, which is at present characterised by methodological uncertainty (Lindley, et al., 2014, p. 243; Morrison, 2018, p. 130). Lastly, and addressing the limitations that bottom-up approaches can present, the projective research provotype suggest the value that HCD can bring value to design practices that operate at the scale of emerging, highly complex technological systems, such as, for example, SCs, Smart Regions, IR 4.0, and artificial intelligence. As noted in the introduction, contemporary HCD struggles to resolve complex, large-scale systemic problems (Mani-Kandt, 2021). The consequence of this disconnection is that in national, regional, and metropolitan infrastructural projects, people are often treated as a "weak force and minor elements of the systems supposedly designed for their benefit" (Herriot, 2019, p. 704). In SC literature, this clash is evident in the tension between bottom-up and top-down design.

In response, PPD presents an approach that while recognising the value of the people who live, work, and actively engage with their neighbourhoods as drivers of change, is conceived primarily for informing, provoking, or challenging the thinking of professionals involved in top-down design and planning. Consequently, the alternative strategy of PPD is not to predict the design of the neighbourhood places of tomorrow but rather to sensitise designers and planners, likely to be working on large-scale smart urban developments, to a range of different considerations that might inform, alter, or confirm their design approaches.

Thus, as outlined in Section 5.3, and evident in the seven themes that emerged from the design experts' engagement with the Westbury 2052 provotype, practices such as PPD that contribute future scenarios premised in considered ethnographic inquiry can result in several valuable outcomes. First, these methods are capable of sensitising city planners and urban practitioners to the broad opportunities that smart technologies can offer in terms of delivering services and generally enhancing residents' experience of their

urban environments. Second, they can expose technologists and planners to the broad concerns of urban neighbourhoods as complex entanglements of activities, desires, experiences, places, cultures, and interactions. In this manner, this type of research locates smart urban development firmly with in the construct of the 'ordinary' city (Robinson, 2002, p.532) as opposed to visions of techno-futurist utopias often associated with the smart city. Third, they can share with top-down SC planners a sense of a community's preferences for their smart urban environments. Fourth, they can sensitise urban planners, practitioners, and technologists to the value of engaging with communities to heighten the likelihood that future technological interventions are designed in an ethical and empathetic manner. Lastly, they can assist human-centred designers to engage with highly complex technological systems in an impactful manner and, in this way, complement other design practices more accustomed to working within primarily technological and legislative systems.

7. Conclusion

This design ethnography introduces the novel PPD method which helps address the shortfall between bottom-up, community-centred approaches and the top-down approaches typical of SCD. As such, PPD utilises the unique knowledge tradition of HCD to generate a neighbourhood community's preferences for their smart urban futures and, subsequently, communicates these preferences to a design audience in a manner that is informative, thought provoking and if necessary capable of challenging existing assumptions. In this manner, and the central argument of this study, approaches such as PPD provide compelling rationale and directions for application of HCD that extend beyond its typical user/product focus.

ABSTRACT | This paper presents a model of empowerment integrated to experiential education in Design. Experiential learning programs provide opportunities for students to empower themselves and develop competencies, attitudes, and maturity to make a successful transition from school to work. Students are prompted to actively engage as designers in their communities and envision themselves as agents of change for the common good. The paper contributes to the track “Ways of Living Together” by presenting an approach embedded to Design Education that advances individual and community empowerment, helps students to constitute identity and community engagement, and expands their awareness of the eco-social responsibilities associated with professional practices. Experiential learning is considered an ideal approach to achieving the tenets of empowering education, because the results of direct experience are often concrete, identifiable, and applicable. To construct and advance their professional identities, Design students need exposure to processes that help developing internally while also having opportunities to enact abilities and skills in the real world. Empowerment is increasingly essential for Design students to develop their professional identities in a changing context requiring reflection, awareness, self-direction, and creativity. The paper also reports a case study on a pilot application of the model in the context of a project-based undergraduate course in Experience Design. Empowering experiential learning supports reflection on sense of purpose, provides exchanges with diverse mentors, participation in community as opportunities to develop confidence in real-world contexts and help to address complex socio-ecological problems.

1. Introduction

Experiential learning programs have the potential to provide opportunities for Design students to empower themselves and develop competencies, attitudes, and maturity to make a successful transition to adulthood as they move from school to work. Because of their involvement in such programs, students may experience opportunities to actively engage as designers in the life of their communities and envision themselves as agents of positive change for the common good.

In this paper, we present a model of empowerment integrated to experiential education in Design. The paper seeks to contribute to the track “Ways of Living Together” by presenting an approach which, embedded to design education, fosters processes of individual and community empowerment, help students to constitute identity and community engagement, and expands their awareness of the eco-social responsibilities associated with professional practices. A case study presents a pilot application in the context of an undergraduate course in Experience Design.

2. Empowerment in the Transition to Adulthood

Typically-aged college students are entering adulthood and dealing with a range of developmental tasks to constitute competencies, attitudes, values, and maturity necessary for a successful transition. Completing education and entering the job market are major milestones to be attained in this phase. Early adulthood might be considered a key turning point in the life span (Schwartz, 2016).

In adolescence and early adulthood, young people ‘construct’ their own selves through a cycle of experimentation and reflection (Erikson, 1968; Steinberg, 2007). The transition to adulthood is marked by a shift from relying on external authority to taking ownership and responsibility for one's life, therefore they need to be exposed to experiences and receive support to develop mature meaning-making and capacity for their own decisions (Baxter-Magolda & Taylor, 2015). For many of them, universities play a significant role in this transition, providing opportunities to improve cognitive and psychosocial development, constituting identity through role experimentation, choice, meaningful achievement, and reflection (Erikson, 1968).

Promoting empowerment in this period has significant benefits, including healthy identity experimentation, gains in confidence, critical awareness, self-efficacy, and self-esteem (Chinman & Linney, 1998). Empowerment is a strengths-based multi-level construct, pointing both to a process of social change and to the outcomes of this change (Rappaport, 1995; Maton et al., 2011). The concept was first defined as an intentional, active, ongoing process through which individuals and groups gain greater control over their lives (Rappaport, 1981; Cornell Empowerment Group, 1989).

Foundational work on youth empowerment (Cargo et al., 2003; Chinman & Linney, 1998; Jennings et al., 2006) highlights the importance of essential elements: welcoming and safe environments; meaningful participation and engagement; equitable power-sharing; engagement in critical reflection; participation in sociopolitical processes to affect change; integrated individual- and community-level empowerment. Focusing on specific contexts and challenges of early adulthood, Mouchrek and Benson (2023) extended previous theoretical propositions and built a comprehensive model of *integrated empowerment in the transition to adulthood*. Their theory informed the work presented in this paper and will be described next.

2.1 Integrated Empowerment Model

In this model, focused on early adults between 18 and 25 years-old (primarily from Western societies, including developed and developing countries), empowerment is understood as a process of capacity building for the transition to adulthood, leading to positive developmental outcomes. The model emphasizes the nature of empowerment as an interactive, gradual, and multifaceted interplay among developmental experiences at the internal and the external contexts (Figure 1), as follows:

> "Empowerment emerges as the interplay between two foundational dimensions. Representing internal processes of development, the key catalysts personal agency and sense of purpose interact to produce the first empowerment dimension: the constitution of self-direction. Since internal development needs a 'stage', a concrete space for enacting and consolidating developmental gains, a necessary counterpart would be external experiences of development. In these, the key catalysts mentoring experiences and engagement in community come together to form the second dimension of empowerment: developing a meaningful role in society. These two dimensions combine and emerge as the overarching construct of empowerment" (Mouchrek & Benson, 2023, p. 6-7)

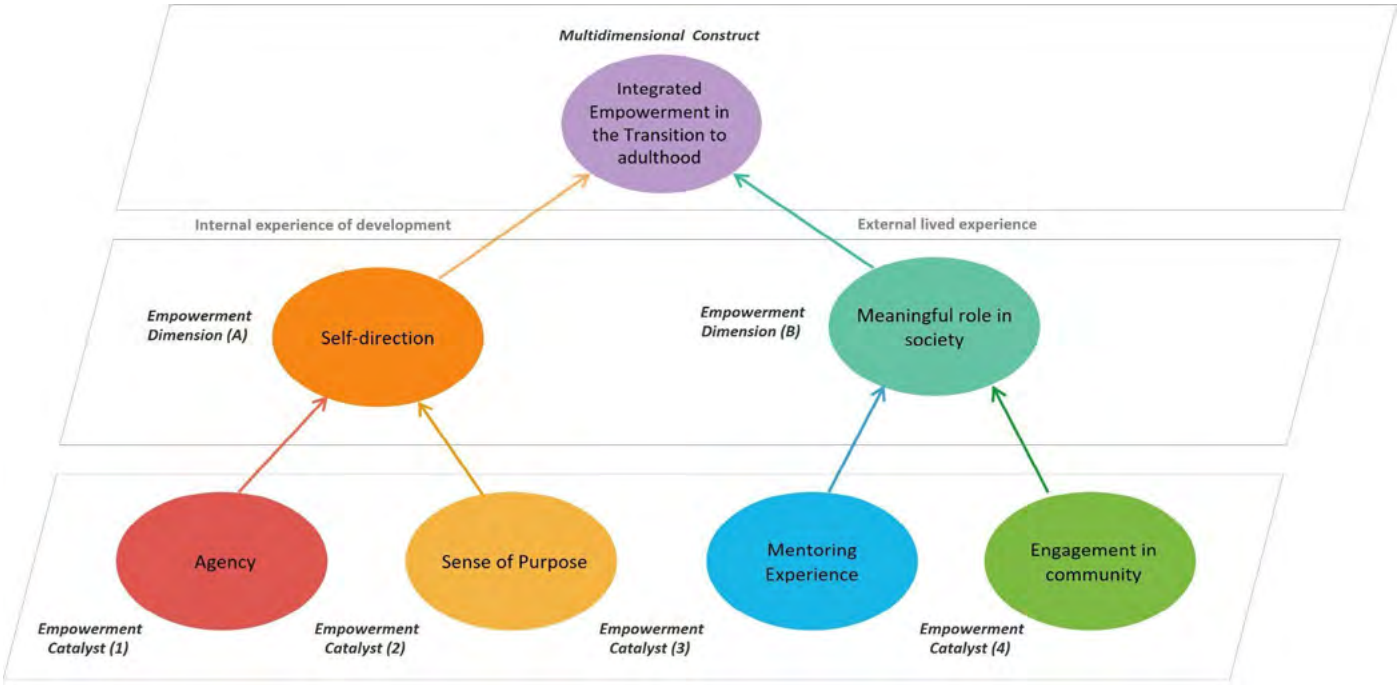

Figure 1. Model of Integrated Empowerment in the Transition to Adulthood (Mouchrek & Benson, 2023).

The empowerment catalysts in the model are described as: (a) *personal agency*, including self-understanding, sense of control, critical consciousness, autonomy in decision making; (b) *sense of purpose*, encompassing a perception of meaning in life and desire to make a positive difference to help solve problems beyond the self; (c) *mentoring experiences,* pointing to experiences with mentors providing guidance, support, appreciation, balance of power, and healthy collaboration; (d) *engagement in community*, when there is a sense of belonging, intrinsic motivation, meaningful participation, space and support to use talents and potential for the success of the community.

The authors suggest potential applications in the form of a model they called CAMP, which posits that interventions aimed at supporting developmental empowerment in emerging adulthood have strongest potential when *combining all four catalysts*: stimulating agency, fostering reflection on purpose, offering opportunities for shared dialogue and action with older adults, and positioning youths as potential active members in their communities (Mouchrek & Benson, 2023). Special consideration is recommended to apply the model to college students, because universities have great potential to be empowering settings supporting youth's self-orientation and future plans, through intentional design of environments for development.

3. Empowering Settings in College: Role of Experiential Learning

Higher Education may play a significant role, constituting positive environments for students' growth and empowerment -- hence the importance of designing the college experience having in mind youth's developmental needs. Colleges may provide a wide range of new experiences while also requiring an increasing complexity in reasoning, executive and reflective skills. Supporting the students' development in this period has important repercussions on their personal and intellectual trajectory, helping them to become active, self-regulated and engaged learners. It matters to capture students' perspectives during these years and understand what makes an empowering experience for them.

Reviews of theory and evidence from research indicate that empowering settings are those that: (a)promote a sense of community, encouraging cooperation and collective decision making (Lakin & Mahoney, 2006); (b) take into consideration young people's needs, interest and abilities (Frandsen & Petersen, 2012); (c) frame their participation as autonomous, responsible social actors (Chaskin, 2009); (d)have both an empowering process (participatory, developmental) and an empowering outcome (enhanced control, capacity, and access to resources) (Maton et al., 2011); (e) foster a critical understanding of their sociopolitical context (Zimmerman, 1995). Based on these concepts, the present paper proposes the following reflection*: How might we create structures and dynamics for empowering settings for emerging adults in college?* Experiential education emerges as a privileged context for this type of developmental setting, for Higher Education in general and for Design Education in particular.

Experiential education is an approach to learning through hands-on, real-world experiences. It follows the conception of learning by doing, in which experience and learning are inseparable (Dewey, 2007). Essential elements of experiential learning are: experiences are chosen by their learning potential; students are actively engaged intellectually, creatively, emotionally, socially, or physically; critical thinking, problem solving, and decision making are present; reflection on and after the experience are integral components; the learning task is perceived as authentic and allows learning directly from real situations; relationships are developed and nurtured (AEE, 2014). Diverse modalities of experiential learning are considered as high-impact practices in Higher Education (AAC&U, 2012): community-based service learning, internships, global learning, undergraduate research, professional work experiences, among others.

4. A Model of Empowering Experiential Learning

Experiential education encourages college students to develop fundamental dimensions of empowerment: personal agency, sense of purpose, mentoring experiences, and engagement in community (Mouchrek & Benson, 2023). The process of youth empowerment is considered as interplay among multiple factors including internal and external processes. In this paper, we propose an application of the empowerment model integrated to experiential education in Design. While the model was derived from theory and evidence from research, it is developed as a potential application[1]. In this section, we present the model of experiential learning that promotes student empowerment by addressing several catalysts. These processes are described as follows, in experiential education in general and applied to Design Education.

4.1 Fostering Agency and Purpose

By addressing needs for experimentation for construction of self and fostering reflection and critical consciousness, experiential learning encourages the development of internal processes such as personal agency. Additionally, by focusing on purpose-driven experiences, this modality promotes a sense of meaning and purpose.

[1] In line also with recommendations from the Education Advisory Board (EAB): Integrating Academic and Career Development (2017).

Experimentation and reflection. In adolescence and early adulthood, construction of self happens through experimentation: there is a richness of experience as the brain presents great plasticity and is extremely sensible to experiences (Erikson, 1968; Steinberg 2007). Since experiential learning focuses on direct experience and in-context action and reflection, this modality may address the students' need for diverse lived experiences that offer room for them to make sense of the knowledge, relating it to their personal way of understanding the world and building connections with their own trajectory. Experiential education fosters skills needed for students to become their own agents of change (Shellman, 2014). The reflective process in experiential learning broadens students' perspectives, addressing important developmental aspects: in this period, the young person develops advanced cognitive processes, including abilities of practical, flexible, and dialectical thinking, greater processing of emotions, perspective taking, and capacity for self-reflection (Berger, 2008; Arnett, 2014). Reflection in context potentially fosters a more complex meaning making process, providing novel options for interpreting experiences and navigating environments (Baxter-Magolda & Taylor, 2015). In Experiential Education, learners are purposefully engaged in direct experience and focused reflection (AEE, 2013).

Purpose-driven experiences. In the college years, cognitive and social transitions lead to the development of personal values and the political principles that will guide the person throughout adult life (Santrock, 2014). Purpose plays a powerful generative role in youth development (Damon et al., 2003), as a sense of purpose assigns meaning to and connects the experiences toward integration and fulfillment of potential when students ask themselves about their own values and goals in life – and how important are concerns that go beyond their selves. A purpose-driven approach to experiential learning promotes developing real-world projects that students can connect to their own aspirations to contribute to and being actively engaged in processes of social change. Empowering educational experiences should look for intentional ways to foster a process of awareness and encouraging intrinsic motivations allows students to explore states of flow and possibility development for the future.

Experiential Modalities Fostering Agency and Purpose in Design Education. Design is fundamentally a discipline of learning by making and doing (Davis et al., 2004), requiring active participation through problem solving, modeling, creativity, critical thinking, and self-construction of knowledge (Fontoura, 2002). Experiential learning opportunities fostering agency and purpose may include project-based learning using studio pedagogy, internships and professional work settings, global learning opportunities, among others. Project-based learning activities embedded in courses allow for studio-like experiences that introduce students to real-world work projects and to how collaborative work in workplace settings may function (Strait & Sauer, 2004). In design education, studios are recognized as the signature pedagogy and provide an engaging mode of learning by making them reflect on ongoing development (Chamorro-Koc & Kurimasuriyar, 2020; Desai et al, 2021). Studio pedagogy might include direct contact with professionals and/or community partners. Those are empowering also because they promote self-directed learning and increase student comfort with uncertainty (Davis, 2004).

Internships and professional work experiences are particularly important to advance the development of students' professional identities. Designers' professional identity is complex and encompasses both developing a range of personal attributes and advancing several design skills. During their academic formation, students start to gradually construct their professional identity as designers, which grows intertwined with their personal identity. To construct and advance their professional identities, students need exposure to processes that help developing internally while also having opportunities to enact abilities and skills in the real world. Opportunities for global education are also excellent to help develop direct experimentation and nurture a sense of purpose by observing and reflecting on the role of design and designers and reflecting on their values and purposeful life goals.

In order to prepare students to face contemporary complex challenges, learning must provide opportunities to develop an emergent in-context skill set, including critical thinking, communication, collaboration, and creativity, among others (Finn et al., 2012). Students need to acquire knowledge and work skills, but also have opportunities for reflection, critical thinking, and systemic competences, to be prepared to participate fully and actively in a changing society (Delors, 1998; Fontoura, 2002). Empowering

experiential learning in Design Education has the potential to support the development of consciousness and required competences, but also to create structures for participation, spaces for students to express their own vision, perspectives, and design ideas for the future.

4.2 Cultivating Mentorships and Engaging in Community

Fundamentally focusing on learning in touch with the concrete realities and lived experiences, experiential learning activities have the potential to address external processes feeding youth empowerment: development of healthy partnerships among youth and adults and opportunities for students to have a meaningful participation in the local and global communities.
Mentoring experiences. Professionals, community members, instructors, and students engage in positive, productive partnerships. We highlight the importance of mentoring and apprenticeship in experiential education: these programs are a promising environment to foster a multi-generational shared leadership and decision-making. Balanced mentoring partnerships in the transition to adulthood are an essential element of empowerment, in which equitable power sharing, opportunities to express their voice, and positive support are considered essential (Cargo et al., 2003; Wong et al., 2010; Krauss et al., 2014). Dialogical experiential learning models, defined by a co-constructed, relational, and holistic approach to learning (Desmond & Jowitt, 2012), are highly beneficial for youth development.

Participation in community. Engaging youth in community issues has important implications leading to developmental outcomes such as independence, problem-solving, hands-on learning, leadership, increased sense of control and personal responsibility, and overall well-being (Browne et al., 2011; Morton & Montgomery, 2013). Active community participation also brings more proactive and healthy behaviors (Cargo et al., 2003) and gains in agency and confidence (Krauss et al, 2014). Empowering settings in community-based projects frame the participation of young people as active, autonomous, responsible social actors and agents of change in their own right (Chaskin, 2009). Experiential learning may offer opportunities for students to develop awareness of multicultural realities and diversity, to participate in a meaningful way, and to work alongside with community partners, at local and global scale. ‘Develop people's capacity to contribute to their communities’ is one of the main goals of experiential education (AEE, 2013). Research shows that, because of their involvement in experiential programs, students experience increased feelings of empowerment and make positive changes in their life and the community (Shellman, 2014).

Experiential Modalities Cultivating Mentorships and Engaging in Community in Design Education. Experiential learning opportunities fostering mentoring and community may include relationships with a diverse set of mentors, community design studios, community-based service learning, among others. A diverse array of mentoring relationships in experiential learning opportunities are beneficial for Design students as they learn about the intricacies of the profession and several aspects of professional activity. Besides their instructors, mentors might include work or internship supervisors, peers, and even local industry professionals. In Design Education, community-focused experiences might include the involvement of community partners as mentors in the learning process as students engage with communities to design solutions (Desai et al., 2021). In community design studios, students learn while doing projects to address issues for real demands in the community. Cameron and colleagues (2001) point that, in this learning modality, students learn about political, cultural, and economic problems faced by designers, besides their inherent responsibilities: "in dealing with the diverse backgrounds, agendas, and schedules of community members, students can learn communication skills, collaboration, and leadership qualities that they would not learn in a traditional studio" (Cameron et al., 2001, p. 106). In community-based service-learning projects, there is great potential to support developing empathic dispositions and skill sets in Design education.

Engaging with communities, student designers act as facilitators and need radical empathy beyond basic understanding of people’s challenges, considering their cultural positioning, engaging in respectful collaboration and ethical practices based in interdependence (Noel et al., 2023). Complex issues regarding the current global eco-social crisis will require designers to work alongside communities to redirect lifestyles towards an active well-being based on the quality of life, infused with a sense of action and

common purpose (Manzini, 2007; Brown, 1981). Collective engagement and problem solving, capacities for self-determination and community-oriented action based on care will be key (Meroni, 2007; Manzini, 2007). Engaging design students in community efforts helps understanding of eco-social responsibilities associated with professional practices, cultivates responsible citizens, and applies learning to their everyday lives.

In this section, we explained the model components and reported on how they apply to experiential learning in Design Education. In the next section, we present an early application of the model combining the four catalysts applied to experiential education in Design.

5. Case Study: Project Designing to Improve Human Experience

In this section, we present a pilot application of the empowering experiential learning model in a project-based undergraduate course in Experience Design at Northeastern University (U.S.). Following recommendations for empowering interventions based on the CAMP model (Mouchrek & Benson, 2023), the project was designed with the four empowerment catalysts in mind – agency, purpose, mentoring, and engagement in community – in a studio setting in which students worked in teams on a seven-week long design process.

Building upon previous higher education experiences with living labs for design, innovation and sustainability (Mouchrek & Krucken, 2018), open innovation co-create labs (Mouchrek, Baum, & McNair, 2016), and participatory design workshops for empowering undergraduate students (Mouchrek, 2023), we build this project-based course to provide opportunities for students to learn how to select and apply design methods, integrate experience design principles to their practice, and work collaboratively in an autonomous, hands-on project geared towards creative approaches to designing for social responsibility.

Context. The undergraduate course, ARTG3462 - Experience Design Principles, includes students in different years, enrolled in majors like Design, Graphic Design, Experience Design, Interaction Design, and majors that combine Design with Behavioral Neuroscience, Business Administration, Mechanical Engineering, or Computer Science. The course was taught throughout four consecutive semesters in 2023-24, involving six cohorts of 12 to 16 students each. After an introduction to principles of Experience Design (including technology as experience, sense making, storytelling, emotions, human needs, engagement, flow, and Design for social impact) and practice of several methods and tools of Design research and development, students set to apply the course concepts on an experiential learning project. The project explores the potential of Experience Design to develop concrete and action-oriented interventions, offering opportunities for students to go through a structured process to collaboratively reflect and work to envision possible futures in a multiparty team (Figure 2).

Figure 2. Students interpret findings from field design research in the Project *Designing to Improve Human Experience*.

Prompt. The project prompts students to research and design to help improve the human experience on a topic of their choice. Applying course materials, students identify real-world needs in the local community,

undertake field research, ideate design concepts, develop prototypes, and evaluate the developed solution. Interventions can be objects, services, information systems, installations, events, exhibits, programs, or campaigns. The Sustainable Development Goals (SDGs) are used as a tool to define the topics and teams for the Experience Design Project.

The SDGs were proposed by the United Nations in 2017 as a blueprint to achieve a better and more sustainable future for all (Spencer, 2021); they are considered one of the best opportunities to frame design for social responsibility (Cooper & Koo, 2021). The goals address the global challenges faced in our current society, including poverty, inequality, climate change, environmental degradation, need for peace and justice (Figure 3). Students are prompted to reflect on how they can design to improve the human experience in ways that address some of these challenges. Participants identify their goals of interest, perform research about them, refine their choice and form teams around the same topic. Each team will then work on one of the Sustainable Development Goals, identifying a need at a local/regional level linked to one or more targets in that SDG. The overall design challenge is: "How might we improve the human experience regarding [specific goal/target]?"

Figure 3. Sustainable Development Goals. Source: United Nations Development Program (2017).

Development. Students progress through a structured process involving project ideas, field research and data collection, interpretation, ideation, prototyping, and initial ideas for implementation. Teams work in a studio-based structure for seven weeks. Several participatory design activities are developed in class and outside class. At each step, students submit documentation of progress (text and design artifacts) and present a summarized update in class to receive feedback from instructor and peers. The five main deliverables are shown in Figure 4. The project constituted an opportunity for students to: learn skills in teamwork, planning, communication, and others; perform research on themes of interest; envision practical applications of experience design in contributing to solve world problems that they care about.

Figure 4. Project Designing to Improve Human Experience - Steps and Deliverables.

5.1 Application of the Model

The multilevel project embedded the four empowerment catalysts (agency, purpose, mentoring, community), as described in the next paragraphs.

Agency. While following a structured method, student teams had autonomy to decide the aims, the audience, the scope and reach of their project. Students received feedback from instructor and peers along the research and development process, but ultimately, they had autonomy to experiment, define and pivot the direction and boundaries of their project, and were responsible for decisions and overall project development. Embedded opportunities to reflect on their practice were helpful to advance and mature their decision-making process. Examples of student projects notable in developing agency, experimentation, and autonomy (Figure 5) were:

- *NUFood community recipe sharing app*[2], in which students started off looking to fight food waste on campus. Their research and analysis led them to uncover a negative loop cycle: students on campus do not have good cooking skills, end up buying more groceries than they actually use to cook, and that generates a sheer amount of food waste. By developing a community recipe sharing app, this team addressed the issue through an innovative angle.
- *ShellYeah! youth educational beach camp*[3], in which students had an initial goal to protect marine life in the Boston region. After surveys and interviews, they pivoted and decided that developing an engaging, fun approach to environmental education for children was the best strategy to indirectly attain the goal. The team developed a creative intervention that included designing a summer camp and pedagogical curriculum for it.

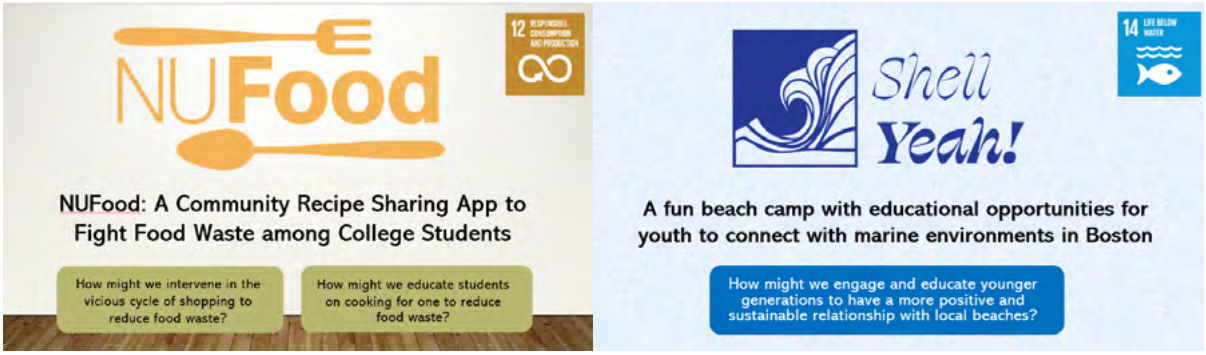

Figure 5. Projects displaying high levels of agency, experimentation, and autonomy: *NUFood* & *ShellYeah!*.

Sense of Purpose. The project intentionally prompted students to select goals aligned with their values and personal aspirations. Being able to choose to design towards a socially relevant goal that was meaningful for them and forming teams with people sharing the same values infused a strong sense of purpose into the projects. This prompted reflections about how potential career trajectories may connect with their willingness to contribute and make a difference to help solving complex contemporary challenges. Examples of student projects that displayed prominent sense of purpose (Figure 6) were:

[2] The NUFood project authors are undergraduate students Beyer Bullard, Caitlin McGuire, Marsha Angkasa, Mollie Harreys (Spring 2023).

[3] The ShellYeah! project was authored by students Brendan Ditullio, Karlee Malcolm, Greg Gold, Caleb Nyhart (Summer 2023).

- *NICE - Northeastern Intervention Care & Education program*[4], in which team members felt very strongly about the need for more intervention and care related to drug prevention and support for students dealing with drug addiction on campus. They developed a full program dedicated to that and wrote at length about how important it was for them to research and design on a topic that was felt was intensely purposeful.
- *Pawrents - Student Parents Club*[5], another example of a highly purposeful project in which students empathized with fellow colleagues going through a difficult time when discovering they were pregnant or would become parents – and how this might affect their college trajectory (and life as a whole). The team developed a thoughtful approach by creating a student parents club with several features.

Figure 6. Projects with a prominent sense of purpose and reflection: *NICE* and *Pawrents.*

Mentoring experiences. Because continuous feedback and collaborative progress were central features, the project provided several opportunities for mentorship. It included intense mentoring from the instructor at the team level, which worked as facilitation, consultancy, and overall support for project management. Relevant experts and community members interviewed become informal mentors for specific groups as well. The project is structured to incentivize peer feedback and collaboration along the project development, which generated interesting peer mentorship dynamics. Examples of student projects with active peer mentoring partnerships (Figure 7) were:

- *Sexual Health for Huskies website*[6], a project developed for a team in an all-female student class that was inspired by needs directly felt by the students, including the lack of ample and integrated conversation and support regarding sexual health on campus. Because some of their classmates were intensely involved with sexual health advocacy on campus, they ended by establishing a strong peer mentorship alliance that helped inform the approach and tone of their project.
- *YouHCS app*[7], a project developed in the same class environment attending to similar needs, this time focusing on increasing on-campus knowledge and support about reproductive health. Once more, intense exchange and feedback from colleagues who were also student activists around the topic generated strong peer mentoring experiences.

[4] The NICE project was proposed by Ila Jagannath, Miles Chun, Matt Downing, Max Spencer (undergraduate students, Spring 2023).

[5] The Pawrents project was authored by students Luci Lobo, Catherine Kennedy, and Juliana LaPara (Spring 2023).

[6] The Sexual Health for Huskies project was created by Bryn Grespan, Natalie Walsh, Deefah He, and Nabaa Lafta (undergrads, Fall 2023).

[7] The YouHCS project authors are Ally Xu, Maya Haney, Sraghvi Anchaliya, Tori Simmons (undergraduate students, Fall 2023).

Figure 7. Projects with active peer mentoring partnerships: *Sexual Health for Huskies* and *YouHCS*.

Community. Being clearly oriented to research and design for a community-centered goal made students envision possibilities to act as "citizen designers", opening perspectives about how designers may intervene with skills and talents towards the common good. This fostered a sense of belonging, besides activating intrinsic motivation and willingness to meaningfully participate. Examples of student projects with increased engagement in community (Figure 8) were:

- *Nubian Station Local Market*[8], a project that started by focusing on improving infrastructure for a neighborhood close to campus that faces increased gentrification. After in-depth research and contact with residents, they developed an open, inclusive strategy to stimulate economic development and community relationships around a local market in a strategic location. The team was particularly concerned with the impacts of the university in the surrounding areas and their resulting designs showed intense involvement in the life of these communities.
- *Boston Hunger Helpers*[9], a project that also had concerns regarding the surrounding neighborhoods, this time focusing on needs related to food insecurity. They developed a dynamic donation-based program connecting food vendors and community members. In this case, student teams also displayed an intense call to contribute to the community inspired by a citizen design approach.

Figure 8. Projects with increased engagement in community: Nubian Station Market and Boston Hunger Helpers.

6. Recommendations

From our study and practice with the model, we derived a set of recommendations. Experiential learning opportunities are well suited to support empowerment for students to the extent that they may:

- provide youth with a wide range of experiences while also requiring an increasing complexity in reasoning, executive and reflective skills.

[8] The Nubian Local Market was proposed by students Bella Stone, Naseem Mohideen, Finn Cuccia-Fenton, Maddy Mckee (Fall 2023).

[9] The Boston Hunger Helpers project was authored by undergraduates Ashley Newell, Alia Alsaie, Aleena Narula (Fall 2023).

- offer opportunities for students to understand and practice competencies leading to autonomy, self-direction, and independence through exercises of problem-solving and decision-making.
- offer opportunities to engage in meaningful roles, and to develop collective work that is authentic, interesting, fun, and relevant to the real world.
- offer stimulating and rich environments for positive and healthy interaction with peers and the extended community, improving students' well-being and supporting their processes of socialization and identity formation in emerging adulthood.
- provide rich environments and social contexts to encourage students to express their values and inspire the development of prosocial values such as social justice, ecology, human rights, sustainability, diversity, and inclusion, among others.

On the other hand, it matters to avoid learning experiences that are ill-suited to support youth empowerment at the extent that they:

- maintain rigid curriculum structures that don't allow for experimentation or active learning experiences.
- offer limited autonomy for students to co-create interesting and authentic learning experiences.
- overlook the fact that students need to develop as a whole person and as a future professional at the same time – hence the importance of integrating academic and professional goals with their personal characteristics and trajectories.

7. Conclusion

Empowerment is increasingly essential for Design students to develop their professional identities in a changing context requiring ongoing reflection, awareness of content, self-direction, and creativity. Empowering experiential learning also supports reflection on sense of purpose and priorities, while providing exchanges with diverse mentors, participation in teams and communities as opportunities to develop confidence and an understanding of who the student can be as a professional in real-world contexts, helping to address the complex socio-ecological problems we currently face.

Experiential education is then seen as an opportunity for students to develop identity and agency, foster critical consciousness and empower themselves to meaningfully participate and be actively involved in their communities. Experiential learning is considered an ideal approach to achieving the tenets of empowering education, because the results of direct experience are often concrete, easily identifiable, and applicable (Perrin, 2014). A consistent framework for experiential learning in college education would consider its potential to positively impact youth development, working intentionally to promote empowering experiences and transformative outcomes for students during the transition to adulthood.

KEYWORDS | CO-CREATION, CHILDREN VISIBILITY, PUBLIC SPACE, SCHOOL ZONE, PLACEMAKING

ABSTRACT | Although children are a large user group of the city and its public transportation, their challenges are not equally handled in the Hungarian context when speaking about urban planning. While there are countless examples in the Western literature of children's involvement in urban planning processes (Derr et al. 2013, Krishnamurthy 2019, Lovrić 2023), in Hungary we are only at the beginning of the discourse. The paper is going to introduce an ongoing research and development project started 1,5 years ago including both research and implementation phases and its results as a case study aiming to adapt the already existing Western know-how into the Hungarian context.

The work-in-progress research aims to explore how social design might facilitate children's physical and mental safety regarding the inclusivity of public places and mobility formats through placemaking. It has been conducted in collaboration with the Innovation Center of a Hungary-based design university, the Budapest Public Transport Center, the ELTE Institute of People–Environment Transaction and the Municipality of the 7th district of Budapest, aiming to tackle the needs of children (age group 10-13) in lights of public transportation, micro and active mobility intensively focusing on the usage and opportunities of public places around their school. To unfold the needs of the target group the research used process-based co-creational data collection, methodological tools of social design, action research, observatory research, and interviews, resulting in the creation of a design prototype focusing on the specific challenges raised by the target group. The research led to finalising a ready-made product with scalable and transferable potential and providing a set of options (installative and regulative) to Municipalities for alternative ways of traffic calming through placemaking in school areas. This prototype is not a result, but rather a research tool to observe and analyse the children's behaviour and discover the adaptation potential. Besides being a research tool, the intervention aims to cause traffic calming and to affect drivers' behaviour through visual stimulation.

The paper introduces the results of the research by illustrating what are the main challenges and obstacles children face when using public spaces in a big city (especially in school zones) and what type of interventions can help to ensure their physical and mental safety while using these spaces. Assessing the usability and impact of the tangible prototype is not the last methodological part of the research project: currently, the research is focusing on a new school environment integrating the findings of the first stage of the project as well as new stakeholders. Concluding the findings of our case study about urban child protection, public place awareness, and liminal spaces, it opens the argument of transferability and paradigm changes in the context of Budapest and has potential relevance in other big cities as well as in the CEE region.

1. Introduction

Children's urban environments play a crucial role in shaping their physical health, social connections, and identity development, especially after their kindergarten years. While much attention has been given to physical health aspects, like air quality and safety standards (Tamburlini et al., 2002), there is a growing recognition of the importance of considering children's emotional connections to their surroundings (Dúll, 2009). Understanding the diverse needs of children in urban environments requires consideration of various factors, including their need for security, exploration, socialisation, and privacy which vary according to their age (Day, 2007; Altman et al., 1978). Balancing these needs can be challenging, particularly as children transition between home, school, and public spaces in their primary school years (Freeman & Tranter, 2011). Given the complexity of children's needs, involving them in the design process is essential for creating inclusive communities (Davis & Jones, 1996). Placemaking, a participatory approach to urban design, offers a valuable opportunity to engage children in shaping their surroundings (Marshall & Bishop, 2015). By actively involving children in community workshops and design charrettes, urban planners can create vibrant and child-friendly spaces that foster a sense of ownership and belonging from a young age (Ellery & Ellery, 2019). Placemaking in urban planning involves a multitude of factors, including the level of involvement of end users, the methods employed, the scale of interventions, and the diverse stakeholders engaged in the process. This paper delves into the intricate interplay of these factors by examining existing examples from around the world.

Building upon these insights, an intersectional collaborative research project was initiated in Budapest's 7th district, involving multiple stakeholders such as the Budapest Public Transport Center, the ELTE Institute of People–Environment Transaction, a Hungary-based design university and the 7th-grade (12-13 years old) children community of a primary school, based in the 7th district of Budapest. The project aimed to address the needs of children regarding public transportation, micro and active mobility, and the usage of public spaces around their schools. Through a comprehensive research and co-creation-based design process, the project sought to enhance children's visibility and safety in urban environments.

2. Children's Urban Environments: Understanding Needs and Promoting Inclusive Design

When speaking about the connection between children and their physical environment, sources highlight mainly the role of places in the context of physical health (Tamburlini et al., 2002; Day, 2007) instead of healthy social connections and the development of their identity. The negative impact of harmful environments on children's physical health cannot be questioned when speaking about poor indoor air quality, hazardous building materials and unsafe building standards, chemical or biological contamination of furniture, arts-and-crafts material and playgrounds, radiation and noise (Tamburlini et al., 2002). But to understand the complex role of children’s environment, we also need to understand the importance of place attachment and place identity. Results of environmental psychology show that people form emotional bonds with the environment they live in and use (place attachment). These meaningful places over time become part of the person's self-definition (place identity) (Dúll, 2009). It has different dimensions since an emotional relationship can develop to a corner of a room, to a house, to the neighbourhood, to the city, or even to imagined or mythical places (Mazumdar - Mazumdar, 1993 cited by Dúll, 2009). With Dúll's literature summary, we learn that attachment to a place develops because the control of the place enables "the manifestation of action and competence" (Dúll 2009, 133). Attachment to a meaningful place has countless advantages, such as the sense of security, belonging, control and ownership as well as experiencing social connections.

Several studies (Altman et al., 1978; Day, 2007; Freeman & Tranter, 2011) examined the connection between the needs of children and the opportunities offered by their physical scenes as well as the significant role of place attachment in the ongoing development of children’s identity (Day, 2007; Gordon, 2010). According to

different ages, children need a place to feel security, integrity, magic, sensory exploration, creative intervention and inspiration (Day, 2007), they need to learn, play, socialise and explore but on the other hand they need to experience privacy (Altman et al., 1978) and quiet reflection (Woolley & Spencer, 2000) as well. According to these conflicting needs and tension between the known and the unknown, Day (2007) also articulated that the environment should serve the children's journey of development by offering enough flexibility and opportunity for adaptation. To serve these diverse needs children need scenes such as their home and their school, cultural spaces, outdoor environments like playgrounds and nature as well as their whole neighbourhood (Christensen & O'Brien, 2003; Freeman & Tranter, 2011; Campos & Luceño, 2020). While the most important of all seems to be the children's home (Altman et al., 1978; Dúll, 2009, Freeman & Tranter, 2011) still it needs to be clarified that different environments can support different needs. 'For children "indoors" is a private domain, the source of physical shelter, social security, and psychic support - and also the locus of adult dominance and the limiting effects of "family" and "school." "Outdoors" is a necessary counterbalance, an explorable public domain providing engagement with living systems and the prevailing culture locus of volitional learning' (Altman et al., 1978, 88). It also seems that after the kindergarten years, during their primary school years, children need to explore more and learn responsibilities and by that, outdoor environments get a bigger role in their development and school environments can play a leading role in being available for these needs (Day, 2007).

The school is a psychologically significant environment, which has a wide range of socio-physical effects on the users of its environment, which is not only educationally important, but the school is also a key socialisation medium (Altman et al., 1978; Day, 2007; Dúll, 2007), a safe environment for unstructured play (Freeman & Tranter, 2011) and an opportunity for informal learning (Day, 2007; Freeman & Tranter, 2011; Alegre, 2023). When talking about school environments, research is mainly focused on the indoor school environment (Altman et al., 1978; Day, 2007), much less on school yards (Day, 2007; Kyriakou, 2014; Green, 2021) and even less on the public areas of school fronts (Krajnović, M. et al., 2023). In this sense, it is also worth examining literature about smaller-scale urban contexts such as liminal spaces in the context of childhood (Christensen & O'Brien, 2003). School fronts, just like liminal spaces, are "at the boundary of two dominant spaces, which is not fully part of either" (Dale and Burrell, 2008: 238), their function is not easily defined just like its ownership by a specific group and these are the spaces where anything can happen (Turner, 1974 cited by Shortt, 2015). Following Day's (2007) explanation about linking spaces, school fronts are territories of arrivals and departures, of welcoming and saying goodbye: this environment should give space for children to reset their mind from outside to inside, from unknown to safety, from liberty to expectations and vice versa. These scenes should offer space for children, to release their tension after a long day at school and to manage their conflicts in a wide-open space which is still close to the safety of the well-known school.

Based on the complexity of children's needs in their urban environment, involving them in the design process of urban planning is essential for creating cities and communities that are truly inclusive, dynamic, and responsive to the needs of all residents (Altman et al., 1978; Davis & Jones, 1996; Bakar, 2002; Day, 2007; Simonsen & Robertson, 2013) and placemaking seems to be a valuable method of involvement. Children bring a unique perspective, often noticing details and aspects of their environment that adults may overlook. By actively engaging children in the planning process of public spaces, decision-makers can gain valuable insights into what makes an area appealing, safe, and functional for younger members of the community (Freeman & Tranter, 2011). Moreover, including children in the process empowers them to have a voice in shaping the places where they live, play, and learn, fostering a sense of ownership and belonging from a young age. Placemaking serves as an excellent tool for involving children in the urban design process due to its focus on community engagement and participatory approaches (Ellery & Ellery, 2019). Placemaking encourages residents, including children, to actively contribute their ideas, creativity, and insights to the development of public spaces. By organising activities such as community workshops, art installations, and design charrettes specifically tailored to children, urban planners and designers can harness their imagination and enthusiasm to co-create vibrant and child-friendly environments. This collaborative approach not only ensures that children's needs and preferences are taken into account but also cultivates important life skills such as teamwork, problem-solving, and civic engagement as well as the development of place attachment (Marshall & Bishop, 2015).

3. Exploring Factors in Urban Placemaking: Tools, Scales, and Stakeholders

When talking about placemaking and the involvement of end users in the urban planning process, many variable factors have to be considered: the level of involvement of the children, the methods used, the type and the scale of the planned intervention as well as the participating stakeholders. In the following section, the paper is going to investigate these factors through already existing examples from around the world.

3.1 Tools of Involvement

As we discussed above, the involvement of children in urban interventions and decision-making is undoubtedly essential in today's urban design process: still involvement has different tools for different aims, which can lead us to reach different depths of participation. When speaking about tools, we can apply introductory but also informal meetings, observations, questionnaires, interviews and participative workshops - also we group these tools depending if there is a direct connection to the target group or not, or depending on what kind of activities they are including. We cannot state that these tools are used in general in most of the examined cases, but indeed these tools can give a real depth when speaking about involvement and by that, they are very commonly used.

Even if we collect examples of participation and collaboration, there are still tools which are not meant to bring new people together but they are still serving placemaking from behind: these are the research methods of observations and questionnaires. Placemaking projects often involve observation as a tool, to collect data about the target group. It can happen in an indirect way when the participants are observed in their natural habitat, where they are not directly involved, as it happened in the project of the Jai Vakeel School (JVS) in Mumbai, where the design team visited the school and studied the children's behaviour during the school hours (NIUA, 2019). Besides observations, questionnaires are classical tools to gather information from a larger group. It can be used in different project phases: getting to know the target group's behaviour before the deeper involvement and used to starting a discussion, and also assessing the results and rapidly evaluating (Danenberg et al., 2018). In the case of children, these questionnaires can also get a more playful form such as the form of a booklet, to get to know the children's point of view about their dislikes, street activities and outdoor playing habits in a playful way (Slingerland et al., 2020).

Verbal tools such as interviews, group discussions and other formal and informal meetings play a significant role in placemaking projects by providing invaluable insights into community needs, aspirations and preferences, thus informing the design process and ensuring the creation of spaces that truly resonate with and serve their intended users. Introductory meetings have to happen to define the roles and expectations of each participant, which are key elements in the process (Sutton, 2002), just like in the case of the research project led by TU Delft in the Tarwewijk neighbourhood in Rotterdam (Slingerland et al., 2020). Besides meetings, interviews are also key elements of placemaking research projects, which can be conducted by the target group itself. In the project of "The Walking Neighbourhood" in Chiang Mai (Thailand), the children conducted interviews with local people (such as shopkeepers, local 'icons' and habitants), who oversee the everyday happenings as constant observers (NIUA, 2019). Another informal verbal tool might be community walks, just like in the project of the Bernard van Leer Foundation in Bogota, where community walks were organised to involve the neighbourhood and to identify possible danger spots (NIAU, 2019).

Participatory workshops represent a cornerstone in placemaking projects, serving as platforms for engaging children, and stakeholders and fostering collaborative decision-making processes aimed at enhancing the quality of public spaces. These workshops encompass a variety of formats and methodologies tailored to specific project objectives and community dynamics. Common workshop types include community visioning sessions and collaborative brainstorming exercises, each offering distinct advantages in eliciting diverse perspectives and co-creating inclusive environments. These participatory

approaches have the potential to facilitate meaningful dialogue, foster social cohesion, and engender sustainable urban development. In urban placemaking research projects different types of workshops appear: Ana Vargas, a Venezuelan architect in her project called ‘Tracing Public Space’ conducts photographic mapping excursions with the children to understand their needs and discover potential opportunities for transformation (Danenberg et al., 2018). Community-engaged co-creational workshops develop a sense of belonging to a community and create stronger connections amongst the locals as seen in the project called ‘Hack Our Play’, which was implemented in the St. James’ Church Kindergarten in Singapore (Danenberg et al., 2018).

3.2 Scales

Urban placemaking projects can be also categorised by the different scales of the interventions such as micro-level scale, public space scale, neighbourhood scale and city scale (Danenberg et al., 2018). Even if it is important to add, that in many cases scales are not necessarily final and they often grow into adaptable solutions (NIUA, 2019), still the paper is going to introduce examples according to these four categories including different types of interventions such as pieces of street furniture, climbable objects, sidewalk games, playful pedestrian street crossings, opened schoolyards and child routes (Krishnamurthy, 2019) as well as built constructions, permanent installations, and also simple visual gestures, occasional solutions, which are more like an event or an activity.

The micro-level scale is the most supervisable setup since it can offer the opportunity to be completely overseen by its users, which results on the one hand parents and guardians immediately acting on unexpected events and on the other hand children reading the environment. The space has well-defined functions and borders and the most common solutions of micro-level scale are street furniture installations. Since the same street furniture can target different user groups, it can play an important role in building a connection between children and other local people sharing the same neighbourhood, just like in the case of the Darling Quarter Playscape in Sydney, Australia (NIUA, 2019). Street furniture can also function as a transitional environment between the children’s home and school, functioning as a liminal space which helps them mentally both to prepare for challenges and to calm down after them (Krishnamurthy et al., 2018). The FURNISH-KIDS research project was realised in Barcelona and is a good example of how street furniture can respond to different challenges while transforming urban space (Furnish Tech, 2020).

In the public space scale, the opportunity to explore appears in different forms of playing and learning, which can happen in the forms of playgrounds, sidewalks, and schoolyards. It happens in the presence of a parent or caretaker but at a broader distance from them. These are often part of parks, shopping centres and other built environments. The Hammarby Sjöstad neighbourhood in Stockholm became a famous model (‘Hammarby Model') since many sustainable design elements are involved, like the example of the overhanging balconies around a public space, offering parents the opportunity to look after their children without bothering their free play (NIUA, 2019). The public parks of Amsterdam designed by Aldo van Eyck (NIUA, 2019) were created with the idea that children prefer places for playing, which are not perfectly organised, but rather places to discover (Han et al., 2018). The main concept was to create a minimalistic place from only a few variables, and climbable elements and let the children explore the space while encouraging them to use their creativity. Climbing helps children improve their decision-making skills, gives them courage and makes them feel and become more independent (Malone K. et al., 2014). The outside world might seem intimidating for a child, but making these functional places more playful might help children feel more connection and security using their urban environment. As an example, creating sidewalk games can create the expression of an extended playground (Muasaroh et al., 2020), just like the playful solution of the Sidewalk trampolines in Copenhagen (ArchDaily, 2022). The closeness of the roadway might be a threat to the children in the case of these sidewalk games, which means that safety measures also need to be implemented, just like in the case of the School Zone Improvement Project in Seoul, where they developed clear separation with the help of small fences (NIUA, 2019). Besides children, playful street crossings can also affect the driver’s behaviour and by that, it can be a tool to increase the

visibility of vulnerable road users and support road safety. After getting the legal permission, an intervention like this can be implemented by the community, involving local schools or artists, either way, it can create a special place for the locals from the neighbourhood. While public playgrounds and sidewalks are available constantly, some places in a city are open only in a certain timeframe for the public, such as schoolyards. Extending the opening hours of these yards can give another venue for local children to play as well as for the local community to organise events and social gatherings (Kyriakou, 2014). The St. Lawrence Neighbourhood in Toronto illustrates the same example: the playground next to the school belongs to the school itself and during school hours it is used exclusively by the students, but after those hours it is opened for the local community (NIUA, 2019).

The neighbourhood scale encourages the children to move forward in independent and playful exploration such as different routes, networks and the riverbank. The Cantinho do Céu Complex in Sao Paulo illustrates how a riverbank can be turned into an inclusive, green urban environment beneficial for all the locals of a neighbourhood: it brings closer the waterfront to the children through accessible pathways, designed for exploration with many playable objects and spaces alongside (NIUA, 2019). Another neighbourhood-scale placemaking intervention can be a network, connecting different sites of the city, such as the 'Playing out' project (NIUA, 2019), showing how a micro-scale bottom-up project can grow into a neighbourhood-scale solution. Its core idea first came from two local parents aiming to create a small outdoor space for children, but through community engagement today the project involves 150 streets in the city. (NIUA, 2019). When discussing a network of child-specific places, we also need to consider their connecting routes to become child-friendly: they can create awareness to help children feel safe and support their independent urban mobility (Corsi, 2002). In Maggie Daley Park in Chicago, the routes are enriched by interactive and climbable objects on their sides (NIUA, 2019). A project realised in Bogota, created routes to develop a sense of safety in children. The project aimed to assess the danger spots by mapping them with the children and the local community and then creating smaller tactical interventions to target the problems (NIUA, 2019).

3.3 Dividing Roles

Urban placemaking projects can be realised with the involvement of different stakeholders, such as educational and research institutions, designers, the state or a local municipality, NGOs or civic organisations, and organisations of the private sector. Each potential stakeholder has a different role and can contribute to a project in different ways by bringing their own experiences, knowledge and power to the table, which means that responsibility can be shared but also that the different expectations of the stakeholders need to be articulated to avoid disappointments and conflicts. Schools might have a significant role in creating a bridge between the design team, the children and other stakeholders too. The school community can realise and articulate a problem and ask for support to solve it just like it happened in Mumbai, where the Jai Vakeel School and the Victoria Memorial School for the Blind have invited a team of designers to transform the campus' outdoor space into a play area, which would fit the needs of the disabled children (NIUA, 2019). The school realised that it is unused and could be turned into an intermingling space, for children from different local schools to meet and play together. Municipalities can support a placemaking project with local funding, they also have the authority to give permissions for occupying public spaces and realise constructions last but not least, municipalities can be the target group of policy recommendations, since they can influence local regulations. The power of civic organisations comes from knowing the local communities directly through public actions which is clearly illustrated by the Smart Park Redevelopment Project in Bhubaneswar, India, where the local NGO had a significant role in the realisation process (NIUA, 2019).

In conclusion, the involvement of end users, particularly children, in the urban planning process through placemaking initiatives necessitates consideration of various factors such as the level and methods of involvement, the scale of interventions, and the roles of participating stakeholders. The depth of participation can vary based on the tools utilised, ranging from introductory meetings and observations to participatory workshops and informal verbal tools like interviews and group discussions. These tools provide invaluable insights into community needs and preferences, informing the design process and fostering collaborative decision-making. Moreover, placemaking projects encompass different scales of

interventions, from micro-level installations like street furniture to neighbourhood-scale initiatives such as creating networks of child-friendly places and routes. Different stakeholders, including educational institutions, designers, municipalities, NGOs, and civic organisations, play crucial roles in these projects, contributing their expertise and resources to create inclusive and vibrant urban spaces that cater to the needs of children and the broader community. Through a comprehensive examination of these factors and examples, an urban placemaking project was realised in Budapest, as presented by this paper.

4. A Collaborative Research Project in Budapest's 7th District

Built upon the introduced learnings, a research project was developed by the Innovation Center of a Hungarian-based design university, the Budapest Public Transport Center, the Institute for Human–Environment Transaction of Eötvös Loránd University and the Municipality of the 7th district of Budapest, aiming to tackle the needs of children (age group 8-13) in lights of public transportation, micro and active mobility, focusing on the usage and opportunities of public places around their school. The main research question was how design might facilitate children's physical and mental visibility and safety regarding the inclusivity of public places and mobility formats using placemaking to mitigate traffic through innovative research and a co-creation-based design development process.

The first chapter of the research project ended in December of 2022 and it had five different stages: (1) observations by the researchers focusing on the current situation of the street of the school, (2) questionnaires for the students focusing on their mobility and socialising habits, (3) problem mapping workshops involving four classes (with 30 students each) of four different schools of the 7th district, (4) participatory design workshops, involving 30 students from one of the previous schools and (5) testing the usage of the already installed prototype through observations and questionnaires among student and teachers.

By the observations and the questionnaires, we could understand the general conditions of the school front environment as well as the general usage of it. During the observations field notes were taken focusing on the behaviour of arriving and leaving students and teachers, accompanying parents, drivers, and pedestrians as well as physical circumstances and social interactions between the different groups. We have learnt that students use micro-mobility vehicles and the matter of their storage is unsolved. Neither students nor parents socialise in front of the school. Pavements are narrow and parking cars are filled up on both sides of the street. Many students are dropped off by car in the morning but in the afternoon students leave in groups by walking. Most of the students leave closer than 10 minutes of travel but some students have to travel more than 30 minutes to get to school.

The problem mapping workshops included four workshops (45 minutes each) for 4x30 students of four different elementary schools, situated in the 7th district of Budapest. The four occasions had four different focuses. During the first workshop, the students created a common cognitive map (Altman et al. 1978) about the urban environment of their school. They had to involve not only its physical conditions (with parking sports, green areas, traffic lights and so on) but also they had to place their emotions (fear, happiness, loneliness, togetherness etc.) on this commonly created map to help the researchers to understand the advantages and limitations of the place in its fullness. In the second workshop, students got involved in small, facilitated group discussions about their mobility habits and most commonly used routes. During the discussions, we used different visual aids to help the conversation. With the third workshop, we created "parent personas" with the students to understand their families' habits and preconceptions about mobility, public space and the built environment. The persona creation was supported first with more general (such as: What does this person look like? What does this person wear? How does this person travel in the city? What is the daily routine of this person) and after with more specific questions (such as: What does this person think of the safety of the street? How does this person feel about the efficiency of public transportation? What does this person suggest us in an urban environment?). During the last (fourth) workshop, students created their common collage based on their needs, including given and desired activities related to public space in the school environment, which helped us to understand both the current and the wished use of the space.

The structure of the following participatory design workshops was developed based on the results of the problem mapping workshops: it included a group brainstorming and modelling session, engaging one class of students, organised into small groups. These sessions aimed to ideate with the students, addressing the challenges identified during the prior examinations (observations, questionnaires and problem-mapping workshops). The brainstorming phase focused on four topics: greening and sustainability, mobility, safety and the usage of the current school front area. To warm up the groups we used different rapid creative games like story cubes, activity and visual prompts. The main activities of the brainstorming phase were situational exercises, where the groups of students got different rapid situations to solve. The situations included examples like: “You are waiting for a public transport service to get home and you need to fill in the time left at the stop. What does an ideal bus stop look like?” and “We need to designate and build a safe way home for our 4-year-old little brother.” In each situation, the students got different tools to work with. We aimed to use child-friendly and playful tools, such as cardboards, blind maps, speech bubbles, printed street view screenshots, colourful tapes and sticky papers, pictures, maps drawn on the floor and life-sized projected photos. After the situational exercises, each group had 45 minutes to model their ideas as detailed as possible, including all the solutions and functions they collected during the brainstorming.

Based on the collected data, a prototype was designed to tackle the challenges raised by the target group. The results of the participatory design workshops gave a significant imprint on the development of the final implementation: aiming to develop an inclusive, child-friendly, sustainable and adaptable urban intervention which supports children’s visibility and traffic calming as well. Assessing the usability and impact of the tangible prototype was the last methodological part of the research. This involved different observation methods such as narrative impact assessment among the target group and quantitative tools like speed measurements using a speedometer. Speedometers were executed twice, approximately one month apart by the Budapest Közút Zrt. The first happened before the installation and the second was one week after it. Both happened on the same four days of the week, from Monday to Thursday measuring the traffic of the entire day. The created and installed prototype at a pilot location is a research tool which combines modular, alone-standing steel structures, asphalt painting and plantain. This research tool provides real-life opportunities to collect and analyse data and start a conversation with different stakeholders (children, parents, teachers, neighbours) in a co-creational manner. The prototype is an experimental small-scale installative intervention that aims to react upon the insights coming from the children such as dedicated space to gather and wait, being visible, having a chance to experience place attachment and having a more recognisable school area. Besides these aspects, the prototype also tests the utilisation of scooter storage to respond to the emerging usage of different micro-mobility tools among children. Another goal of this placemaking tool is to make the school more visible and affect the traffic surrounding it. The intervention aims to cause traffic calming and to affect drivers’ behaviour through visual stimulation.

After collecting and analysing the results of the first project, the collaboration started a second chapter last November, involving a new school from the same neighbourhood aiming to move forward with the learnings of the already closed project. The methodology is built upon the previous one including some changes based on the feedback and takeaways.

5. Results

During the whole research project, we collected (1) qualitative data through observations, questionnaires as well as problem mapping and co-creational workshops and (2) quantitative data by speed measurement tools.

Both the prior examinations (observations, questionnaires and problem mapping workshops) and the co-creational workshops resulted in a deeper understanding of the challenges children face in the specific urban environment of school front areas. Regarding the built environment we have learnt that the involved students face a high level of placelessness: there is no dedicated place for them to gather and socialise after school or to wait for each other. And even more, they feel unwanted in this environment resulting in

them being unable to develop an attachment to this place which should have a major role in their development. They also articulated the need for greening, alternatives for playgrounds, colours, bright bus stops, seating areas, storage spaces for rollers and bikes, litter bins, and larger visible spaces but also smaller spaces for more privacy. They also have different levels of knowledge about the school environment, they could not (or hardly) point out favourite places, although they mentioned parks, squares and places for sport and sitting close by. Students' physical and mental safety also turned out to be a main concern: they feel that they are not visible and their sense of security is disturbed by traffic and strangers. Regarding the children's physical safety, speed measurements proved that drivers not only avoid slowing down in the close environment of the school, but we recorded a significant amount of speeding as well. The speed limit was 50 km/h, and the maximum velocity was over 90 km/h.

Besides learning about the needs of the involved children, we also gained a deeper understanding of the perspectives of their teachers, parents and locals through observations, interviews and questionnaires. Parents are a large group, who frequently spend some time in front of the school waiting for their children, mostly during mornings and afternoons also. They were often leaning against the safety barrier while talking to each other. Also, there were occasions, when they met with a teacher for a brief discussion or just handed over a paper. The school front area turned out to be a meeting point for the school's whole community as well as for some locals, even if it was not established in its planned form.

Based on the prior examinations and the co-creational workshops, a prototype was created and installed in the form of an experimental small-scale and modular intervention, to react upon the insights listed above coming from the children and their teachers as well as to use it as a research tool for more data collection. After the installation of the prototype we applied different observation methods such as narrative impact assessment among the target group, questionnaires as well as speed measurement tools. The most beneficial functions offered by the prototype seemed to be the leaning components placed on the safety barrier, the bag holder surfaces, the bench and also the place itself created by the installation. According to our new observations (one year after the installation), we can see that the placed modular system is widely used by the school's community for a shorter period during the mornings and for a longer time during the afternoons according to the observatory research. The prototype tested the utilisation of scooter storage to respond to the emerging usage of different micro-mobility tools among children, but it does not offer a permanent solution, however, it draws attention to this question. According to the suggestions of teachers and students, the installation should involve even more sitting surfaces and more opportunities to store bicycles, also teachers had suggestions to strengthen the structure of the installation to make it more resistant and thus safe. Besides these suggestions, only one main criticism was formulated by the school community about the painting of the asphalt around the installation, which means it needs more structured preparation and more involvement of the target groups in its design process. The goal of targeting traffic calming is partially reached, since the average velocity compared to the starting setup decreased by 3 km/h, after the installation.

Receiving feedback from the children and teachers through questionnaires (repeated one year after the installation) and group discussions, we learned that many children enjoy the colourful and playful solutions as well as the plants and seatings, we could also learn that in the case of both students and teachers, the installation is popular and it became the centre of social interactions in the school front area for both teachers and students as well as their parents. Since the children also articulated their new ideas according to the size and setup of the installation, it means that the participatory process was successful in involving the students in the design process: they started to feel engagement, ownership and control. Although on their first visit after the implementation, students hardly stepped into the new installation to explore it, a few months later during observations we learnt that it has become an often-used space, not only by the children, but the whole school community as well.

6. Conclusions

The involvement of students in co-creational workshops presented both challenges and opportunities in the design process. Despite initial difficulties in expressing their opinions, a few participatory workshops effectively engaged the students, emphasising the importance of their inclusion in urban interventions. This research highlighted systemic issues such as the general placelessness of the target group and their invisibility. Moreover, the findings regarding public place awareness, liminal spaces, and traffic calming suggest potential paradigm changes in Budapest and other cities in the CEE region. The research methodology provided valuable real-life opportunities to collect and analyse data and initiate meaningful conversations with various stakeholders, including children, parents, teachers, and neighbours. Moving forward, the research aims to integrate the findings into a new school environment, involving additional stakeholders more directly and focusing on more diverse groups of users besides children. While the traffic calming installation showed some improvement in traffic speed, there is still room for bolder solutions, and concerns about children's safety near intense car traffic persist among teachers. Observations revealed consistent use of the installation during after-school hours, indicating its potential impact despite cold weather conditions. The next steps involve extending the scope of traffic calming through placemaking by further developing tested prototypes and creating new, ambitious small-scale interventions in collaboration with intersectoral actors to provide scalable and transferable solutions for Municipalities in school areas.

About the Authors:

Erzsébet Hosszu is an architect, lecturer, researcher and doctoral candidate at MOME. Her research mainly focuses on vulnerable groups and the development of their physical environment using the combination of participatory design approach and environmental psychology.

Rita Szerencsés is a doctoral candidate, social designer, impact researcher, urbanist and design and arts manager. She focuses on impact studies regarding social design involvement. She is interested in maintaining urban communities, pursuing socially rewarding innovations and supporting disadvantaged people.

Borbála Marosán is a research assistant with a background in design, art and engineering management. She focuses on social and environmental sustainability, currently, she is working on practice-based research projects involving children from both disadvantaged communities and urban environments.

Acknowledgements: We thank all the support of our colleagues for their constructive comments about this project as well as the community of the Hungarian-English Bilingual Primary School of the 7th district of Budapest. We gratefully acknowledge that the project was and still is supported by the 7th district municipality of Budapest.

KEYWORDS | DESIGN WITH PERIPHERIES, URBAN INFORMALITY, RESILIENT CITIES, SOCIAL DESIGN, DESIGN FOR AGENCY

ABSTRACT | Today, the world faces a multitude of complex societal issues, that need urgent attention for enhanced quality of life and resilient futures. With the help of a study on the daily mobilities of urban marginalised women (UMW) supported by state-of-the-art literature, this paper presents insights into the aspects of urban informality that can inform the design and planning of future cities capable of surviving the situations of crises. By adopting a combination of new technologies along with mobile methods and ethnography, this research centres around the everyday travel experiences of the urban marginalized women from the peri-urban areas of New Delhi who contest their right to access stationery and mobile public spaces. Following the elements of qualitative research, this study examines the socio-spatial environment comprising the daily mobilities of UMW to reveal certain conditions of informality that enable their access and participation in socio-economic activities. In doing so, the paper highlights the significance of various infrastructures emerging from the social conditions of doing things together (social interdependence), belonging to a community and the aspects of self-organisation that are crucial for the sustained functioning of cities. Moreover, it presents a perspective for designers to identify and embrace temporary ways of existing and operating towards resilient cities of the future. With the help of the findings from this study, this paper presents urban informality as a design paradigm for various systems and services of future resilient cities that are more equitable and inclusive, and at the same time adapt to the dynamic uncertain situations of crises by being flexible, adaptable and leaving spaces for the emergence of bottom-up citizen-led initiatives.

1. Introduction

In recent years, there have been several incidents of crisis where informal arrangements constituted by the actors or people have been able to mitigate uncertain situations, such as during the coronavirus pandemic[1] or in case of issues related to migration (Ukraine, Syria), where the existing formal structures or the national governments have been unsuccessful. This questions the proper functioning and sustenance of formal service systems within the cities established by the policymakers, and at the same time brings attention to the potential of informal, bottom-up processes initiated by the inhabitants for their survival. This phenomenon where citizens act together to make use of the available resources to address their needs can be linked to 'subaltern urbanism' or urban informality. According to Roy (2011), subaltern urbanism provides a perspective focused on the habitation, ways of life and politics within slums or peripheral areas of megacities. In recent studies, the notion of peripheries signifies the physical space on the fringe of the megacities, the in-between, that is constantly evolving and lies between the urban and the rural, also referred to as the peri-urban interface that presents the space for making and remaking of urban life (Simone, 2010a). This implies that the notion of peripheries goes beyond the topographical space and also reflects the various discontinuities, hinges or relationships that emerge within the socio-urban territories (Simone, 2010a). These peripheral areas or regions of megacities also known as Third World slums, from the Global South are considered to be outside the notions of developmentalism (Robinson, 2002) but at the same time reflect their various survival abilities (Roy, 2011) where the inhabitants have devised their own creative ways to function as a response to the negligence of the state (Roy, 2011). It is emphasised by Roy that subaltern urbanism reflects two main subjects of attention, namely, economies of entrepreneurialism and political agency (Roy, 2011). Through the study of everyday mobilities of urban marginalized women (UMW), in the peri-urban areas of New Delhi, characterized by aspects of exclusion, this paper presents insights that would enable the design and planning of future resilient cities through equitable and inclusive service systems that provide spaces for emergence of alternate bottom-up processes to meet the needs of people. This paper presents urban informality as a value for the design and planning processes and brings debates on spaces of poverty, access, agency and politics to the forefront.

2. Understanding Informality (Subaltern Urbanism)

Within the context of modern Indian historiography, the notion of subaltern emphasised to depict power, domination and relationships signifying inferiority and dependency (Sarkar, 1984) along with a space of indifference (Spivak, 2005). However, Guha (2005) argues that the concept of subaltern represents the politics of the inhabitants and should be understood as an agent of change. The survival actions explored by people of the Third World megacities are described by architect Rem Koolhaas as inventive measures characterised by experimental responses and reflect a 'culture of make-do' (Patteeuw, 2003, p. 116) that engender significant systems based on alternative ways of functioning, aspects of self-organisation and provide spaces of deregulated actions (Godlewski, 2010). Similarly, for De Soto (2001) the Third World slum reflects an economy of the people, rich in assets that represent many of such self-organised mechanisms that could be understood as valiant entrepreneurial experiments. Several scholars argue that the urban peripheries present settings for critical contestation of citizenship and practices of hegemony (Holston & Caldeira, 2008; Roy, 2011; Simone, 2007). Within the context of political agency, Gidwani (2006) repudiates the argument on probable connections emerging between the different vulnerable inhabitants of the urban peripheries.

The informal sector is most prevalent in cities of developing countries since these cities are experiencing huge urban growth (Roy, 2005). These cities are reminiscent of complex machines that comprise interwoven layers of human beings and physical materials that further produce social, cultural, political, economic and environmental relations (Simone, 2010b). In developing an alternate way to understand

[1] In early 2021, during a major Covid break out in India, most government-run and other formal systems in healthcare and other logistics sectors collapsed at the time of an unexpected situation of crisis. During this time, several informal and non-hierarchical systems emerged that were formed by the people and for the people to support one another.

cities, Castells (1985) relates it to urban social change where he emphasises the notion of collective actions signifying the presence of multiple acting forces in its production. In doing so, Castells (1985) presents a critique of the Marxist theory that fails to consider important issues, for instance, related to feminism and culture, that may help to understand the urban as a critical element related to aspects of urban social change. Castells (1985) presents a definition of urban social change as contemporary social and urban movements that are characterised by a culture representing communities and that lay emphasis on political self-determination (Mayer, 2006). It is further elaborated by Castells that the existing hierarchical structures that comprise the urban, undergo transformation leading towards a kind of reorganisation of the society based on values signifying democratic participation and decentralisation as its critical elements (Mayer, 2006).

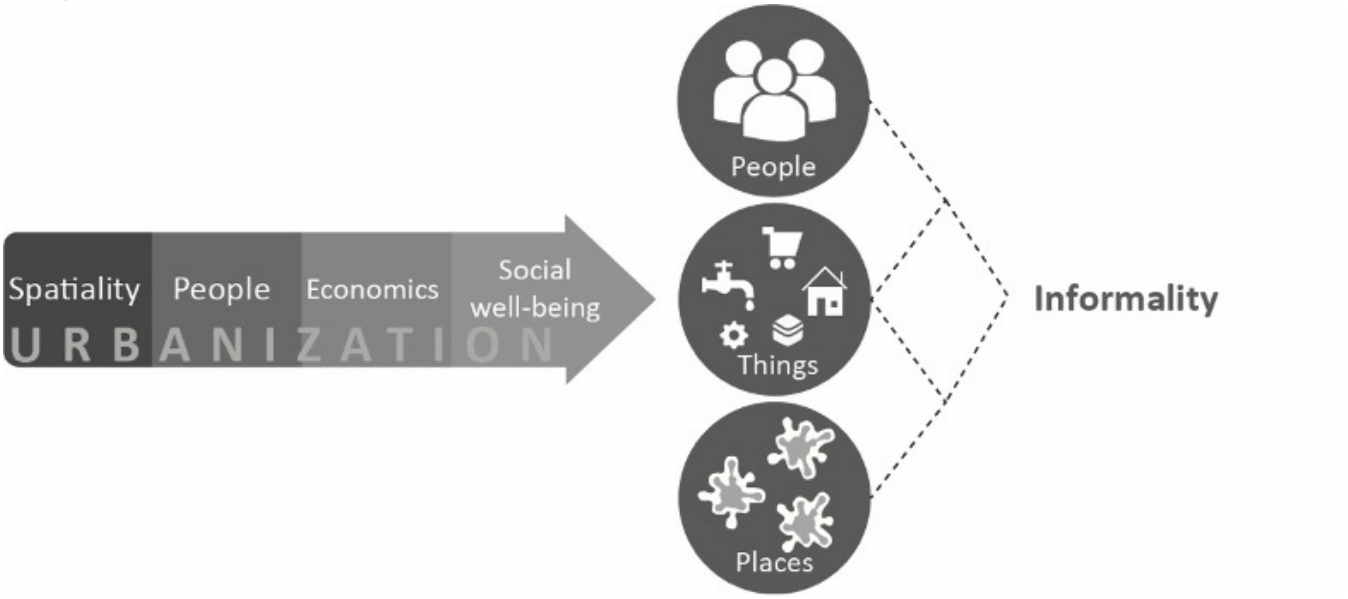

Figure 1. The socio-technical aspect of urbanization produces productive relationships among people, things and places. This inter-relationship gives rise to 'informality' which is an integral component of urbanisation. Source: Adapted from Simone (2010b).

In the case of developing countries, a flexible model of governance, signifying the concept of political agency (Guha, 2005; Roy, 2011) is based on self-initiatives of the individuals and gives rise to bottom-up solutions addressing various issues of the society. However, the recognition of such informal self-organised models as a comprehensive social or political force is often doubtful, yet such actions present opportunities to the inhabitants of the city for negotiations, collaborations, exchanges and strategic planning (Brown et al., 2010; Grant, 2009; Lewinson, 2007; Lindell, 2010; Mohan, 2008). The daily work or activities allow the inhabitants to be actively engaged in each other's lives to create and sustain relationships with their neighbours, co-workers and extended family members. These relationships with the city and other people enable the inhabitants to create a map of their own whereby they identify and categorise safe and unsafe places, the belongingness to those spaces and the connection between different spaces (Simone, 2010b).

Often, the survival techniques, which emerge from socio-economic or geographical reasons, give the cities an alternative mechanism to co-exist and maintain a balance in urban city life. These solutions to urgent or otherwise unsolved problems of urban cities are defined as idiosyncratic innovative paths, that is, a structural or behavioural characteristic unique to an individual or group (Srinivas & Sutz, 2008). In such contexts, the relationships of individuals with one another and with their social, economic, and political environments are of utmost importance. Most cities of developing countries generate a conglomeration of social activities that either align themselves or strive their way through city governance and policies. The deficiencies of certain kinds of infrastructure in cities give way to other possibilities relating to policy interventions and governance that are more flexible (Simone, 2010b). In these contexts, flexibility and uncertainty are considered inherent parts that transform into crucial resources for survival. Adding to this,

Bayat (2007) asserts that besides flexibility, the informal life is signified by aspects of 'doing things on your own', negotiations and describes it as a continuous process that involves a struggle for the vulnerable to survive and for self-development.

The concept of informality is also supported through understanding 'resilience'. The cities characterised by adaptive and flexible systems through the capacities emerging from the constantly evolving social learnings (knowledge of people) enhance their chances of being more resilient in situations of crises comprising complex societal issues (such as social inequalities, migration, climate change etc.) (Davoudi et al., 2013). Holling (2001) argues that (identifying) human capacity(ies) is an important characteristic of social systems specifically for foresight and intentionality. This is supported by different ways and means (or appropriation) to enhance their ability to strategise and plan. Identifying potential vulnerabilities and 'other' ways to function (opportunities) within the social learning processes enhances the likelihood of societal transformation (Davoudi et al., 2013). Thus, resilience is more than resisting the forces. It includes focusing on critical issues such as the intentionality of human actions, the purpose of resilience, the non-linear approach that diffuses the boundaries imposed by existing systems and the questions of power and politics (Davoudi et al., 2012, 2013). This paper presents the findings of a study from the Global South (New Delhi) to discuss the concept of informality as a significant design paradigm through the daily mobilities of urban marginalised women.

3. Self-Organisation through Available Infrastructure

Most peripheral areas of the cities of the Global South lack resources, political will and technical capacity, but they demonstrate the ability to build a connection between individual households and other economic, cultural and religious activities to support their livelihoods (Simone, 2010b). To perform these activities, the participation of individuals is important within the larger networks. According to Piermay and Schler (2003), as cited in Simone (2014), such arrangements give rise to unique, but dynamic interaction patterns including exchange and socialising. Roy (2011) emphasises two main themes of focus in relation to informality, namely, economies of entrepreneurialism and political agency. These attributes contribute towards new possibilities of citizen participation for bottom-up urban governance practices, and is termed by Botero and Saad-Sulonen (2010) as 'infrastructuring'. According to Simone (2004), the social infrastructure that comprises the inhabitants of territories forms an important core of cities. Blommaert and Klinenberg argue that social infrastructure enables different connections within the groups, and it can facilitate various interactions, including contrasting thoughts (Blommaert, 2014; Klinenberg, 2018). Emerging from everyday economies, behaviours such as reciprocation, negotiation and cooperation highlight the bottom-up initiatives of participation in contrast to an unintentional dominant top-down design approach (signifying colonialism, capitalism or heteropatriarchy) (Costanza-Chock, 2020). According to De Soto (2001), the insurgence of the grassroots against the state power epitomises the informal and signifies bold and risky ways of doing things on your own. This aspect can be related to community-led design that focuses on civic participation leading towards democratic outcomes (Alexiou et al., 2013).

Several social aspects like social norms, social trust and social networks comprise what is known as social capital (Durlauf & Fafchamps, 2003) which has characteristics like flexibility and openness as critical components (Star & Bowker, 2006) and grows with every act of participation and sharing of acquired knowledge (Star & Ruhleder, 1994). It is understood that in the case of informal economies, social networks and personal relations help in the formation of several mini and micro-economic activities. Moreover, in some cases, these social networks aid in providing access to certain favourable resources for entrepreneurs (Meagher, 2005). The collaborative initiatives involving different users is explained by Bollier and Helfrich (2014) as an act of design, which paves the way for a 'commons culture' (Bollier & Helfrich, 2014), that is, through social relationships and shared knowledge. Botero et al. (2010) discuss 'infrastructuring' as a shared resource where it is crucial to consider 'when' something is being considered as an infrastructure or a resource by its users. It is not just the resources and context that are important; it is crucial to consider the right time and use of these resources by its users (Marttila et al., 2014). Different kinds of infrastructures, including social, physical and institutional, affect the emergence of bottom-up initiatives

and how these can be appropriated under different situations or contexts (Pipek & Wulf, 2009). Several studies (Star & Bowker, 2006; Star & Ruhleder, 1994) have highlighted significant features of these informal emerging resources, such as the inter-relationship and connectedness with other social, spatial and technological structures, their spatial and temporal reach and the non-obvious arrangements between people, spaces and things that go unnoticed. The formation of new infrastructures does not take place from nothing; it results from acts of negotiations and contestation (Star & Ruhleder, 1994) between different entities involved.

4. Context of the Study

This study focuses on urban marginalized women (UMW) living in the peri-urban areas, also known as, informal settlements, of New Delhi in India. Most people living in the informal settlements of these peri-urban areas are migrant poor who have travelled from neighbouring states of Delhi in search of work. Among the various groups of women in India, the most vulnerable are the UMW. This group of women are marginalized from two perspectives. First, because they belong to the socio-economically weaker section of society and second, they are women. Besides experiencing exclusions at a household level, women from marginalized communities also face several other challenges at the city level. These women are primarily employed in the semi-formal or informal sector[2] and often cannot afford to use any transport mode but walking. A study conducted by Bostock (2001) on low-income women also presents the numerous problems women face while walking, including fatigue, stress and psycho-social effects. According to Uteng (2012), the cultural aspect plays a crucial role in the positioning of gender with respect to mobility, namely, access to outer space and kinds of activities. Several studies highlight the impact of risks associated with travelling on public transport modes, such as sexual harassment and travel behaviour of women, where women tend to self-exclude themselves from certain activities hence limiting access to social, leisure and economic activities (Anand & Tiwari, 2006; Murray, 2016). Fear of space is one aspect of risk aversion that is related to the interaction of women with urban space (Pain, 1994). Due to this reason, they tend to return home early and thus lose out on employment opportunities (Tanzarn, 2008). However, Tulloch (2000) states that many factors contribute to risk experience and depend on spatial and social contexts.

5. Methods

This study uses a combination of new technologies along with mobile methods and ethnography to focus on the daily mobilities of UMW. The participants for the study were recruited by establishing contacts with two NGOs in Delhi that work with issues related to women or women empowerment[3]. The study is divided into two main phases. The first part of Study I requires understanding the socio-demographic conditions of the participants through the means of unstructured interviews. The second part of this study shifts the focus of the interviews towards developing a cohesive understanding of their daily routines. In-depth interviews are used as a preliminary method to understand the socio-demographic characteristics of the participants living in urban peripheral settlements of New Delhi. Subjective and experience-related questions, such as the description of their daily routines and travel experiences were asked during the ethnographic interviews. It was ensured that the interviews were conducted one-on-one and in private to make the participants feel comfortable so that they could share their experiences freely. These interviews also included a detailed explanation of their daily travel patterns. Through this description, information regarding their travel patterns was extracted for further inquiry.

[2] The formal economy is marked by regular work, is legally sanctioned and is regulated through state intervention (Hart, 2006; Portes & Schauffler, 1992). Institutions that do not fall in the formal policy regulated environments and are more ephemeral and, not easy to categorise or define (Demant Frederiksen, 2015; Kelsall, 2011) may be called the informal sector, informal arrangements or informal economy.

[3] Azad Foundation is an NGO that mainly works towards the capacity building by providing driving training to women from resource-poor communities. It has its centres in north, south and east Delhi. The other NGO is CEQUIN India, located in southeast Delhi in Jamia Nagar and promotes equal rights for women and girls.

Further, in Study II, mobile methodology is used for collecting information about the participants' daily movement through GPS path tracking. The second part of the study collected data focusing on the path travelled by the participants for a period of two weeks. This study adopted the use of phone GPS and Google Maps timeline. To identify underlying themes and categories abductive approach to constant comparative analysis is applied for unstructured interviews. Mapping is used as an interpretive analysis method for GPS travel path data. This study adopted the use of phone GPS and Google maps timeline. This study was conducted during the Pandemic, with restrictions on mobility and social gathering. Thus, based on the availability and knowledge of the participants, appropriate tools (WhatsApp and Google Maps Timeline) are used during the field study[4]. Interviews are conducted through both face-to-face interviews and voice calls using WhatsApp[5]. The researcher educated the participants with the help of screenshots and voice calls on how to turn on the GPS location on their smartphones and how to share their current location on WhatsApp. Along with this, travel diaries are also filled out for each participant[6]. These methods helped to identify the characteristics, motivations and barriers that affected the movement patterns of the participants. This process gave the researcher a broad idea of the different journeys performed by the participants.

Travel diary, along with the GPS tracking method, helped in the data triangulation that allowed the study to investigate small but important factors related to the daily travel routines of the participants.
To identify underlying themes and categories abductive approach (where codes emerge gradually) to constant comparative analysis or coding is applied for unstructured interviews. However, manual mapping is integrated into the analysis method to avoid overshadowing of the computer software, which could missed finer details of the data (Silverman, 2015). Mapping is used as an interpretive analysis method for GPS travel path data.

A group of 20 women participants were interviewed for this study. The data relating to travel patterns were gathered for 14 participants through their Google Maps Timeline[7]. All participants reside in informal settlements towards the outer periphery of Delhi and belong to the lower-income section of the society. Their age varies from 19–46 years. In terms of occupation, 17 participants are employed full-time, and the rest are involved in either part-time or informal jobs or are pursuing education or some other course or training. Few other women are associated with the NGOs where some of them work as ‘mobilisers’ (social workers) and others are taking driving lessons. Besides travelling for these purposes, for some women, their daily travel also includes attending to daily reproductive responsibilities such as picking up or dropping children at school, grocery shopping, etc. The daily mobility of these UMW is characterised by travelling long distances and therefore is accompanied by increased travel time and travel cost. In absence of direct connectivity between their home location and workplace, they need to include multi-modal trips within a single journey to accommodate for spending less money on travel-related activities. In most cases, the last mile of their journeys is completed with the help of informal modes of transport and walking.

[4] While conducting preliminary research it was found that not all UMW owned a smartphone. Thus, the selection of participants was based on the availability and access to smartphones (with Internet and WhatsApp).
[5] The data collection process began in February 2020 through face-to-face interviews. After interviewing fourteen participants and obtaining GPS data for five participants, the field study came to a halt in the second week of March 2020. During the total lockdown in New Delhi, India, people’s mobility was affected the most and thus it was difficult to pursue data collection with the existing approach involving face-to-face interactions.
[6] In this case, there were limitations concerning the literacy level of the participants and thus the researcher filled out the travel diary during face-to-face interaction with the participants.
[7] Due to lack of technical knowledge and issues related to availability of smartphones, the GPS data could not be collected for all the participants.

6. Findings

This study focuses on the daily mobilities of UMW to highlight emerging aspects of informality towards future resilient cities.

6.1 Social Interdependence

The study reveals that social interdependence is one of the main characteristics of informal settlements (also see sections 2 and 3). It means that people within these societies consider themselves dependent on others for various reasons without any economic benefits to any person or group. Specifically, it is observed that UMW appropriate their ability to engender social interdependence as a means to evade incidents of sexual harassment to carry out their daily mobility.

It is mentioned by many participants that they find walking one of the most unsafe travel options. The study shows that it is quite common for women to experience incidents related to sexual harassment or eve-teasing while walking. Moreover, these incidents take place mainly on the inner streets and are more common after dark, where there is presence of fewer people on the streets and inadequate lighting on the streets. To cater to this issue, UMW prefer travelling in groups of two or more. Thus, social interdependence forms a critical component that impacts the accessibility of UMW to public spaces.

> “I have a friend who goes with me. She lives nearby and we work in the same office.”
> Daksha, 20, tele-caller

> “Two of us go from this area. We meet in the morning at the nearby junction to travel ahead.”
> Rima, 24, social worker

Besides addressing other tangible travel-related issues such as cost, these informal arrangements act as safety nets for their travel journeys. These safety nets are formed through temporary collaboration between known and unknown female co-passengers who need to travel in the same direction (see interview quotes above). This highlights that the aspect of interdependence is not limited to their enclosed social network but expands to include other unknown women co-travellers to form groups while performing the act of travel.

The study also reveals that the women from these communities often make use of their social connections. For example, in absence of support from their families, many women depend on their neighbours to help them with basic but necessary tasks, such as childcare, which enable them to participate in the socio-economic activities to contribute to the finances of their respective families (see interview quotes below).

> “If I could not get back by 1.30, I’d tell my neighbour and she’d pick my daughter from the school transport.”
> Bitti, 33, taking driving lessons

> “I tell ma’am at work that I have to pick my child, then I am able to leave a bit early.”
> Tanu, 28, healthcare worker

> “I have such wonderful neighbours. He is like my brother who has a tailor shop. He keeps my shop’s keys. So, whenever he opens his shop in the morning, he also opens my shop by 12 pm. If there’s a customer, he puts me in touch on the call. Otherwise, he tells them that I will be available in the evening. So, I come by 3–4pm. as my kids return from school at 2 pm.”
> Rubi, 34, entrepreneur

Thus, these women try to get the maximum out of the available resources to put to advantage their capacities to facilitate social capital (see section 3) through spontaneous yet systemic informal networks to carry out their daily mobilities and thus participation in socio-economic activities.

6.2 Self-Organisation

The findings highlight that certain formal mobility systems, such as radio taxis and *auto-rickshaws*, are used as informal mobility arrangements by UMW, especially during their return journeys from work. This system emerges within the formal urban context and is driven by informal collaborations between women and acts as an option that meets their travel needs.

> "We travel together as it gets late (dark) and then we feel safe to travel together. We didn't know each other earlier. It is through our daily travel on the same route that we got to know each other. At times, when we are four-five of us together then we hire a private auto and share the cost. Sometimes we also get into these idle Ola or Uber cabs that make a halt at the bus stop."
> Pulki, 30, beautician

The above interview quote highlights that the women get acquainted with each other through their daily travel routines and enter into unvoiced informal arrangements with each other to self-organise safe and low-cost travel options for themselves. They make use of available resources such as their cumulative physical presence along with the social and collaborative forces that are guided by informality. It is also observed that in the realisation of these alternate options, a significant role is played by modern resources accessible to them through ICT, such as smartphones and instant messaging applications to coordinate and self-organise into groups.

> "We don't even need to stop them, if they see any girl or woman standing and waiting on the road (for a bus or rickshaw), these cab drivers stop on their own and start calling out if she needs to go in that direction. These cabs stop for both men and women. And in the morning sometimes there are auto-rickshaws that are available on sharing basis."
> Madhu, 46, social worker

It is understood that when off-duty (or when the taxis are unoccupied), the drivers of the app-based taxis halt at specific transit points where they usually find passengers travelling in the same direction as theirs. Although anyone waiting at the transit point can make use of this informal system, yet because of safety concerns this system is availed by UMW when they are travelling in a group. It is observed that these decisions need to be quick and spontaneous because they are being taken 'on the move'. This informal arrangement gives UMW an alternate way to travel in a specific direction by spending less money. It is noted that an informal agreement is formed between the driver of the radio taxi and passengers waiting at the transit nodes and is based on aspects of mutual understanding of each other's needs (such as earning extra money for the driver and low-cost travel mode for UMW). These collective capacities enable UMW to plan and make decisions (agency) for their travel journeys on a daily basis. These arrangements demonstrate unsaid rules of cooperation and trust among women who initiate these services for themselves by having empathy and care towards one another. More importantly, these arrangements allow them to plan and design their travel journey with the ability to exercise decision-making for themselves.

6.3 Sense of Community Guided by Socio-Spatial Infrastructure

UMW also shared different experiences while travelling within their home settlements, i.e., informal settlements. The findings from the study highlight that the internal streets of the informal settlements represent a diffused territory through the amalgamation of public and private spaces (Figure 2) that support the daily activities within these settlements. The weekly markets (similar to pop-up kiosks) within the informal settlements that support commercial transactions also help to stimulate a range of social activities, thus transforming the street into a vibrant public space – making it comfortable for UMW to walk through. Specifically, the daily needs shops or activities that mainly involve women's participation, such as buying vegetables and groceries, enhance women's involvement in various socio-economic activities.

> “I feel safe walking back home on Fridays because there is a Friday market on the way, and there are many people around.”
> Neelu, 23, beautician

Figure 2. The streets are an extension of household and other social activities. Source: Participants.

Additionally, the built environment and socio-cultural aspects of the informal settlements create 'in-between' spaces (between the public and the private) and make the presence of many people evident on the streets, ensuring the appropriate conduct of everyday activities within these settlements. The access to walking within the neighbourhood is greatly supported by the urban infrastructure of the informal settlements and thus enables women to perform their complex daily activities (Jurczyk, 1998).

> “From there I have to take the alleyways, so I walk from there. Because I have to pick my son from his school, do some shopping, buy stuff for the house and then come home - I always prefer taking the alleyways (short-cut).”
> Naina, 30, healthcare worker

Many women use the interconnected street network of the informal settlements for walking because of issues related to time as well as safety. The presence of people acts as ‘eyes on the streets’ and ensures a sense of everyday security to these UMW while walking. This draws attention to the significance of the social infrastructure that arises from the density of the informal settlements and reflects on an environment where things (people, spaces, activities, objects) are always acting on one another to create various permutation and combination of infrastructures. It is also highlighted through the findings that mixed land use within these informal settlements enables the participation of women in various socio-economic activities and their access to public space (encouraging other women) without any fear and hesitation. The next section discusses the findings to highlight the elements of informality that inform design practices towards resilient cities of the future.

7. Discussion

The findings of the study present 1) social interdependence, 2) self-organisation and 3) a sense of community guided by socio-spatial infrastructure as significant elements of informality. Informality as a concept is not limited to the physical infrastructure but also builds through the sociality of the urban. The findings reveal that the various connections that are formed among women and other infrastructures bring focus towards the importance of the affordances and capabilities emerging from social interdependence, adaptability, flexibility, trust, reciprocity and offering unstated support to each other. These foster mechanisms that can help to take care of the void left in the (formal) services of the cities (in this case public transportation system). This findings from this study focus on infrastructures managed and organised by actors themselves (Botero & Saad-Sulonen, 2010), that is, facilitated by elements of adaptation, negotiations and rules that are created by the actors for themselves. These are critical factors that align with the concept of evolutionary resilience (Davoudi et al., 2013).

Moreover, the aspect of participating in the decision-making process and designing their own services (mobility) provides confidence and sense of ownership to the people. Such informal arrangements are not fixed in any way but are rather fluid and emerge in uncertain situations and with presence of different kinds of available resources. Marttila et al. (2014) discuss these as critical elements towards participatory design practices signifying importance of tangible and intangible common resources. Thus, from a design perspective, the idea is not to integrate any specific arrangement into the existing formal systems or services of the city. We recommend that the existing (formal) systems should be flexible (not rigid and top-down) and leave space for the actors to design their own temporary services based on their collective needs. This approach would provide autonomy to the actors and enable democratic decision-making processes. The findings highlight the role of city infrastructure should be to support and enhance the formation of social connections and interactions between actors so that alternative options for different services can emerge. The existing urban infrastructure and services (of mobility) need to be adaptive to provide room for mediation of different kinds of social spaces that may emerge during everyday routines of actors. A flexible approach to the design and planning of (mobility) service-systems will aid towards the possibility of the emergence of in-between arrangements that are citizen-driven and thus equitable.

Through this study, we also point towards the changing role of designers to the one that focuses on creating conditions for emergence of bottom-up citizen-led initiatives. That is, instead of designing rigid systems and services within a city, the focus should be on leaving space for dialogue and negotiations to take place (Nthubu et al., 2022) for unimagined, unidentifiable infrastructures to emerge. Thus, this paper presents the need to identify, acknowledge and embrace bottom-up collaborations and non-hierarchical arrangements to be resilient towards the complex societal issues the world is facing today.

8. Conclusion

With the help of a study on the daily mobilities of urban marginalised women (UMW) supported by state-of-the-art literature, this paper presents insights into the aspects of informality to inform the design and planning of future cities capable of surviving the situations of crises. Sense of community, social interdependence and self-organisation emerge as significant elements of informality that enable citizen agency, flexibility and adaptation in uncertain situations (or such as due to lack of resources). The study also highlights the significance of appropriating available (tangible and intangible) infrastructure (as discussed in section 2) which leads towards community-led design and democratic outcomes (Alexiou et al., 2013). This paper highlights the significance of citizen agency to be considered within the design of future cities. Moreover, it presents a perspective for designers and planners to identify and embrace temporary ways of existing and functioning for more resilient cities of the future.

This research focuses on New Delhi as one case example for the study on socio-spatial mobility of UMW, however, it opens up further avenues of conducting similar research in other metropolitan cities where urban informality forms a significant aspect of everyday life of its inhabitants, such as, within the metropolitan regions of South Africa, Bangladesh, Pakistan, Sri Lanka, Nepal, Argentina, Colombia, Brazil and other Latin American cities, to name a few. The findings of the study that highlight informality as a design paradigm open up a broader discussion around access to resources for more open and equitable service systems other than mobility, such as food, education and housing.

About the Authors:

Krity Gera is an architect, designer and researcher. Her research and practice revolve around design justice where she explores concepts related to urban informality, marginalised communities and citizen agency. Krity is currently working on a society-centric project in collaboration with the Wandsworth Council in London.

Peter Hasdell is an architect, urbanist and academic. He is Professor and Associate Dean (Academic Programmes) at the School of Design, The Hong Kong Polytechnic University. He currently directs In-situ Project, a research by design platform focusing on sustainable development and social design.

Gerhard Bruyns is an architect and urbanist. He is Associate Professor at the School of Design at The Hong Kong Polytechnic University, Hong Kong. His research deals with the aspects of spatial morphology and its impact on the formal expression of the city and societal conditions.

Diego Sepulveda-Carmona is a designer and a regional planner and currently holds the position of Assistant Professor at TU Delft. His main research topics are strategies to integrate the development of marginalized areas into metropolisation processes, with an emphasis on design and planning perspectives and tools.

Acknowledgements: This study is a part of a PhD thesis which was completed at the School of Design, The Hong Kong Polytechnic University.

KEYWORDS | TYPOGRAPHY, MONUMENTS, ARCHITECTURE, DELHI, TYPE DESIGN, DESIGN HISTORY

ABSTRACT | This paper delves into the symbiotic relationship between type design and the built environment, focusing on typographic inscriptions on monuments in Delhi. Delhi's rich architectural and urban history, which serves as a hub for various cultural influences and historical eras, is the driving force behind the choice of the city as a case study. Three iconic monuments—Humayun's Tomb, India Gate, and the Indian War Memorial - are selected for their temporal diversity and the common thread of grief and loss of individuals or soldiers in wars, reflected in their typographic content. The study meticulously documents and analyzes typographic elements, including inscription methods, script styles, content presentation, and spatial integration, while also considering the materiality of the inscriptions, such as the use of different types of stones and forms. Findings reveal a dynamic evolution in typography across different eras and materials, highlighting the resilience and adaptability of type design in conveying messages of remembrance and loss within the urban landscape. This research contributes to understanding the evolution of type design, particularly within the context of memorial inscriptions in Delhi, addressing a literature gap. Aligning with the conference's theme of civic engagement through art and design, the paper explores the intersection between typography and materiality in urban artifacts. Ultimately, this study deepens our appreciation of typography's role in shaping cultural heritage and commemorating moments of significance in the built environment.

1. Introduction

Communication has undergone significant evolution throughout history, with typography emerging as a powerful tool that leaves a lasting impact due to its documented nature. In the diverse culture of India, characterised by languages, scripts, and typefaces, typography has played a pivotal role across various historical epochs. Looking at historical monuments, where we see great application and use of typography in their architectural spaces, raises a question! Does this typographic inscription in architectural monuments have any impact on users? How are these typographic inscriptions and their use evolving in and around the same geography? Thus, this study delves into the intricate dynamics of typographic evolution, exploring the changes in its application across different temporal periods. By scrutinising various factors influencing typography, including advancements in tools, technology, craftsmanship, materials, and colour palettes, this research endeavours to unravel the complexities surrounding its implementation in architectural monuments. Through meticulous analysis and examination, we seek insights into the nuanced evolution of typographic expression within India's rich cultural and historical context.

2. The Object of Study: Typography

2.1 Typography and Communication

Typography has played a crucial role in human communication and expression throughout history. From the earliest forms of written language to the intricate designs of modern digital fonts, typography has evolved to convey not just information but also emotion and aesthetic appeal. Typography is more than just arranging letters; it is an art form that merges artistry and technology to convey meaning and emotion (Lim, 2022).

Today, typography permeates print and digital media and physical spaces like urban environments and architectural designs. Its evolution from handwritten scripts to digital typefaces has transformed how we interact with written language in various contexts. Moreover, the diversity of scripts and styles across different cultures and periods underscores the dynamic nature of typography and its impact on visual communication (Haveman, 1997).

The evolution of typography has paralleled advancements in architectural and urban design (Haveman, Andrea. *Typography: Visual Connections to Art and Architecture through the Ages*.). As human activities have diversified, so too have the spaces we inhabit, ranging from intimate domestic settings to sprawling urban landscapes. Typography is crucial in shaping these environments, serving functional purposes like signage and wayfinding while contributing to a space's aesthetic and identity. Integrating typography into architectural design reflects a symbiotic relationship between written language and built environments. Whether it is the nameplates on residential buildings, the signage in commercial areas, or the monumental inscriptions on public structures, typography enhances architectural spaces' usability and visual appeal. Moreover, the historical evolution of typography can be traced through the diverse array of scripts and styles found in different architectural contexts worldwide (Smith, 2011).

2.2 Typography and Architectural Monuments

Architectural monuments serve as tangible manifestations of cultural heritage and historical narratives, often adorned with inscriptions and decorative elements that reflect the aesthetics and values of their respective periods. Famous landmarks that witness centuries of cultural exchange and political upheaval dot the architectural landscape of Delhi, a city with a rich and varied history. Delhi's monuments represent a tapestry of architectural styles and typographic expressions, from the towering Qutub Minar to the stately Rashtrapati Bhavan. These structures serve as landmarks and repositories of collective memory,

embodying the stories and aspirations of past civilizations. By examining the typography adorning these monuments, we can gain insights into the socio-cultural dynamics and historical narratives that have shaped the built environment of Delhi and its surrounding regions (Chernyh & Raspopova, 2020).

3. The Context: The City of Delhi

3.1 Delhi’s Architectural History

Delhi, as the capital of India, epitomizes the nation's cultural, political, and historical significance. Its secular ethos has fostered a harmonious coexistence of diverse religions, beliefs, and ideologies throughout history. Known as Indraprastha in ancient epics, Delhi has evolved into a modern metropolis of global importance, bearing the imprints of various dynasties and empires. The city's architectural landmarks, such as the Qutub complex and Rashtrapati Bhavan, narrate conquest and cultural exchange tales. These monuments symbolize Delhi's rich history and cultural heritage, showcasing architectural prowess from the Delhi Sultanate to the Mughal era. Each structure, from majestic forts to intricate tombs, reflects the social, political, and religious dynamics that have shaped Delhi's identity over centuries. Delhi's monuments are a living testament to its enduring legacy, inviting visitors to explore its diverse architectural heritage. From ancient ruins to modern marvels, they offer glimpses into the past while celebrating the diversity of human achievement. In essence, Delhi's architectural landmarks are symbols of resilience, cultural richness, and the timeless allure of architectural excellence. Selecting Delhi as the focal point for research provides a rich landscape for exploring the intricate interplay between architecture, urban development, and cultural heritage. With a history spanning over a millennium, Delhi is a testament to the enduring legacies of multiple civilizations and dynasties. From its ancient origins, including the legendary city of Indraprastha mentioned in Hindu epics, to its prominence as the capital of the Delhi Sultanate and later the Mughal Empire, the city's architectural heritage is imbued with a wealth of historical narratives and artistic achievements (Singh, 2019).

Delhi's architectural and urban history offers a captivating narrative of the city's evolution from ancient times to the present. This journey is etched into the city's built environment, showcasing various architectural styles and urban landscapes. Delhi's architectural legacy is a testament to the city's cultural richness and historical significance. From ancient settlements to Mughal-era monuments, the city's landmarks, such as the Qutub Minar and the Red Fort, reflect a blend of indigenous craftsmanship, Islamic influences, and colonial architecture. Delhi's urban history also highlights its role as a center of commerce, culture, and power. The city has been a hub of trade and cultural exchange through the centuries, resulting in vibrant urban centers like Shahjahanabad and Lutyens' Delhi. Despite rapid modernization, preserving Delhi's architectural heritage remains a challenge. Balancing urban development with heritage conservation requires innovative strategies and community engagement. Researchers gain insights into urban dynamics, cultural identity, and heritage preservation by studying Delhi's architectural and urban history. This understanding informs discussions on urban planning, sustainable development, and the adaptive reuse of historic buildings. In essence, Delhi's rich architectural and urban history provides a lens through which to explore the complex interplay between cities, societies, and the built environment, enriching our understanding of urban life and cultural heritage (Chernyh & Raspopova, 2020).

a. b. c.

Figure 1. a. Humayun’s Tomb (elevational front view from the entrance) (Author, 2024). b. Light show at India Gate (view from east during the night) (Author, 2024). c. National War Memorial (view from the entrance) (Author, 2024).

3.2 Diverse Cultural Influence in Delhi

As India's capital, Delhi encapsulates the country's rich cultural diversity, drawing people from varied regions, religions, and backgrounds. This amalgamation fosters a vibrant urban landscape where different traditions coexist harmoniously. Throughout the year, the city pulsates with a myriad of festivals and events, spanning religious and cultural spectrums. Diwali, Eid, Holi, and Christmas are just a few examples, each offering opportunities for cultural exchange and mutual celebration. Delhi's cultural vibrancy also extends to its thriving arts scene, with numerous workshops, exhibitions, and performances held regularly. These events showcase various artistic expressions, from traditional forms like classical music and dance to contemporary innovations in theater and the visual arts. Such platforms promote cultural exchange and foster a sense of community and an appreciation for diverse artistic traditions (Singh, 2019).

Delhi's cultural diversity serves as a source of enrichment for residents and visitors, embodying India's ethos of unity in diversity. By embracing its multicultural heritage, Delhi exemplifies the inclusivity and tolerance that define the nation. The city's diverse cultural influences underscore its role as a dynamic cultural hub, where myriad voices come together to create a vibrant tapestry of shared experiences and traditions.

3.3 Historical Eras

Delhi's historical significance spans millennia, with remnants of ancient settlements dating back to antiquity. However, during the Mughal and Colonial ruling eras, the city witnessed the construction of many iconic architectural monuments that continue to define its urban landscape today. The Mughal era, in particular, left an indelible mark on Delhi's architecture, characterized by grandeur, symmetry, and intricate ornamentation. During the Mughal rule, the emperors and nobility commissioned the construction of numerous architectural marvels, including forts, palaces, tombs, and mosques. These structures, such as the Red Fort, Humayun's Tomb, and Jama Masjid, are enduring symbols of Mughal architectural prowess and cultural patronage. One notable aspect of Mughal architecture was the integration of typography, mainly Arabic and Persian calligraphy, as a decorative element in their monuments.

4. The Subject of Study: Typography in Delhi's Architectural Monuments

4.1 The Purpose of Typography in Delhi's Architectural Monuments

Typography shapes society, and as discussed, the monuments that integrate typography into their architecture have their role in making a certain impact on people. During the Mughal period, architecture was not merely ornamental but conveyed profound spiritual and poetic messages. Arabic inscriptions from the Quran, Persian poetry, and royal decrees adorned the walls and gateways of Mughal buildings, imbuing them with a sense of divine beauty and cultural sophistication. The elegant curves and fluid lines of calligraphic script added a layer of visual richness to the architectural ensemble, enhancing the overall aesthetic experience for viewers. Moreover, the integration of typography in Mughal architecture reflected the empire's cosmopolitan ethos and cultural synthesis. The Mughals created a distinct visual language that transcended linguistic and cultural boundaries by incorporating elements of Islamic art and Persian aesthetics into their architectural designs. This fusion of artistic traditions enriched Mughal architecture and facilitated cultural exchange and dialogue among diverse communities. In essence, the integration of typography in Mughal architecture exemplifies the intersection of art, culture, and religion in the built environment. Through skillful calligraphy, Mughal architects transformed stone and marble into expressions of spiritual devotion and aesthetic beauty, leaving behind a legacy that inspires awe and admiration in Delhi's architectural landscape (Baydoun & Kamarudin, 2020).

Many iconic monuments built during different periods in Delhi share similar purposes and functions despite variations in architectural styles, materials, construction techniques, and technological advancements. While the aesthetics and design elements may differ, the underlying agendas behind their construction often remain consistent throughout history. Most monuments built simultaneously share similar aesthetics in the typography incorporated into their spaces. Whether celebrating victory, honoring sacrifice, or asserting authority, these monuments serve as tangible expressions of human creativity, resilience, and aspiration, connecting past, present, and future generations in a shared cultural narrative (Canepa et al., 2019).

a. b. c.

Figure 2. a. Lodhi Garden, 15th century (inscriptions on the tomb's entry) (Author, 2024). b. Humayun's Tomb, 15th century (inscriptions in the grave) (Author, 2024). c. Safdarjung Tomb, 17th century (inscriptions on the entrance to the staircase) (Author, 2024).

In the examples shown above (Fig. 2. a, 2. b, and 2. c), all the monuments were built during the Mughal era. However, the material used in the Safdarjung Tomb changed as it was built more recently (~200 years later than the other two monuments). In contrast, in Lodhi Garden and Humayun's Tomb, the inscriptions depict similar visual language, even though the intention with which both monuments were built was drastically different.

4.2 The Role of Typography in these Monuments

Typography has significantly influenced the design and ornamentation of monuments across Delhi's historical landscape. Virtually every iconic monument in the city features typographic inscriptions, showcasing a diverse range of writing styles, scripts, and languages. These inscriptions serve multiple purposes, from conveying historical narratives and religious teachings to commemorating significant events and honouring individuals. For example, with its towering height and intricate architectural details, the Qutub Minar is adorned with Arabic calligraphy inscribed in the Kufic script. These inscriptions, primarily verses from the Quran and the names of the patron rulers, serve to glorify the achievements of the Delhi Sultanate and proclaim the supremacy of Islam. Similarly, the Red Fort, a UNESCO World Heritage site, features Persian inscriptions that adorn its walls and gateways, highlighting the grandeur and authority of the Mughal Empire (Berger, 2014).

Rashtrapati Bhavan, the official residence of the President of India, features Sanskrit inscriptions from ancient Indian texts, symbolising the continuity of Indian civilisation and the principles of governance. Despite the diversity of writing styles and scripts, typographic inscriptions in different monuments across Delhi often have similarities. For instance, Arabic calligraphy is prevalent in both Mughal-era monuments and Islamic religious structures, reflecting the influence of Islamic art and culture in the region. Similarly, Sanskrit inscriptions can be observed in Hindu temples and colonial-era buildings, underscoring the enduring legacy of India's linguistic and cultural heritage. In essence, including typography in Delhi's monuments serves as a visual expression of cultural identity, religious symbolism, and historical continuity. These inscriptions not only enhance the aesthetic appeal of the monuments but also imbue them with deeper layers of meaning and significance. By studying the typography used in different monuments, researchers can gain insights into the socio-cultural context, religious beliefs, and artistic traditions that have shaped Delhi's architectural heritage over the centuries (Arora, 2014).

5. Case Study: Three Architectural Monuments from Delhi

The choice of three monuments from Delhi, namely the Humayun Tomb, India Gate, and Indian War Memorial, presents a fascinating opportunity to explore the temporal evolution of perceptions towards similar structures across different eras. Each monument embodies distinct historical contexts and cultural significance, offering insights into how societal values and attitudes towards commemoration and remembrance have evolved. Studying these three monuments in tandem provides a comprehensive understanding of how temporal evolution influences the perception of similar structures. From the imperial legacy of the Humayun Tomb to the nationalist sentiment embodied by India Gate and the contemporary reverence of the Indian War Memorial, each monument reflects the nation's changing socio-cultural dynamics and collective memory. The evolution of these monuments in the eyes of beholders underscores the enduring significance of commemoration and the power of architecture to shape historical narratives.

5.1 Humayun’s Tomb

Humayun's Tomb, located in Delhi, is a UNESCO World Heritage Site. Built in the 16th century, it serves as the final resting place of Emperor Humayun. The tomb's symmetrical design, char bagh (four-part) layout, and intricate decorative elements, including intricate calligraphy and ornate carvings, exemplify the grandeur of Mughal craftsmanship. It is renowned for its elegant Persian-influenced architecture and its role in inspiring the design of later Mughal monuments, including the Taj Mahal.

5.2 India Gate

Situated in the heart of New Delhi, India Gate is a monument commemorating the Indian soldiers who lost their lives in World War I and the Third Anglo-Afghan War. The towering archway, inscribed with the names of over 13,000 soldiers, serves as a poignant reminder of India's contribution to the Allied forces and the price paid for freedom. Surrounded by lush lawns and ornamental fountains, India Gate is a popular destination for locals and tourists, especially during commemorative events.

5.3 War Memorial

The National War Memorial, inaugurated in 2019, is dedicated to honoring the sacrifices of Indian soldiers who have fallen in the line of duty since independence. Located near India Gate, it comprises several elements, including the Amar Chakra (Circle of Immortality), the Veerta Chakra (Circle of Bravery), and the Tyag Chakra (Circle of Sacrifice), each representing different facets of valor and sacrifice. The central obelisk, known as the "eternal flame," symbolizes the undying spirit of the soldiers.

6. Comparative Analysis

Among the three structures, built in different eras from 1571 to 2019, the oldest structure, Humayun's Tomb, took the longest to build. While the most recent structure, the National War Memorial, was built in the shortest time, the size of the structures also varies greatly, with Humayun's Tomb being the largest and the India Gate being the smallest. The materials used to build the structures also vary, with Humayun's Tomb made of red sandstone, marble, and quartzite, the India Gate built in beige sandstone, and the National War Memorial prominently made of granite.

Table 1. Selected three monuments and their information.

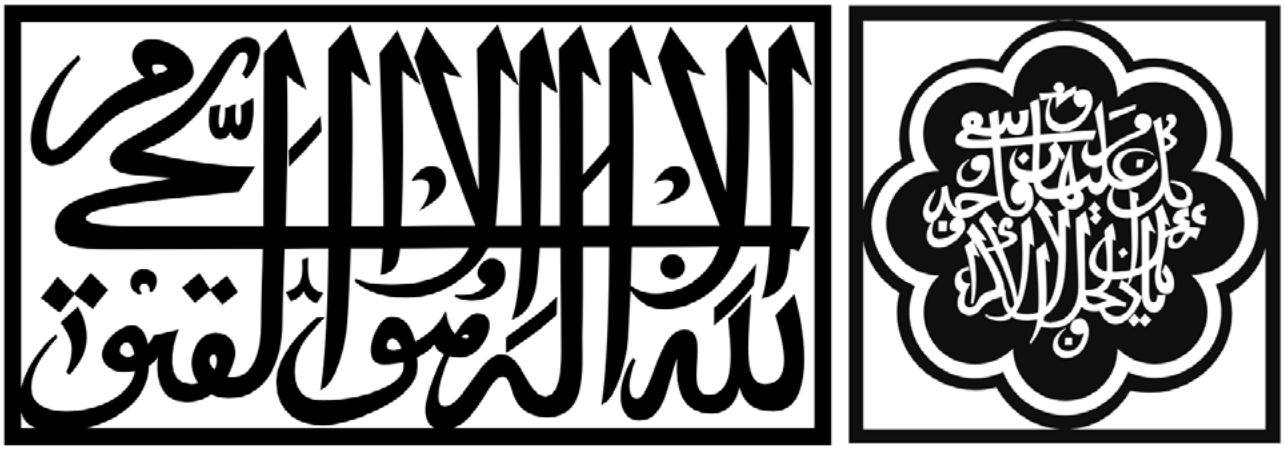
	Humayun's Tomb	**India Gate**	**National War Memorial**
Year Built	1571	1931	2019
Construction Time (Years)	9	10	3
Architect	Mirak Mirza Ghiyas	Sir Edwin Lutyens	Yogesh Chandrahasan
Area (Acres)	66.8	10.56	40
Materials	Red sandstone and marble	Red & yellow sandstone	Granite
Religious Elements	Quranic quotes	-	Eternal Flame (Amar Jyoti)
Inscription	Persian, calligraphic	English, serif	English, sans serif
Events	Heritage walks	Light shows, marathons	Retreat ceremony, flag down
Colour	Natural	Natural	Gold
Estimated Daily Visitors	5000	10000	3000

As we can see, the three structures have been built over a long period, from 1571 to 2019. The oldest structure, Humayun's Tomb, took the longest to build, while the newest structure, the National War Memorial, was built in the shortest time. The size of the structures also varies greatly, with Humayun's Tomb being the largest and the India Gate being the smallest. The materials used to build the structures also vary, with Humayun's Tomb being made of red sandstone, marble, and quartzite, the India Gate being made of red and yellow sandstone, and the National War Memorial being made of granite.

The three structures also have different religious elements. Humayun's Tomb is decorated with Quranic quotes, while the India Gate has an eternal flame (Amar Jyoti). The National War Memorial does not have any religious elements. The inscriptions on the structures are also different. Humayun's Tomb has inscriptions in Persian calligraphy, while the India Gate has inscriptions in English serif script. The National War Memorial has inscriptions in English sans serif script. Finally, the three structures have different events that take place at them. Humayun's Tomb hosts heritage walks, while India Gate is a popular spot for light shows, protests, and marathons. The National War Memorial hosts retreat ceremonies, flag-down events, and family events.

All three monuments today have created their unique perceptions among visitors. Humayun’s tomb today represents the majestic architecture. The scale of structure overpowers other elements; typography is integrated into the built form; it adds to the aesthetic, never becoming the point of attraction. This is different in the case of the war memorial, where the events are hosted every day. The emphasis is on the names of the *Shahid Jawans*, as well as the fact that the events that caused their loss are recent and are fresh in the minds of the visitors compared to those of the other two monuments, making the use of type more impactful.

Table 2. Typographic inscription and its execution on the selected sites.



Structure	Inscription	Color	Materials	Tools
Humayun's Tomb	Persian, caligraphy	Natural	Marble	Hammers & Handheld chisels
India Gate	English, serif	Natural	Sand Stone	Hammers & Handheld chisels
National War Memorial	English, sans serif	Gold	Granite	Granite engraving machine

6.1 Humayun's Tomb

- **Typeface:** Not a single, identifiable typeface, as the inscription uses calligraphy, specifically Nastaliq script. This script emphasizes flowing lines, exaggerated curves, and contrasting stroke thicknesses.
- **Style:** Formal, ornate, and elegant. The use of calligraphy reflects the artistic traditions of the Mughal era and adds a sense of grandeur and religious significance.

a.

b.

c.

Figure 3. a. Typographic engraving from Humayun's Tomb on white marble (quote from the Quran) (Author, 2024). b. Digitally made typographic art from Humayun's Tomb (Author, 2024). c. Cross section of the levels of engraving on Humayun's Tomb typographic art (Author, 2024).

اللهُ لَا إِلٰهَ إِلَّا هُوَ الْحَيُّ الْقَيُّومُ

1. *"Allahu la ilaha illa huwa alhayyul qayyum."*
   The translation of this verse from the Quran is:
   "Allah! There is no deity except Him, the Ever-Living, the Sustainer of Existence."

" كُلُّ مَنْ عَلَيْهَا فَانٍ ۖ وَيَبْقَىٰ وَجْهُ رَبِّكَ ذُو الْجَلَالِ وَالْإِكْرَامِ"

2. *"Kullu man alaiha faann. Wa yabqa wajhu Rabbika zul jalaali wal ikraam."*
   Is a part of verses 26-27 of Surah Ar-Rahman in the Quran.
   These verses are translated as follows:
   "Everything on earth will perish,
   And there will remain the face of your Lord, owner of Majesty and Honor."

Several factors impact the legibility (Lieberman, 1977), which is based on the ease with which one letter can be told from the other, of Arabic calligraphy on Humayun's tomb. Firstly, the intricate nature of the script and its elaborate carvings pose challenges for readers unfamiliar with the style. Secondly, weathering and erosion over time diminished the clarity of the inscriptions, affecting readability (Lieberman, 1977). Additionally, the positioning of the calligraphy, placed on a horizontal plane, requires closer inspection for effective readability, which is the ease with which the eye can absorb the message and move along the line. Contrast and lighting conditions, influenced by natural elements, further obscure the carvings, making them less discernible.

6.2 India Gate

- **Typeface:** Identified as Garamond, a serif typeface known for its elegance and readability.
- **Style:** Traditional, serif, and legible. The use of Garamond creates a sense of dignity and timelessness, aligning with the monument's purpose as a war memorial.

a.

b.

Figure 4. a. Typographic engraving over India Gate on sandstone (Author, 2024). b. Cross section of typography at India Gate (Author, 2024).

The choice of Garamond for the inscription at India Gate raises intriguing questions about the context of its construction and its significance in typographic history. Garamond is renowned for its elegance and readability in book typography, its adaptation for a monumental scale is indeed unconventional. This departure from its traditional usage prompts speculation about the deliberate departure from convention and its implications for the visual impact of the inscription. Moreover, the challenges posed by factors such as the background's colour and the text's size highlight nuances in legibility that deserve careful consideration.

6.3 National War Memorial

- **Typeface:** A custom sans-serif typeface explicitly designed for the memorial. It features sharp edges, geometric shapes, and a condensed letterform.
- **Style:** Modern, bold, and impactful. The custom typeface reflects the contemporary nature of the memorial and aims to convey strength, sacrifice, and remembrance.

a.

b.

c.

Figure 5. a. Typographic engraving from War Memorial on Brown Granite (Names of *Shahid Jawans*) (Author, 2024). b. change in the landscape from 2015 to 2019 (as the war memorial was built) (Priya & Kumar, 2021). c. cross-section of the levels of engraving on brown granite (Author, 2024).

Several factors influence the legibility of the custom sans-serif typeface at the National War Memorial. Firstly, the edges and condensed letterforms of the typeface contribute to its aesthetic but pose challenges for readability at a distance. Secondly, the geometric, compact shapes used in the design add complexity to the letterforms, requiring closer inspection for adequate interpretation. Additionally, the style and colour aim to convey strength and remembrance, but the intricacy of the letterforms affects clarity, particularly in adverse lighting conditions. The memorial and its typography are crucial for visitors to appreciate their significance, emphasizing the importance of materials on-site.

- **Script vs. Typeface:** Humayun's Tomb stands out for its unique use of calligraphy, offering a handcrafted and culturally specific touch compared to the standardized typefaces used in the other two monuments.
- **Serif vs. Sans-serif:** India Gate employs a traditional serif typeface that exudes a sense of history and respect. At the same time, the National War Memorial embraces a modern sans-serif design for a more direct and impactful message.
- **Formality:** Humayun's Tomb and India Gate lean towards a more formal style, reflecting their historical significance and grandeur. The National War Memorial adopts a slightly less formal approach, prioritizing clarity and legibility for a wider audience.
- **Color:** While the typeface and style analysis focuses primarily on the inscription itself, it is worth noting that the color choices also contribute to the overall impact. Humayun's Tomb uses natural stone colors, India Gate blends in with its surroundings, and the National War Memorial's gold inscription creates a stark contrast and demands attention.

6. Epilogue

6.1 Discussion

The War Memorial excels in overall readability due to meticulous attention to anthropometric factors, ensuring that the text is positioned at eye level for readers at an optimal distance. Additionally, using a striking gold color against the brown granite backdrop enhances legibility, making the text highly visible and easily discernible. Conversely, the text is scarcely visible at India Gate from a distance, with only the word "India" being readable due to its more extensive scale. To decipher the names of Sahid Jawans, individuals must approach the monument closely, yet visibility remains limited. The absence of color contrast between the text and background, the non-linear layout, and erratic stone joinery all contribute to this lack of readability. Moving on to Humayun's Tomb, Persian challenges contemporary readers. However, despite this linguistic barrier, readability is enhanced through well-defined grooves and a clever play of levels on white marble surfaces.

Furthermore, the typography's calligraphic style adds to the inscriptions' aesthetic appeal. Despite the enduring prominence of these monuments, changes in perception and understanding over time have altered the significance of their typography. With successive generations lacking historical context, there has been a decline in the appreciation of the typographic inscriptions' relevance, relegating them to mere objects of artistic appreciation devoid of contextual understanding. This underscores the importance of preserving and promoting awareness of typographic heritage to ensure its continued appreciation and understanding.

6.2 Conclusion

In conclusion, all three monuments utilize distinct typographic choices that effectively complement their individual design, purpose, and historical context. The technologies, tools used, and artistic and design abilities the artisans possess defined the visual languages of the monuments, thus shaping the visual

landscape of the era. Humayun's Tomb's ornate calligraphy reflects artistic traditions; India Gate's serif typeface conveys dignity and timelessness; and the National War Memorial's custom sans-serif design delivers a bold and contemporary message.

From this study and documentation of the monuments of Delhi, we can relate the use and application of various styles of typefaces in architecture in different temporal periods.

About the Authors:

Rana Shinde, a PhD student at the Indian Institute of Technology, Delhi, has experience in architecture and visual design. During his Masters, he developed an interest in typography, which he pursued by working at the Indian Type Foundry, India's leading type foundry, where he worked on various scripts to create a wide range of typefaces. In this research, he incorporates his interests in architecture and design, focusing on the integration of typography in architectural monuments, ultimately shaping the visual landscape of the city over time.

Saurabh Tewari, PhD, is an Assistant Professor at the Department of Design, Indian Institute of Technology Delhi. With a background in architecture (SSAA, Gurgaon) and later communication design (IIT Bombay), he completed his doctorate in design at IIT Kanpur. With extensive research and teaching experience spanning over fourteen years across various prestigious institutions in India, his present research interests are Design History, Sustainability and Design Studies at his newly initiated DeSH Lab at IIT Delhi.

ABSTRACT | Social complexities have increased in the aftermath of global phenomena such as the migrant crisis, intensifying socio-economic inequities, racial discrimination, and backlash against the universal rights of minority groups. These are challenging how designers respond to social issues. Human-centred policies and socially inclusive design methods, gravitating towards designer-centred perspectives, fall short of encompassing systemic, intersectional, and transdisciplinary perspectives and limit possibilities for action. Consequently, we are calling for a paradigm shift from the centralisation of power held by design processes to situation-centred approaches (which we define as design-uncentred) that prioritise local communities, strategies, movements, and activism. Responding, we introduce the Radical Inclusive Attitudes (RIA) concept, a cultural design framework to challenge conventional thinking about inclusive design in favour of critical, collaborative, transdisciplinary strategies that can best address complexity. Findings from the Designing for Inclusive Attitudes (DxIA) project illustrate what the Radical Inclusive Attitude (RIA) concept is (or aims to be). RIA was developed from a triangulation analysis of resources such as insights from (i) a co-design workshop run at an international design conference, (ii) a situational analysis of an immigrant hospitality model case study, and (iii) a thematic analysis of data collected via virtual workshops with an international collective of design researchers. We are introducing a novel approach to navigate and explore social complexities while creatively acting in the situation. Conclusions highlight relevant implications of the RIA design framework for the third and voluntary sectors and policymakers and foster the decolonisation of the design process.

1. Introduction

This paper aims to position the idea of Radical Inclusive Attitudes (RIA) which has emerged from the research experiences of the authors. To do so, the paper explores three key aspects through which the RIA concept can be used to explore and support the decolonisation of the design practice. Specifically, literature on radicality and design opens our early reflections. After that part, a discussion on the literature on design for inclusion is presented to demonstrate how the context and the background of inclusive design can support the emerging RIA framework. Essentially, the RIA concept leverages "radicality", "inclusion" and "attitudes" as keywords of a theoretical framework. Finally, in this introduction section, the research context from which the RIA concept was generated is presented about the concept of inclusive attitudes and design. The methodological section of the paper describes the triangulation of data that the authors used to conceptualise the RIA framework. The RIA framework is a theoretical instrument that enables us to consider potential applications in the real world. Indeed, RIA can be described as a way of understanding and acting in a given situation where complex problems about inclusion are manifested. RIA is a way of approaching challenges by focusing on radical evaluations of phenomena that generate inclusive or exclusive practices. In short, RIA promotes a perspective for addressing complex conditions of inclusion needs by focusing on radical promotions of inclusive attitudes. RIA focuses on action-thinking for an inclusive society in those situations where design assumes blurred and hybrid forms.

1.1 Designing Inclusive Radicality

Conventional design research is often initiated from a designer-centred perspective, which limits possibilities for taking meaningful action. Consequently, the line of thought we are advocating for involves us and the "other" within the design process, becoming "we", and collaboratively reflecting on our reasonings, experiences, feelings, and actions concerning any challenges we experience together. Getting 'inside' users' experiences helps researchers better understand their needs, enabling them to participate in shaping what henceforward we refer to as the world-in-the-making, which, building on Dewey's (Dewey, 1928) philosophy, opens a new window into the world we all inhabit. Hence, it's essential to comprehend and interpret the concept of world-in-the-making – a design perspective to understand the world we live in collectively. The proposed paradigm shift should assist those doing social design to disentangle new perceptions of *everydayness* (Lefebvre, 2014) and *otherness* (Husserl, 1960/1933). This will lead to new insights that get closer to the root or core cause of why we need to practise radicality in design, which should be perceived as a way to prevent "the oversimplification and ignorance of power dynamics" (Udoewa, 2022) therefore decolonising it.

Radical inclusion can be seen as an approach based on dialogue among multiple perspectives by also taking into account "unfamiliar and unexpected field situations including potential conflicts" (Sarantou et al., 2018). While the role of design is increasingly less defined in this area, radicality, especially in the context of design literature, is crucial; this literature and work on inclusion in design, despite decades and multiple stages of evolution—excluding literature on participatory practices (e.g., Barcham, 2021; Udoewa, 2022)—has largely been limited to designer-centric perspectives. Many ideas promoted in human-centred design, for example, involve "assuming" the role of the end-user by the designer and successfully "othering" end users (King & Cormack, 2023). Richard Heriott's work articulates that the lack of holistic inclusive practices in design and a tendency to position oneself in a place of authority within design practice is particularly relevant (Herriott, 2013; 2023). In parallel, the "radically inclusive design" perspective is pushing for a decolonial design approach where designers are 'always situated-ness' and contribute to "actively works to bring into being worlds, which are respectful and welcoming of difference and interconnectedness without subsuming one world by another" that, in practice, is entailing a combined design approaches among the involved parts (Barcham, 2021).

In general terms, design must look to more genuinely inclusive approaches from other disciplines to radically reframe how designers approach inclusion. Consequently, we argue in favour of situation-centered design, a concept introduced by Cinnamon L. Janzer, Lauren S. Weinstein and Victor Margolin (see

Janzer & Weinstein, 2014). We aim to champion a collaborative practice that cultivates "a complex, multidimensional understanding of people and their environments" (Janzer & Weinstein, 2014). In this direction, the introduction of the Radical Participatory Design (RPD) approach may help in understanding the meaning of addressing a "design that is participatory to the root" (Udoewa, 2022), in other words, allow people to fully participate in a real inclusive manner. In RPD designers divest of power in favour of the communities and adopt a decolonisation of the participatory design process (cf. Udoewa, 2022).

We learn that to be radically inclusive about attitudes, we should decolonise the meaning of "inclusive attitudes". More specifically, the conception of radical inclusive attitudes centres around two primary concepts – a) Radical Inclusivity as a philosophy and b) the formation of attitudes in society and the professional realm. The first concept is discussed in "The Frustrating Impossibility of Radical Inclusivity" (Nawratek & Nawratek, 2015) as an impossible scenario yet an essential consideration in spatial design. The text looks to religious studies to postulate that while radical inclusion as a permanent state of being may be an impossibility, it may yet be a possibility at certain points in time. Two aspects of this text are crucial: the relevance of temporality in radical inclusion; and the borrowing of ideas and philosophies from a seemingly unrelated discipline (religious studies). This radical inclusivity aims at creating an ideal that is utopian in some ways. On the other hand, design discussions on inclusions/exclusions understand exclusions through lenses of singular identities such as disability, gender or socio-economic backgrounds. Perhaps a middle ground between this position of radical inclusivity and the way design studies approach inclusion/exclusion would be an intersectional approach (Crenshaw, 1991), which offers a more nuanced approach than traditional design thought and is more actionable and implementable than the philosophical radical inclusivity approach. However, even in this thought process, intersectionality is one thread of the larger fabric of radical inclusivity that attempts to get closer to genuinely inclusive design practices.

1.2 Design, Inclusion and RIA

The RIA concept has been influenced by design for social impact and inclusion perspectives. Regarded as a design discipline that purports to "do good" for communities and society at large, social impact design (SID) has been eagerly embraced in the design community and promoted through human-centred design (HCD) and design thinking processes (Janzer & Weinstein, 2014). Affirming designers' collective interest in addressing complex issues, Nigel Whiteley writes in Design for Society, "The strength of the [social design] tradition is that design is firmly grounded in a relationship to society rather than being presented as an area of study which feeds only on itself..." (Whiteley, 1997). At the same time, in our eagerness to participate in solving the world's problems, we have often failed to acknowledge the limitations of what we can or should contribute within such a broad arena of opportunities. Standards of practice vary greatly (Lasky, 2013) and there is little to no accountability or follow-up when projects end.

Still, the field and standards for practice are evolving. And emerging studies on design for inclusion show a gradual change from Inclusive Design (Clarkson & Coleman, 2015), Design for All (DfA) (see European Institute for Design and Disability, 2004; Bendixen & Benktzon, 2015) and Universal Design (UD) (see Story, 2011; Steinfeld & Maisel, 2012) to newer approaches, i.e. Inclusive Service Design (Aceves-González et al., 2016), psychosocially inclusive design (Lim et al., 2021), design for service inclusion (Fisk et al., 2018), the just design perspective (Bianchin & Heylighen, 2018), the Design Justice framework (Costanza-Chock, 2018; Costanza-Chock, 2020; Huffstetler et al., 2022) as well as the Design for Inclusive Attitudes (DxIA) approach (Busciantella-Ricci, 2023b). Collectively, they call for a paradigm shift from design approaches that take into account physical and cognitive barriers towards universal solutions to accommodate as many needs as possible to approaches that take care of the different cultures, diversities, and situated complexities that intercourse in a design process.

Similarly, we are calling for a shift from the centralisation of power held by designers and design processes to situation-centred approaches that prioritise local communities, strategies, movements and activism. This perspective recalls the debate regarding the shift from a "designerly ways of knowing" perspective (Cross, 2001; 2006), which we recognise as predominantly "designer-centred", to a critical view that

questions the uniqueness of “designerly” ways of understanding the world and producing knowledge (cf. Herriott, 2023). We also argue in favour of moderating these tensions to decentralise designers’ sense of omnipotence to address complexities. In response, we are introducing the RIA, a cultural design framework to explore how foregoing conventional thinking about inclusive design in favour of critical, collaborative, transdisciplinary strategies can best address complex social problems.

1.3 Forging Inclusive Attitudes

Traditional perspectives on design for inclusion, and generalised participatory approaches fall short to support the depth or dimensions of the topics we present in this paper. These perspectives do not present convincing models and perspectives to address the complexities that need a ‘radical’ approach (new forms of engagement extending RPD), i.e., it needs to be done in the situation - or while immersed in the 'world-in-the-making'. At the same time, radical positions and approaches in design need support to offer flexibility, encouragement to adapt, and lowering barriers to make it easier for people to speak, act and engage without overly complicating processes.

We argue that RIA can generate a framework to work with and embed the discourse under a common and shared ‘action-thinking’ perspective rather than ‘design thinking’. At the same time, RIA focuses on people's attitudes through a cultural perspective, rather than on a set of tools and methodologies to be applied by designers detached from the 'world-in-the-making'. RIA is also connected to the emerging Design for Inclusive Attitudes approach (DxIA) (Busciantella-Ricci et al., 2022; Busciantella-Ricci, 2023b) and serves as an exponent of the ‘inclusive attitudes’ term that we use to evaluate issues related to diversity, equity, accessibility, and inclusion (Busciantella-Ricci, 2023b; based on the ‘attitude’ meaning in Eagly & Chaiken's 1993; 2007; Maio et al., 2019). This term reflects the main definition of attitudes. Indeed, by assuming a social psychology perspective, attitudes are evaluative judgments about a “stimulus object" (Maio et al., 2019). Using Eagly & Chaiken's (1993; 2007) words, an attitude is “a psychological tendency that is expressed by evaluating a particular entity with some degree of favor or disfavor”. In general terms, attitude describes “people’s global and relatively enduring” “evaluations of objects, issues, or persons” (Petty, 2012). In practical terms, we evaluate the stimulus object around us according to the beliefs we associate with that object, the linked emotions, and the past behaviours or experiences regarding those objects, issues, or persons. Respectively, they are the cognitive, affective, and behavioural components that shape this evaluation (Eagly & Chaiken, 1993; Maio et al., 2019). Attitude has also been described as “one’s routine predisposition toward an object or event” (Musgrove, 1998), which underlines a general predisposition toward an object, entity, or issue. Consequently, an inclusive attitude can be described as the tendency expressed by evaluating entities, objects, or issues related to inclusion and diversity with some degree of favour or disfavour. Within the context of design culture, an inclusive attitude is a designerly predisposition toward inclusion and diversity (Busciantella-Ricci et al., 2022; Busciantella-Ricci, 2023b). In our literature review, we had difficulty finding direct support for the RIA concept through frameworks and models that embed the following three key components (i) a radical position toward inclusion; (ii) support of the inclusion concept with instruments that focus on cultural barriers, rather than technical tools that are mostly design-centric; and (iii) a focus on attitudes and people’s actions in a given situation. While these three concepts are partially and/or individually addressed within the related scholarship, the discourse we are facilitating by bringing them together under one framework makes our approach distinct.

2. Methodological Approach

Triangulation of data, which has been used to corroborate evidence and make the findings stronger (see Dezin, 2009; Hanington & Martin, 2012), was a useful process for developing the RIA framework. We first gathered data from a co-design workshop, the analysis of a case study, and the thematic analysis of online workshops made by an international group of design researchers from India, Italy, the Netherlands, the UK, and the USA. These data sets were collected in correlation with a research project that is exploring the DxIA approach. As described in its original version (Busciantella-Ricci et al., 2022) the DxIA is based on the transition design framework (Irwin, 2015; Irwin et al., 2020) through which it is possible to compare (i) the

design for the built world with the perspectives of the design for inclusion approaches; (ii) the design for social innovation with the logic of the design for social inclusion; and (iii) the continuum of the Transition Design with the concept of the DxIA. The DxIA originated as a design research response to create a framework for shifting from a physical barrier-dominated discourse on design for inclusion, towards culturally-driven methods. Consequently, the DxIA corresponds to transition design and focuses on radical change through design for addressing diversity and inclusion issues (Busciantella-Ricci, 2023b).

2.1 Co-Design Workshop, Process and Materials, and Insights

The first author of this paper prepared and delivered a workshop at an international design research conference (Busciantella-Ricci, 2023a) to engage design researchers in exploring the application of the DxIA framework. The workshop (programme in Figure 1) was developed by (i) introducing the main topics related to the DxIA, (ii) discussing and ranking case studies, (iii) discussing the design principles of the DxIA, and (iv) Co-designing a service concept with the DxIA approach. The workshop was attended by six participants (including a facilitator) engaged in three and a half hours of in-person activities (at the conference venues). All four steps were completed except for step four, for which the participants came to do the How Might We question.

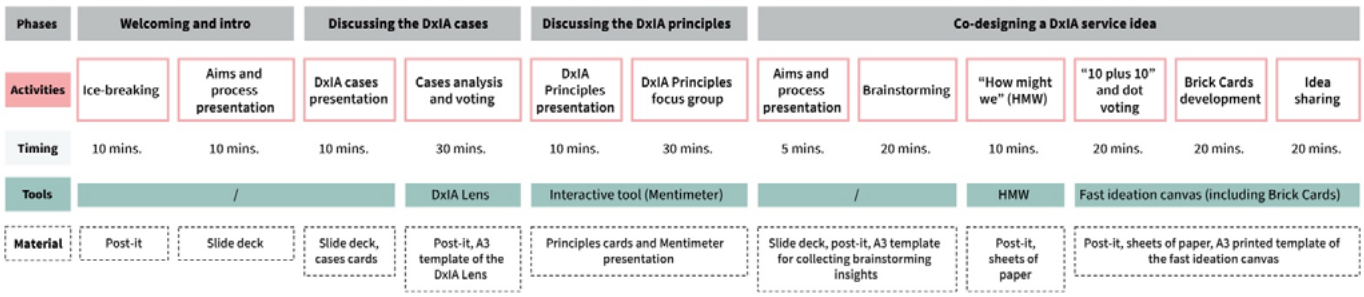

Figure 1. Process and materials of the workshop provided at the International Design Conference (Busciantella-Ricci, 2023a).

Relevant insights for this paper emerged from the workshop. Firstly, a ranking and a qualitative evaluation of the shown case studies have been obtained where the most consistent case for the participant is Riace's model (see paragraph 2.2); it is an immigrant hospitality model (Driel & Verkuyten, 2020; Ranci, 2020) (Fig. 2) and it can completely address the complexity of the idea behind the DxIA approach. Equal merit has been obtained for the Lovegiver project and the Includability service (see Busciantella-Ricci, 2023b for the cases). The first has been evaluated as a potential disruptor for addressing disability stereotypes, and the second is an example that every service should adopt to develop innovations for encouraging organisational changes.

Secondly, participants provided an evaluation for each of the presented DxIA principles (cf. the DxIA principles in Busciantella-Ricci, 2023b). Among the most relevant, they suggested focusing on autopoiesis (Maturana & Varela, 1980) both to provide design responses that can evolve as conditions of the context change and to address the concept of "diversity" in nature with a "more than human" perspective. Also, participants suggested supporting the systemic perspective about inclusion by underlying a needed shift from single-identity approaches to intersectionality theory approaches (Crenshaw, 1991).

Regarding principles, participants suggested supporting transdisciplinarity through models and frameworks to apply the DxIA, rather than focusing on design toolboxes. The latter risks losing the flexibility and adaptability needed in complex conditions determined by action in the situations. In terms of insights gained from the generative session, participants suggested a "how might we" question to be used as a research question in a shared Miro board to involve additional researchers during the conference days. Indeed, additional people were invited to collaborate with the Miro board after the workshop by integrating opinions, comments, and ideas. This was the base to start up an informal community of RIA design researchers. The Miro board continued to be used by the involved researchers after the conference, and it was used as a shared platform for design conversations around the RIA concept.

2.2 Analysis of a Case Study

The second source of methods and data provided insights from a situational analysis of an immigrant hospitality model case study situated in a small village in southern Italy. Specifically, data analysed for the case study emerges from an ongoing project named DesIA (Busciantella-Ricci, 2023b) that explores how to substantiate the DxIA approach with cases, principles, tools, and service concepts. During the research activities of this project, the first author of this paper conducted design ethnography to observe the potential context where relevant information happens for impacting design (Stickdorn et al.,2018; Hanington & Martin, 2019), in this case for the DxIA approach. Two full days were spent in two villages in the south of Italy (Riace and Camini) to understand aspects of two models of immigrant hospitality (see Driel & Verkuyten, 2020; Ranci, 2020). In these contexts, the researcher interacted with the local communities, as well as with the founders and the former policymakers (including the former mayor Domenico "Mimmo" Lucano) who created the case study. Pictures, notes, and a brief diary of the days have been produced by collecting information through direct observations, contextual interviews, and spontaneous focus groups to understand how local communities changed or reshaped, their attitudes towards immigrants. The ethnography activity aimed to observe the context of Riace's model shaped by people not trained in design. The focus was on understanding how designed artefacts (e.g., services), design processes, or practices contributed in this context and how they can impact the DxIA approach.

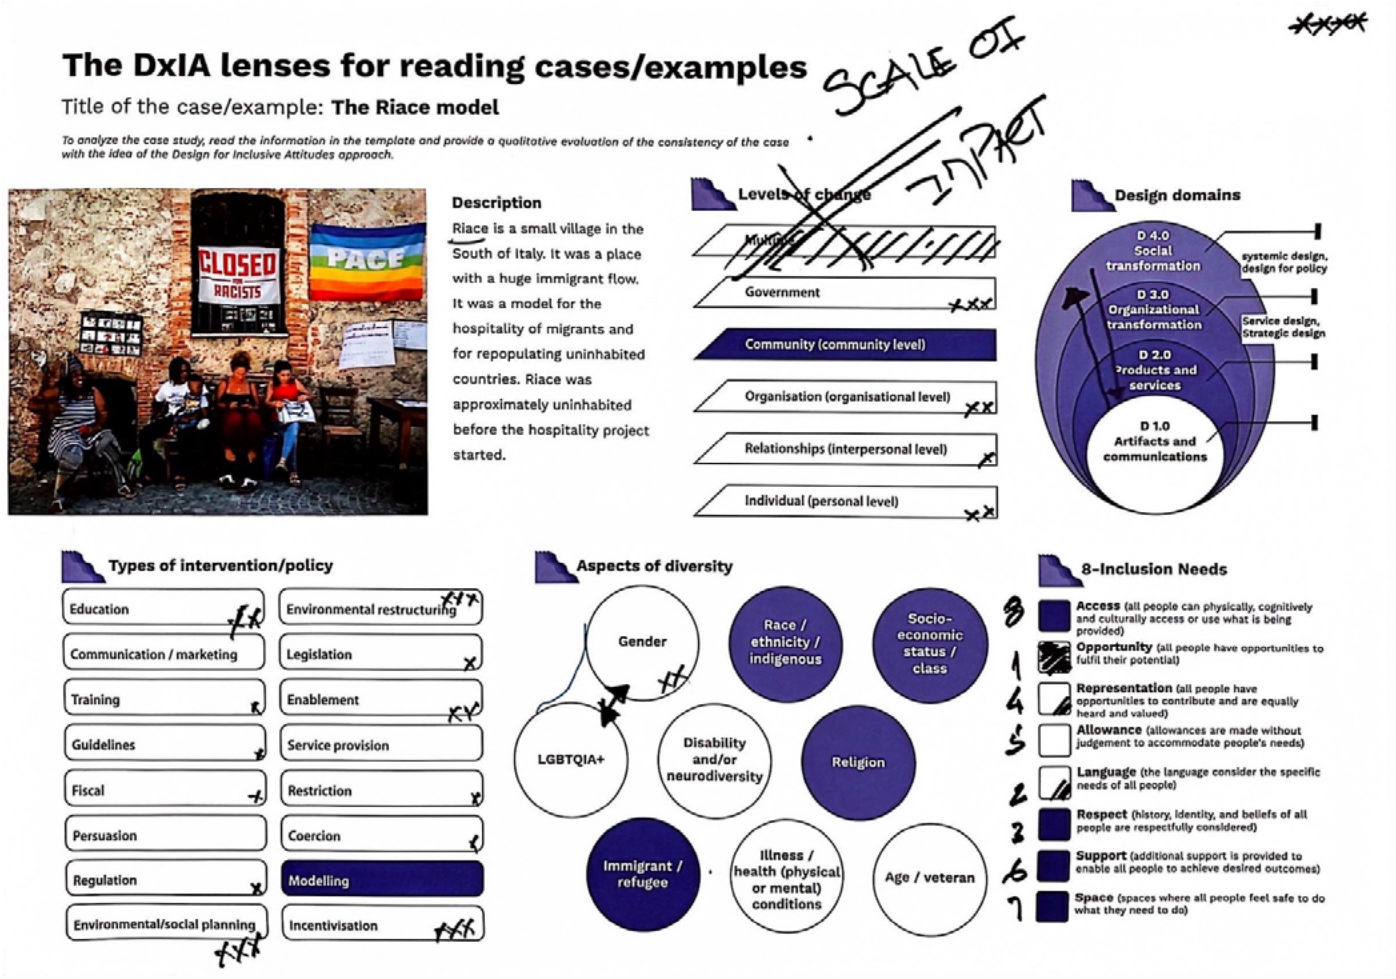

Figure 2. One of the templates participants used during the workshop: an example.

As a result, the design ethnography helped us understand how the Riace model can contribute to DxIA. All the data captured were thematically analysed (Braun & Clarke, 2006) to support the observed context as a case study exploration (Yin, 2018). The obtained insights can be framed through the following themes:

- The Riace hospitality model promoted inclusive attitudes among local communities through collaborative services among locals and immigrants;
- The exchange values of the provided services put everyone on the same level by responding to the needs of long-term residents and immigrants;
- Successful and innovative services were generated because immigrants' and residents' intersectional needs were manifested and used as drivers to find solutions that work for all;
- Third-sector entities played a crucial role in establishing encounters, connections, and organisational and ethical values for the involved stakeholders, both locals and immigrants.

2.3 Analysis of the Virtual Workshops

After the in-person workshop run at the international design conference, and as a result of the encounters at the same conference, an international RIA collective was established and developed virtually, including design researchers from different backgrounds and six different countries. Specifically, insights from a thematic analysis (Braun & Clarke, 2006) of data collected via virtual workshops (with the support of Miro) from October 2023 to January 2024 have been used to set important design conversations (cf. Laszlo & Laszlo, 2008; Glanville, 2007) around the RIA concept. Three main themes have been discussed by the RIA collective in these design conversations, as follows:

- (i) the RIA people; i.e., who are those who impact and are impacted by the idea of the radicality of inclusive attitudes;
- (ii) the RIA applications; i.e., how the RIA concept can be applied in complex, real-world situations;
- (iii) the RIA visions and references; i.e.; where the RIA concept is driving/motivating the people (design researchers) invested in radical inclusive attitudes.

3. The RIA Framework

Data from the co-design workshop, the case study, and the design conversations contributed to the research questions (RQ) related to the framing of the RIA concept (Figure 3). Every set of data provided specific insights that allowed us to structure components of the RIA framework.
Findings support RIA as a novel approach for navigating and exploring social complexities while prototyping solutions for a given challenge or situation. RIA has two core ideologies:

- (i) a commitment to inclusion and justice, which critically examines existing approaches and transcends disciplinary boundaries;
- (ii) inculcating a commitment to inclusion and justice as an ingrained social attitude.

These ideologies have been developed through the insights in Figure 3. Also, the insights we gained from the data triangulation stimulated the formulation of the framework which we present next.

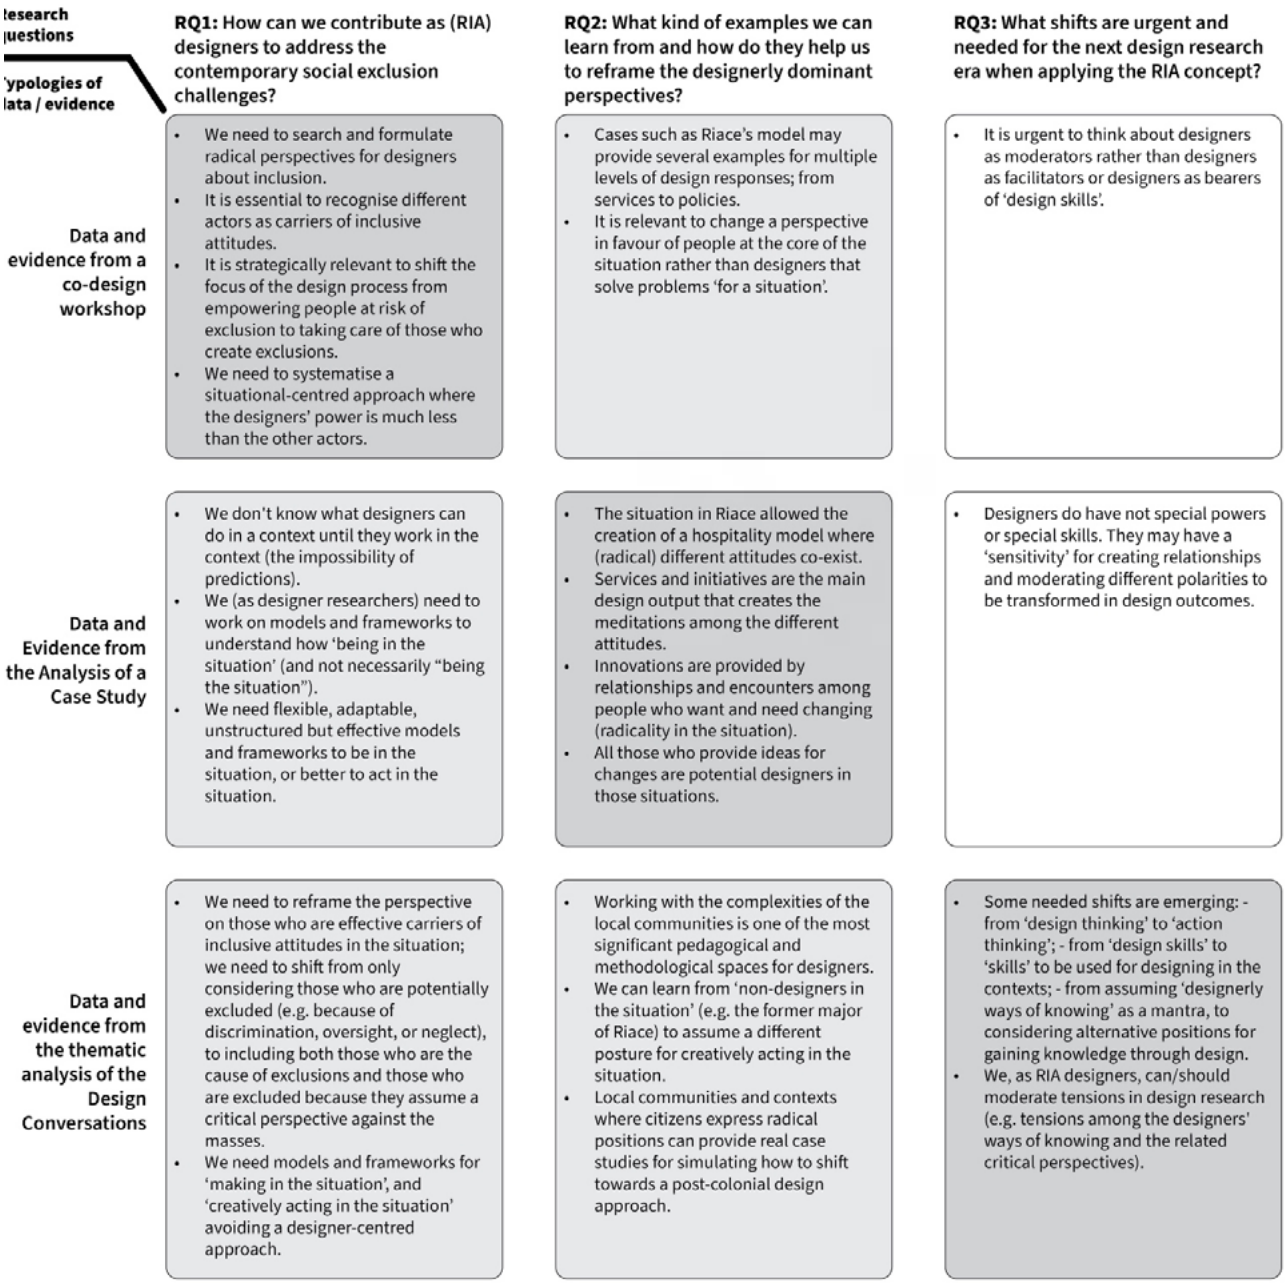

Figure 3. Insights from each data set in correspondence with the research questions (RQ).

3.1 The RIA Framework Components

By following the insights gained from the data triangulation, the RIA framework emerged with four main areas of interest related to:

- i) how can we understand the existence of the RIA concept and perspective (i.e., the RIA design ontology);
- ii) how can we learn by assuming an RIA perspective (i.e., the RIA design epistemology);
- iii) how can we (best) design by adopting the RIA framework (i.e., the RIA design praxiology);
- iv) what kind of outputs and outcomes we can frame through the RIA concept/framework (i.e., the RIA design phenomenology).

The RIA framework manifests itself as a conceptualisation to produce a new kind of design experience that is useful to co-designers (including non-designers, participants, citizens, etc.) (cf. Manzini, 2009) in a given

situation. So, by assuming Cross' (2006) taxonomy in design research and by considering the paradigms for qualitative research (Lincoln et al., 2018), we described the RIA framework through components that are made by dimensions and groups of people such as:

- i) those potentially excluded (e.g., because of discrimination, oversight, or neglect);
- ii) those excluding others (e.g., they create the conditions that exclude underserved, underrepresented, and marginalised groups);
- iii) those 'not involved' but still persuadable (e.g., they may hold controversial views outside of the mainstream but are still open to conversations).

According to the RIA framework, these three different groups of people inhabit three important dimensions of the world-in-the-making, i.e.; the praxeological dimension, the phenomenological dimension, and the ontological dimension, which we describe next:

- i) RIA design praxiology is a component that describes the processes we conceptualised for the application of RIA action thinking. Specifically, we renewed the concept of 'making in the situation'. It is developing a situated process or a situated-centred approach that emerges from case studies such as Riace's model. A situated-centred approach requires empathising with the context by adopting an ethnographic approach as it can be applied in design ethnography. Essentially, a designer in the RIA framework is not an all-knowing designer with a special way of knowing (cf. Herriott, 2023), they are more an active citizen who makes themselves available to the 'situation' and discovers how to be a designer in these relationships. Conceptually, it is a form of active citizenship, a way of acting through design in the situation;
- ii) RIA design phenomenology is a component that includes a set of reasonable and sustainable kinds of design output in the application of the RIA framework in the context. By referring to orders of design (Buchanan, 2001; Mortati, 2022), design contents (Young, 2008), and design domains (Jones, 2014) we expect to work with design disciplines such as product-service system design, service design, systemic design, strategic design, urban design, and design for policies;
- iii) The RIA design ontology is a component that describes what it is and how it is possible to understand its existence. RIA is not an approach, a method, a technique, or a toolkit. RIA is a way of understanding and designing. It is a way of living a given experience. So, we question, what is a radical attitude? It is a radical evaluation of the phenomena that generate inclusion and related values (e.g., equity, dignity, equality, respect, etc.). Essentially, RIA is a radically positive cognitive, affective and behavioural (cf. with the multi-component model of attitudes in Eagly & Chaiken, 1993; 2007 as also adapted by Maio et al., 2019) status in front of a complex condition of inclusion needs.

4. Discussion

4.1 How Does RIA Complement Previous Frameworks

For a better understanding of what RIA is we can provide a discussion by comparing the RIA framework with resources and approaches we introduced at the beginning of this paper. We should premise that RIA is not an approach that purports to substitute or replace existing methods/approaches that are useful for designing for social challenges. Rather, it would provide a broad foundation to support existing approaches while simultaneously promoting positive attitudes towards diversity, inclusion and the unfamiliar and unexpected conditions in situations where social challenges happen (e.g., migration flows and related issues). To use a metaphor, RIA is a new quality of cement to joins known bricks that are needed to build a specific situation. We are not proposing a new kind of bricks, but rather a new kind of cement. In terms of comparing RIA with the approaches and frameworks we mentioned at the beginning of this paper, the following are some similarities, differences and thus novel aspects that can be framed.

Firstly, about the RPD (Udoewa, 2022), as well as radical positions about inclusion - e.g., the radically inclusive design (Barcham, 2021) we can provide the following comparisons:

- similarly, to these approaches, RIA embraces a situatedness action approach and apply a decolonised approach about the concepts of participation and inclusion through design; equally similarly design is a common resource among the parts and design processes the results of the mediation among communities, and the other actors of the actions (including formally recognised designers);
- different to these approaches, the RIA framework focuses on creating the conditions for promoting a diffused culture of inclusion and participation by tackling the attitudes of people as a pre-condition to address real radical acts in the situation.

Second, approaches to design for inclusion:

- similarly, to the emergent approaches, the RIA framework focuses on creating the conditions to design intangible things such as services, strategies, and policies by also focusing on social and psychosocial aspects that affect the way a design artefact is inclusive;
- different to the traditional approaches on design for inclusion, the RIA framework focusses on the inclusive attitudes as a cultural value to be promoted through the design of services, strategies and policies.

Third, let's focus on the design justice framework (Costanza-Chock, 2020) as a relevant approach that adopts the intersectionality theory through a design perspective:

- similarly, RIA, as it is based on the DxIA approach (Busciantella-Ricci, 2023a), is considering a (radical) intersectional perspective to adopt a systemic approach to diversity and inclusion; the aim is to focus on inclusion needs, rather than on very specific issues about diversities (e.g., cf. Wilson, 2023);
- differently, it radically focuses on different targets respect the design justice framework; the main target of an action driven by the RIA framework are not those suffer a condition of exclusion, abuse of power, or marginalisation but on those who generate those conditions; it radically focuses on those cause or contributes to the perpetuations of understanding diversity as a problem; in parallel, it also creates the condition to be emancipated from that abuse of power, i.e. decolonising design process.

Fourth, by taking into account the transition design framework:

- similarly, the RIA framework presses towards diversity as a natural human condition (towards the natural world); RIA looks for a radical change through design in terms of finding radical actions to look at human diversities;
- as a real comparison among the frameworks is not possible, RIA takes the transition design logic to provide a radical interpretation and to be adopted for diversity and inclusion purposes.

Finally, concerning RIA in the DxIA approach: RIA introduces the concept of "radicality" in the DxIA model. We have adopted the political interpretation of the word, which is related to taking an unconventional, revolutionary, extreme, reformist position. RIA promotes inclusive attitudes in an unconventional, revolutionary, reformist way. Radical 'participation', 'inclusion', or 'ideologies' are critical positions towards a subject matter that, if adopted, can influence the way people live and/or how they respond to challenges.

So, the primary objective of RIA is to advocate for altruism as an essential core principle and foster an ideological shift in the way people relate to one another, towards acceptance rather than rejection; prompting individuals to give (back) more than they take (from) (e.g., in our relationship with the natural world we need to understand that resources are not endless); and to practise sharing rather than withholding (e.g., developing altruism and social justice levels). This represents the essence of our concept of "radicality". We aim to develop new ways to reinterpret and understand our beliefs and connect different methods underpinning cultural experiences. Bringing together different cultures can generate true appreciation for the diversity and depth of human life (refer to transcendental phenomenology in Moustakas, 1994). This approach and understanding will, hopefully, help RIA researchers to actively participate in shaping the world we all live in.

4.2 Moderation as Radicality

As initially presented in the introduction of this research, the objective of the RIA methodology seeks to provide situation-centred strategies rooted in design justice principles (Costanza-Chock, 2018; 2020) to push the boundaries until resistance is met. This inherent but favourable tension allows for the emergence of creative energy and new, diverse conceptualisations of the complex, everydayness contexts we are responding to.

RIA challenges power structures by shifting from top-down processes to revolutionary, multidirectional perspectives, similar to the outcomes of the Ripple Framework (Soares et al., 2023). This approach aligns with Husserl's concept of horizontalisation (see van Deurzen et al., 2019), necessitating the construction of novel connections between various actors and situations. This reorientation is supported by a new attitudinal behaviour, i.e., "moderation, as radicality" which allows for new situational understanding in a permanent evolving context, providing a new, and more optimistic horizon, which can be translated to 'hope'.

The dynamic framing of RIA facilitates an increased devolution of power amongst all societal participants, regardless of their background, gender, sexual orientation, age, or socioeconomic status. The objective of this paradigm shift is not only to contest the existing assumption that design by itself can make the world better but to enable new transdisciplinary mechanisms to explore humankind's innate ability to permanently adjust, assimilate and incorporate new things into their existence, i.e., to take action. This would subsequently generate better design processes and enable RIA practitioners to continually adapt to the continual changes and complexity of everydayness in daily experiences: in other words, a world currently under construction as we have been stressing the world-in-the-making.

4.3 RIA Implications and Potential Audience

The findings of this study underscore significant considerations for a few areas of implications concerning design and potential audience such as:

- I) Design research: our findings suggest a need for shifting from a design-centred perspective to a situation-centred perspective; or, better yet, towards a design-uncentred perspective in the situation; we are observing relevant shifts in design research (e.g. from 'design for inclusion' to 'design justice' - Costanza-Chock, 2020; as well as demystifying the 'designerly ways of knowing' - Herriott, 2023) and through this work, our data triangulation confirms the necessity of moving from the application of 'design thinking' to 'action thinking' approaches, as well as from a design-driven perspective to a 'moderation in action' or 'moderation in action through co-design'; those who adopt a research through design approach to address social impacts about diversity and inclusion are the main beneficiaries of these aspects;
- II) Civic innovation/civic design: in the introduction of this paper we discussed the importance of embedding relevant resources for the RIA concept such as radical design positions (e.g. Udoewa, 2022; and Barcham, 2021), and approaches that include interdisciplinary perspectives such as

intersectionality theory (Crenshaw, 1991); consequently, we argue the RIA framework may work as a civic education device for third-sector entities, policy-makers, and design researchers engaged in these realms; they may benefit from the RIA framework due to its capacity to create a common space of reflection in action and by giving a moderation model; the RIA framework can support the encounters between designers engaged in social innovation practices with those communities that know and live the situations;

- III) Design practice: we discussed calling for radical positions in design to look for a new perspective that can address the inclusion issues; effectively, through the data triangulation emerged the need to shift towards radical positions in design for supporting world-in-the-making in the situation; the RIA framework supports mediations through a model for creatively acting in the situation where the fifth order of design (Mortati, 2022) is the main one interested about design, and where the concept of "object" (e.g. the "eclipse of the object" in Findeli & Bousbaci, 2005) is latent and relative; service and strategic designers, as well as those interested in applying design for policy could use the RIA framework as a tool to guide their introduction in the situations;
- IV) Design education: the RIA framework calls attention to the role of the designers that attempt, on the one hand, to dominate the participatory process (cf. Udoewa, 2022), and on the other hand, assume an ambiguous position on the acquisition of knowledge (e.g. as discussed in the Herriott, 2023 discourse); as emphasized by the data triangulation, the RIA framework provides a model for better simulating designers' role in real life where diversity is a systematic variable, and the contexts are full of tangible and intangible complexities that shape the situation; in these contexts, designers need cultural drivers rather than toolboxes; this may inevitably change the way design education (especially in the field of service design, strategic design, systemic design, information design and design for social innovation) is conceived, designed, and distributed.

4.4 Opportunities for Further Work

To understand RIA, it is important to critically reflect on the idea that design can improve the world. Designers who manifest a radical inclusive attitude know that our ontological world requires flexibility, long-term commitment, perseverance, and, more importantly, the need for (new) approaches that simultaneously embrace diversity and create methods/processes that lead to greater understanding. RIA provides a way for us to translate and untangle the twists and turns (or difficulties, challenges) of day-to-day situations, which can often be seen as uncertain and complex. For these reasons, we are positioning the RIA concept as a non-design-centric approach. However, we have used methods which mostly involved people engaged in design research, even though they have very different backgrounds. Despite the case study being fully from a non-design context (with non-designers), and despite most of the experiences of the involved people in the RIA community being design researchers engaged in informal, third-sector, and community-based contexts, the methodology can provide a contradiction concerning the proposal of a non-design-centred perspective. This can be a limit of this work and an opportunity for further research. For instance, further research can focus on replicating the same process in contexts non-led by design(ers) or providing the framework in specific case studies with community-dominant initiation (cf. Udoewa, 2022) processes.

Also, the RIA framework is the result of a joint work of the RIA community that is self-reflecting - in this stage - about the need for design-uncentred approaches that shift from 'design thinking' to 'action thinking' where design is a "mutually constitutive process" (Barcham, 2021). This is quite evident, and where we are learning from, in cases such as the Riace model. For instance, the former mayor of Riace (namely Domenico Lucano - "Mimmo" Lucano) has been recognised as the main creator of Riace's model (see Ranci, 2020). As design researchers, we recognise that Mimmo Lucano is the best example of an RIA person (or RIA designer) who assumed action thinking and contributed to designing services, strategies and policies for applying the ideating, developing and delivering phases of Riace's model. Mimmo Lucano was not formally trained in design. We hypothesise that he applied a radical inclusive attitude and at the same time, he designed artefacts because this kind of attitude can be promoted among the local communities.

Observing and assuming this practice for the RIA framework means recognising the need for a new decentred role of design(ers) and design researchers in those contexts.

5. Conclusion

To conclude, we introduced the concept of RIA as a supporting framework for emerging perspectives in design that follow situation-centred approaches; we refer to this new perspective as design-uncentred. Design-uncentred is not at odds with a design-centric perspective; rather, it extends the design-centric to a new, multi-centric dimension that shapes the situation. This multi-centric perspective requires flexible interactions between designers and the people we design with.

The RIA framework should also be seen as a cultural model for addressing social complexities and global challenges where actions and mediations are rather more relevant than design-driven, design thinking, and design-centred (ego) perspectives.

According to this position, we are calling for shifts from 'design thinking' to 'action thinking'; from promoting design-driven processes to supporting the 'making in the situation'; from design for inclusion and human-centred approaches to cultural models that practise radical positioning towards inclusive attitudes. These shifts can be supported by the RIA framework as we presented in the way of the RIA ontology, praxeology, and phenomenology. It is a framework for supporting the world-in-the-making where conceptually the process of doing, undoing, and redoing is essential for addressing the complexities of certain contexts.

Finally, we highlighted the implication of the RIA design framework for design research, practice, and education, as well as in the civic innovation realms where the third and voluntary sectors and policymakers play crucial roles. We recognise that the RIA representative cases and principles—which are foundational components for understanding how to creatively act upon universal human rights—produce results that might be perceived as intangible, however, we believe the work still provides opportunities for further research.

About the Authors:

Daniele Busciantella-Ricci, an Assistant Professor (non-tenure track) at the Department of Architecture at the University of Florence, works on the Research Through Co-design for inclusive services and social innovation. Also, he is exploring the Design for Inclusive Attitudes approach.

Luis Soares, PhD in Science and Technology Studies, holds a prestigious role at the Institute for Design Informatics, Edinburgh. He contributes expertise to collaborative research on Generative AI and IoT device lifecycles, aiming to improve urban environments, IoT repairability, and foster a fairer, sustainable society.

Lakshmi Srinivasan, an Assistant Professor of Design at BITS Design School, Mumbai, is a design educator, spatial practitioner, and architect. Her research interests and passion centre around developing interdisciplinary approaches in design pedagogy and the spatial dimensions of inclusion.

Mike de Kreek is a Senior Researcher at the Civic Interaction Design research group at the AUAS Faculty of Digital Media and Creative Industries. As an action researcher, he focuses on collaborative learning processes between diverse community stakeholders fuelled by creative methods.

KEYWORDS | SCENARIO BUILDING, SERVICE DESIGN, CO-DESIGN, PLACEMAKING

ABSTRACT | This paper presents a case study: the design of future service scenarios for the Tourist Harbour Carlo Riva in Rapallo, the Italy's most important private marina destroyed by a storm in 2018. Historically, design has been viewed as a reflective practice aimed at creating futures to address complex challenges and this is why a group of design researchers and students from the School of Design of Politecnico di Milano were involved in an exploratory workshop to provide original solutions. The traditional urban planning approach has emphasized the consistency of the urban form of the built environment; however, such approach can be complemented by combining a service logic to the spatial planning perspective and this was precisely what was experimented during the workshop. The scenario building methodology and the service design discipline were employed to develop some scenarios to imagine the future of the harbour throughout the workshop, which encompassed three phases: a research stage to get in touch with the context, a concept generation to originate a great variety of ideas and a third phase to build final scenarios and their service solutions.

The scenarios resulted from the workshop served as a basis not only to stimulate the conversation among stakeholders, but above all to enhance the quality of their conversation, providing originality, detail and specifics on space and time. This could be viewed as a part of a wider placemaking strategy aimed at creating an innovative harbour in which (service) designers can provide a valuable contribution to the existing work of urban planners, architects, and policymakers.

1. Background Knowledge: Urban Planning, Service Design, Scenario Building

This paper moves from an unexpected extreme weather event occurred in 2018, a storm that destroyed the Tourist Harbour Carlo Riva in Rapallo, the most important Italian private marina. After this natural disaster, the necessity to redesign the area in light of climate changes and with a more community-centred approach clearly emerged. The real-estate company in charge for the re-opening of the harbour, named Bizzi & Partners, recognized the importance to adopt a different approach to conceive an innovative marina in harmony with the environment and, to achieve this aim, they involved a group of design researchers from the the Polimi DESIS Lab of Politecnico di Milano. Output of this collaboration was the ideation and development of a special educational activity, including students coming from different Masters' Degree of the School of Design who engaged in a dedicated workshop to envision future scenarios for the Tourist Harbour Carlo Riva.

Design has historically been conceptualised as a reflective practice which aims to build futures in response to problematic situations that are uncertain, disordered and indeterminate (Dorst, 2015; Schön, 1983). Here is why Bizzi & Partners identified the design discipline as a valuable set of approaches and methods to tackle the challenge of reimagining the future of the Rapallo marina. Another important element identified by Bizzi & Partners was to consider both the tangible and intangible dimension of the project, i.e. the physical spaces and services to be provided, therefore the expertise of the Polimi DESIS Lab in service design appeared as crucial to build a future scenario in which the spaces are informed and shaped by the activities that take place there.

The traditional urban planning, since the 1950s, was focused on the coherency of the urban form of the built environment and its developmental process with the functional necessities of an area (Beauregard, 2003); however, this approach needs to be expanded by embedding a service logic to the spatial planning perspective (Vargo & Lausch, 2016; Meroni & Selloni, 2022). This is because services are hybrid artefacts that can be viewed as technical and social networks where people, products and places interact for a common purpose (Mont, 2002; Meroni & Sangiorgi, 2011). Hence, assuming a service design perspective in spatial planning means to deal with complexity and to consider a systemic dimension to better organise the people and the infrastructure that may enable interactions in a given place.

The adoption of a service design approach was indeed complementary to the use of the scenario building methodology throughout the experimental workshop to envision the future of the Tourist Harbour Carlo Riva. Such methodology has a long history in business, government, and military sectors: Warfield (1996) suggests that a scenario is a narrative description of a possible state of development over time, it is useful to stimulate imagination and to conceive speculative thoughts about future evolutions. In general, it is possible to argue that scenario-building and foresight methodologies, incorporate diverse techniques, perspectives, and practices from various research and application fields, including Future Studies (Voros, 2001; Dunne & Raby, 2013; Fry, 2020;) and Strategic Planning (Hillgren et al., 2020; Jantsch, 1972). Additionally, strategic foresight has been integrated into the planning processes of the European Commission, with current efforts focused on incorporating it broadly into policy development across all sectors (European Commission, 2020). More specifically, according to Ogilvy (2002) scenarios are stories about the future conceived in a narrative and visual form and this is precisely the way in which design researchers formulate future narratives, i.e. by combing storytelling and visual elements. In the design field, Manzini and Jégou (2004) talk about 'DOS - Design Orienting Scenarios', defining a scenario as a vision for the future that is motivated and illustrated through specific solutions. They are useful to explore a panorama of alternative possibilities and act as 'thinking material' to orient conversations between actors, in other words they are "tools designed to facilitate the design process" (Manzini & Jégou, 2004, p. 193). For the purposes of this paper, it is important to highlight that the idea to characterize a scenario through specific solutions is peculiar to service designers: they use to craft scenarios around a service-logic, by mainly envisioning scenarios of interactions and relationships among people in a way that is anticipatory of the design of the physical space (Selloni et al., 2023). Here is why, during the workshop 'Design of future

scenarios for the Tourist Harbour Carlo Riva' students and researchers firstly envisioned how people could interact and relate within the space of the harbour so that these dynamics can be given priority when planning the related physical layout. Hence, in the next paragraph, an in-depth description of the 'Design Orienting Scenarios' developed during the workshop will be provided, focusing firstly on their service offering and secondly on their application in space and time, while in the final paragraph, a reflection on a wider placemaking strategy for the Rapallo marina will be drafted.

2. Case Study: Design of Future Scenarios for the Tourist Harbour Carlo Riva

Design of future scenarios for the "Tourist Harbour Carlo Riva" is the title of a special educational activity that was carried out at the School of Design of Politecnico di Milano involving a group of 20 international students selected from 3 different master's degrees programme: Product-Service System Design, Interior and Spatial Design, and Naval and Nautical Design. The group of students was created after a selection process and included them in an extensive workshop, conducted from March to May 2022 and designed as a contest for the envisioning of the futures of the marina.

As anticipated, the initiative was part of a larger process of rebuilding, rebranding and managing the tourist harbour 'Carlo Riva' in Rapallo damaged after a sea storm in 2018. Such a process, which is currently in the final phase of the construction site, met the teaching activity at a transition point between the closing of the architectural master plan and the beginning of the design of the intangible elements. This represented a key moment: the main spatial elements were already defined and played the role of creative constraints, and, at the same time, it was still possible to influence the detailed physical layout's choices through the design of scenarios embedding services and activities. Hence, building upon such constraints, we defined a brief that guided the students in the main phases of research, concept generation and development of future scenarios. The following paragraphs will describe these three main phases and the process of setting up and conducting the didactic experience while introducing the 4 emerging scenarios.

2.1 Phase 0: Setting Up and Defining a Brief

The initial phase comprised formulating a brief, followed by a collaborative problem-framing stage with Bizzi & Partners and Tectoo, the architectural firm responsible for developing the master plan. The components contributing to the brief were categorized into two groups: firstly, functional elements necessary for envisioning a novel offering for the harbour, and secondly, potential opportunities aimed at establishing a specific identity for the marina and therefore for the various identified targets.

Regarding the first category, the brief was to create a 'high-end tourist harbour', a marina providing the most complete and updated range of services that could characterize an efficient and pleasant future destination, considering environmental and social sustainability as the basis of the whole project. In fact, although the main customer is the international tourist, the brief indicated as the core element of any proposal the need to imagine this new place as an extension of the historic city of Rapallo. And therefore, to overturn the logic of exclusivity and privacy on which the old marina had been designed, adopting an inclusive, open and above all integrative approach as well as a community dimension.

> "It is an inclusive space devoid of barriers and borders, warmly embracing guests, tourists, and city residents alike. This dynamic environment thrives in every season, seamlessly integrating into the daily life of the city. It serves as a hub where individuals can encounter and enjoy a variety of new services." (from the original brief)

Finally, two must-have requirements have been thoughtfully integrated as key components in each scenario:

- **Sustainability**: this involves embracing advanced approaches to environmental responsibility, optimizing resource utilization, and actively addressing waste and impact through practices such as recycling, repairing, and reusing.
- **Technological Advancement**: this encompasses the seamless incorporation of innovative solutions and the integration of the latest technological products to enhance the port's services and offerings.

As regards the second category, the brief was complemented by a series of contextual project opportunities in different areas, arising from a preliminary analysis of both emerging global trends and the specific vocation and resources of the place. These opportunities have been crafted as potential avenues for further exploration concerning their connection to a local scale, including local services and initiatives. Additionally, they extend to a national scale, delving into characteristics and vocations acknowledged as typical of Italy. Furthermore, they reach an international scale, examining the offerings of marinas in the Mediterranean. This analysis refers to both competitive perspectives and considerations of complementarity within the tourist circuit. The same approach of examining various scales is also applied to the analysis of potential users. This encompasses not only the marina's primary international target but also includes considerations for internal tourism. Most importantly, it involves viewing the residents of the area as potential new users but also potential co-designers and co-producers of services and spaces.

The four identified areas of opportunity are:

- **Sports**: The Tourist Harbour Carlo Riva is a marina highly specialized in water sports. It stands as a centre of excellence in sailing, offering a comprehensive experience for sailing enthusiasts—from learning and practice to competition and the sheer enjoyment of sailing. Additionally, it provides a diverse range of sports, promoting a holistic approach to well-being for its users.
- **Tourism**: The Tourist Harbour Carlo Riva emerges as a new focal point for Mediterranean yacht tourism, providing a comprehensive hospitality experience encompassing accommodation, dining, well-being, and entertainment. In this context, Rapallo is seamlessly integrated into the Golden Triangle of Yachting, alongside the Italian Riviera, French Riviera, and Sardinia.
- **Heritage**: The Tourist Harbour Carlo Riva serves as a hub for the cultural and natural heritage surrounding Rapallo. It is a space where individuals can engage in learning and practical experiences related to biodiversity, environmental sustainability, and landscape protection. It acts as a gateway for exploring and discovering the historical and cultural sites within the area.
- **Design**: The Tourist Harbour Carlo Riva serves as a showcase of Italian design, where the essence of "made in Italy" is manifested in every facet of the environment, services, and activities offered to users. It encapsulates the most authentic and sophisticated Italian experience.

2.2 Phase 1: Research

The initial phase of the programme included both desk research and on-site activities. As students delved deeper into the information provided in the brief regarding future directions and requirements, they seized the opportunity to visit the Rapallo harbour area, which has been inaccessible since 2018 (Figure 1). During this on-site exploration, students engaged with workers and residents of the city, previously identified by Bizzi & Partners. The crucial aspect of this phase was the interviewing of citizens who serve as recipients of the services and beneficiaries of the harbour. This hands-on activity played a pivotal role in gaining insights into the needs and perspectives of the local community, enriching the overall research and educational experience.

Figure 1. Visit to the city of Rapallo and to the building site of the marina (pictures by the authors).

2.3 Phase 2: Concept Generation

The students actively participated in a series of brainstorming sessions aimed at generating a wide array of ideas. The use of the 'DOS - Design Orienting Scenarios' was crucial in exploring possibilities for different futures, moving from the seeds of the present and identifying possible solutions in form of services to be further developed in the following phases. Such methodology makes it possible to explore a range of experiences that people could have in the marina spaces in future, even before these spaces are designed in detail. This set of services and relationships manifested in the scenarios helps build the identity and distinctiveness of each of the scenarios.

Exploring the opportunities outlined in the brief, the students identified a series of influential factors that could shape the design of both scenarios and services. These factors encompassed various polarities of concepts, including Temporary vs Permanent, High Season vs Low Season, Private vs Public, Reserved for Clients vs Open to the City, Personalized vs Standard Offering.

Such dichotomies served as key elements to stimulate the creative phase. They provided a structured framework for considering and conceptualizing different aspects of the potential offering. The outputs of this phase culminated in a series of 'draft scenarios', which would be further refined and selected for the consequent development. This iterative process allowed for a dynamic exploration of possibilities and laid the foundation for more focused and detailed design choices.

2.4 Phase 3: Development of Future Service Scenarios

In the third phase, students built four specific scenarios, for each of them they outlined the following items:

- a general description in the form of a narrative and a visualization highlighting the most important characteristics of each future Tourist Harbour Carlo Riva.
- the main and additional services, therefore exploring the offering and the set of experiences provided to the different targets: from the tourist to the local citizens, including marinas' staff and workers.
- the main user journeys to map out the complete user experiences, touchpoints, and stakeholder maps. These visual representations provided a comprehensive view of how people would interact with the services, illustrating key touchpoints (both tangible and intangible ones) and identifying important actors to be involved in the scenarios, according to different roles and levels of engagement.
- the usage technology and the adoption of technological solutions both by exploring the development of innovative touchpoints as well as by integrating such innovations as part of the offering (see scenario 2 as an example).

This process of scenario generation and development aimed to establish a clear framework for understanding both the distinctive character of each scenario, in terms of actual offering and experiences, but also the stakeholder engagement plan, essential to implement the vision of the future marina. Moreover, it allows to start connecting the level of human interactions with the level of spatial interactions and design, thus contributing to imagine a new 'place' as anticipated in the introduction.

Here below there is a description of the four scenarios, written in the typical storytelling form of the scenario building methodology, which attempts to provide a specific and visionary narration at the same time.

Scenario 1. The Harbour of Amusement: offering 'sportainment' adventures.
Imagine a harbour where visitors embark on an unforgettable "sportainment" adventure, featuring recreational and multi-experience port entertainment facilities unique to the space (Figure 2). The marina has the potential to set a new standard for the region, offering one-of-a-kind experiences for adventure seekers of all ages. From the amusement of wellness to the thrill of intense emotions, individuals can interact with others and have fun.

Picture a scenario where a wholesome family of yacht owners and visitors enters the harbour area in the morning, ready to embark on an unforgettable "sportainment" experience, ranging from recreational multi-experiences to adrenaline-fueled adventures. What if the harbour spaces facilitated playful interactions among visitors and guided them toward community building? Envision the unique sports spaces unveiling new rules and introducing new sports/activities exclusive to Rapallo!

According to the findings, theme parks attract more visitors than any major sports league worldwide, and by a significant margin. Furthermore, sports entertainment is a global industry that has experienced exponential growth in recent decades. Given the diverse activities, locations, and users, there is ample opportunity for a profoundly multi-experiential and community-building experience.

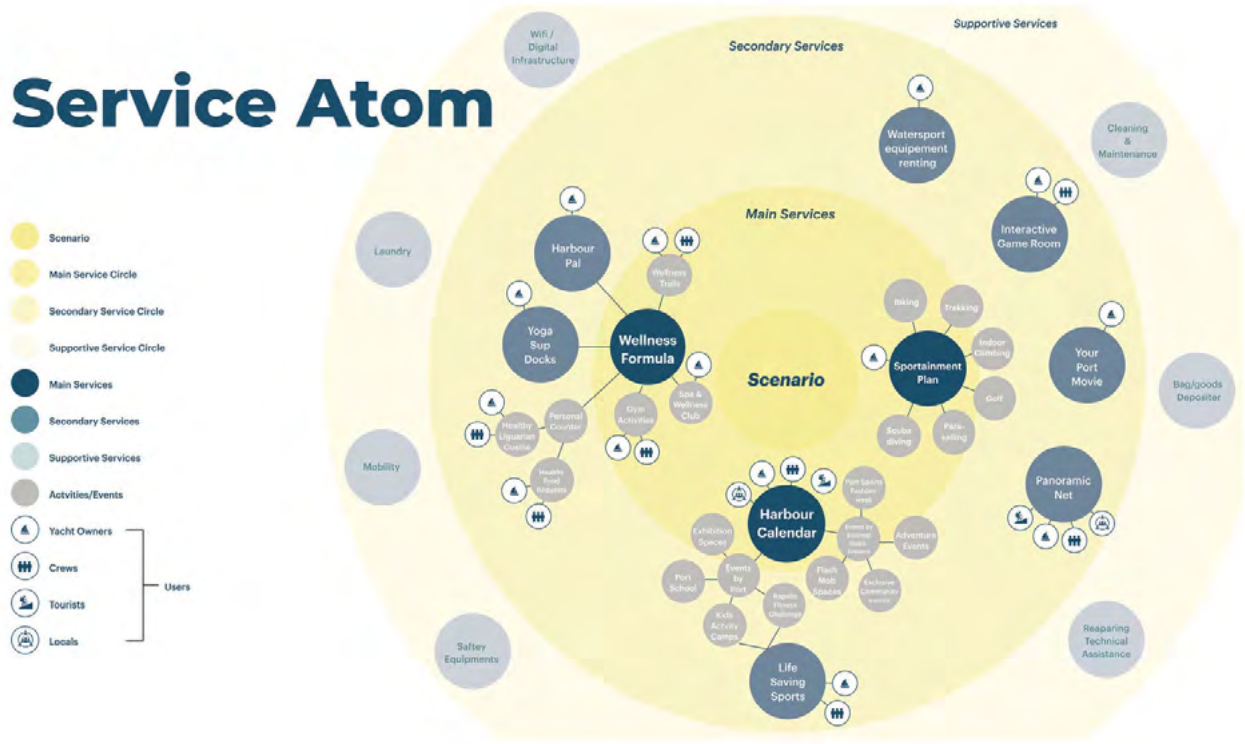

Figure 2. The Harbour of Amusement: offering map (students: A. Bosso, G. Musumeci, A. Panzetti, and D. Perera).

Scenario 2. Europe's leading carbon-negative marina: setting a new standard for sustainable marinas. We live in a new world where the reality of climate emergency is on our doorsteps and can no longer be ignored. Rapallo's Carlo Riva Tourist Harbour knows this reality well and is determined to set necessary ecological boundaries to reduce emissions at the local level and become Europe's leading carbon-negative marina (Figure 3). Rapallo is setting a new standard for the future of marinas by proving it is possible to create a new sustainable ecosystem around how marinas and harbours are run. You just need to be brave enough to leap. The many people who live, work, and holiday in Rapallo are ready to embrace a green economy, live sustainable lifestyles, and contribute to this dynamic, green zero-carbon future. Rapallo is installing the systems and infrastructure needed for this resourceful and innovative green future to become a reality by becoming a car-free private marina. Through their awakened respect for nature, Rapallo is creating pathways for empathy and ingenuity and brings forth a response that breaks free from convention and defies the system.

Those to visit Rapallo will find various products, services, and systems that encourage and enable hassle-free green consumerism. Not only this, but they will also feel refreshed by its spirit and virtue. However, becoming carbon negative admitting marina does not happen overnight, and it takes the coming together of several solutions to create a truly efficient and sustainable ecosystem.

Figure 3. Visualization of scenario 2 “Europe’s leading carbon-negative marina” (students: C. Ravasi, M. Torres, S. Checker and S. Peluzzi).

Scenario 3. Design Bay: aspiring to transform the marina into a hub of nautical design.
In a context marked by a great history of design, the new Tourist Harbour Carlo Riva was born. Starting from its history and from the importance that this place had for the engineer Carlo Riva, Design Bay wants to transform the Marina into a place of reference for nautical design. It becomes a place for everyone, where users can enjoy the best services and live premium experiences, enriching their passion for boat design. This will be possible thanks to the creation of spaces that will be simultaneously related to leisure and culture. In the marina, it will be possible to enjoy the Italian beauty in its simplicity: having a typical aperitif while admiring the hulls rocked by the waves and learning more about the world of boat and product design, thanks to exhibitions, courses, activities, and shops open to everyone (Figure 4).

Figure 4. Visualization of scenario 3 “Design Bay” (students: A. Colombo, G. Frattini, L. Imperio, B. Akyazici, O. Saglam).

Scenario 4. The Floating Resort of Rapallo: combining sea and land tourism to build a destination suitable both for work and vacation.
The harbour of Rapallo presents a unique opportunity to extend a luxurious experience as imagined by Carlo Riva between land and sea. The Floating Resort is a craft of luxury between land and sea, envisioned as an epitome of the ‘Carlo Riva style’. It offers a seamless transition from the shackles of mundanity to the gift of rejuvenation. From the moment of docking, the yachts become the resting abodes to a world of pampering and entertainment, just as cottages are to resorts. Responding to the remote lifestyles of today, it presents a unique destination for celebrating life on vacation and at work alike (Figure 5).

Nowadays tourists are totally connected with all available experiences they could reach. Harbours are changing their approach toward very different solutions, becoming a point of reference in a specific area. Carlo Riva Harbour could become the one where tourists find new engaging entertainment based on the idea that the sea mixes with the land generating a unique surface where the show takes place. Around it, people will meet and share the experience and enjoy the journey as a yacht owner, as a Rapallo resident, as a tourist, and as part of the Tourist Harbour Carlo Riva.

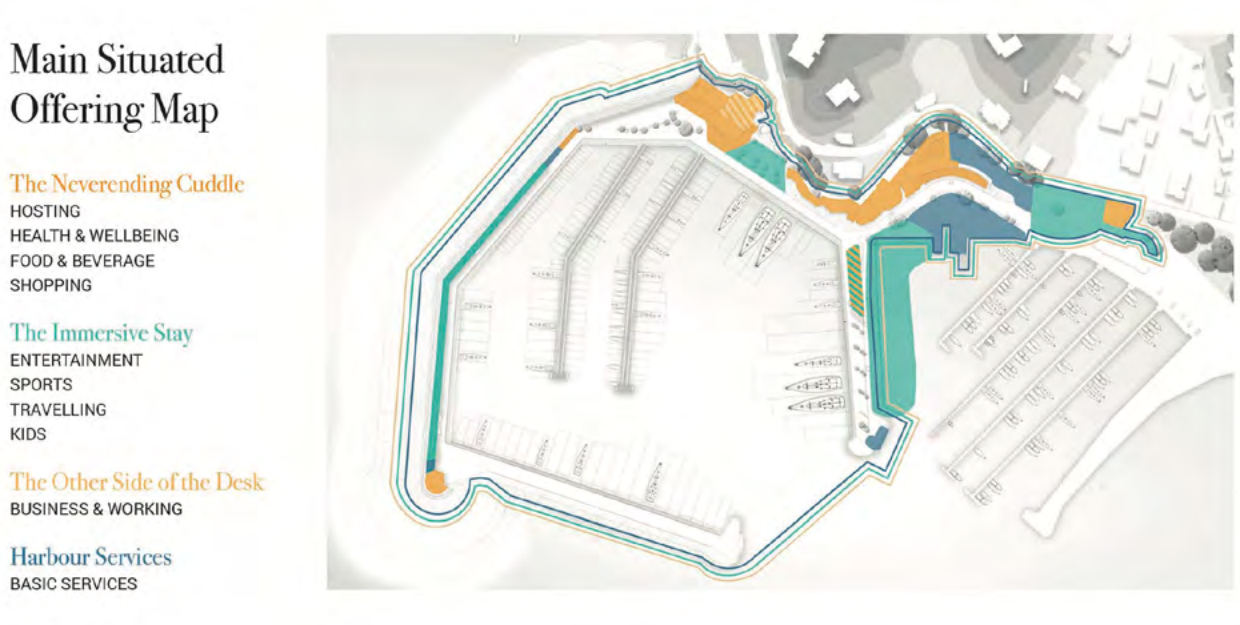

Figure 5. The main situated offering map of scenario 4 “The Floating Resort of Rapallo” (students: M. Diaz Gonzales, G. Lisoni, G. Luciani, G.Martini, R. Mondal).

Finally, a public presentation took place at the Municipality of Rapallo in the presence of the city's mayor, council members, and representatives from Bizzi & Partners. The outcome of this phase contributed to a broader and comprehensive conversation concerning the future of Rapallo, wherein the new marina played an integral role. The scenarios crafted by students offer a valuable framework for envisioning the city's future, thanks to their ability to incorporate and integrate a diverse range of spatial and service elements.

3. Service-Oriented Scenarios as a Placemaking Strategy

The scenarios elaborated during the workshop served as a stimulus for the executive project as each of them made emerge potential elements that, selected and combined in the most appropriate way for Rapallo and its context, can be considered as an integral part of a wider placemaking strategy to create an innovative harbour. More specifically, the identification of several service solutions was useful in imagining an unprecedented use of the spaces, which become then actual ‘places’ thanks to the involvement of physical, cultural, and social identities into the equation. The transformation of a space into a meaningful place (LeGates & Stout, 2020; Gehl, 2013) is precisely the very aim of a placemaking strategy and, in Rapallo, this was possible thanks to the inclusion of intangible elements extending beyond the physical aspect. Granata, in her book about placemaking (2021), states that traditional urban planning and architecture have long lost their role as society’s spur, their capacity to transform places and conceive long-term visions. Here is why the adoption of the scenario building methodology and of a service design approach was useful to shift the focus on people and their interactions, aiming at strengthening social relationships to share meanings about a place (Buser et al., 2013 in Romeiro, 2017). In the same vein, Granata (2021) continues arguing that placemaking centres mainly on behaviours, nature, feelings, and lifestyles, employing an envisioning perspective that originates in the real world but looks further, perceiving possible connections, and integrating apparently unrelated components into new opportunities. Therefore, she highlights that complex urban projects (as that of the Tourist harbour Carlo Riva is) need a great variety of ‘placemakers ‘who are not only architects or policymakers but more widely ‘inventors of places’ who elaborate on people's necessities and desires and generate a common future vision. It is not by chance that the real estate Bizzi & Partners and the architectural firm Tectoo recognized the need to include in their strategic conversation experts in service design and scenario building and to benefit from the fresh perspective of design students. After the natural disaster of 2018, the pressure on the part of the community and the municipality of Rapallo to develop a more meaningful project in a strategy of adaptation or mitigation to climate change was high: however, it was not only a challenge related to

environmental sustainability, but it was also about envisioning a way to build communities around that place, identifying activities and services, ensuring diversity and inclusion, in other words to create a new 'place' as integral part of life's people. The work of the students in conceiving scenarios in which tourists and local communities coexist and interact was a key component in building a wider placemaking strategy in which both time and space are carefully designed and combined. One of the distinguishing features of the service-oriented scenarios built by students was precisely the development of a calendar considering a variety of time ranges, from the seasonal dimension to weekly or daily levels that need different reasoning and approaches and conceive the wide plethora of services in a systemic and progressive way. Another 'time feature' that was attentively designed was the distinction between permanent and temporary activities: this was important to make an estimate of the effort needed for each service and, above all, to better define the hierarchy of the service offering, identifying the main one and what was on the contrary considered secondary. The adoption of a well-known tool as the service offering map (Foglieni et al.2018; Morelli et al.,2021) with the 'time filter' integrating permanent and temporary activities was made in every scenario and was considered a fundamental ingredient in a planning perspective, not only by Bizzi & Partners but also by the Municipality of Rapallo who expressed a clear interest in considering such agenda the starting point for the future. The inclusion of the time dimension into the project is a specific characteristic of service design (Meroni & Sangiorgi, 2011; Sangiorgi & Prendiville, 2017) and its integration in a wider placemaking strategy was particularly meaningful in the case of the Tourist Harbour Carlo Riva, as the objective was to envision the transformation of a place over time. The time issue was central not only in terms of the 'service agenda' for the harbour, but also as a fundamental reference in applying scenario building: this methodology is employed considering a future perspective, in the case study described it was specifically a timespan of about 10-15 years. The medium and longer term are particularly useful in complex situations, full of uncertainty and conflicting issues (Leney et al., 2004) especially because they usually cover a broad spectrum of elements, including demographic shifts, geopolitical and climate changes, and disruptive technologies. They demand a higher level of creativity and the capacity to imagine alternative futures that may seem distant or speculative (as some of the Rapallo scenarios are, as 'Europe's Leading Carbon negative Marina' scenario) but they complement and extend the value of traditional forecasting and above all they are useful to ignite a conversation among stakeholders. The four scenarios designed by students for the Tourist Harbour Carlo Riva contributed not only to encourage but above all to enhance the quality of the overall conversation, providing originality, detail and specifics on space and time. They served as basis for the wider placemaking strategy that Bizzi & Partners together with the Municipality of Rapallo intend to develop and apply in future.

Preparing and cultivating the ground for making this conversation flourish is precisely what Selloni and Meroni (2023) suggest in their attempt to define design for placemaking: "a collaborative process by which we can shape our public realm by acting on soft infrastructural and intangible (cultural, relational, policy, etc.) levels to maximize communal value/common good and sustainability in a community-centricity perspective and configure, re-configure and re-signify the space (from space to place)" (p.2). Hence, the contribution of the service design researchers and students in the case study here presented can be defined as a pioneering activity of design for placemaking valuable for the future: here there is room for further research as the work of designers can provide an effective contribution in complementing and expanding that of urban planners, architects, and policymakers.

KEYWORDS | CO-CREATION, FLEXIBLE ATTACHMENT, INTERCULTURAL ENCOUNTER, VISUAL COMMUNICATION, COMMON VALUES

ABSTRACT | CultiRider is a moving community space that has been bringing intercultural workshops to several villages in Hungary in the form of a redesigned camper van since 2020. CultiRider is also a case study illustrating a collaboration of urban and rural NGOs, communities, and artists. The paper explores how design might take a role in community building by creating a shared place and shared language. The authors are both doctoral candidates, practising designers, and social activists whose aim is to support creating common values by connecting two very different target groups: youth with refugee and migrant backgrounds living in Budapest as well as their underprivileged Hungarian peers living in the rural area of Hungary.

First, the paper introduces the diverse challenges of the involved groups, highlighting the dimensions of the insecure physical environment and the barriers of language. It also discusses the significant roles of "flexible place attachment" (Dúll, 2009) and visual communication (Kress & Van Leeuwen, 2020; Radtke, 2021) in the context of intercultural encounters (Kapitány 1996). In the case of migration, besides the transformation of cultural identity, separation from home entails a multiple loss. In the new society, the migrant loses the gestures and codes that help the problem-solving ability in social contacts (Horvát-Militity, 2011), and by losing their home, they face the challenges of grieving the old environment and rebuilding a new one (Dúll, 2009). The group of underprivileged Hungarian youth living in rural areas of Hungary face the challenges of rural segregation and lack of intercultural encounters, leading to closed communities and discrimination (Halász, 2020). While the ability of "flexible attachment" can support effective adaptation to changing environments (Dúll, 2009), visual communication, as a global language, can be a tool for intercultural communication, storytelling, and self-expression. The opportunity to work in intercultural teams develops new competencies and creates shared ownership and community. (Murdoch-Kitt, 2020)

In the second part, the paper introduces the case study of CultiRider, a community-created project using collaborative design methods. Following a democratic decision-making process from the very beginning, the project of CultiRider developed through the steps of community brainstorming, redesigning and rebuilding a van through co-creation, conducting intercultural creative workshops focusing on language barriers and sharing different cultural views as well as creating common values such as a commonly owned flexible space and a common visual language. Non-formal evaluation methods and half-structured group interviews were

Conducted to monitor the process of co-creation and understand the learnings of the project. Results show that by joining CultiRider, migrant youth raised their motivation to learn about the local culture and the Hungarian language, enabled them to create new friendships, and offered them a chance to share their culture with others in a respectful environment. Hungarian youth became motivated to learn foreign languages, which helped them to dismantle stereotypes and xenophobia. Both target groups benefited from gaining intercultural and collaboration skills. The moving community space created a flexible but still stable environment in multiple places, raising the feeling of security and belonging in the participants.

1. Introduction

The bottom-up project of CultiRider is initiated by an interdisciplinary group of activists in the frames of a Hungarian NGO, Útilapu Hálózat, emerging as a dynamic and innovative moving community space aimed at fostering intercultural dialogue and cooperation. The NGO itself is home to the Open Doors working group - a diverse and proactive community open for Hungarians, foreigners, refugees, volunteers, and activists, or anyone who is engaged in building an inclusive society by opening spaces (physical or metaphoric) for intercultural dialogue which enables us to learn from each other through a co-operative design process (planning, designing and realising) by workshops, pieces of training, and events since 2013. The inception of CultiRider during the COVID-19 pandemic was the result of an online collaborative design thinking process involving the NGO community members. Since 2020, CultiRider has been delivering intercultural workshops by a redesigned minivan to various rural locations in Hungary, serving as a case study that illustrates intercultural collaboration among urban and rural NGOs, communities, and artists. The project focuses on how design can play a pivotal role in community building, bridging the gap between youth with refugee and migrant backgrounds living in Budapest and their underprivileged Hungarian peers in rural areas. The collaborative efforts involve three rural partner organisations.

The paper examines the role of flexible place attachment and visual communication in fostering intercultural encounters, drawing on theoretical insights from Dúll (2009), Csíkszentmihályi and Halton (2011), Roberts (2018), and Gustafson (2013). It highlights the importance of creating safe spaces for encounters among underprivileged groups and explores the complexities of belonging in disrupted environments. The necessity of acquiring intercultural competencies for effective communication and understanding is emphasised by Hidasi (2004), while visual communication, as advocated by Neurath (1936), serves as a universal language facilitating dialogue across cultural boundaries. The collaborative approach in design, as discussed by Radtke (2021) and Murdoch-Kitt & Emans (2020), fosters innovation and inclusivity, promoting problem-solving skills and a sense of shared ownership and community. Visual tools outlined by Manzini (2015) play a vital role in facilitating intercultural teamwork, serving as conversation starters and storytelling aids, ultimately enhancing intercultural dialogue and promoting inclusivity in diverse cultural contexts.

Based on the theoretical background and the case study, the paper states that collaborative design methods can be effective tools for creating a common space and common language to bridge together underprivileged youth from different cultural backgrounds. By transforming a minibus into a multifunctional space, CultiRider seeks to address the challenge of lost connections exacerbated by the COVID-19 pandemic and provide opportunities for intercultural encounters. Through a series of collaborative workshops, camps, and community-based projects, the project facilitates dialogue, skill-sharing, and the co-creation of meaningful experiences among participants. Commonly owned tangible results such as workshop materials and a renovated van, combined with improved social and language skills, can boost participants' confidence in their creativity.

2. Bringing Together Underprivileged Hungarian and Refugee Youth

CultiRider brings together two very special underprivileged groups who do not have many opportunities to meet in the Hungarian context: (1) young refugees from the Middle East and Africa living in Budapest and (2) disadvantaged Hungarian youth living in the rural areas of Hungary.

The global rise in asylum seekers and refugees, particularly in transit countries like Hungary, presents significant societal challenges. Integration barriers are compounded by xenophobia and stereotypes, leading to conflicts between host society members and newcomers (Gyulai, 2014; Sik, 2016). "In every case, we consider migration as an unexpected, so-called accidental crisis, which is an important task of the individual to process it" (Hautzinger et al. 2014, 69). This crisis alters interpersonal relationships and can lead to learned helplessness, isolation, and depression due to communication difficulties and cultural differences. Migration involves more than just a shift in cultural identity; it encompasses multiple losses,

including the loss of familiar gestures and social codes crucial for problem-solving in new environments (Horvát-Militity, 2011). Additionally, migrants face the challenge of grieving their old surroundings and rebuilding new ones after leaving home (Dúll, 2009). This study focuses on unaccompanied minor refugees and young migrants who arrived in Hungary between 2013-2023. These minors face unique challenges, as their experiences are shaped not only by refugee status but also by their protection under the childcare system. Their arduous journeys and uncertain asylum processes exacerbate post-traumatic stress disorder stemming from the trauma of displacement. Cultural disparities and language barriers further complicate their social integration, necessitating new tools such as cultural knowledge and language proficiency (Hautzinger et al., 2014).

The group of underprivileged Hungarian youth living in rural areas of Hungary face the challenges of rural segregation and lack of intercultural encounters, leading to closed communities and discrimination (Halász, 2020). When speaking about the underprivileged Hungarian target group of this project, similarly to many other underprivileged families in Hungary (Bányai & Kelemen, 2022), each of the participating youngsters has parents who were raised in state care. Families living in extreme poverty experience material deprivation, one-sided diet, intermittent or even regular hunger, shortage of proper clothes, and disconnection of utilities, which can force families in winter to move in together to reduce the number of apartments or houses to be heated (Husz-Marozsán, 2014). Because of their insecure situation, these families might have to face debts and family conflicts, which can lead them to hide or change their place of residence. These families have less chance to develop supportive relationships in the local community, and they often have to face prejudices from the majority of society. Children raised in families facing these problems live in a “culture of poverty” (Lewis, 1968; Solt, 1998; Kozma, 2003, cited by Bányai & Kelemen, 2022, 8).

The challenge of bringing together these two very special groups has different layers but might have one main source: the challenge of cultural differences. Nothing is more proof of the multiple layers of culture than the fact that it covers and influences countless areas of our lives. Without wishing to be exhaustive, we must mention here the most striking aspects of culture, such as the material environment, time management, the dominant worldview, religion, celebrations, and communication. However, culture also affects many more elementary details, such as the way we help others, human relations, the way we experience conflict, appropriate behavior, our main ambitions, the boundaries of the private sphere, the use of space, attachment to the material environment and the concept of power (Kapitány & Kapitány, 1996). It is understandable, then, that our culture influences our most basic habits and can determine our most fundamental values and behavior (Kapitány & Kapitány, 1996). Socialisation and culture go hand in hand (Hidasi, 2004) since "it is only through the medium of culture that man can act meaningfully and relate to others" (Hall, 1987, 251). Connected to this, both Hall (1987) and Schütz (1944) point out that our culture-based knowledge is incoherent and only partially clear. Since we socialise in this knowledge system, it gives the members of a group coherence, clarity, and consistency to understand each other. Still, it creates huge confusion and conflicting points for outsiders (Schütz, 1944).

In conclusion, we can see that the main challenge of the CultiRider project is to facilitate two culturally very different groups towards a commonly accepted set of rules, including a shared place and common language. On one hand, "one's culture determines how one perceives the world" (Hall, 1987, 251), which can lead to deeply rooted conflicts among different groups. On the other hand, culture can also be seen as a major integrating and socialising force of a group since the set of rules and norms are correct and accepted by its members (Haviland, 1987). To use cultural differences as an empowering resource, intercultural competence needs to be developed. According to Radtke (2021), intercultural competence is a trainable skill which refers to the ability to effectively navigate and communicate across different cultures, understanding and appreciating diverse perspectives. (Radtke, 2021)

3. Co-created Place and Language

It is not easy to decide which should come first: creating a common language for a transnational and intercultural dialogue or creating a safe place for the encounter of differently underprivileged people. The

Paper has no intent to prioritise these needs but rather raise awareness about the importance and opportunities offered by flexible place attachment (Dúll, 2009) and visual communication (Kress & Van Leeuwen, 2020; Radtke, 2021) in the context of intercultural encounters (Kapitány & Kapitány, 1996).

3.1 Safe Place

As we have made clear above, both target groups have their sense of belonging and place-based security disrupted: refugees are uprooted from the communal and physical connections of their home that provides security, while young Hungarians living in poverty are anchored in a distorted conception of home that cannot provide security. If the primary territory is (burned down) or psychologically (receives a negative charge) destroyed or damaged, "this causes the same grief as the loss of important companions." (Tuan, 1974, cited by Dúll, 2009, 131). By this damage, the person leaves the familiar, intimate, protective, and autonomy-providing environment, the personal sphere and territorial behavior are violated, and the possibility of control is also lost. In this case, the person faces a double task: "to deal with the grief of the lost place and to create attachments to a new environment at the same time" (Dúll, 2009, 238).

While several studies of environmental psychology state that place attachment has countless advantages, such as the sense of security, belonging, control, and ownership, as well as experiencing social connections (Dúll, 2009). Still, others conclude that mobility is associated with development and personal growth (Gustafson, 2013). What is for sure is that place attachment is the emotional bond between person and place, and it has different dimensions (Dúll, 2009). With Dúll's (2009) summation, it becomes obvious that knowledge of a place and its usage together create place attachment, social actors, ownership, a sense of security, and self-determination play an important role as well. Maybe it is not surprising that the highest manifestation of place attachment is the place called home.

As we discussed earlier above, we can see that cultural differences reach not only material dimensions but also habits, social connections, values, and perceptions, which also leads us to the point that the concept of home as well depends very much on cultural dimensions. If the sense of home has a cultural context, it can also mean that changes in the home environment do not have to be a traumatic event in every case. The Eskimos, the North American forest Indians, the nomads of the Inner Asian steppes, have no permanent homes (Csíkszentmihályi&Halton, 2011). By this, we can conclude that the idea of an irreplaceable home has been created not as a universal human concept but as a culturally influenced definition “created in certain places at certain times and neglected in others” (Csíkszentmihályi&Halton 2011, 181). Even though this change can burden everyone and can be a source of many conflicts, it does not result in a negative effect only, as it also promotes the formation of "flexible attachment" (Dúll, 2009, 239). A growing body of research suggests the advantages of a lifestyle based on mobility and that even highly mobile people may develop strong bonds to place (Gustafson, 2013; Roberts, 2018). Marshall (2018) states, based on his research, that participants who live a modern nomadic lifestyle put down roots instead of passing through locations; the homes of these participants became multi-sited, and still, they needed strong and embedded connections. According to his findings, people on the move can develop belonging through multiple grounded practices, such as gardening, cooking, and finding familiar landscapes. Active homemaking practices create connections between people and their environment, and by this act, “remembering also becomes an active process and constitutes a motion of attachment” (Roberts, 2018, 40). Sense of belonging involves tangible resources, everyday embodied practices, as well as memory and emotion (Roberts, 2018).

Studies also point out that it is not only stable physical environments where we can develop strong place attachments and that emotional bonds can be developed towards different scales of settings (Dúll, 2009;

Gustafson, 2013). Gustafson points out that vehicles and infrastructures for travel may become meaningful places for mobile people: they may develop an attachment to such places of mobility. Studies of mobile workers show that they can even try to make themself at home in settings that theorists stated before as liminal places or places of transition, such as cars, train compartments, airports, and hotel rooms (Gustafson, 2013). Speaking about different scales of attachment, immigrants in Denmark expressed a sense of belonging to their new hometown and residential area but not to the country of Denmark. According to Gustafson, immigrants suggest that their belonging was based upon everyday positive interactions, while their national belonging was limited by negative representations of immigrants in national Media (Gustafson, 2013). These findings mean that research about place attachment “needs to go beyond its common focus of Home places and examine other important places as well, including non-residential settings” (Gustafson, 2013, 45).

Concluding we can understand that mobile people may develop and sustain attachment to several different places, multiple attachments are potentially enriching since "flexible attachment" can support effective adaptation to changing environments, and the "settlement identity" can mean effective adaptation also to the pace of modern life and this flexible bond can develop spontaneously in the case of immigration (Dúll 2009). However, it needs to be highlighted that these advantages mostly come when positive experiences are associated with these journeys and changes, which is not the case in either of the target groups of this study. This leads us to one of the sub-questions of the project of CultiRider: Are temporary setups able to create (and if so, how) a supporting environment where vulnerable people can cooperate and grow?

3.2 Intercultural Competence Through Visual Communication

The issue of social integration and its relationship with culture concerns a much wider audience than refugees and asylum seekers since not only does cross-border migration involve an encounter with a new culture but in case of small geographical movements within national borders or movements between different social groups also entail interaction between different cultures (Hidasi, 2004). Even though we no longer need to cross a national border to encounter another culture, in the era of globalization and during migration processes, there is a growing need for intercultural competencies related to both transnational encounters and encounters among the citizens of the same nation. According to Hidasi, “intercultural communication is nothing other than the interaction of people from different cultural groups” (Hidasi, 2004, 33). Learning culture is as essential to successful interaction as learning a language, and it cannot be avoided in our everyday conversations and work. About intercultural competencies, Hidasi states that.

> "To have an effective and smooth conversation with a foreign partner, or to read a foreign novel, or even to understand an advertisement, or to be successful in marketing, these are all essential skills" (Hidasi, 2004, 25).

Culture is, therefore, not an innate quality but an acquired and learned set of knowledge and norms. This fact makes it possible to learn culture and acquire intercultural competencies.

As Otto Neurath (1936) states, "Words divide, pictures unite." (Neurath, 1936) Visual communication is the language of images and has the potential to bridge language barriers and promote intercultural understanding. Visuality speaks to a much more ancient layer; it skips a stage in the process of the mental image becoming a verbal concept, and it connects to reality more directly than words (Mitchell, 1986). While the perception and recognition of images is indeed a universal ability, reading them and decoding their meaning is far from being so. Meaning in images is often negotiated through cultural and social contexts, requiring an understanding of semiotic codes (Kress & Van Leeuwen, 2020). Understanding the pictorial signs that make up visual language is a social process, one that presupposes a social, historical, and geographical context and one that requires prior experience and knowledge. Just as spoken language conveys a shared understanding of the world within a specific community, images also reflect this collective comprehension among members of the same group. Consequently, the interpretation

individuals derive from an image often hinges on the common knowledge they share with others in their group (Kostelnick, 1993). According to Kostelnick (1993), three levels of social context influence the perception of images: (1) the cultural context includes the shared worldview and values of the group members, (2) the conventional context means that members of the group share a particular discipline or a visual language of a particular discipline or a special topic, while (3) immediate context is the situation in which the participants use the particular image.

Therefore, we can say that images are universal and culture-specific at the same time, they have an important role in both bridging cultural differences and sharing cultural specifics and values. Visual communication as a global language can be a tool for intercultural communication, storytelling, and self-expression, and it is an extremely important tool when the participants of the communication process do not share the same language or culture.

In the context of design, intercultural collaboration fosters innovation and creativity by bringing together diverse perspectives. Problem-solving competence, social competence, professional competence, and self-competence can be seen as the four cornerstones of intercultural competence that enable participants to work in teams, overcome difficulties, share skills, and act self-reflectively and responsibly (Radtke, 2021). By integrating various cultural insights, collaboration becomes a catalyst for developing more robust, inclusive solutions that cater to a broader audience (Murdoch-Kitt & Emans, 2020). The opportunity to work in intercultural teams develops new competencies and creates shared ownership and community. Visual tools can be effectively used in intercultural teamwork, as conversation subjects, conversation prompts, or experience enables the starts of social dialogues. They can be tools for mapping and amplifying, mapping and placemaking, amplifying and dynamizing, creating stories, reconstructing local identities, digital storytelling, hybrid realities as well as building scenarios (Manzini, 2015).

4. Cultirider - a Case Study of Collaboration through Design

CultiRider is the outcome of an ongoing bottom-up movement started four years ago: the developers of CultiRider (also the authors of this paper) did not articulate the goal to bring the project into academic discussion. Instead, they are members and coordinators of a creative community aiming to open (physical and metaphorical) places for intercultural exchange using the tools of participatory design, visual communication, and placemaking. Therefore, the introduced process, methods, and structure used through the project were developed based mainly on their own experiences complemented by the relevant literature on participatory design (Armstrong & Stojmirovic, 2011; Simonsen & Robertson, 2013; Duarte et al., 2018; Bustamante Duarte et al., 2021). These methods ensured that the often-neglected target group had a say on the design of Cultirider (both its physical and program development), and their needs were at the center of the project.
During the ongoing project of CultiRider, collaboration happens on different levels, such as collaborating between (1) different organisations, (2) participants representing different cultural and social backgrounds, (3) professions, as well as (4) urban and rural locations. On the level of organisations, the project so far involved three different NGOs and a child-care center based in different parts of Hungary. Collaboration with locally operating NGOs ensures the link between the different stakeholders and provides the base of knowledge for new ideas. The program involved participants coming from more than ten countries as well as underprivileged Hungarian youth. Cultirider used an interdisciplinary approach involving different stakeholders in the co-design process from the very beginning. Designers and artists coming from different fields (visual communication, media, architecture) worked together with local community leaders, social workers, psychologists, local and international volunteers coming from different professions, and local and international youth. Cultirider, as a moving community space, connects urban and rural communities, giving a chance for dialogue about local issues and finding common interests in global values. Through these connections, a network was born - the involved places are no longer isolated entities but part of a larger network.

4.1 Creating a Common Space

In 2020, just like everywhere in the World, the intercultural community of a Hungarian NGO had to face an unknown challenge: COVID-19 reached Hungary as well, and suddenly, all public indoor places had to close for an unknown period. Like many other collectives, this organisation also tried to hold together its community through online events and meetings, but the members slowly started to fade away due to a lack of motivation and a sense of distance and isolation. The core members of the community accepted the invitation of the two authors of this paper to join a series of sessions on the online design thinking process to analyze together these new challenges and try to find solutions somehow. The main design challenge of this process was: “How might we strengthen and rebuild the lost connections for our community after COVID-19?” This joint online process took six weeks, including problem-mapping workshops, user and expert interviews, brainstorming, and rapid prototyping sessions, followed by voting on different ideas from different perspectives and expectations. We could conclude several insights from the problem-mapping workshops and the interviews. First, our community is not motivated to socialise through online platforms, they rather stay isolated or take the risk of real encounters. Second, food is a key element in motivating people to join activities. Third, our refugee members have high motivation to visit the Hungarian countryside since the rural environment reminds them of home. Fourth, our intercultural community is active only in the capital, while people living in rural areas have much less chance to experience intercultural encounters, which leads to prejudices. After several brainstorming sessions, the final two most supported ideas were (1) developing a series of intercultural cooking events after the lockdown and developing a structured task-sharing system among the community to give roles and responsibilities to the members and (2) transforming a minibus into a moving community space to be able to bring intercultural values to new locations, to give infrastructure for outdoor activities and by that, to serve the community even at times of lockdown.

After the decision to dedicate our energies to creating a moving community space, we have learned by desk research that the idea of reconstructing a minibus reached other creative initiatives as well: there are examples of vans upgraded into a photo machine, a climbing wall for refugee children, or a warming space for street workers. The Inside Out Photobooth project (Insideoutproject, 2023) mobilizes portable printers, allowing participants to instantly receive black and white posters of their portraits, which are then displayed as public art, fostering connection and expression. Wapikoni Mobile's 40-foot studio (Evenementswapikoni, 2023) offers intervention services and dialogue spaces for the Aboriginal community living on the streets, promoting inclusivity and skill development among youth through audiovisual and musical creation. Fantastic Norway (Fantasticnorway, 2013) utilizes a bright red caravan as a mobile platform for architectural discussions and workshops, engaging communities in inclusive design processes that enhance public awareness and participation in urban development. ClimbAID's "Climbing for Peace" project in Lebanon employs "A Rolling Rock" (Katherinechoong, 2020), a mobile climbing wall, to bring joy and promote mental health among over 2,000 disadvantaged youth, showcasing the diverse possibilities of reconstructed minivans in fostering community engagement and well-being.

Designing and creating the minivan of the CultiRider project has also been a joint effort, from ideating its exact functions and creating a crowdfunding campaign through learning about the renovation process and obtaining materials until the last step, the realisation itself. For the first ideation sessions, different visualization tools were used, such as paper mockups, small-scale physical prototypes, and 3D models, which allowed community members to discuss priorities concerning the main functions and appearance of the moving community space. As a next step towards realisation, participating community members collaborated on a short narrated animation. The collaboratively written script and the tangible 3D paper models provided an opportunity to use storytelling to make decisions, set goals, and visualize and communicate ideas to others.

Figure 1. Frame from a crowdfunding video - https://www.youtube.com/watch?v=Yy12bPRFdeA&ab_channel=OpenDoorsHungary November 2021.

The short animation was used as a base of a crowdfunding process, which created the financial opportunity to turn ideas into reality: our association bought an old minivan, and the construction work could begin. Even if some parts of the minivan are still under construction, CultiRider already served its main purposes for two years. The minivan, on the one hand, needs to involve in itself the functions of a huge storage, a kitchen, a meeting room, and a small workshop space, on the other hand, thanks to its several doors and the foldable items of furniture and accessories it carries as a storage, CultiRider can open up to create the outdoor environment of a community space, a workshop space, an open-air kitchen or an outdoor cinema. After the event is over, the outdoor space can be folded again into the minivan and taken to the next location. Not only its inner functions but also its appearance needed to be characterised: by decorating the minivan through co-creational painting sessions, CultiRider became a common landmark for the communities of different locations. The purpose of creating such a moving space was to take community events outdoors, gather people, attract new participants, and facilitate connections with diverse communities. The mobility of the van addresses the challenges of lost connections and diversification by reaching people from different locations, including those who may be hesitant to attend large indoor gatherings.

Figure 2. Decorating the minivan through co-creational painting sessions. September 2022.

4.2 Creating a Common Language

In 2022, the minivan of CultiRider started to fully operate, visiting different communities in the rural area of Hungary. During the two full seasons of the project (2022 and 2023), several team-building meetings and five short (two to five days long) camps were organised in different locations to enable intercultural creative collaboration between underprivileged participants from different backgrounds and creative professionals. The team building events happened outside of the communities' original location to meet all together in a neutral environment where we could create our common safe space from zero. The aim of team building meetings has two levels: one is to support participants to get to know each other, and two, to give space for them to plan their local programs, share ideas through facilitated participatory design workshops, and create a network based on shared experiences. By this approach, youth were involved in all stages of the design process, starting from research through ideation until the realisation itself. Through their involvement, they could design the program according to their interests and needs, which ensured a common understanding of each result and design product. The programs of local short camps were built based on the ideas of the team building meetings, implementing the concepts on site. Besides the participants who were involved in the preparation, the short local camps were joined by new local and international participants as well.

All (two to five days) camps used participatory design methods and followed the same structure:

1. *Preparatory site visits:* The one-day-long site visits allowed participants to meet and get to know each other informally. The international Cultirider team from Budapest visited all the venues (Ágasegyháza, Fót, Tiszadob) during several site visits. The visits involved icebreaker games, playful brainstorming sessions about future programs, and usually, a community cooking event that allowed participants to get to know each other informally. These site visits served as a main foundation for long-term collaboration.

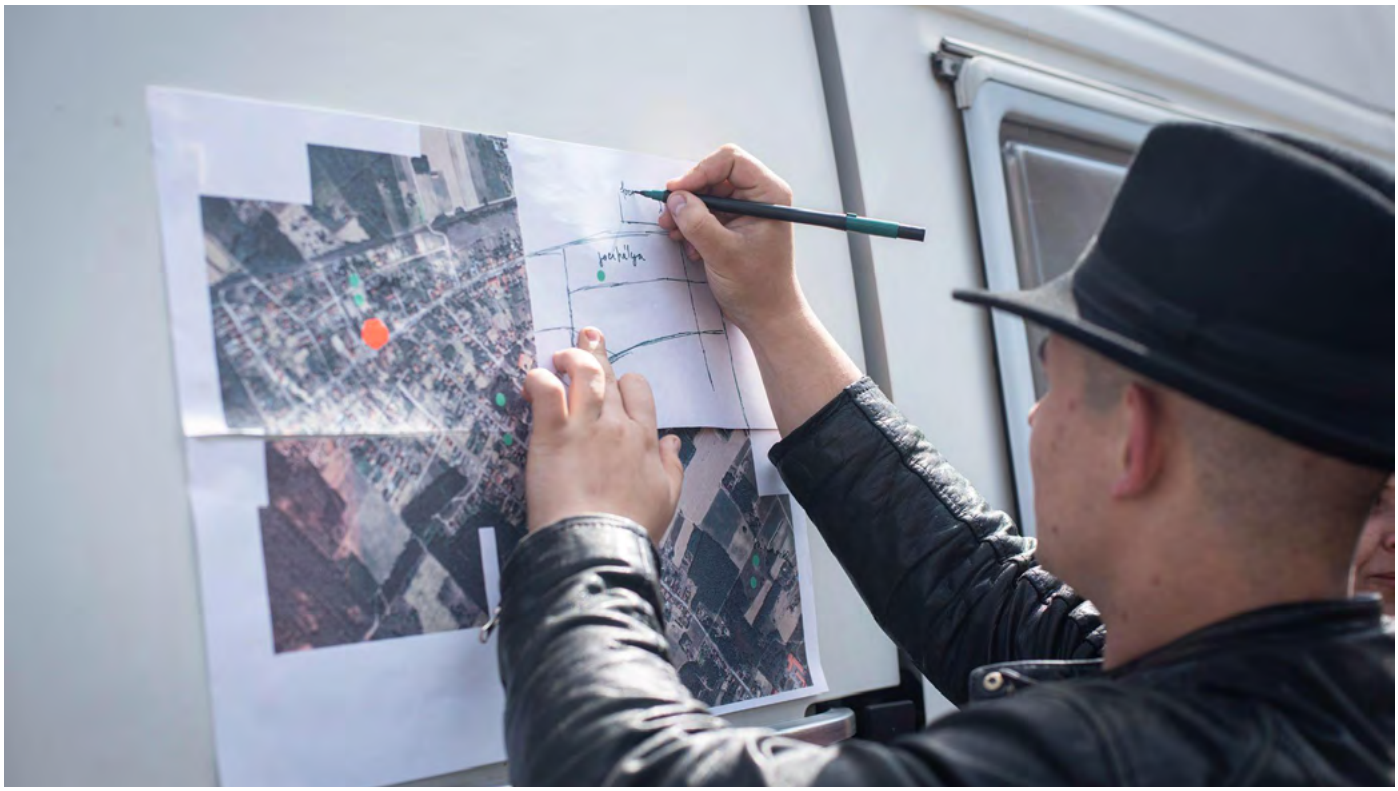

Figure 3. Creation of a common cognitive map about one of the involved rural locations. April 2022.

2. *Getting to know each other & team building:* non-verbal and visual tools such as drawing collaborative portraits or “rapid date” using visual signs ensured that participants could learn each other's names and basics about each other and enabled them to talk to each other even though they do not share a common language. Participants also created a community-based memory game, working in pairs and creating matching cards about their shared interests. They also created a common cognitive map of their village, which gave the structure of an afternoon bike tour.

Figure 4. Drawing collaborative portraits during a summer camp. August 2023.

Short creative workshops in pairs or small groups: The creative workshops aimed to actively involve all participants in mixed groups, facilitated by experienced designers and workshop leaders. Through participatory photo workshops, local participants had the chance to guide their international teammates through their hometowns, map and analyse their environment, point out problems, and look at their known environment with a new perspective. Through a zine workshop, participants were able to share ideas about the topic of "help" from the perspective of a local donation shop. Through screen-printing workshops, participants used and personalised already prepared visual symbols and templates for self-expression and self-representation. Refugee participants - who have been part of the Open Doors community for a longer time - have stepped up as workshop facilitators themselves: Afghan paper kite workshops were organised for the local children using the format of participatory design workshops. This gave a chance for participants for intercultural learning and exchange.

Figure 5. Discussion of a photo workshop. August 2023.

3. *Community-based project work:* In each camp, participants had the chance to form messages together and create common products based on shared values. In Tiszadob, through a community-based design workshop, participants collaborated to design a mural for the facade of the local donation shop, which plays an important part in every local's life. The participants of the process were local and international youth, the workers and managers of the donation shop, and the designers leading the program. As a first step, each participant created their designs, which they shared and combined in pairs, then in groups of four, and later in groups of 12. The final two designs were discussed by the whole group, and the elements were synthesized into one design with the help of the designer. The community actively participated in the realisation process of the mural as well: the design was projected and masked on the wall of the donation shop, and stencils were created from the drawing of the participants, which allowed all participants to participate in the painting process but keep the result clean and visually pleasing. In Ágasegyháza, participants - aged between 6 - 15 - created a community-based stop motion inspired by the topic of "magic." Each participant was asked to use their creativity with the given prompt - make it appear or disappear, grow, transform into something else - using different visual tools and random objects. We created stop motion clips of 8-12 frames by each participant and edited them into one single video, merging everyone's creative trick as a common visual result.

Figure 6-7. Design and co-creational process of the community mural. August 2023.

4. *Evaluation and follow-up* - As a closure of each camp, participants were asked to share their experiences verbally and in a playful form as well. Visual aids were used to help the intercultural understanding of participants, such as picture cards and large-scale diagrams, that provided opportunities for youth to reflect on the learned tools, give feedback, and have ideas about the possible continuation.

5. Results

The bottom-up project of CultiRider aimed to create a common space and common language to be able to connect two very different vulnerable groups and their supporting NGOs, as well as to create a bridge between the urban and rural areas of Hungary. The results and learnings of the project are based on non-formal (participatory-based) evaluation methods and half-structured group interviews with the target groups, NGO members, and professionals. We could recognize that both the tangible and the non-tangible results of the CultiRider project led to positive changes in the target groups as well as the collaborating NGOs.

According to the target groups, results show that by joining CultiRider, migrant youth found the motivation to learn about the local culture and the Hungarian language, which enabled them to create new friendships and offered them a chance to share their culture with others in a respectful environment. At the same time, Hungarian youth became motivated to learn foreign languages, and by joining these activities, they dismantled stereotypes and xenophobia. Based on our observations and the interviews with the NGO leaders, both target groups benefited from gaining intercultural and collaboration skills. The moving community space created a flexible but still stable environment in multiple places, raising the feeling of security and belonging in the participants. One Russian participant, who joined the collaborative process from the very beginning of the online ideating process, expressed her surprise since she “would not have thought back then that such an idea could come to reality.” Both the tangible (such as the results of the workshops, like posters, memory games, zines, photos, murals, as well as the commonly renovated van itself), the non-tangible results (such as the improved social and language skills) and the whole collaborative process led the participants to gain confidence in their creativity. The participatory methods contributed to the sustainability of the project by ensuring the sharing of responsibilities: participating youth are motivated to continue the collaboration and take on different roles in the future.

The ongoing project brought positive changes into the life of the collaborating NGOs as well. On the one hand, some of the members of their involved target group became inspired by the developed intercultural community of CultiRider to take a step towards being a community organizer in their local environment as well as being a bridge person of the ongoing CultiRider project. By encouraging these young participants to take on new roles and more responsibility, NGOs can gain more capacity in the long term. The other main change, on the other hand, for NGOs is connected to the motivation to learn the used collaborative and creative methods in the next stage of the project. By mastering these new methods, both the members and the staff are going to be enriched with a creative toolkit supporting their community with visual and spatial tools. NGOs also gained and strengthened their partnerships with each other, which brings new ideas and project opportunities.

6. Conclusions

The ongoing project of CultiRider illustrates a bottom-up movement aiming to create a bridge between refugee and Hungarian underprivileged youth, involving designers, artists, international volunteers, and NGOs, bringing together the rural and urban areas of Hungary by a moving community space. In the paper, practice is supported by theoretical background to explain how it is possible to create a peaceful common platform for such extreme diversity with the tools of participatory design. In the long-term, by owning shared values through commonly created space and language, youth living in disadvantaged rural areas may find new perspectives through intercultural inspirations, migrant youth may start rooting through their new senses of belonging, and grassroots organisations may reach sustainability through their newly engaged members.

The main limitation of the project comes from the challenges of time and scale. Community-based processes need time to find engaged members, to support each other, build partnership and trust, as well

as to learn the local context of each community and location. In the sense of mobility, traveling is also time- and energy-consuming, especially if we consider that every involved person (designers, facilitators, coordinators, builders, and project writers) is a volunteer. The refurbishment and operation of a minibus seems to be a scale that challenges the capacity of bottom-up initiatives: in the context of voluntary-based engagement, it takes a lot of time and cooperation - more than an average funded project - to learn and rebuild such a complex construction.

The project of CultiRider highlights several takeaways for the future: the importance of tangible results and flexible roles. Tangible results of the participative design process fostered confidence among participants by providing concrete evidence of their contributions and the value of their input. It boosted their confidence in their ability to influence outcomes and encouraged further engagement. We acknowledge the nature of participative design processes, where roles are often flexible, allowing for a dynamic and collaborative approach. The designer facilitates the process, providing a design framework and technical support while ensuring that participants' voices are heard and valued. Participants actively contribute their knowledge, insights, and creativity to the design process. The importance of changing these roles lies in promoting inclusivity, empowering participants, and fostering a sense of ownership.

ABSTRACT | The so-called Namyeong-dong Anti-Communist Interrogation Office Building in Seoul, South Korea, was designed as a place for the torture of pro-democracy activists in the 1970s and '80s. Since 1987, as the subsequent effort to address a history of state violence and to put democracy into practice, the Anti-Communist Investigation Office transformed into the Human Rights Center of the National Policy Agency in 2005 and became the Democracy and Human Rights Memorial Hall in 2018. The Korea Democracy Foundation, which oversees the management of the hall, began preparations in 2021 to reopen it in 2024 as the National Museum of Democracy and Human Rights. This new setting aims to serve as a space for memory, reflection, communication, solidarity, and human rights education—something akin to an organism that the public can sense and connect with directly.

In 2022, Seed Pods of Democracy: Design for Human Rights was designed to support these changes in the memorial hall. It consists of three parts: poster designs, a publication, and an exhibition for democracy and human rights. This project aimed to collect and preserve artistic work related to the democratization movement and human rights while sharing issues related to democracy and human rights to enhance broader awareness. Seed Pods of Democracy: Design for Human Rights used posters as a medium and tool to investigate incidents and issues involving resistance to state abuses, anti-democratic activities, and human rights infringements—events that persist in a world of intensifying polarization and domination by corporate interests.

This project explored how visual language maximizes the effectiveness of democracy and human rights discourse and practice by inviting 51 international artists and designers: Guerrilla Girls, Jonathan Barnbrook, Garth Walker, Roshi Rouzbehani, Everyday Practice, etc. Some artists created work in environments and wars where actual state violence occurred, while others told stories relating to multinational and multiple identities. To enable viewers to comprehend the state and problem areas of global democracy today, these artists juxtaposed or connected two newly created posters. These posters explored and expanded on incidents related to systems and critical values of democracy, acts of state violence, and human rights within their historical temporal and spatial contexts.

In the process, artists used dynamic visual languages to interpret such intangible values as dignity, empathy, memory, critique, dialogue, boundaries, resilience, future, sustainability, and solidarity. Those visualized values have raised questions about the present and future of democracy and the creation of new civic spaces. It has resulted in 100 posters shedding light on the suffering experienced by the vulnerable in society and visualizing the power and importance of solidarity. Lastly, as an expansion of this project, a publication and exhibition, Seed Pods of Democracy, are work in progress to guide audiences not toward some stale version of enlightenment but rather a dynamic and organic future; they will take place in the National Museum of Democracy and Human Rights in 2024.

Façade of the Namyeong-dong Anti-Communist Investigation Office. The 5th floor, where the interrogation rooms were located, was designed with thin vertical windows 300 mm wide, too narrow for a human head to fit through, to prevent victims from escaping or harming themselves. Currently, this building is being prepared to be reborn as a new space.

Perforated wooden boards used on the walls of the investigation room for soundproofing. The victims could not be heard from outside, but the high-pitched screams were transmitted through the walls to adjacent rooms, instilling endless fear.

Objectives (Design for Human Rights)

1) To support the inauguration of The Democracy and Human Rights Memorial Hall in South Korea
2) To investigate incidents and issues involving resistance to state abuses, anti-democratic activities, and human rights infringements—events that persist in a world of intensifying polarization and domination by corporate interests
3) To investigate how visual language can maximize democracy and human rights
4) To take action on improving social justice through visual communication design / graphic activism
5) To envision the future design tasks and responsibilities for human rights

WAYS of LIVING TOGETHER Seed Pods of Democracy: Design for Human Rights CUMULUS BUDAPEST 2024

Research

1) Democracy: Persistent questions for Freedom, Peace, Equality, Equity

2) Human Rights: Everyone’s story

Methodology and Creative Works

1) 100 Posters newly created by 51 international artists who were invited to Seed Pods of Democracy:

- Everyday Practice, Jonathan Barnbrook, Karo Akpokiere, Chris Burnett, Cristina Daura, Garth Walker,
- Pracha Suveeranont, Design & People, Viktoria Cichoń, Bernhard Lenger, Mykola Kovalenko, Kateryna Korolevtseva,
- Chris Lee, This Ain't Rock'n'Roll (Charlie Waterhouse and Clive Russell), Mark Gowing, An Mano, High on Type,
- Elliot Stokes, Aaron Nieh, Good Question (Yuni Ooh and Sun-ah Shin), Kyungmin Lee (flagflag), Shin In-ah,
- Minho Kwon, Jiwon Lee (archetypes), Saehan Parc, Guerrilla Girls, Roshi Rouzbehani, Anina Takeff, Melinda Beck,
- Raven, Jaeyoung Lee (6699press), Yeji Yun, Elmer Sosa, Luis Mazón, Frenci (Francesca) Sanna, Luca Soncini,
- Jieun Guk, Yudai Osawa, Mun Sang, Golden Cosmos (duo Doris Freigofas and Daniel Dolz), Saki Ho, Sebastian Curi,
- Fahmi Reza, Diana Ejaita, Elaine Lopez, cement (Hyojung Yang and Park Yonghoon), Elaine L, Studio Half-bottle,
- Kim Albrecht, Studio Rejane Dal Bello, and Moon Jung Jang

2) A publication including research, 100 posters, and articles

3) An exhibition, Seed Pods of Democracy, at the National Museum of

- Democracy and Human Rights, Seoul, South Korea in 2024

HUMANIZING HIGH SECURITY SPACES: REFORMATORIES FOR MINOR OFFENDERS - THE TEACHING AND PRACTICE OF DESIGN FOR SOCIAL INNOVATION TOWARDS VULNERABLE COMMUNITIES.

Eugenia Pérez de Mezquia*[a], Álvaro Albajez [a], Vanesa Gil [a], Maria Anonia Valverde[a]

a Escuela Superior de Diseño de Aragón, Spain

DOI: 10.63442/CBRZ4297

KEYWORDS | DESIGN FOR SOCIAL INNOVATION, VULNERABLE COMMUNITIES, REFORMATORIES FOR MINOR OFFENDERS, ENVIRONMENTAL PSYCHOLOGY, LIMINAL SPACES

ABSTRACT | Community-engaged design project between the students of design of Escuela Superior de Diseño de Aragón (ESDA) and the minor offenders interned in the Education and Internment Center by Court Order (CEIMJ Juslibol) Zaragoza, Spain. The focus of the project is on teaching our students and practicing design skills with people living in poverty or at risk of exclusion, working with vulnerable communities to accelerate the transition to a fair and ecological society. The practice of design involves intervention in a social group, and therefore, we should incorporate the anthropological dimension in methodological terms. Man being spatial, all experience depends on the place where it happens (Herrera & De Oña, 2016) A collaborative effort between students and vulnerable communities contributes to various aspects of design. A different approach and change of mindset applicable to teaching social design and design for social innovation (Mazini, 2015) A reformatory for minor offenders is neither a prison nor should it look like one (Pol, Esteve, García-Bores & Llueca, 1992)

Educational-formative and welfare institutions, and more explicitly correctional institutions, are organizations that have served, by satisfying the urgent basic needs of the vulnerable population, as an effective method of social control, and architecture plays a very important role in this. The main objectives are:

- The better use of space and its environmental conditions as spatial resources of intervention to facilitate treatment.
- More dynamic environmental conditions facilitate the appropriation of the space by the inmates.

The first project, “My personal space,” developed in 2023 by the students in the 3rd year of Interior Design, focuses on the individual rooms of the inmates, developing 14 proposals for more friendly and personalized rooms through the design of interior details and complying with the necessary safety conditions. Surveys were conducted to measure the mood of the design students before, during, and at the end of the project. The students who were initially against working directly with minor offenders were, in the end, satisfied that they were actively involved. During the ESDA DESIS Social Design Days, experiences and projects of social innovation are shared publicly. Our students explained the project to the educational community.

The second project, “Humanizing high-security spaces,” developed in 2024 by the 3rd year Interior Design students with the collaboration of 3rd and 4th year Graphic Design students, focuses on the reception module, a liminal space where the minor is admitted for the first time and spends his first week of adaptation to the center until he is transferred to the module that corresponds to him with other inmates.

Design students learn and discover in an immersive way the social dimension of design by developing new interpersonal skills.

The proposals were born from the dialogue between the designers and the inmates as a process of deep knowledge of their needs and expectations, bringing together new points of view through participatory design. The result confirms how small gestures in interior design make possible great improvements, creating an environment conducive to positive therapeutic development work.

The focus of the project is on teaching our students and practicing design skills with people living in poverty or at the risk of exclusion

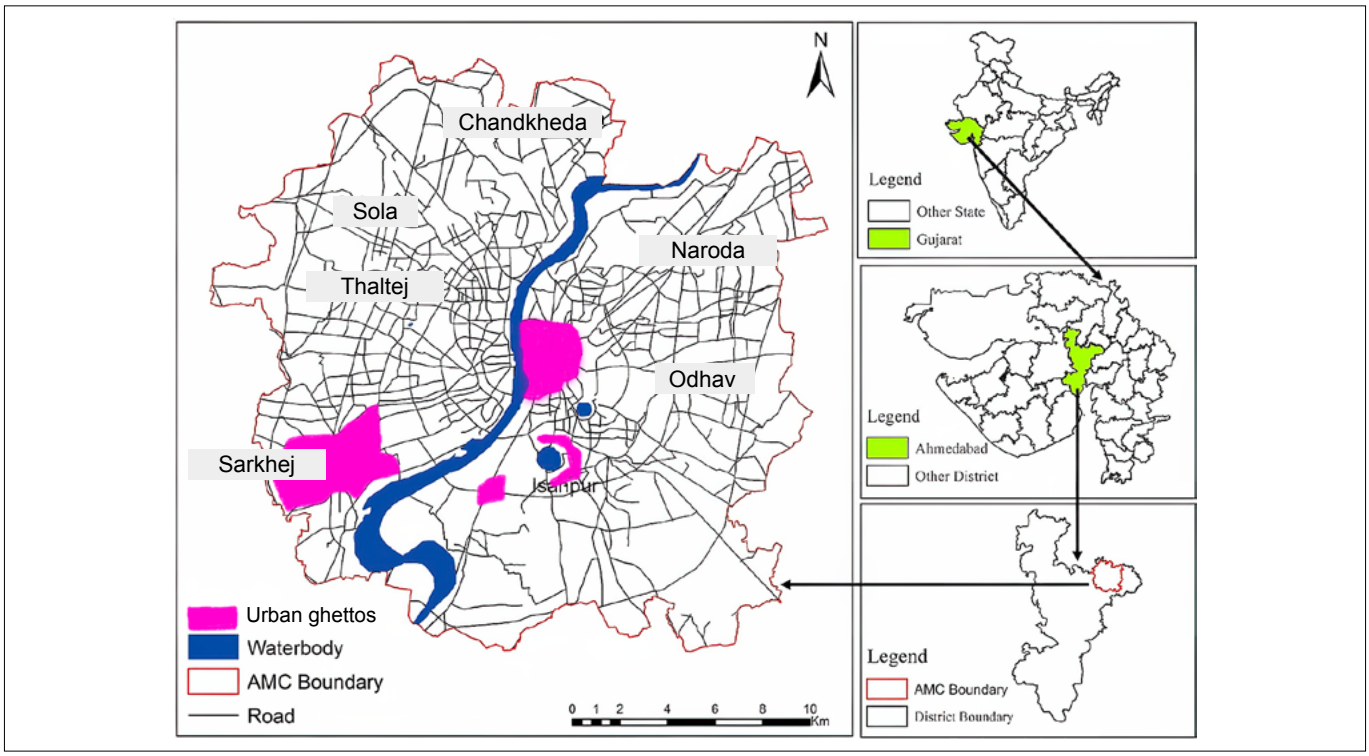
KEYWORDS | DESIGN FOR SOCIAL INNOVATION, VULNERABLE COMMUNITIES, REFORMATORIES FOR MINOR OFFENDERS, ENVIRONMENTAL PSYCHOLOGY, LIMINAL SPACES

ABSTRACT | This project was part of the ten-week course 'Design for Social Change.' The design inquiry began with questions about access to public spaces in the city. How can public spaces be transformed into equitable and fair spaces? How do different communities perceive the city and its spaces? We investigated how factors of religion and class affect the usage of public spaces in the western city of Ahmedabad, India. Our study focused on how religious communalism has led to the segregation of Ahmedabad's neighbourhoods into ghettos. The area of focused study was the neighborhood of Juhapura, an urban ghetto that has predominantly residents of the Muslim faith (a minority community in India), and developing an understanding of how communalism affects their lived reality (Rajagopal,2011). The insights from our study indicated an overall need for better access to public spaces (Bobbio,2022), and we felt that directing our action toward children was essential since their play spaces are neglected. The demographics include women who have been discouraged from working and are asked to stay home. Still, they show resilience and work out of their homes with jobs like tailoring and catering (Wahid,2019).



The central question we addressed became: Why is there a lack of access to public spaces for people belonging to a specific community? The project aimed to create space for all stakeholders involved in a neighbourhood by converting an open ground used by multiple stakeholders into a shared, equitable, and inclusive space. Inclusive public spaces are essential for marginalised and underserved neighbourhoods, as they often do not have equal access to other paid services and commodified spaces in the city. This is true for Juhapura, where the community does not have access to public spaces such as parks that function as play areas. (Mahadevia, 2007, pp 27-30)

We studied how Juhapura's residents have shown resilience and how the city can change if it is planned with children in mind as vital users of space (Danenberg, Doumpa, and Karssenberg, 2018). Working with children as our primary focus group, we aimed to create a habit of equitable sharing and inculcate ownership of the space. The children of today will go on to become the voice of the future, and we felt it was pressing to address issues of discrimination from the bottom up. Parwaaz, a women-led organization, facilitated our access in the community. We used participatory action research while working with the community, and their input was crucial to designing the solution. The final design solution developed was a 'Painted Playland,' using the floor as our canvas to demarcate space in the area. Throughout the process, the project was constantly grounded by the question- whom are we designing for and why?

The community came together to clean the space and help in the execution of the painting of the ground. The paintings immediately activated the space and attracted many people. Children from other neighbourhoods came to play, and older adults joined in. The issue of vehicles taking over the space was tackled by painting parking lines. This behaviour change resulted in a shift in the attitude toward space among the women of the community, who then took charge of cleaning areas where construction debris was dumped to convert them into parking spaces. The design intervention became a blueprint for the community to show themselves that they are capable of change and can adopt small measures to make their space more inclusive.

How can *young designers* tackle convoluted, systemic problems?

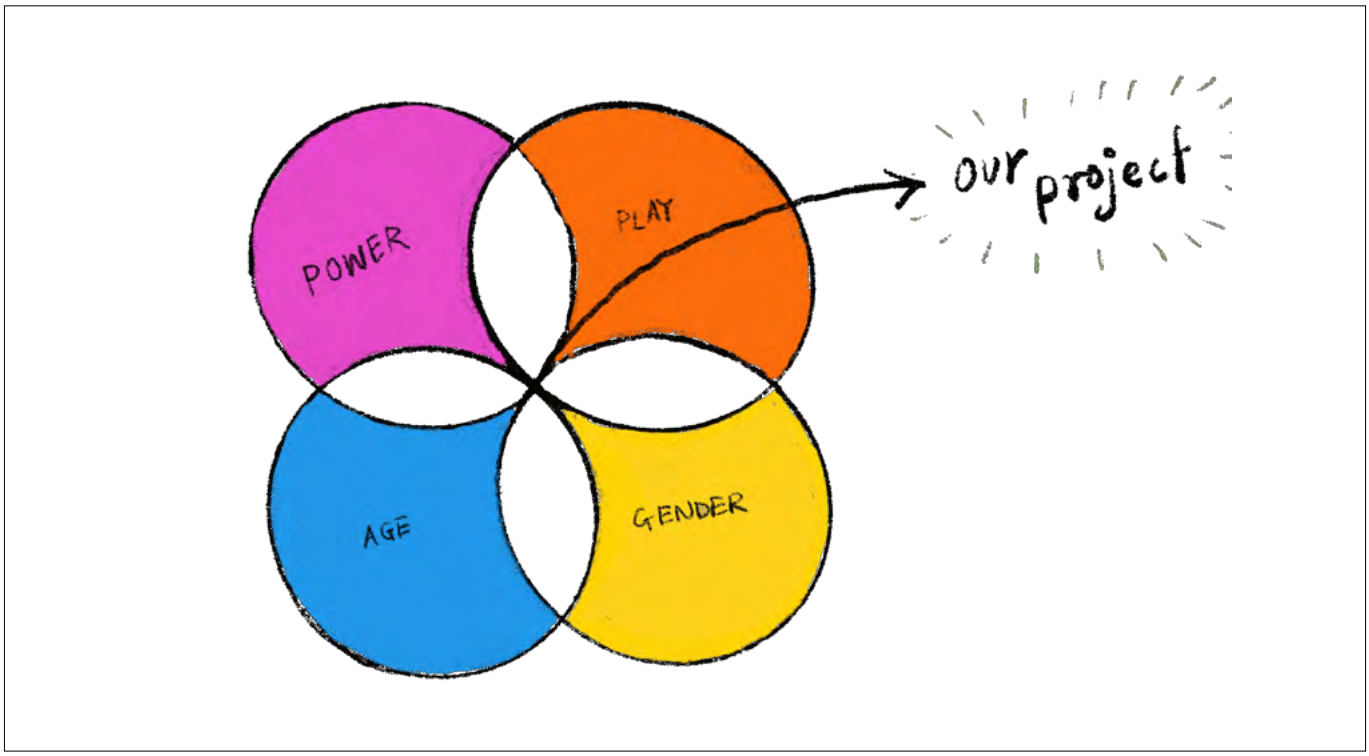
safety, *play* and *happiness* in urban spaces

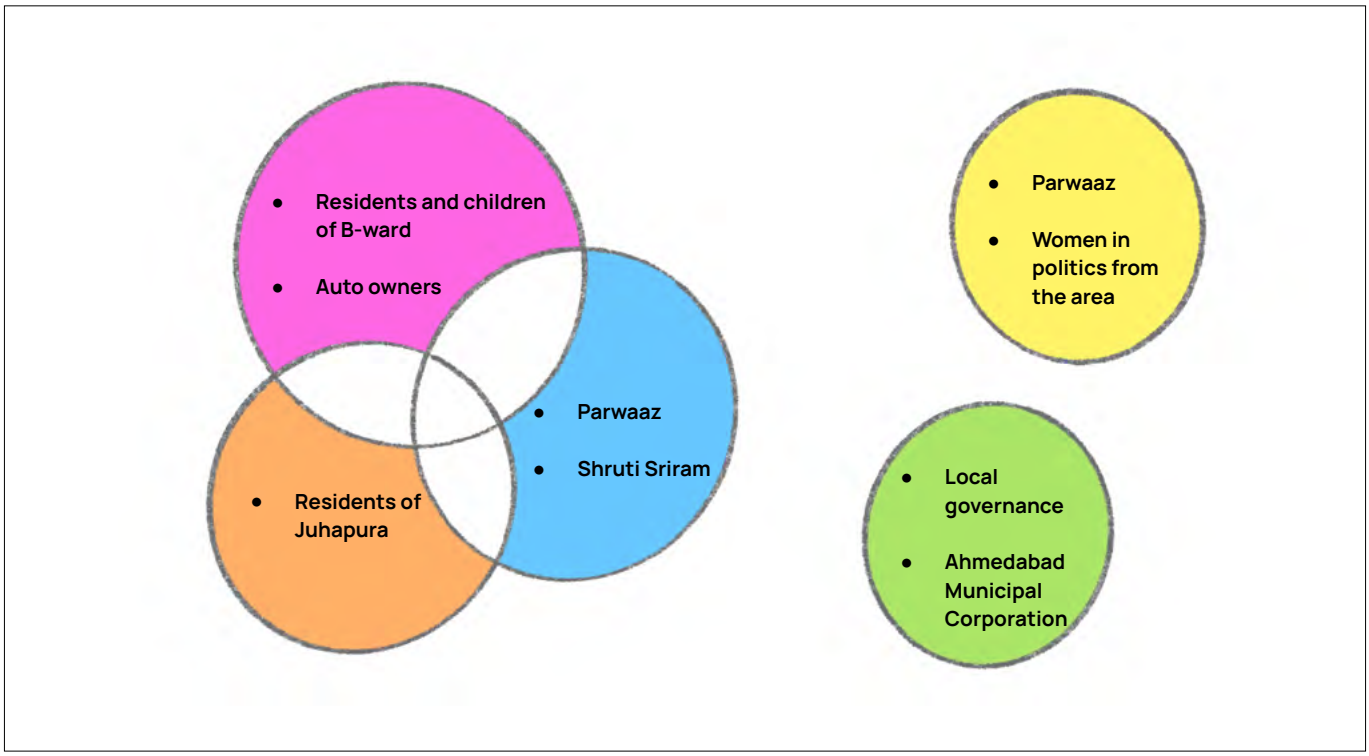
How can we divert attention towards kids to create ownership and responsibility of the shared space?

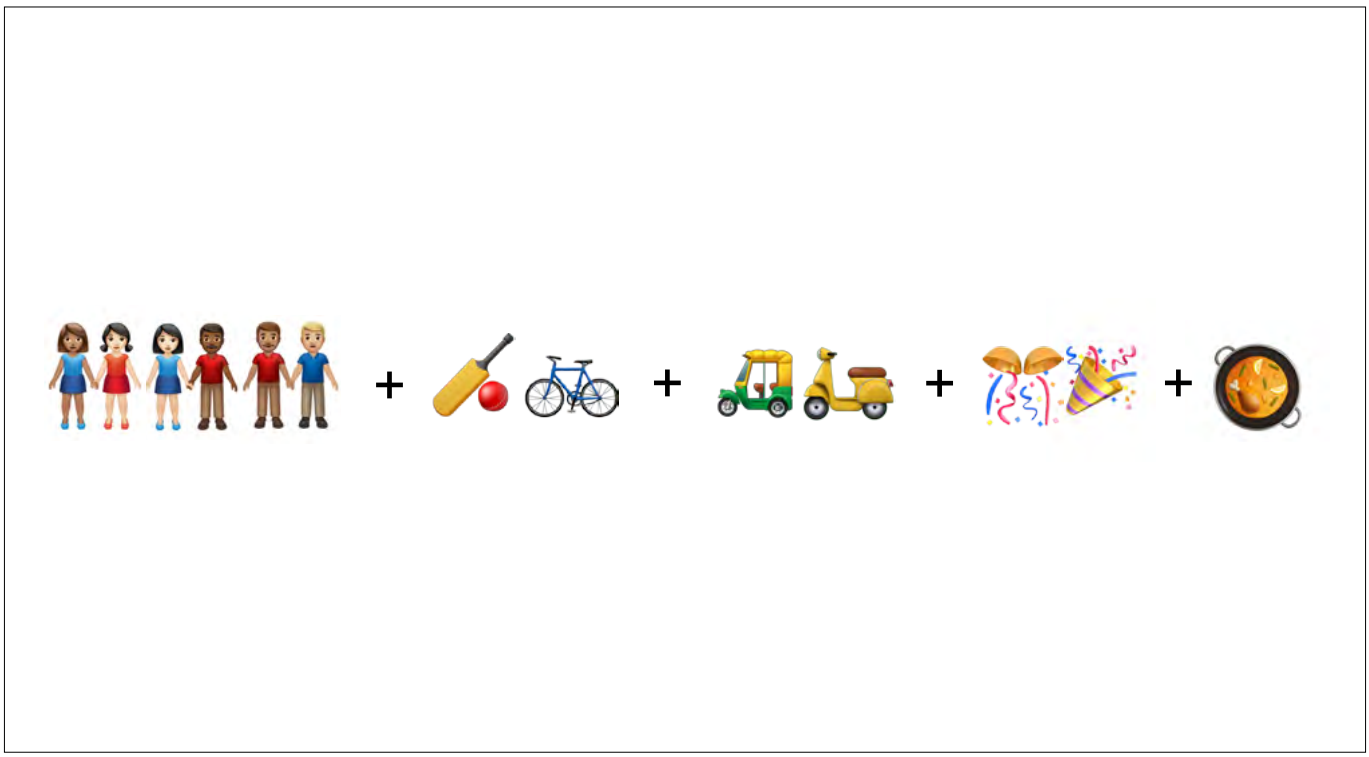
"How can we transform the existing common ground to be *equally accessible* to all the stakeholders with the community?"

How can we design with, within and for the community?



How can we dismantle existing hierarchy that functions on power and age in shared spaces?





How can we empower communities to take charge of their spaces and make them realise that they can create change with small actions?

ABSTRACT | Even in its most elementary manifestation as involving just a single designer and a single client, designing is a process of interaction between different people who command different bodies of knowledge and who approach the design process from different perspectives and expectations, and most design processes involve a much wider range of stakeholders and expertise. The mobilization of this varied cast of characters and the sustaining of a process of working together towards a common goal requires an ongoing web of interactions and exchanges among the participants in the context of conversations.

Additionally, efforts toward achieving more inclusive and informed design processes underscore the importance given by designers to achieving more effective modes of engaging non-designers in the conversation of design (Floyd et al., 1989). Growing attention is being paid to processes of design undertaken by communities of heterogeneous individuals and (not necessarily involving designers) in addressing issues in their own lives (Manzini, 2015). This broadens the meaning of design to include processes involving the efforts and intentions of diverse others in practices that transcend the understanding of design as a special purview of professionals operating in controlled teams.

The impacts and implications of design processes and the designed things that they put out into the world, though, are felt by others even beyond this broadened perspective on the communities of design, to include a wide swathe of members of society, who are thus also drawn into the conversations of design. This workshop aims to explore what a cybernetic perspective can contribute to our understanding of communal processes of design.

The field of Second-order Cybernetics explicitly links processes of conversation and processes of design. Pangaro has argued that conversation and design are analogous processes through which goals and understandings are negotiated through interaction (Pangaro, 2008). By this reckoning, there is no designing that is not co-designing. Gordon Pask's (1975) Conversation Theory, as further elaborated by Glanville (2004), asserts that all learning happens by the communal construction of understanding through conversations. Different types of conversation, each with its role, are central to the processes of design (Dubberly & Pangaro, 2009). Within the field of Design Cybernetics (Glanville; Fischer & Herr, 2019), Conversation Theory has been applied to articulate Design as a set of nested conversations at levels spanning from the design team to society at large (Jachna, 2019).

Workshop participants will undertake a series of awareness-building and diagramming exercises to elucidate the actual and potential conversations involved at different levels in their design practice, building up from the conversations within the design team incrementally to the level of the conversations between one's design practice and design products and the myriad of systems and practices in society and the world at large. This approach will provide a framework and conceptual/practical tools for an intentional and methodical approach to engaging in the conversations of design.

KEYWORDS | EATING, RELATIONALITY, PARTICIPATORY DESIGN, EMBODIED KNOWLEDGE, GLOSSARY

ABSTRACT | Grounded in Participatory Design (PD)'s evolving embrace of relational and processual approaches (Huybrechts et al., 2022; Huybrechts & Teli, 2020; Pihkala & Karasti, 2022), this session explores the intersection between bodily experiences, particularly related to eating and digestion, and the language we use in PD. The specificity, situatedness, materiality, relationality, and transformation capacity already embedded in eating make it a rich and provocative field for researchers and designers to engage with. The focus of this session is on how the acts of cooking, eating, and digesting together can inform and shape new terms and concepts—and, by extension, new practices—within the realm of PD. By incorporating the insights from philosopher Boris Groys (2022), anthropologist Annemarie Mol (2008, 2021), and sociologist Elspeth Probyn (2004, 2015), we aim to craft a collection of meanings that reflects the interplay between personal satisfaction, communal experiences, and the materiality of our designerly actions.

Exploring bodily experiences and their intersection with language is critical to "thicken" (Haraway & Goodeve, 2000) our understanding and approach to Participatory Design. Sensitivities are born through the act of naming; "we cannot perceive that which has no name" (Sekiguchi, 2023). Therefore, we aim to develop a sensory-rich glossary, a collection of word meanings that captures the nuances and subtleties of our experiences when we dare think and feel with our guts (Escobar, 2016). The format of the session will be divided into three acts, as follows: :

1. Creating a setting to challenge what a "conference lunch" is. And its hygienic, formal, ready-toeat format. We will devise a space for in-digestion as the moment to gain awareness of the diversity of bodies, positions and biases participating, bending ourselves and PD notions to allow the gut—instead of our brain—to step in.
2. Participants will engage in a shared cooking experience set up as a reflective platform to digest the embodied aspects of PD. It will be a very interactive moment for collectively smashing, massaging, crushing, peeling, cutting and squishing materials and meanings.
3. A communal meal. When eating, participants will be encouraged to reflect on how their senses are expanding their understanding of PD during the session. By actively listening to our gut, we will give shape to our Gut Feelings glossary: a sensory-rich collection of meaning, coining new expressions and redefining existing ones based on the many forms of digestion explored during the session.

For tools and infrastructure, a space with a round table, essential cooking tools, and ingredients for the planned meal. Additionally, participants may bring utensils or ingredients to contribute to the collective experience if we can contact them before the session.

Exploring the connection between the gut and brain in Participatory Design could potentially lead to more embodied and holistic approaches, considering the messy and complex nature of human experiences and interactions (Braidotti et al., 2018; Haraway, 2016). This experimental format promises an engaging, social, and cooperative environment, fostering a deep exploration of our guts and digestion processes as mediums to access embodied knowledge and its integration into the language of Participatory Design.

KEYWORDS | EDUCATION FOR SUSTAINABLE DEVELOPMENT (ESD), ANTICIPATORY COMPETENCE, GAME-BASED LEARNING (GBL), BOARD GAME, COGNITIVE DEVELOPMENT

ABSTRACT | The urgent issues of climate action and social justice are intertwined, demanding immediate attention, particularly within higher education. Educators underscore the imperative to incorporate climate change into the curriculum, emphasising the integration of eco-social justice (ESJ) within educational frameworks. Building upon critiques of emphasis on making-oriented aspects in traditional design education, scholars highlight the disproportionate focus on crafting often overshadowing broader ecological and societal contexts.

Stemming from my experience in product design and university teaching, this doctoral research explores the potential of design education and physical interventions in addressing the climate crisis and social justice. The research is currently in its early experimentation phases, and this paper outlines the ongoing progress and achievements.

My research revolves around embedding eco-social justice into curriculum content through "object-based learning (OBL)", advocating for student engagement with artefacts in learning and teaching. The overarching aim is to investigate how OBL artefacts can serve as communicative tools, conveying knowledge of eco-social justice within design education. The research question, "How might we design and embed artefacts in design education to convey eco-social justice in higher education learning and teaching?", leads to sub-questions exploring current practices of OBL, the typologies of artefacts, and the understanding of eco-social justice within higher education curriculum. The methodology conducts a practice-based research framework, incorporating qualitative research, research through design, and document analysis, utilizing a triangulation approach. The case studies are currently collaborating with the BA and MA Design Management programs at a creative arts university in London, UK, spanning over two academic years. Within this research context, the artefacts indicate (re)designing and creating 'drinking vessels' for Design Management curriculums.

The contribution of this research extends beyond enriching our understanding of object-based learning, design practices, and eco-social justice. It aims to explore OBL and its potential to enrich student learning and teaching about eco-social justice by emphasizing the design of artefacts. It contributes to narrowing the divide between general commitments to Education for Sustainable Development and day-to-day learning and teaching activities, thereby contributing to the transformation of design education toward a more sustainable future.

1. Introduction

In an era marked by escalating environmental challenges and the pressing need for social justice, the role of design education stands at the forefront of reshaping eco-societal perspectives. As emphasized by Meyer and Norman (2020, p. 16), addressing global challenges is imperative, including those outlined in the United Nations' Sustainable Development Goals, such as inequality, climate change, justice and so on. Papanek (2019) underscored that design schools focus excessively on design skills and neglect aspects of the ecological, social, economic, and political environment. Coinciding with Meyer and Norman (2020, p. 22), traditional design education tends to lean towards “creating great craft”, and although making-oriented has served a purpose, it falls short of meeting today’s needs. This research responds to the growing need for a shift in design pedagogy by addressing the identified gap and exploring the potential of object-based learning (OBL), as a pedagogical approach to convey eco-social justice principles.

The subject area of this research encompasses design practices and learning and teaching (L&T) within the context of eco-social justice (ESJ) in this research. The following diagram illuminates the relationship between these subject areas and the research aims. The overall aim is to demonstrate how designed artefacts for L&T sessions can communicate the knowledge of ESJ through curriculum delivery in design education. This research contends that the prevailing framework of design education predominantly emphasizes materialistic aspects in design practices when teaching sustainability to higher education students. In contrast, this research seeks to address the gap by exploring object-based learning (OBL), a pedagogical approach, to centralize eco-social justice within the domain of design education in Higher Education Institutions (HEIs).

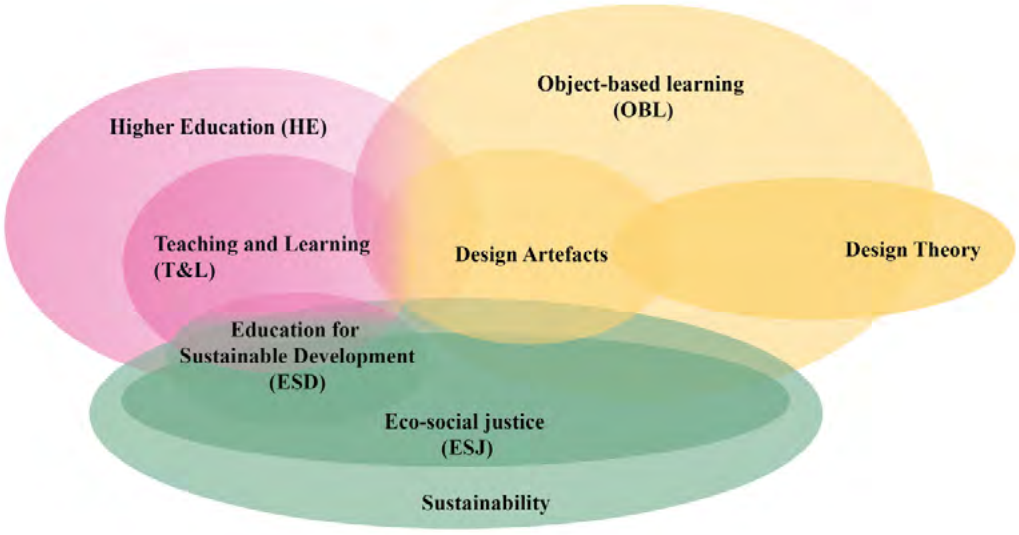

Figure 1. General Subject Area.

The primary aim transforms into the main research question: “How might we design and embed artefacts in design education to convey eco-social justice in higher education learning and teaching?”. This research question unfolds into five sub-questions:

1.1 What is the current practice and scholarship from OBL and related pedagogy, and in what potential ways this can be integrated with (product) design knowledge and practice?

1.2 How might artefacts be used to generate students’ ESJ awareness and understanding in teaching and learning sessions?

1.3 What characteristics or typologies of artefacts are designed for in-classroom learning, and in what theory could be built for designing from design curriculums?

1.4 What are current articulations and understandings of ESJ, particularly in HE curricula, and how can ESJ be understood for purposes of T&L in a particular case context?

1.5 What typologies of artefacts are designed for eco-social justice in higher education teaching and learning?

Each of these sub-research questions has its own set of objectives contributing to the research: Starting with 1.1, the objective is to investigate the current utilization of OBL in integrating with (product) design knowledge and practice required for HE. This investigation will primarily rely on literature reviews to discern existing practices and scholarly perspectives in this intersection. Moving on to 1.2, the objective is to understand how the integrated knowledge gained from OBL can be practically applied in experimental settings, specifically through the utilization of designed artefacts. This incorporates a literature review, 'research through design' and qualitative methods with experimentation and iteration within case studies. In sub-RQ 1.3, the focus lies on evaluating the typologies and characteristics of artefacts within OBL environments, their impact on learning and teaching, and the methods of designing them. This investigation will employ research through design and iterative practice to assess the artefact typologies. Sub-RQ1.4 captures the current understanding of eco-social justice within higher education through document analysis, allowing for comprehending ESJ for teaching and learning. In 1.5, the objective is to comprehend the typologies of artefacts designed for eco-social justice teaching and learning in HE.

The research adopts designer's perspective rather than that of a teacher, focusing on resolving design problems instead of pedagogical issues. In this context, as the designer-researcher, I position myself in the role of a designer instead of assuming the perspective of a teaching staff. This approach ensures the exploration of design artefacts for teaching and learning while delivering ESJ knowledge.

This research aspires to make contributions to three subject areas: object-based learning (OBL), design practice, and eco-social justice (ESJ). The logical relationships among these components are visually represented in Figure 2.

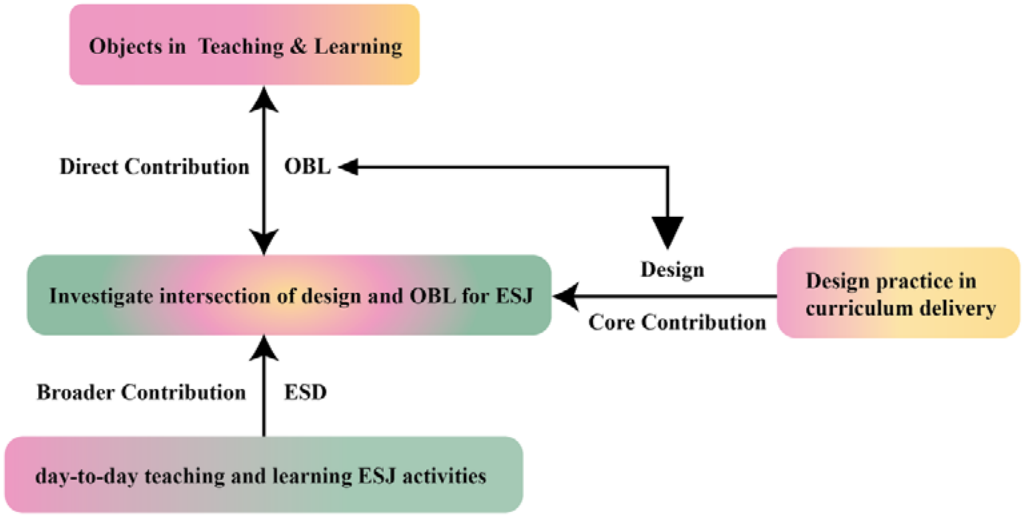

Figure 2. Framework of Contributions to Knowledge.

The direct contribution of this research centres on generating new design insights for object-based learning, particularly in how objects are designed to communicate knowledge in teaching and learning contexts. Emphasizing the incorporation of design practice (artefacts) into curriculum delivery, the research reveals typologies and characteristics that convey information about eco-social justice within

educational settings. The long-term impact extends to the domain of Education for Sustainable Development (ESD). It is crucial to emphasize that the research does not aspire to revolutionize every aspect of ESD. Instead, the ambition is to bridge the gap between general ESD commitments and the day-to-day learning and teaching activities of educators by utilizing design practices.

2. Context

The term "object-based learning (OBL)" refers to a student-centred pedagogy (Cain, 2011), that provides students with opportunities for active engagement with artefacts or objects in immersive and multisensory learning experiences (Chatterjee & Hannan, 2016). Artefacts as a central information source for students engaging in object-based learning, necessitating observation, analysis, and interpretation (Reiley & DeLong, 2023, p. 57). The term "artefact", originating from anthropology/archaeology, refers to a man-made object (Stappers & Giaccardi, 2014). In this research context, "artefacts" are defined as three-dimensional tangible objects, extending beyond traditional specimens (Cobley, 2022), and artwork, to encompass everyday items and designed practices.

Hardie (2015, p. 23) notes that physical objects play a pivotal role in facilitating the exploration of "design, culture, and society" within teaching and learning contexts, also serving as a "host" for interdisciplinary viewpoints. The significance of objects is highlighted in transferring "subject-specific and cross-disciplinary" (Chatterjee & Hannan, 2016) knowledge. Schultz (2018) asserts that students' learning is enhanced through interaction with artefacts, a perspective endorsed by Hardie (2015).

Within the scope of this research, eco-social justice (ESJ) serves as the contextual content for integrating object-based learning into design education within the creative arts university. ESJ, constitutes the foundational precept of sustainable development, emphasizing the interconnection between ecological and social systems (Jaffe & Gertler, 2008). Wang and Altanbulag (2022) underscore that ESJ prioritizes the interdependence between nature and society. Specifically, Attfield (2021) advocates for ESJ, acknowledging the realm of racial justice, colonialism, and capitalism in creating social divides and environmental disasters.

The implementation of OBL is posited as a pedagogical strategy, that not only navigates the complexities of climate action and social justice but also situates learners at the centre of the educational experience, fostering active engagement and a holistic understanding of eco-social justice issues.

3. Research Method and Approach

This doctoral research is grounded in a practice-based research framework, guided by the principle that "creative artefact is the basis of the contribution to knowledge" (Candy, 2006, p. 3). Various methodological approaches have been employed in this research, including literature review, qualitative research, research through design, and document analysis. These methods are utilized in a triangulation approach (Gray & Malins, 2004) to analyze complex issues. A non-chronological diagram (Figure 3) has been introduced to visually elaborate on the intricate relations and structure of these approaches and methods.

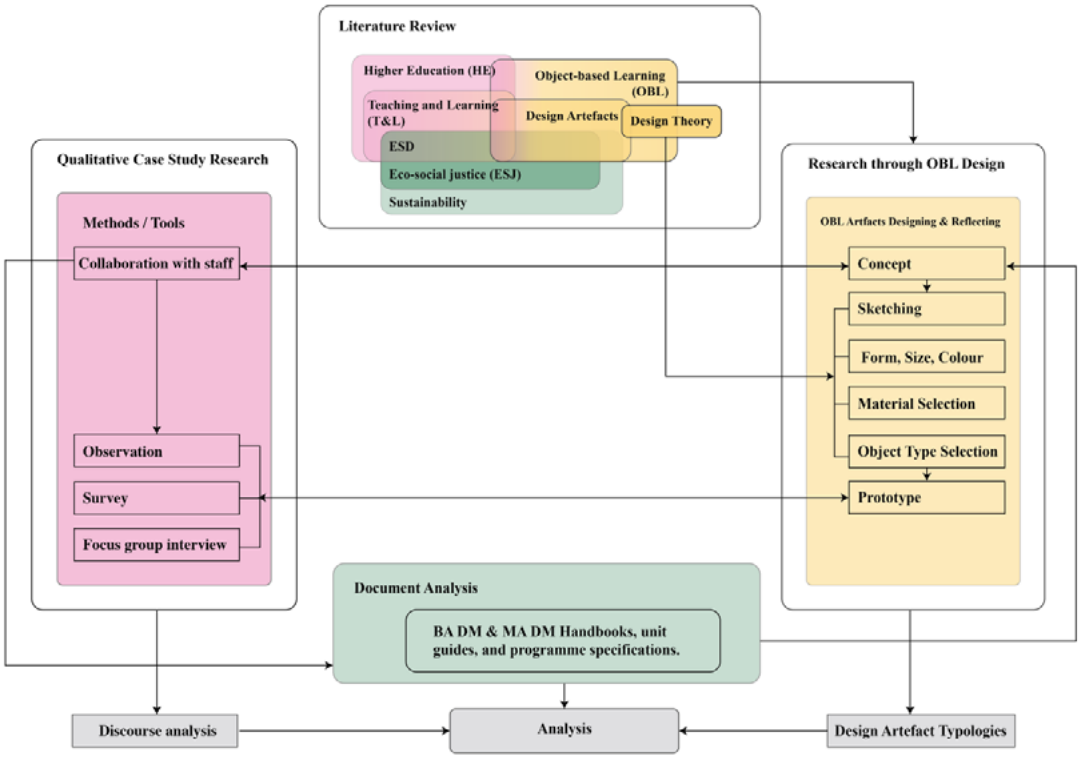

Figure 3. Research Approach and Methods.

3.1 Qualitative Inquiry

This study employs qualitative research, as defined by Leedy and Ormrod (2019, p. 418), encompasses the exploration of information that “cannot be easily reduced to numbers”. In this approach, the researcher assumes a pivotal role as the primary instrument, actively engaging in the collection of data “through examining documents, observing behaviour or interviewing participants” (Creswell, 2018, p. 164). This multi-sourced approach surpasses reliance on a single data stream, providing a richer dataset. The data in this research comes from the researcher's first-hand observations, interviews with students and teaching staff, surveys, and analysis of documents. While there might be instances where data emanates from surveys, the predominant focus will be on questions that do not lend themselves to numerical categorization.

Research through design stands as one of the primary research approaches applied in this research. Research through design not only draws upon established theories but also generates new knowledge through design practice (Gaver, 2012). As articulated by Downton (2003), the process of research through designing involves applying practical knowledge to attain tangible outcomes, thereby revealing the inherent knowledge embedded in their creation. The significance of artefacts in research through design is underscored by Stappers and Giaccardi (2014), who emphasize the important role that objects crafted by designers play in the research through design process. Within the context of this research, the generation of new knowledge occurs through the process of designing artefacts specifically tailored for authentic learning and teaching environments. In essence, the research through design employed in this study contributes to the application of knowledge in the domain of OBL artefacts within educational settings.

3.2 Research Strategy and Research Structure

In the exploration of qualitative designs and research strategies, this study incorporates two research strategies - ‘case study’ and ‘document analysis’. The utilization of both case study and document analysis strategically contributes to the depth and breadth of insights sought in this inquiry.

A case study, also referred to as “idiographic research” (Leedy & Ormrod, 2019), involves in-depth studies of a particular individual, program, or event for a defined period. This research adopts the case study, defined by Yin (2014) and is characterized by its empirical inquiry into real-life contexts (Creswell & Poth, 2016; Yin, 2009). This research collaborates with Bachelor of Arts (BA) and Master of Arts (MA) Design Management (DM) programs at a London-based creative arts university over two academic years, spanning two academic years from 2023 to 2025. The objectives of case studies are to (re)design and evaluate a series of tangible artefacts aligned with the existing curriculum and learning outcomes for DM programs.

DM, as a cross-disciplinary field, adopts a non-traditional design education approach by avoiding centralization of the making process. Meanwhile, the DM programs have graciously supported and provided me access to their classrooms and their teaching materials (such as handbooks, unit guides and reading lists) for this research. It makes those two DM programs an ideal environment for OBL practices, especially testing of OBL artefacts and evaluating the impact these artefacts have on student learning experiences.

Document analysis is one of the strategies in this research, which investigates the inherent meanings present in text, images, and spoken languages (O’Connor, 2019). This analytical method applies various textual analytical techniques to study texts “as sources or objects of study” (Karppinen & Moe, 2012, p. 189). Within the BA and MA Design Management case studies, document analysis is applied to comprehend existing course curricula by analyzing course materials such as course handbooks and unit guides. The focus will be on scrutinizing sections or parts of the course handbook that are pertinent to eco-social justice in DM courses.

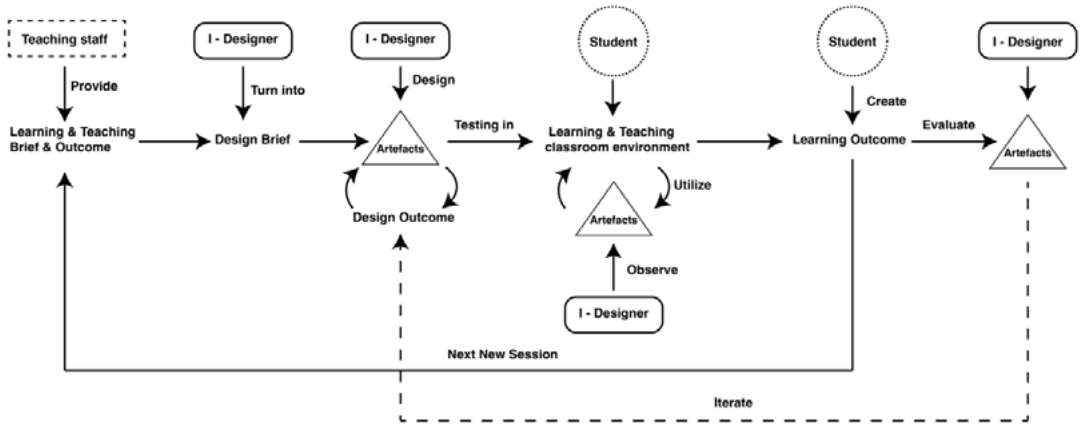

Figure 4. Research Structure.

The ‘research structure’ in my research refers to a systematic chain (see Figure 4) that guides the progression of the research, delineating key phases and activities undertaken. My position in the research as a designer-researcher converting extant Design Management learning and teaching briefs into design briefs. This involves (re)designing a series of OBL artefacts infused with ESJ information, introduced into the classroom for student interaction. Analysis grounded in students’ learning outcomes, gauges the incorporation of ESJ information, and iterative refinement relies on student feedback from questionnaires and focus group interviews. This systematic approach ensures the integration of OBL artefacts into ESJ education within the case studies.

4. Proposed Design Intervention

This research aspires to (re)design a series of ‘drinking vessels’, chosen as the primary type of designed artefact. In this research, the term ‘vessel’ extends beyond its conventional definition as a container

facilitating liquid consumption, encompassing broader conceptualizations as described by Sharpe (2022) in her keynote 'What Could a Vessel Be?'. Emphasis is placed on integrating design practices and OBL with conveying ESJ knowledge within the Design Management curriculum.

The rationale behind selecting drinking vessels is grounded in the following key considerations. The direct reason arises from the universal nature of "drinking vessel" and its immediate recognition as a sustainability concern. The prevalent awareness surrounding issues like disposable, plastic, and reusable cups make them an accessible and pertinent subject for intervention. Simultaneously, this reason intertwines with the historical and cultural connection between humans and vessels. Dating back to the earliest civilizations, using vessels for liquid consumption has been a fundamental practice.

The realistic reason emerges from my observations during over 15 hours of shadowing and sketching in Design Management courses. Analyzing objects present in the classroom (refer to Figure 5), a pattern emerged, with water bottles, cans, plastic bottles, and coffee cups being common items categorized as "drinking vessel". Recognizing these objects as ubiquitous in the DM learning environment, the study acknowledges that conveying knowledge related to ESJ can commence through the familiar entry point of "drinking vessel".

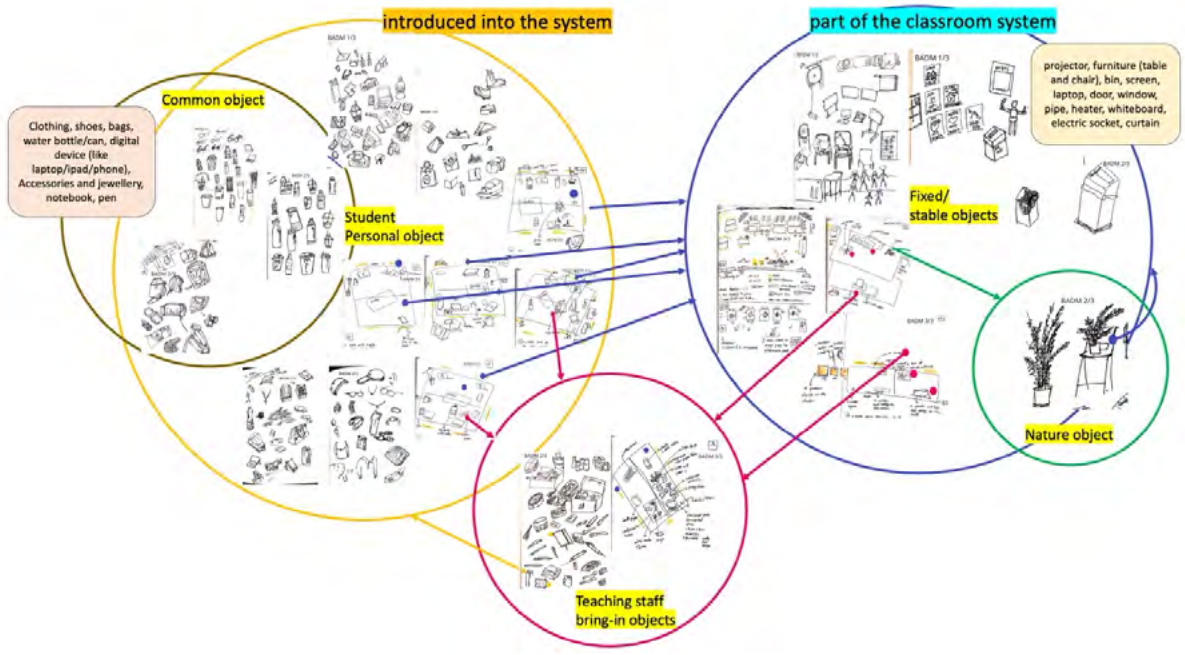

Figure 5. Mapping of object sketches in DM classroom.

5. Conclusion and Future Development

This research, currently in its early phases of experimentation, has sought to address the imperative need for a paradigm shift in design education toward an emphasis on eco-social justice (ESJ), through the integration of object-based learning (OBL) artefacts. Collaborating with Design Management courses has provided valuable insights into the potential of incorporating ESJ within the curriculum.

As this research progresses, ongoing iterations of drinking vessels within the context of eco-social justice in Design Management courses will continue. The emphasis remains on evaluating student learning outcomes, refining the artefacts based on feedback, and ensuring the integration of ESJ knowledge into the curriculum.

Future research could extend to broader subjects, emphasizing the transferability of OBL artefacts and exploring their application in diverse educational settings. This continual journey of research holds the promise of further enriching our understanding of OBL as a pedagogical approach to fostering eco-social justice.

DESIGNING AUDITORY EXPERIENCES: EXPLORING THE MIGRATION OF BEIJING SWIFTS THROUGH SOUNDSCAPES.

Fangxia Wei[a], Zhigang Wang*[a]

a Academy of Arts & Design, Tsinghua University, China
* wangzhigang@mail.tsinghua.edu.cn

DOI: 10.63442/JWHK2057

KEYWORDS | MIGRATION DATA SONIFICATION, BEIJING SWIFT, ECOSYSTEM HEALTH

ABSTRACT | “The Voice of Swifts” is an ongoing sonification installation project that transforms the migration data of Beijing Swifts into an immersive soundscape. Utilizing beamforming speakers and spatial audio techniques, the project recreates the swifts’ 30,000-km journey from Beijing to South Africa. It blends swift flocks’ sounds with environmental elements, reflecting geographical stopovers. The installation’s design symbolizes the swifts’ flight, using a “one month per minute” scale for sonification and aligning speaker placement with migratory waypoints. This approach bridges science and public engagement, deepening the understanding of swifts’ ecological significance and the impact of environmental changes. The project exemplifies how art can communicate scientific concepts, enhancing environmental awareness and education.

1. Introduction

The Beijing Swift (Apus apus pekinensis), renowned for its remarkable speed, serves as a key model for one of biology's most intriguing puzzles: the mechanism of long-distance migration. Highlighted by “Science” magazine as one of the 125 most challenging scientific questions, it remains at the forefront of ecological research. The migratory journey of Beijing Swifts, spanning nearly 30,000 kilometers between Beijing and South Africa, offers a unique perspective on this complex biological phenomenon. However, this species faces severe threats in its native habitat of Beijing. Urban redevelopment and pesticide use have reduced their numbers from a peak of 50,000 in the early 20th century to just 3,700 in 2021 (National Forestry and Grassland Administration, 2021). This drastic decline not only signals an ecological crisis but also underscores the urgency of understanding and protecting these swifts. Their transcontinental migration is more than a biological phenomenon; it serves as a window into complex ecological interdependencies and the consequences of human activities. Studying their migratory patterns provides insights into ecosystem health, species adaptability, and the broader impacts of human-induced environmental changes.

Sonification is the process of translating data into sound, forming a core component of auditory display systems. By systematically transforming sound parameters, it represents changes and structures in data, leveraging human auditory abilities to enhance data understanding and exploration(Hermann, T., Hunt, A., Neuhoff, J. G. ,2011). A study by Supper(2014) emphasizes how sonification in ecological research can turn abstract data into an experiential format, revealing patterns and dynamics that might otherwise remain obscured. In the context of Beijing Swift migration, sonification extends beyond mere data representation. It evolves into a storytelling medium, effectively bridging the gap between scientific understanding and public awareness. By transforming abstract ecological data into auditory forms, sonification provides experiencers with a new sensory dimension, thereby enhancing their intuitive and immersive understanding of these data, and deepening their appreciation of complex natural phenomena(Foteinou, Kokla, Tomai, & Kavouras, 2022)

In an endeavor to accentuate active listening and foster a heightened sense of embodiment among participants, beamforming loudspeakers are utilized. These speakers are notable for their pronounced directivity, creating an immersive soundscape that is perceptible only within a specific listening radius. This characteristic compels participants to physically follow the path of the swifts to fully engage with and appreciate the auditory representation of their migration. The use of beamforming technology aligns with contemporary auditory display research, which emphasizes the importance of listener engagement and interaction in spatial sound experiences. Brownell (2017) thoroughly explores the importance of active listening in his comprehensive work, defining it as “a deliberate and conscious endeavor directed toward achieving understanding.” Active listening is not a passive occurrence; rather, it requires awareness and conscious effort, demanding high levels of concentration and engagement. Moreover, the goal of active listening is to achieve understanding, not merely to hear sounds superficially. This necessitates proactive decoding, analysis, and internalization of the information heard.

2. Installation Design

“The Voice of Swifts” is a multi-channel immersive audio installation that skillfully employs beamforming speakers suspended from the ceiling for a unique auditory transmutation of data on the migration of Beijing swifts. This design draws inspiration from the swift as an emblem of Beijing and its characteristic of nearly uninterrupted flight, symbolizing the continuity and omnipresence of sound reverberating through the air. This piece integrates sound materials from Beijing swift flocks and, based on the geological features of the stopover locations, skillfully incorporates marine and wind sounds to reflect the topographical characteristics of the migration stopovers. In alignment with key waypoints on the swifts’ migratory route, eight speakers are meticulously arranged. I used Python to create a simple map of spring and winter migration paths based on the description of Swifts migration in (Zhao, Zhao, Wu, et al., 2022), as shown in Figure 1. A projector is utilized to cast a mapping of the area onto the floor, providing a visual reference for spatial orientation. Subsequently, specific coordinate points are meticulously marked on the surface, delineating precise locations based on the projected map. Following this, loudspeakers are strategically positioned in

accordance with these demarcated coordinates. This methodical approach ensures accurate spatial distribution of sound, adhering to the predefined mapping for optimal auditory experience.

The distance between each speaker mirrors the kilometers spanned between nations traversed by the swifts. For example, the distance from Beijing to Mongolia, approximately 1273 kilometers, is represented by a spatial interval of 636.5 millimeters between two speakers. Additionally, each speaker serves as an independent auditory channel, facilitating sound movement within the space. By representing geographical distances through proportional spatial intervals between speakers, the installation transforms the abstract concept of migration into a tangible auditory experience. This innovative approach brings the audience closer to the swifts' epic journey, spanning thousands of kilometers, by translating these vast distances into an intimate, immersive soundscape. The choice of beamforming technology further enhances this experience. These speakers, known for their ability to direct sound with precision, create a focused and intimate auditory environment. As a listener moves through the space, they encounter different segments of the swifts' migratory path, almost as if they are traveling alongside the birds. This dynamic interaction between sound and space invites the audience to actively engage with the installation, fostering a deeper connection to the story being told.

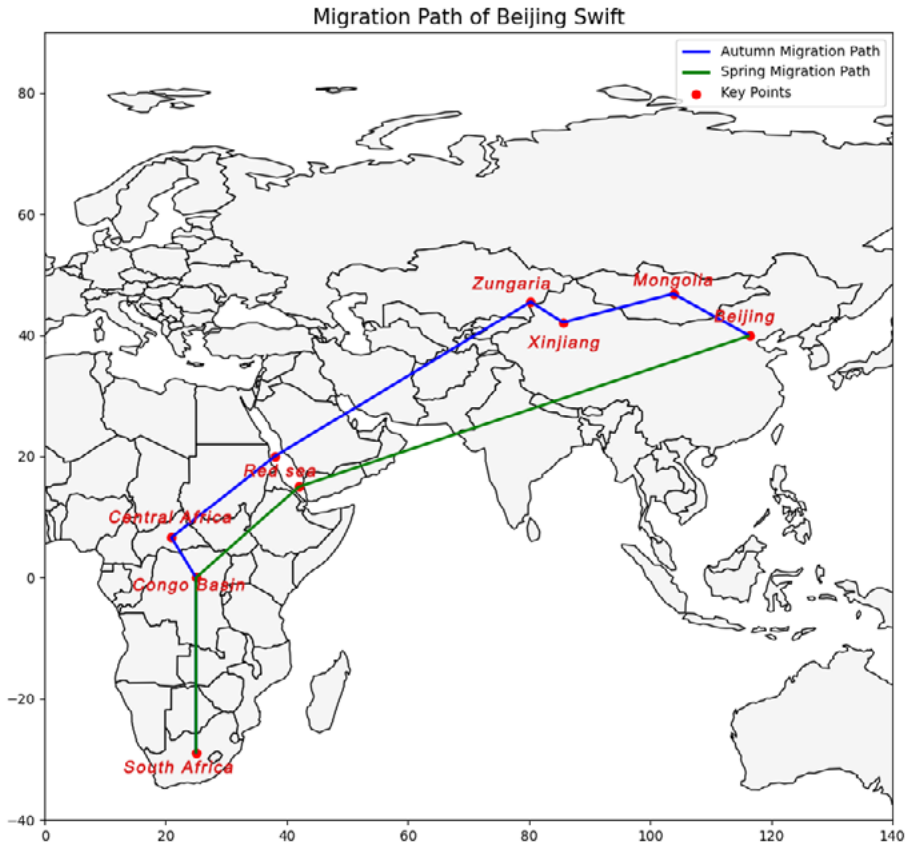

Figure 1. Migration Path of Beijing Swift made by Python.

3. Sonification Method

The 12-minute composition simulates swifts' migratory process through dynamic auditory changes. Aligned with the actual migration timeline, each minute represents one month, starting from mid-July in Beijing. Due to the limitations in the number of speakers, a perfectly smooth transition of sound is not feasible. Currently, this is managed by adjusting the volume between two speakers. For example, if the sound moves from one coordinate to another in one minute, a one-minute fade out is executed on speaker A, while a simultaneous one-minute fade in is implemented on speaker B.

Furthermore, the flying speed of swifts is mapped onto the volume of the sound. The velocity is deduced from the distance between coordinates, which in turn informs the volume adjustments: higher speeds result in louder volumes and slower speeds in quieter volumes. In this study(Zhao, Zhao, Wu, et al., 2022), a total of 66 geographical locators were used, but only 25 provided effective data. This data was then mapped to the complexity of the swifts' sound. Initially, the sound material of swifts was processed to create 66 separate audio tracks, which were reduced to 25 by the end of the journey. This method allows for the creation of a dynamic soundscape in the performance, reflecting the characteristics of the swifts' migration.

From the sound design aspect, the integration of environmental factors affecting the swifts' migration into the auditory experience. As the swifts encounter different environmental conditions – from the urban sounds of Beijing to the natural sounds of the Red Sea and Congo – these changes are reflected in the sound design. This not only adds a layer of realism to the experience but also educates the audience about the diverse challenges faced by the swifts during their journey. Additionally, the use of real-time data processing techniques can be explored to further enhance the dynamic nature of the installation. By incorporating live data feeds, such as current weather conditions along the migratory path or real-time tracking of swifts, the sound composition can evolve continuously, making each performance unique. This approach not only reflects the real-time aspect of migration but also emphasizes the ever-changing nature of ecological systems.

Also, the representation of the swifts' migratory journey through musical elements, infused with the geographical features and cultural contexts of their various locations, is an innovative blend of music, geography, and ecology. This concept, where the swifts' presence in Beijing is signified by the ancient sounds of Bianzhong, aligns with the idea that geography profoundly influences musical styles and instruments, as well as the emotional resonance of melodies(‘Musical Landscapes - How Geography Influences Music’,2023.). This traditional music, known for its melodious and resonant tones, linking the swifts' journey to the historical and cultural context of Beijing. Upon reaching Africa, the installation embraces the vibrant and rhythmic music of the continent. African music, known for its complex drumming patterns and lively melodies, reflects the diverse ecosystems and rich wildlife of the continent. As depicted in Figure 2, a basic conceptual illustration includes sound design examples of locations where Beijing swifts dwell.

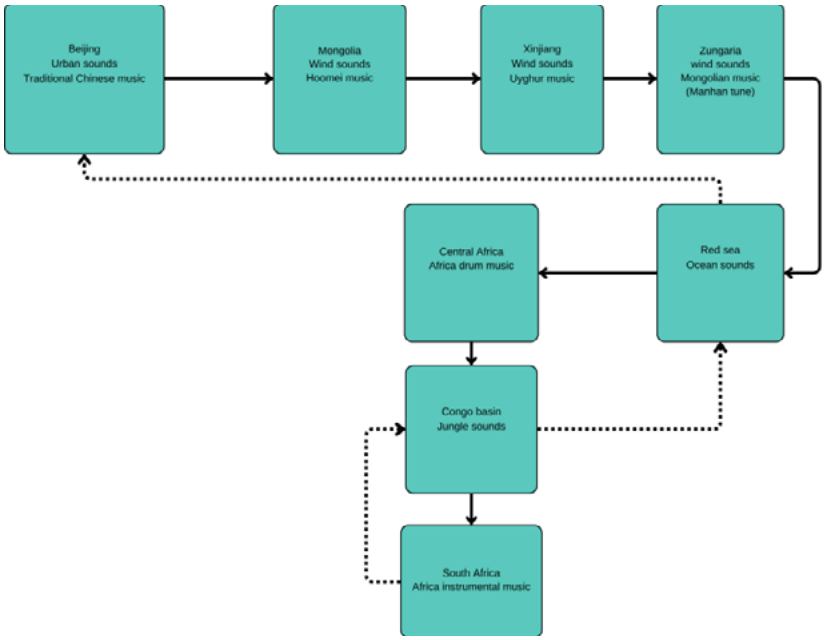

Figure 2. A Basic Conceptual Illustration of Sound Design.

This shift to a more energetic and dynamic musical style symbolizes the swifts’ arrival in a land teeming with life and diversity. By incorporating these regional musical elements, “The Voice of Swifts” not only charts the geographical journey of the swifts but also celebrates the cultural diversity of the regions they traverse. This approach enriches the narrative, allowing the audience to experience the migratory path of the swifts not just

as a biological phenomenon but as a journey through diverse cultural landscapes. This method deepens the audience's engagement, making the swifts' migration a journey through sound, culture, and history.

4. Conclusion

“The Voice of Swifts” serves as a pioneering exploration in sonifying ecological data, transforming the intricate migratory patterns of Beijing Swifts into an immersive auditory narrative. This innovative blend of art and science not only deepens our understanding of these birds' journeys and their ecological significance but also highlights the impact of urbanization and climate change on biodiversity. By employing spatial audio techniques and thoughtful speaker placement, the installation invites active listen and fosters a deeper appreciation for nature's complexities. Ultimately, this project stands as a testament to the potential of sonification in bridging the gap between scientific research and public engagement, offering a compelling model for future interdisciplinary endeavors in environmental awareness and education.

CONTEXTUAL REVIEW OF THE PEDAGOGIC DESIGN STUDIO.

Cróna O'Donoghue*[a]

a Atlantic Technological University, Ireland and Central Saint Martins, UK
* studio@designeducation.ie

DOI: 10.63442/ILDD1507

KEYWORDS | TERTIARY PEDAGOGIC DESIGN STUDIO, SIGNATURE PEDAGOGY, CONTEMPORARY DESIGN EDUCATION, CONTEXTUAL STUDY OF PEDAGOGIC DESIGN STUDIO

ABSTRACT | In Higher Education the design studio has evolved as an intimate space of learning that facilitates experimentation, discovery and personal growth as an enduring typology within creative education. When design departments are incorporated within larger institutions where most subjects are taught through lectures and seminars a difficulty can arise trying to create a studio culture within a classroom setting. The classroom has developed through a different educational philosophy that conflicts with the design studio model and compromises the design student experience. This study explores the distinctive character of the design studio and design pedagogy to develop recommendations for institutions and educators as to how to provide and manage studio spaces that will strengthen their students' creative skills, aspirations and access to global design professions.

Applying Henri Lefebvre's position that space is never neutral but is constructed through multiple inter-related social and political dynamics. This study examines five key spheres of influence on the studio as a signature space of learning: the geographic location, the socio-economic status of the area; the pedagogic philosophy; the spatial configuration; and the digital strategy developed for the learning environment. The investigation seeks to explore how these spheres combine with cultural perceptions of the studio space to influence the student experience and their aspirations.

To create a theoretical framework that can consider the relationships between the multiple variables that shape the student experience, the thesis references the work of sociologist Pierre Bourdieu and his work on habitus, field, and capitals. The framework is developed by applying Doreen Massey's theories that geography shapes social relations and power dynamics, Donna Haraway's work on situated knowledges and the work of bell hooks and Paulo Freire in relation to educational equality.

The methodology undertakes case studies of different institutions that offer design starting with the institutions where the researcher teaches. Adopting a user-centred, mixed methods approach, the research draws on the experience of the multiple stakeholders who shape the values of the studio: tutors, students, management and architects. It analyses their opinions and experiences with reference to theorists in pedagogy, sociology and architecture and draws on the knowledge and best practice of a case study analysis. As this is a practice-based investigation, the insights will be used to develop new spatial and pedagogic models which will be tested and evaluated at the host institution with design and creative media students.

It is anticipated that the outcomes of the analysis and the new recommendations will consist of guidelines that enable institutions to create studio spaces which can be configured to their specific socio-geographic contexts and to digital transformations in pedagogy.

1. Introduction

> "In the first half of the twentieth century, there were 180 Art Schools in the UK, and there were 28 universities. By 2011 there were 11 Art Schools and 119 universities (Beck and Cornford 2014)." (Orr and Shreeve 2018, p.11)

The 'academic turn' and trend to absorb design education into university campuses, which emerged in the early 1970s in the UK and Ireland, has created challenges in many institutions (Orr and Shreeve 2018, Houghton 2016). The enduring studio pedagogy of design education is not easily adopted in more traditional lecture and classroom spaces of learning. This research aims to investigate the role of the design studio and its associated pedagogy, to discover how these can be strengthened. Although proposed before the coronavirus outbreak, this study has become more urgent in the wake of the pandemic. The physical space of design learning was lost in the pivot to online learning, however, new educational practices were developed with fresh approaches to student-centered education. This seismic shift has caused questioning and re-evaluation of the studio as a signature pedagogic space (Shulman 2005) and the assumptions on where teaching is based. These conditions have led to the central research question: can the enduring typology of the pedagogic design studio accommodate emerging curricula to support the aspirations and creativity of the students?

This paper condenses the initial contextual review of the history of the pedagogic design studio and introduces the five key spheres of influence identified in the PhD study.

2. Historical Outline of the Pedagogic Design Studio and Design Pedagogy

Acknowledging the importance of context, this section offers a brief historical outline of the development of the design studio to identify the multiple strands that contribute to its present-day pedagogic and spatial characteristics and contribute to its enduring character. The outline encompasses the design studio as a physical place as well as the site of many cognitive and social practices and values. As such, the term studio represents the space, the activities within it, and the teaching approach.

The artist's studio and architectural studio have received most academic attention (Beck and Cornford 2014, Cole 1983, Cret 1941, Culotta 2020, Green and Bonollo 2003, Houghton 2016, Pevsner 1940, Souleles 2013) and inform this research but it is Nicholas Houghton 2016 paper that the study adopts and adapts. Houghton defined six periods or 'historical curricula': Apprentice, Academic, Formalist, Expressive, Conceptual and Professional. Figures 1-3 illustrate the changes in practice, principles and relationships within the design studio and the legacy of each of these historical curricula on the contemporary pedagogic design studio.

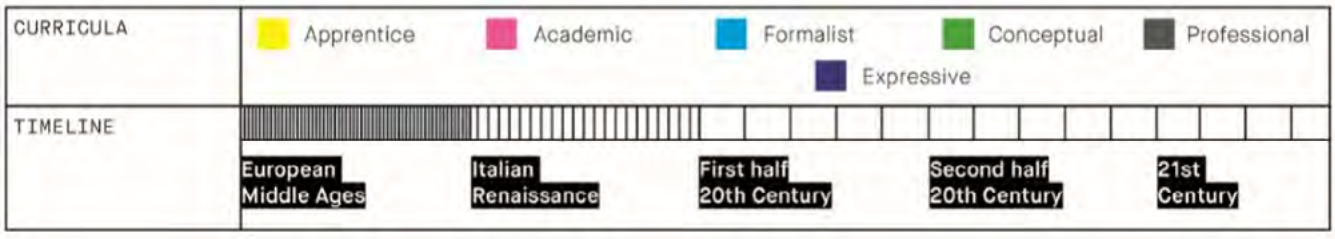

Figure 1. Timeline adapted from Houghton's (2016) Six Historical Curricula.

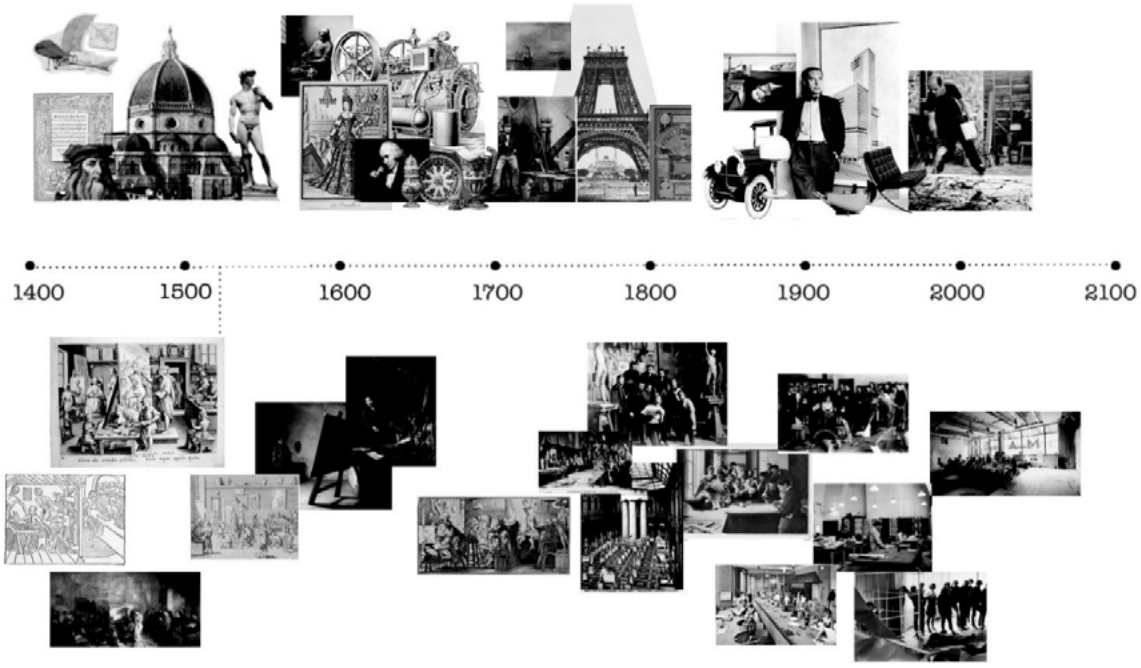

Figure 2. An illustrated timeline of key thinkers, innovations, artistic practices and studios from the 16th to 20th century based on Houghton's curricula.

For this abbreviated paper the different priorities of each curriculum are summarised in figure 3. This is a simplified analysis of Houghton's findings, with an emphasis on what was most valued rather than the only attributes honed.

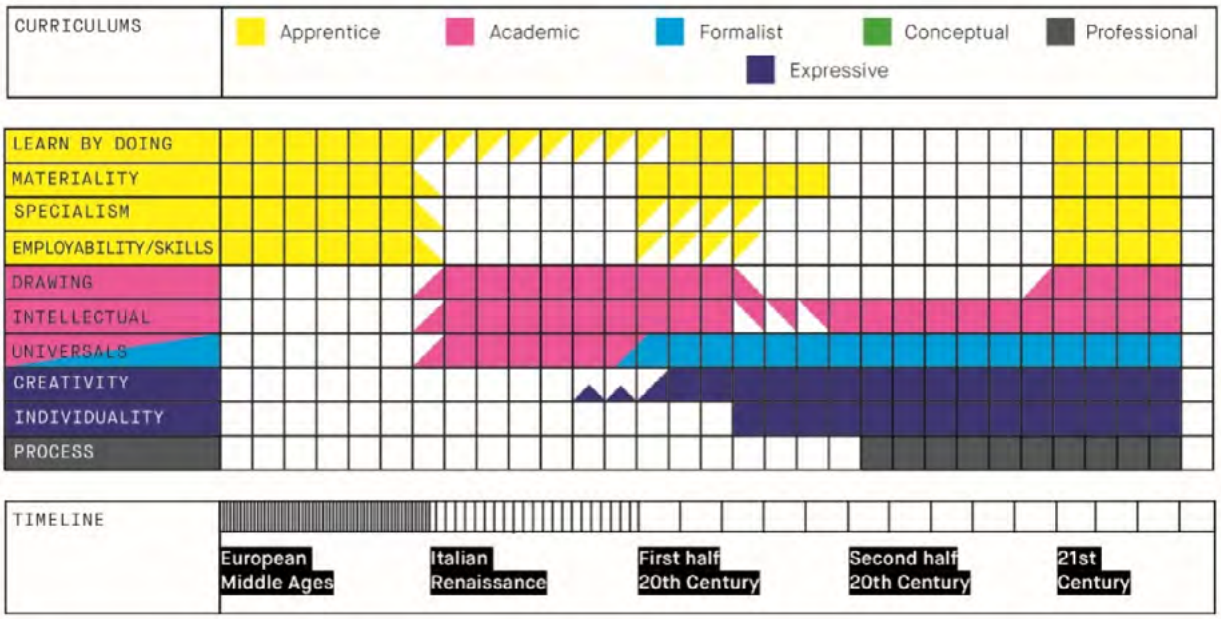

Figure 3. Identifies key attributes that emerged from Houghton's (2016) six curricula, some fall out of favour to reemerge in later periods. Others are unique for their combination of previous curricula.

Applying Houghton's six periods to the design studio reveals the complexity and often contradictory affordances necessary in the space: head-down quiet work, group work, making, prototyping and presentations, these have been further explored by design researchers: Thoring et al (2018)1; Williams (2009)2; Groves and Marlow (2016)3; Doorley and Witthoft (2012)4; Velhhoen (2005)5.

These strands have been organised into a studio hierarchy of needs-based Abraham Maslow's 1943 study on motivations for human behaviour, the Hierarchy of Needs Pyramid. Although criticised by some for the 'hierarchical' nature of his stages and the singular basis for the categorisation (Méndez and Rojas 2023) (Wahba and Bridwell 1976), the holistic approach Maslow takes to the physiological and psychological well-being of a person resonates with the student-centred, embodied ethos of this study and the scaffolding nature of design education (Orr and Shreeve 2018).

Figure 4. Learner's Hierarchy of Needs of the Studio, created by the researcher.

This diagram encompasses a student-centred, practically based, industry-led, experiential, socially driven approach to education which creates unique relationships between tutor and learner and demands a tailored teaching environment. It also recognises the external factors that envelope the studio which will be explored next.

3. Spheres of Influence

The contexts refer to the multiple intersecting strands that shape the experience of the pedagogic studio. These dimensions were identified as the spatial, the space of the studio, the architecture of the building and the campus; the geographic, the location of the institution, regional employment and enterprise; the pedagogic, the embodied practices of teaching and learning design; the socio-economic demography of the area and the student profile; and the digital, its particular infrastructure and practices in the institution. At the core of all these lenses is the students' educational experience and the impact of these variables on their learning and motivation.

3.1 Spatial Dimension

There is an argument and evidence that education can occur anywhere, and indeed design pedagogy happens in many spaces, but a key focus of this study is to explore the perception and therefore impact of the enduring typology of the pedagogic studio. Architect Peter Carl's reflections on the difference between type and typical assist in this exploration.

> "For example, the type "bedroom" tends to solicit a medium-sized room with a bed, side-table, window, closet, and access to a WC; whereas the typical situations of sleep, dreams, sex, illness, death, etc., open much more profound and rich possibilities of interpretation (evident, for example, in the sleeping-terrace beneath the canopy of Le Corbusier's Villa Shodan, 1952)." (Carl 2011, p.3)

Considering the 'space of' opens greater possibilities and more authentic ways of viewing space. The spatial is the practical elements but as Lefebvre (1991) argued, space is not a neutral backdrop but is itself a product of social relations and plays a crucial role in shaping them. More than just an area to work in, the studio is a learning culture and 'space of' learning, experimentation, expression, safety etc., affordances a regular classroom cannot nurture as effectively (Boys 2011, Spruce 2007). This was born out at creative educators' workshop, March 2023.

Figure 5. Responses from creative educators, March 2023 via Mentimeter on what they felt the pedagogic studio was a 'space of'.

Carl recognises the "tension between the conceptual field for types and the concrete topographies which we inhabit." (Carl, 2011, p 3). This is taken to mean how a person teaches, how the students respond, their expectations are influenced by the physical configuration and the cultural values of the space and the appropriateness of the space for the activity being undertaken.

Critical theorist Homi Bhabha urges that we examine the way we theorise and historicise architectural production with a contemporary lens of cultural interrelatedness (Hernandez 2010). He reminds us that 'in a world of increasing transnational traffic, the signature of specificity and locality – the productive signs of difference – often inhere in the telling detail that provides a narrative of the dialogue between tradition and social change' (Bhabha 2007).

3.2 Geographic and Socio-Economic Dimension

To create a theoretical framework that can consider the relationships between the spatial and the other variables that shape the student experience, the study turns first to sociologist Pierre Bourdieu. Bourdieu (1984) observed that a person's standing in society does not simply depend on their material worth, their economic capital but also on symbolic capital (social and cultural capital). Bourdieu suggests capital equals power and this thesis argues the studio may be seen as a symbolic form of capital that may have the potential to empower students. In Richardson (1986) Bourdieu notes that unlike economic capital, embodied cultural capital cannot be accumulated from someone else. "The worth of acquisition is work on oneself (self-improvement) an effort that presupposes a personal cost" (p 244). It can be described as their habitus.

> "Habitus is the learned set of preferences or dispositions by which a person orients to the social world. It is a system of durable, transposable, cognitive 'schemata or structures of perception, conception and action'." (Bourdieu 2002, p.27)

This is of particular significance for this study as it points to an opportunity to contribute to students' embodied cultural capital through the tacit knowledge exchange and an opportunity to introduce students to objectified cultural capital through the studio.

Donna Haraway (1991) also explored the power and legacy that visuals have on how we perceive something and notes that these are often not formed locally or organically but are tied "to militarism, capitalism, colonialism and male supremacy" (p 188). She argues that this produces specific visions of difference and hierarchy (Rose 2012, p 9). This links to the perception of the studio and the inherited cultural capital it represents. Further to this Haraway's work on situated knowledge (1988) suggests that knowledge is situated in specific social contexts, and that our understanding of the world is shaped by our positionality within those contexts. She advocates that knowledge is not a universal, objective truth, but rather is situated within specific social and historical contexts. In the context of higher education, this means that students' experiences and outcomes are shaped by the spatial and cultural context in which they are learning.

Social geographer Doreen Massey echoes Haraway's position asserting that, knowledge is always located and partial; it is always the product of a particular set of social relations and practices and reflects the interests and concerns of particular social groups (Massey 1994). Bourdieu argues that individuals from higher socio-economic backgrounds have access to cultural resources such as knowledge, skills, and networks (capitals) that can help them succeed in educational institutions. This leads to the "geography of opportunity" theory (Briggs 2005, Reece 2019, Brain and Prieto 2021). An investigation in the 'potent impact of 'place''. This theory also suggests that the location of a student's university can provide them with unique opportunities that may not be available in other regions e.g. universities in metropolitan areas may offer students greater access to internships, research opportunities, and networking events.

Educationalist and feminist writer bell hooks argues that the current neoliberal model of education is deeply flawed, as it reinforces rather than disrupts societal inequalities (1994). She envisages education as a tool for social change, "a practice of freedom" that enables students to "transgress" societal boundaries and challenge the status quo (hooks 1994, p. 12). For hooks, the role of education is not just to provide students with technical skills or information, but also to create critical thinkers who can challenge the dominant narratives that perpetuate the inequalities she observed. Educational reformist Paulo Freire had an impact on hooks' philosophical position. Freire argues that higher education is often seen as a means for upward mobility perpetuating existing socio-economic inequalities rather than a tool for social transformation.

3.3 Pedagogic and Digital Dimension

The pedagogic design studio can enact Freire's approach of "the problem-posing concept of education as an instrument for liberation" (Freire 2005 p 71). Orr and Shreeve (2018), Tovey (2015) and Boys (2011) note the ownership and individuality of open-ended briefs, traditionally used in studio pedagogy, afford the learner this agency and are very motivating for the student.

Although computers have been ubiquitous in universities since 1990's the shift to online delivery necessitated by the pandemic further cemented the digital into the fabric of the university (Lamb et al. 2022). This study will examine some of the legacies of the imposed transition online. The positive aspects include greater access to educational resources (online libraries, digital books, industry-standard applications), the ability to visit cultural and educational institutions online and explore their digitised collections, the development of more extensive and geographically spread social and industry connections (equating to greater diversity of voices and experiences), and as a result better understanding of potential future opportunities. These initiatives go some way to lessening the differential between rural universities and their urban counterparts. The internet allows students to accumulate Bourdieu's symbolic capital (1987) by gaining access to cultural and educational resources that were once out of reach (Ignatow and Robinson 2016) of quality internet and digital hardware are not accessible to all and as with physical spaces joining digital spaces can also seem alienating.

The hands-on learning-by-doing approach is more difficult to mediate and feedback on in a digital environment. Research continues (Marshalsey and Sclater 2018, 2020) on how to incorporate ways of online delivery that can facilitate or encourage tacit knowledge exchange, peer learning and even serendipitous moments (Jones et al 2020, Baynes et al 2013; Lotz et al 2015, Makri et al 2014).
Post phenomenology theorists Idhe (2009) and Veerbeck (2006) view the digital in similar terms to many of the spatial theorist mentioned previously, particularly with regards affordances and embodiment. Ihde illustrates this relationship as:

(human – technology) —> world

The technology facilitates the interactions, but it also alters them. Just as space is not neutral, neither are digital interfaces and spaces.

4. Conclusion

This paper sought to outline the central components and contexts that have led to the Western pedagogic design studio typology. It encourages an approach that looks at learning environments not simply as places of learning but to recognise the rich and multiple activities it can encourage and the need to reflect these in the properties and affordances of the space. These may need to alter in response to the five spheres of influence noted in this paper: the physical space, geographic location, socio-economic demographic, and the digital and pedagogic strategies of the institution. It is intended to conduct further research into these spheres to develop guidance and recommendations that enable institutions to create studio spaces that can be configured to their specific socio-geographic contexts and to digital transformations in pedagogy.

KEYWORDS | GLOBALISATION, CULTURAL REPRESENTATION, IDENTITY CONSTRUCTION, DESIGN CULTURE, CHINESENESS

ABSTRACT | This study explores the intricate interplay between Chinese identity and the design industry, focusing on independent product designers. As China undergoes significant transformations in its economic, political, and cultural spheres due to globalization, this research explores the impact of these changes on the design practices of Chinese independent designers. By examining the narratives of designers such as Mario Tsai, Frank Chou, and others, the study aims to unravel how Chinese identity intertwines with design across practice, manufacturing, and exhibition. Methodologically, the research employs ethnography, involving qualitative analysis through interviews, observations, and thematic analysis. Interviews with prominent Chinese independent product designers, coupled with fieldwork at Mario Tsai design studios and international design exhibitions such as Milan Design Week, provide firsthand insights into their experiences and perspectives. The findings of this research reveal the multifaceted negotiation of Chinese identity within the realm of design practice, manufacturing processes, and exhibition strategies. Notably, Chinese designers are observed to gravitate towards a design language characterized by simplicity and universality, challenging conventional expectations that often associate Chinese design with stereotypical symbols. Moreover, the study discusses the impact of the Shanzhai phenomenon, which refers to the production of fake goods, on the development of design in China. This exploration reveals ideological conflicts and societal tensions inherent within the design field as designers navigate the complex landscape shaped by cultural, economic, and political factors. In conclusion, this study contributes significantly to a nuanced understanding of Chinese identity within the context of design. By illuminating the ideological conflicts, cultural tensions, and strategic maneuvers prevalent within the global design landscape, this research advocates for a liberation of contemporary Chinese design from traditional cultural constraints. Furthermore, it calls for a more nuanced representation of Chinese identity in design practice, detached from conventional stereotypes and government propaganda. Ultimately, this study anticipates a more sophisticated outlook in the realm of international design promotion, fostering a broader appreciation for the diverse and evolving landscape of Chinese design identity.

1. Introduction

During Milan Design Week 2023, when the author was assisting Chinese independent product designer Mario Tsai in promoting his works, multiple visitors inquired, "Are you Japanese?" This question's underpinning logic rests on the stereotype that Chinese identity remains marginalized within the design community. Why is there such a huge discrepancy between the volume of China's economy and its sense of existence in the independent design community? To answer this question and explore the intricate interplay between Chinese identity and the design industry, this study endeavours to dissect how Chinese identity intertwines with the design industry, as seen through the eyes of Chinese independent product designers.

The process of globalisation significantly impacts Chinese identity. After 1978, in a quarter of a century, China has 'moved from communism to capitalism' (Guthrie, 2012, p6). The world's largest communist society is also the world's most dynamic capitalist economy, which is one of the greatest ironies of our time (Wang and He, 2014). The juxtaposition of China's economic progress with its political identity engenders a significant contradiction. Meanwhile, globalisation has also inevitably brought about the Americanisation of global culture, weakening the integrity of local and national cultures, and Chinese culture has been deeply affected by it (Knight,2006). Few countries in history have gone through such a process of transformation involving the economic, political, and cultural spheres, and such a profound transformation is bound to bring about extremely sharp pains in the face of identity (Liu& Turner,2018). The fluidity and pluralism of identity and culture, the homogenisation of lifestyles, and the ambiguities within traditional Chinese culture have all contributed to difficulties in the perception of Chinese identity, which is the Other in the West's context (Said, 2003). However, the impact of globalisation on various fields varies significantly, for example, traditional fine arts, such as Chinese calligraphy, is a cultural phenomenon that remains intricately connected to traditional culture and exhibits minimal association with economic practices of capitalism. So Chinese calligraphy stands as a rare example of a cultural heritage that has endured relatively unchanged for over a millennium and has experienced limited influence from Western factors. In stark contrast, design, particularly product design, maintains a close and intricate relationship with the industrialisation process and cultural and aesthetic contexts, thereby prominently exemplifying the paradoxical implications of globalisation on cultural practices and identity construction. This demonstrates the special attributes of design, especially product design: it can serve as a social medium for loading, extending, and exchanging information, and this research exploits this quality by using product design as a lens to gain insight into the entanglements generated by China's cultural- political-economic identities.

2. Aims of the study

This research focuses on Chinese independent product designers who design lamps and furniture for both national and international consumption. Chen (2006) previously highlighted the lack of globally influential design studios and designers in China, which impacted Chinese designers' identity to some extent. However, after 17 years, China has witnessed the emergence of a group of Chinese independent product designers, such as Frank Chou and Mario Tsai, who now attain stability in profits from their studios, collaborate with European brands like Louis Vuitton, and frequently feature in international exhibitions and media platforms such as Wallpaper. This research takes this small group of independent designers as a starting point to explore how they differently perceive their Chinese identity and how they understand the impact of modern Chinese identity in design practice, manufacturing, and marketing. The objective of this research is to enhance academic comprehension of the professional experiences of Chinese independent product designers and their perspectives on Chinese identity by gathering and analysing their narratives. Pavitt and Crowley's (2008) exhibition and book "Cold War Modern" unraveled the multifarious ways in which Cold War politics and attendant anxieties imprinted themselves upon the canvas of modernist art, design, and architecture post- 1945. In congruence with this lineage, this study aims to offer inspiration to other scholars interested in exploring 'Chineseness' or investigating the influence of diverse national cultural contexts on design. From a practical perspective, through the in-depth analysis of the independent design field's development in China and the consolidation of experiences from established practitioners,

this research seeks to make valuable contributions and serve as a reference for aspiring young designers pursuing careers in this domain. For national design agencies and cultural departments, this study hopes to help them broaden their systematic understanding of Chinese culture by sorting out the Chinese independent design industry and Chinese independent product designers' narratives.

To achieve these objectives, this research is structured around five primary research questions, serving as the foundation for the study's investigation:

1. How have important periods in China's product design trajectory influenced the contemporary Chinese independent product design industry?
2. How did cultural Chinese characteristics impact the construction of modern Chinese design?
3. How do Chinese independent product designers perceive their Chinese identity?
4. How do Chinese independent product designers organize their design and production, whether situated within China or abroad?
5. How do Chinese independent product designers promote their identity at domestic and international exhibitions?

3. Methodology

This research methodology centered on ethnography, involving qualitative analysis through specific methods, including interviews, observations, and thematic analysis. This study primarily focused on interviewing a cadre of famous Chinese independent product designers, including Mario Tsai, Xu Gang (Bento Studio), Frank Chou, Sing Chan, Gao Guqi (Fnji), Weng Yuxin (YUUE), Mona He (Studio Monana) and Jiang Qian (Studio DEJAWU).

These interviews gathered first-hand information about their experiences in the field. Subsequent to two months of fieldwork, the author was involved in extensive engagement at Mario Tsai's studio and Milan Design Week 2023. The immersion in Mario Tsai's studio environment facilitated comprehensive insights into all facets of design, manufacturing, and promotional activities. At Milan Design Week 2023, the author conducted observations focusing on Chinese designers' presentations and the articulation of their identities. This comparative study extended to designers from other countries, notably Norway and Denmark. The aim was to investigate how their national governments and cultural organizations incentivized and facilitated their participation while fostering cultural exchange. After the transcription of all collected material, the thematic analysis served as the analytical framework to decipher patterns, recurrent themes, and underlying meanings embedded within the extensive data acquired through interviews, observations, and fieldwork.

4. Findings

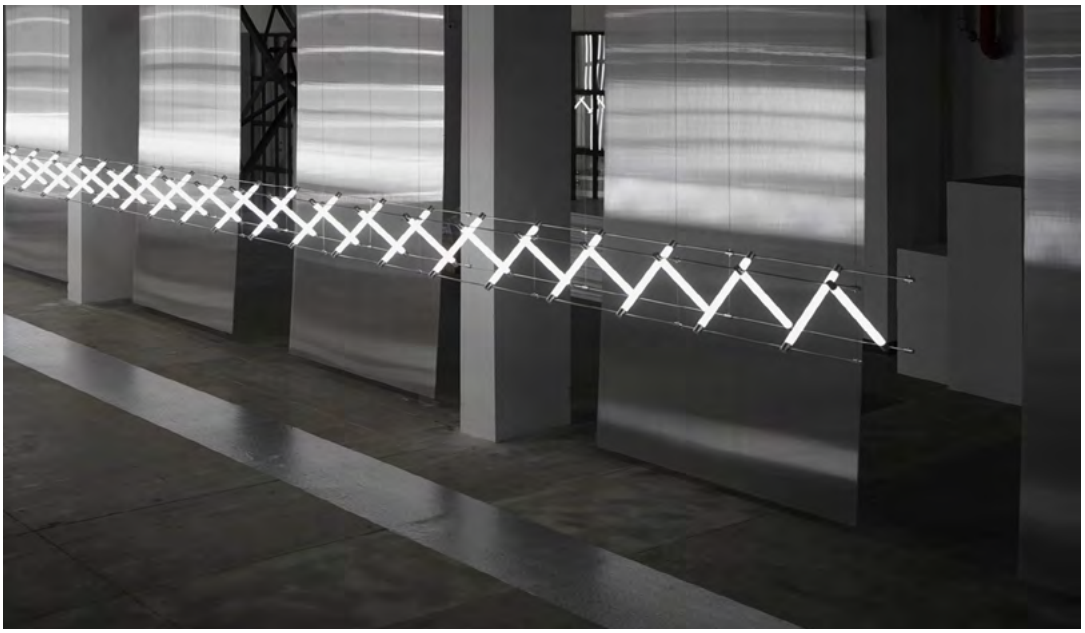

Figure 1. Mario Tsai' Mazha system. The conductive transmission of low voltage across the structure of the lighting allows the lamp to be free from wires and to build diverse and endlessly changing systems with free units. Based on these theoretical and technical foundations, the first generation of modular lighting systems in the Mario Tsai studio was inspired by the traditional Chinese sitter Mazha Lighting System.

I look at the works of these designers (see Figure 1&2), it is almost impossible to find typical Chinese symbols. Instead, they have gravitated towards a design language characterised by its simplicity and universality. Xu and Xie (2019) suggest that Chinese designers predominantly follow Western design systems and aesthetics while overlooking elements of Oriental culture, which affects the construction of their Chinese identity. This research questions this argument, particularly in today's transcultural and globalised world: is the incorporation of classic Chinese cultural symbols indeed the quintessential conduit for the manifestation of Chinese identity in design? However, from another perspective, does the adoption of a so-called universal design language by Chinese independent product designers contribute to expediting the disappearance of China as the 'Other' in the field of design? This research prompts contemplation regarding the extent to which the modern Chinese design might merely function as a rhetorical device, homogenising and consolidating diverse individuals within a specific context. The ostensible emphasis on distinct markers of identity often obfuscates the underlying Western cultural lineage and identities, thereby rendering the 'Other' designation vacuous, making the term 'modern' transmuted into a tool for assimilation. This research explores the reasons behind this conflict, drawing from the historical development of Chinese design from ancient times to the present, the high degree of homogenisation of designed products in the context of East-West fluid relationships, and Western design colonialism.

Figure 2. Sing Chan’s Fragment. Sing Chan's work uses stainless steel folded into long, tense vertebrae with textured glass, exposed lamp bases, screws, and wires to create a structured product.

Jean Baudrillard (1976) claimed that the manufacture of industrial products is not only a process of material production but also a construction of consciousness and discourse. And China is in this secondary discourse. Due to historical negative evaluations of faulty quality toys and toxic pet food, the “Made in China” label is still evaluated negatively (Ling, 2022). Apart from being the world's factory for low-end manufacturing, the Shanzhai factory is also a highly negative label. In Chinese, Shanzhai means “mountain stronghold,” but it is more often used to refer to fake goods (Han, 2017, p56)(See Figure 3), representing a subversive play on the original. Paradoxically, the Shanzhai phenomenon serves as an essential innovation model for China's technological advancement and embodies the spirit of open source (Lindtner and Greenspan, 2015; Wu et al., 2020). Nonetheless, the open-source socialist ideology underlying Shanzhai has inflicted a severe blow upon the independent design sector and the safeguarding of Chinese independent designers’ intellectual property rights, and even worse, they have also suffered from the negative perceptions of their image brought about by Shanzhai, which means they became double victims of Shanzhai. Using manufacturing as an entry point, the study provides insights into the ideological conflict between the careers of Chinese independent designers and the Shanzhai phenomenon, tacitly condoned (or even covertly encouraged) by the government (Hennessey, 2011). Shanzhai embodies a deconstruction of conventional notions of ownership, serving as a pivotal catalyst for expansive production on a broader scale, facilitating enhanced livelihoods for a more significant number of individuals, thereby engendering the realisation, to a certain degree, of what can be referred to as a "commonwealth society." In other words, fundamentally, this contradiction is an inherent conflict between capitalist Chinese characteristics and political Chinese characteristics, this dual victimisation illustrates the inherent contradiction between capitalist and political characteristics in China and unveils a deeper exploration into the role of national political formations in design development.

Figure 3. Shanzhai Gucci shoes, with the label "made in P.R.C.." Photo taken on 16/12/2023 by author.

The fact that China is a manufacturing but design-undeveloped economy, rather than a design-developed one like Japan, profoundly but subtly shapes the overseas promotion of Chinese independent product designers. A decade ago, some Chinese manufacturers attended Milan Design Week to take photographs to copy since many Italian manufacturers were reluctant to receive Chinese guests (Liu, 2016). As a result, some Chinese “designers” printed Japanese business cards, and they had a clear division of work, with someone in charge of the tabletop and someone copying the legs (Ibid). This negative impression of plagiarism and past absence at international exhibitions is an inherent disadvantage for Chinese independent product designers nowadays. This research uses Milan Design Week as another focal point to explore how these designers strategically market their identities and challenge implicit stereotypes caused by “Made in China” and Shanzhai.

Furthermore, a comparative analysis of Design Shanghai and Milan Design Week illuminates the varied formats and participation dynamics, revealing how exhibitions can serve as vehicles for identity promotion and industry representation.

5. Conclusion

In essence, the complex nuances within Chinese identity in design underscore the intricate interplay between global influences, cultural legacies, and economic realities. This study serves as a stepping stone in unraveling the multifaceted narratives of Chinese independent product designers, shedding light on the ideological conflicts, cultural tensions, and strategic manoeuvres within the global design landscape. The exploration of identity construction within the design realm unveils an ongoing discourse where

'Chineseness' negotiates its place amidst globalised paradigms, redefining notions of modernity, identity, and cultural representation in design practice. From a cultural perspective, this study calls for a detachment and liberation of contemporary Chinese design from past traditional culture and the Chinese government's propaganda. It anticipates cultural representation in design to manifest in a more nuanced and profound manner rather than merely through symbols. From the standpoint of manufacturing, independent design undertaken by designers represents a sophisticated top-down influence within society. However, during the research process, it was found that the Shanzhai phenomenon is evolving into a more diverse and democratic force, encompassing societal powers at the grassroots level. The intertwining of these two forces has created a complex landscape within China's social design sphere. In the realm of promoting within the international design community, while the identity label of Chinese designers serves as a rapid and efficient means of promoting and establishing inherent impressions, designers are hesitant to play the identity card any longer. This is because such Orientalist expectations often act as constraints when endeavouring to create designs that reflect a more modern outlook.

DOI: 10.63442/BTDB6984

KEYWORDS | CONSUMABLES, HEALTHCARE, CIRCULAR ECONOMY, RESOURCES MANAGEMENT, SYSTEMIC SUSTAINABILITY

ABSTRACT | Climate change, linked to greenhouse gas emissions, has been identified as the primary challenge to public health in the 21st century. The medical device supply chain contributes to over 70% of the healthcare sector's emissions, encompassing the production, transportation, and disposal of items such as drugs, hospital equipment, instruments, and medical devices. The doctoral research focuses on consumables management within the Department of Neonatology of Umberto I Polyclinic of Rome, aiming to support medical personnel and administrative staff in optimizing the procurement, utilization, and disposal of medical consumables. Through a collaborative design process involving key stakeholders, the objective is to create an innovative mobile application that improves the efficiency of managing disposable medical consumables associated with electromedical equipment and medical procedures. This app is anticipated to deliver several benefits, including enhanced operational efficiency, real-time tracking of consumables, and comprehensive data collection for investigating circular design strategies from both qualitative and quantitative perspectives. Relieving users' cognitive efforts, the application promotes sustainable practices throughout the lifecycle of disposable medical consumables, spanning procurement, usage, and disposal. This, in turn, contributes significantly to broader sustainability initiatives. In the long run, implementing strategies focusing on sustainable product use holds the potential to revolutionize how we approach medical consumables. By emphasizing redesign, reuse, recovery, and recycling, these strategies can improve resource availability, minimize waste, and foster systemic sustainability within the healthcare sector.

1. Introduction

Climate change, linked to greenhouse gas emissions, has been identified as the primary challenge to public health in the 21st century. The increasing aging population, rising rates of non-communicable diseases, and rapid advancements in medical technology combine to escalate the demand for healthcare. Without sufficient mitigation measures, this will increase the carbon footprint of healthcare systems (Smith, 2022). These converging factors pose significant challenges for healthcare systems (Karliner et al., 2019; Victoria Gov., 2021). The healthcare sector, in its ongoing dedication to improving societal well-being and health, provides curative care, generating significant economic and environmental impacts due to the extensive use of energy and resources, thereby becoming one of the most polluting sectors globally (Echkelman, 2020; Watts, 2019). To ensure a high level of care, these facilities require a wide range of medical supplies and equipment. Health Care Without Harm has highlighted that the medical supply chain contributes to over 70% of the healthcare sector's emissions, encompassing the production, transportation, and disposal of items such as drugs, hospital equipment, instruments, and medical devices (Karliner et al., 2019). Since the 1980s, SUDs have followed a linear product economy model, causing significant waste and emissions, leading to environmental and public health damage (Benedettini, 2022; Moultrie, 2015). This inherently unsustainable production and consumption model contributes to global ecological destruction, depletion of natural resources, excessive generation of solid waste, global greenhouse gases, and other harmful environmental emissions (Mac Neill, 2020; Rizan, 2023).
To reduce the high volume of waste produced daily by SUDs, the introduction of a circular supply chain can be implemented by adopting innovative human-computer technologies to improve efficiency and transparency in consumable management (SUDs and reusable medical devices), staff training (Walker, 2008; Wani, 2013), and the promotion of sustainable clinical practices (Mang, 2023; WHO, 2017). Similarly, to achieve an ecological transition in the healthcare sector, it is necessary to drive changes in healthcare practitioners' behaviors by engaging various stakeholders in sustainable systemic design phases related to SUDs throughout their entire lifecycle (Hinrichs et al., 2022). To understand and improve healthcare personnel behaviors in the use of consumables, this study focused on Neonatology and the Neonatal Intensive Care Unit at Umberto I Polyclinic of Rome. This department exhibits one of the highest uses of SUDs and significant impacts on costs and the environment (Newman, 2011; Nichols, 2014). The issue originates from a pilot study conducted by Verma et al. (2019), which highlighted that neonatal care, given its acute nature and the high frequency of admissions related to neonatal sepsis and infections, involves the disposal or sterilization of all unused items near neonates that test positive or are suspected of having an infection. Therefore, the doctoral research explored the lifecycle of medical consumables for Neonatology departments in hospital settings, where new sustainable solutions can be observed, designed, and tested for the entire product lifecycle, including proper separation and disposal within the hospital area. In particular, the research questions guiding the study were as follows:

- What behaviors do stakeholders exhibit during the lifecycle of single-use medical devices in Neonatology and the Neonatal Intensive Care Unit at [hidden for peer review]?
- How can interdisciplinary collaboration involving healthcare service users, stakeholders, and hospital staff enhance the delivery and use of healthcare services, particularly in the sustainable management of single-use medical devices?
- What sustainable solutions can be designed and tested to optimize the entire lifecycle of medical consumables, including acquisition, management, use, separation, and disposal?

The research aim is to improve and make transparent the acquisition and management practices of medical consumables for healthcare professionals through the implementation of a mobile application for real-time access to critical information, such as consumables inventory, usage, disposal methods, and their linkage to electromedical equipment and daily clinical treatments in the hospital. After implementing the mobile application in the departments, the results will be analyzed, and staff satisfaction will be assessed. These data will guide future research, providing insights into the procurement, use, and consumption of consumable products within the department. The goal is to identify consumables suitable for circular design strategies without compromising the efficiency and quality of the supply chain.

2. Literature review

2.1 Single-Use Medical Devices and Environmental Impact

Medical devices constitute a significant portion of emissions from healthcare supply chains (Eckelman, 2020; Sousa, 2021). Numerous studies compared the use of SUD with reusable alternatives, highlighting that SUDs typically involve significantly higher petrochemical consumption and global greenhouse gas emissions over their lifecycle (McGain et al., 2010; Sanchez et al., 2020; Sherman et al., 2018). Research, such as that conducted by KPMG (2023), has examined the end-of-life of single-use medical devices and their contribution to environmental pollution. Indeed, the study emphasizes that:

> "Currently, many single-use medical devices and equipment are disposed of through incineration, which generates a dangerous emission of greenhouse gases and has poor ecological credentials. However, every other potentially 'greener' disposal option should be carefully considered, as its benefits are not always easily attainable, with complications such as collection, sorting, and transportation that could add to harmful emissions as much as incineration, especially if size and volume are not managed correctly." (KPMG, 2023)

2.2 Single-Use Medical Devices and Environmental Impact

Effective management of medical consumables has become an area of growing importance in the healthcare sector, identified as a key lever for cost containment in industrialized countries (Volland et al., 2017). An urgent issue pertains to costs and waste associated with the management of medical consumables, which represent about 30% of hospital operating budgets (Zepeda, 2016). There is a growing emphasis on optimization techniques to address the rising healthcare expenditure (Volland, 2017), suggesting the implementation of new management methods to improve operational performance (Aptel et Pourjalali, 2001). For example, an audit in an Australian intensive care unit revealed that 60% of total waste was potentially recyclable with proper processes (McGain et al., 2009). Effective consumable management is closely linked to the optimization of the supply chain, and leveraging inventory management and control can enhance hospital supply chain performance (Dasaklis, 2012). Integrating information systems through technologies like RFID could improve logistics and supply chain management in healthcare (Çakıc et al., 2011; Chong et al., 2015; Reyes et al., 2012). Research suggests that the integration of digital technology into healthcare systems serves as an innovative solution to address the complexities of supply chain management for quality healthcare management (Kim et al., 2016).

3. Methodology

To address challenges and gaps in hospital consumable management, this study adopted a research-based design methodology (Leinonen, 2008) aimed at building on shared evidence to generate design solutions [Figure 1]. This methodology includes the following phases: 1. contextual inquiry, 2. participatory design, 3. product design, 4. prototyping as hypothesis.

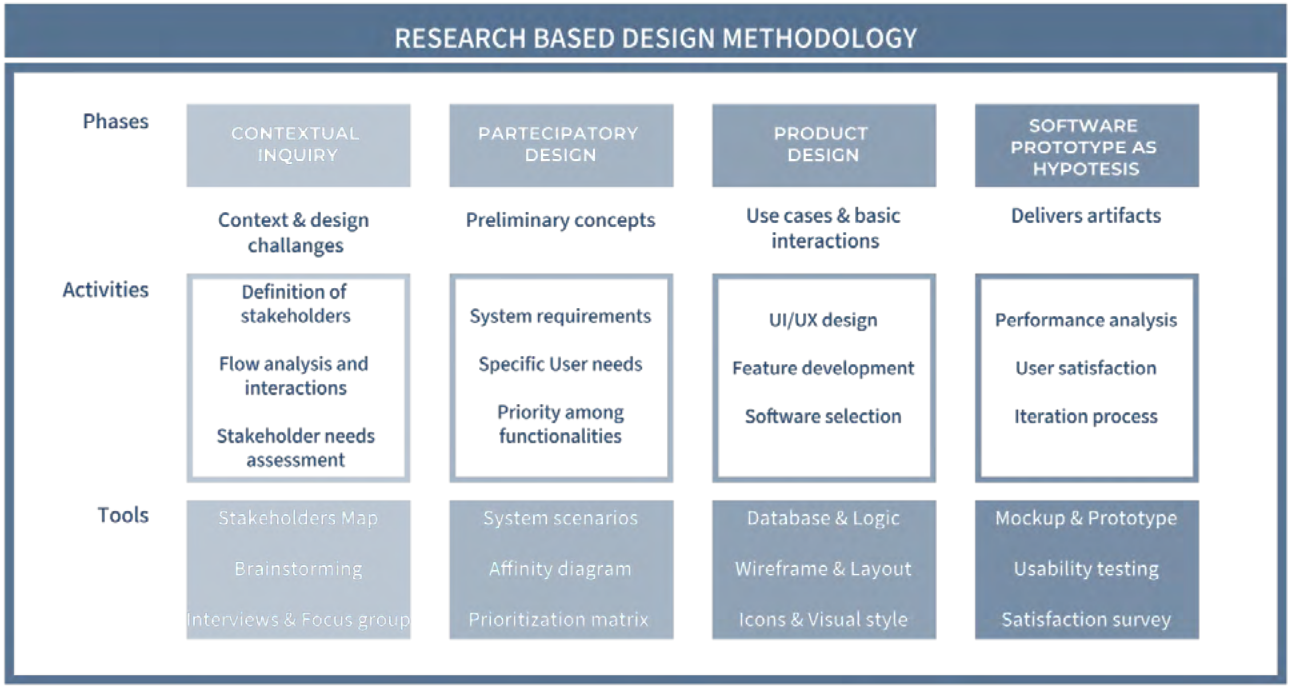

Figure 1. Research-based Design Methodology – adopted from Leinonen, 2008.

1. Contextual Inquiry:
   - Identification of stakeholders involved in consumable management.
   - Analysis of flows and interactions of single-use medical devices (SUDs).
   - Needs assessment through interviews and qualitative research.

2. Participatory Design:
   - Involvement of hospital staff in the development of the mobile app.
   - Collection of key app requirements, including features and technical specifications.
   - Identification of specific needs of hospital staff and stakeholders.

3. Product Design:
   - Selection of tracking management software.
   - User interface design through prototypes and mockups.
   - Development of identified crucial features, considering graphic preferences and design standards.

4. Prototyping as Software Hypothesis:
   - Creation of functional prototypes to evaluate proposed solutions.
   - Evaluation of app performance through usability tests.
   - Collection of feedback on performance, usability, and user satisfaction.

4. Results

The phases of action research have led to several significant outcomes in different stages of the process:

1. Contextual Inquiry:
   - During the stakeholder identification process through comprehensive mapping, it emerged that medical and nursing staff play crucial roles in hospital consumable management. This highlighted the need to create a consumable management support tool capable of guiding nursing staff in adoption decisions.

   - In the analysis of flows and interactions, stakeholders emphasized the importance of compatibility between consumables and department equipment, indicating that some previous consumables were not suitable for the new equipment and vice versa [Table 1]. This was identified as a critical point where consumables were not effectively used. Consequently, solutions were proposed for user training and management in the selection of consumables related to equipment and specific medical procedures and treatments.

Table 1. Stakeholder's needs, challenges, and proposed solutions.

Stakeholder	Needs and Challenges	Proposed Solutions.
Manufacturers	Timely delivery and product quality, regulatory compliance	Supply chain monitoring, quality audits
Medical Device Suppliers	Efficient delivery processes, technical support, long-term supply relationships	Delivery automation, technical support, long-term supply contracts
Hospital Pharmacy	Efficient inventory management, timely procurement	Inventory management systems, real-time inventory monitoring
Administrative Staff	Consumables shortage prevention, optimal costs, supplier management	Improving procurement processes, negotiating contracts with suppliers, reviewing policies.
Medical Staff	Compatibility between consumables and equipment, stock availability, patient safety	Compatibility assessment, entry and exit tracking systems
Nursing Staff	Efficient reordering, quick access to consumables, error reduction	Stock-based reordering, bar codes to identify consumables, staff training
Social and Health Care Workers	Easy consumable acquisition and transport, proper waste separation	Transportation procedures knowledge, waste management training
Waste Collection and Disposal Companies	Safe collection and disposal of medical waste. Reduced environmental impact waste	Waste treatment training, collection and disposal operations monitoring, environmental regulations compliance
Local and National Health Authorities	Regulatory compliance, transparency in hospital practices, quality of care	Policy review, promotion of audits, compliance support.

   - Through interviews with departmental staff, various challenges related to the supply and management of consumables emerged. During these interviews and multidisciplinary brainstorming sessions with doctors and nurses, qualitative observations were made, highlighting the need to create an IT system capable of monitoring consumable depletion rates and issuing alerts for inventory management.

2. Participatory Design:
    - To address the needs, a quantitative analysis was conducted, categorizing clinical procedures, equipment, and department consumables. This led to the creation of Excel databases to store this information. The goal was to automate reordering based on stock levels, implement a consumable tracking system, develop an app for staff training, and integrate everything with the hospital's supply system. Currently, the research focuses on finalizing the app structure and guidelines for consumable disposal in collaboration with a Computer Science Department student at Sapienza University of Rome.

3. Product Design:

The product design phase for the identified solutions was divided into two stages: user interface design, feature development, and software selection.

- User Interface Design: completing these activities allowed the design of the app's user interface in the considered context together with healthcare professionals [Figure 2]. The goal was to make navigation seamless for users, with elements arranged logically and easily accessible. Regarding colors, a palette inspiring trust and seriousness was chosen, using dark blue tones for the main sections and light blue for buttons highlighting positive actions. This color scheme aimed to create a professional and minimalist atmosphere. Additionally, the contrast between text and background was considered to ensure good readability. As for fonts, a clear and easily readable font type was selected, with a size suitable for both mobile devices and desktop or tablet stations.

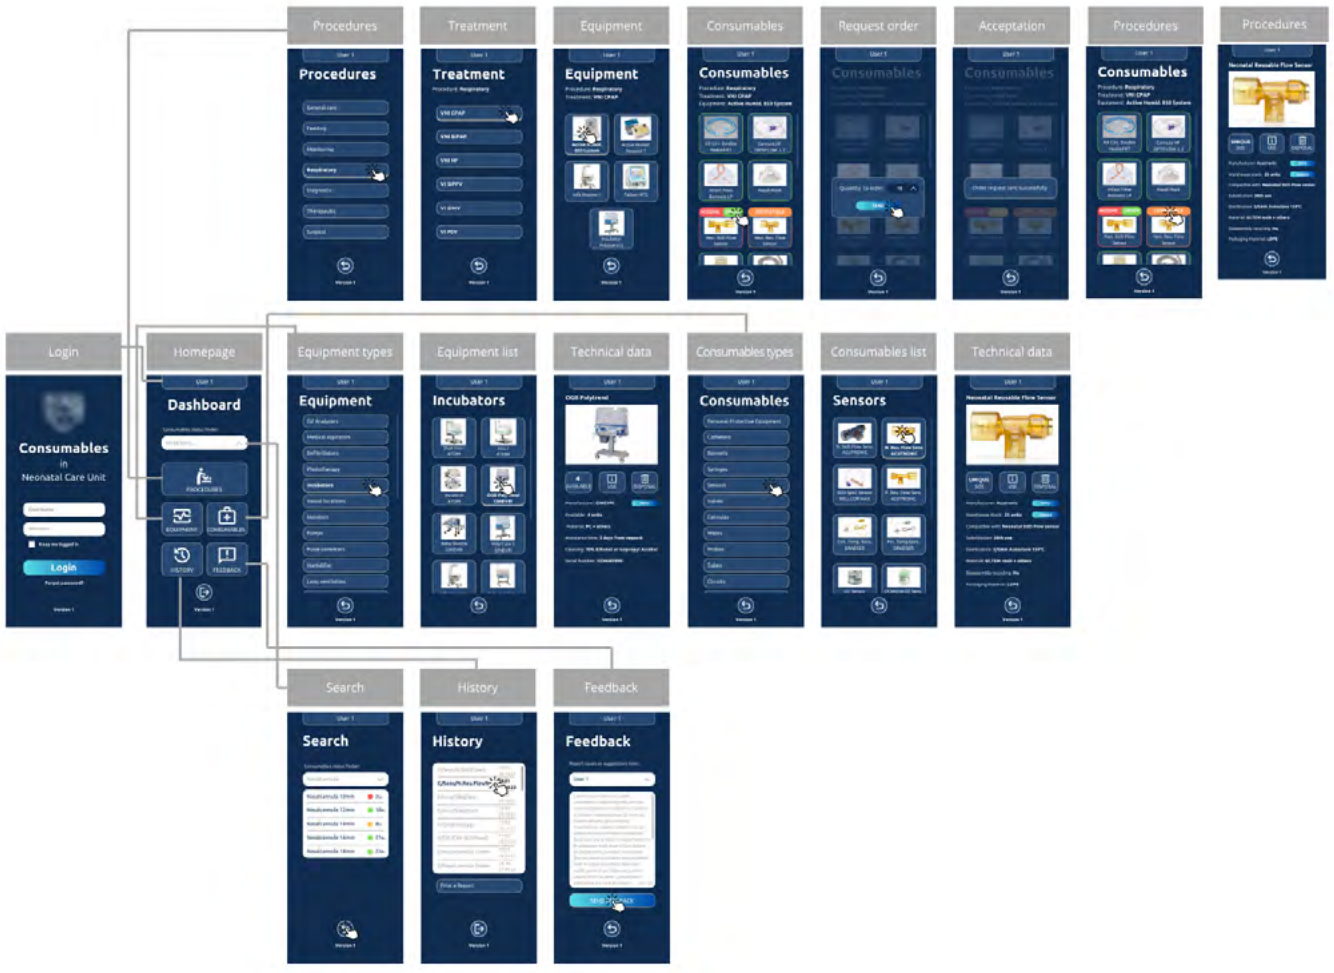

Figure 2. User flow App prototype.

- Feature Development: during the feature development phase, the app was enhanced with a welcoming home page, user access and profile management, a functional dashboard, and a smart consumable search feature. Relationships between procedures, equipment, and consumables were established, and comprehensive management systems for equipment and consumables were implemented. A feedback system was integrated for continuous improvement, and a history and reports function was added for monitoring and compliance purposes.

4. Software Prototype as a Hypothesis:
   - Evaluation of the app through performance analysis: a clearly defined protocol involving healthcare professionals was employed to assess the app's performance. The evaluation included various activities such as app access, consumable search, report generation, barcode scanning, and real-time inventory viewing. The results provide valuable insights into app performance and inform targeted improvements to enhance the user experience in healthcare material management. Key parameters evaluated include:
     - Completion Time: The average time users took to complete assigned tasks, measuring speed and efficiency.
     - Success Rate: The percentage of users who completed tasks without issues, reflecting app usability and user competence.
     - Issues Encountered: Documentation of problems or challenges encountered by users during app usage, such as interface errors, technical difficulties, or navigation confusion.

5. Conclusions and Future Developments

The integration of a mobile app for hospital consumable management is a significant step toward optimizing healthcare operations and achieving sustainable environmental goals. Achieved through a co-design process with key stakeholders, this approach addresses specific needs and challenges in Neonatology and Neonatal Intensive Care. Analysis of fluctuations and interactions highlights the importance of medical device compatibility and inefficiencies in consumable management. The app addresses these issues, offering efficient inventory management, detailed reporting, waste reduction, and improved healthcare operations. Ongoing user involvement and feedback ensure adaptability. The current phase focuses on the tracking system and the user interface, with plans for further system refinements. This project underscores the value of interdisciplinary collaboration and user involvement, promoting behavioral change at various levels. Investing in innovative technologies enhances healthcare efficiency and quality, paving the way for future research in hospital consumable management.

CUSTOMER, USER, OR CITIZEN? A COMPARATIVE ANALYSIS OF HUMAN-CENTERED DESIGN PARADIGMS.

Luca Baldini*[a]

a Sapienza University of Rome, Italy
* l.baldini@uniroma1.it

DOI: 10.63442/JCVF5297

KEYWORDS | DESIGN THINKING, PUBLIC SECTOR, CITIZEN-CENTERED DESIGN, POLICY INNOVATION, USER EXPERIENCE

ABSTRACT | A person is always a human being but not always a user, a citizen, or a customer. These terms bring normative and value models that shape how we think, act, and design. And yet, central to design thinking theory and practice, they are used interchangeably. This short paper explores the point of convergence and contrast between different people-centered paradigms. Through systematic literature review, two distinct clusters are identified: the first connects customer and user centricity and is concerned with situated and solution-driven instances; the second associates citizen and human centricity and refers to undefined and discovery-driven instances. This comparative analysis suggests that more research is needed to frame design thinking better when introduced to the public sector, as different values and tensions might be at play. It is the purpose of our Ph.D. proposal to address the knowledge gap at the boundary cracks between design thinking and complex policy change, where design is confronted with politics, power, and democratic dialectic.

1. Introduction

In recent years, growing discontentment with democratic politics has increased worldwide (Foa et al., 2020). In addition to internal pressure, governments are confronted with external burdens of ambiguous, volatile, “wicked” problems (Brown, 2010; Buchanan, 1992). As governments seek solutions, innovation in the public sector appears to be a promising path to foster citizens' engagement on one side while reducing costs and improving efficiency on the other (Lewis et al., 2017). However, more innovative forms of government do not necessarily reflect more open, accessible, and democratic governance (Johnson & Kolko, 2009). Amongst innovation paradigms, design thinking (DT) has captured the attention of governments worldwide (Kimbell, 2016). DT derives from the processes and methods of industrial designers, expanding on the concept of “human-centered design”, often referred to as “user-centered” (Norman, 1998, 1992), which aims at including human factors in the design of information and technology systems. Although the public sector is not new to design thinking (Howlett, 2014), it is the application to the business endeavors that propelled its diffusion, creating methodologies that reflect a business and commercial mindset (Cross, 2019; Shah et al., 2000; Sheth et al., 2000). However, it appears that simply translating DT within the context of public services and policies does not come effortlessly (Brinkman et al., 2023; Tromp & Hekkert, 2019).

Despite the different endeavors, the terms human-centered and user-centered design have been used interchangeably (ISO 9241-210:2010), as well as “citizen” and “customers” (Osborne and Gaebler, 1992), whether or not they have similar meanings or implications. The different paradigms are based on the concepts of “humans,” “users,” “citizens,” and “customers,” which are not synonymous, and they refer to specific, situated, and contextualized instances. A person is always a human being, but not always a user, a citizen, or a customer. These terms bring normative and value models that shape how we think, act, and design (Denhardt and Denhardt, 2000). Lewis et al. (2019) argue that when design thinking meets the power structure of politics, it risks disestablishment. Simply applying the commercial paradigm of design thinking to the politics of policymaking might not be the answer. There is a new and exciting space of research, a locus where lies a broader opportunity for design to make an impact. Our PhD research aims to address the knowledge gap between design thinking and high-level, strategic, and complex policy change.

In this paper, we first investigate similarities and differences in relationship, audience, scope, and values of customer, user, human, and citizen-centric paradigms. Secondly, two clusters are proposed, each with distinct qualities. Finally, we present further research implications for design thinking in the public sector.

2. Four Human-Centered Design Paradigms

In this section, we discuss four human-centered paradigms that sit at the core of design thinking theory and practice. We first introduce customer centricity; then we discuss user-centricity; third, we present human centricity, and we conclude with the citizen-centricity paradigm. Each of these paradigms is scrutinized in terms of relationship, audience, scope, and values.

2.1 Customer-Centricity as a Competitive Advantage

The attention toward customer wants is not new to the industry context, Levitt (1960) argued that companies should not focus on selling products but rather on addressing customer needs. The move from product to market-driven firms already began with the new marketing science (Keith, 1960), whereas customer centricity emerged as a powerful way to establish mutually satisfactory customer relationships (Day, 2003). According to Boulding et al. (2005), there is a double value exchange between customers, who manifest their needs, and firms, which activate their internal resources to meet customers’ requirements while, in the process, creating value for the firm. Ultimately, customer centricity provides the most profitable, and not easily countered by competitors, way to develop close customer relationships (Shah et al., 2000). In this paradigm, customer feedback is integrated into participatory decision-making processes;

the supply chain makes available the resources for highly customized offerings (Lamberti, 2013), and customer needs permeate the whole organization, continuously adapting to customers' preferences, including their emotional, and ethical, social selves (Sun, Li, & Zhou, 2006). In short, the main characteristics of the customer-centricity paradigm imply:

- Establishing a bidirectional relationship with the customer, which is exclusive and targeted.
- Increasing the profitability of the firm while creating value for the customer.
- Transforming the whole organization to fulfill customers' needs.
- Implementing solutions and offerings to contingent and defined customer requirements

2.2 User-Centricity Improves the Usability of Technology Systems

Donald Norman coined the term "user-centered system design" to refer to the practice of engaging the users of designed artifacts, bringing their needs and perspectives into the design process (Marti & Bannon, 2009; Norman, 1988). User centricity is rooted in the mix of ergonomics and psychological studies that seek to recognize the many factors that describe users as humans, reclaiming their role in the interaction with technological systems (Gould et al. 1998; Nielsen 1993). According to Richter and Fluckiger (2014), the user-centered approach involves understanding the user and the context, designing a suitable solution to the problems identified, moving from solution to prototyping and development, supporting the implementation, and finally evaluating the results through user-testing (Gulliksen et al., 2010). Comparably with customer-centricity, user-centered design impacts the whole organization throughout the development lifecycle (Kapor 1990). User centricity increases user productivity and operational efficiency, lowers costs related to training and development as a result of products being more understandable, and improves affordability, accessibility, and overall usability (Chammas et al., 2015).

In conclusion, user-centricity is characterized by:

- A clear action cycle that rotates around the object of usage, which needs to provide feedback on its use to the user him/herself.
- Full iterative integration of users in the design process.
- Improving overall efficiency and efficacy of a system interacting with humans.
- Addressing well-defined and known technical issues.

2.3 Human-Centricity Reflects Human Dignity

Originating from the European human-centered movement of the 1970s, human-centered design acknowledges cultures, practices, and costumes that make humans human (Gill, 1996). According to Boy (2017), human-centered design emerged in contrast to the engineering sciences, which believe that engineers lead the design, and only then can users give feedback on what is produced. Initially lingering towards human rights and human dignity (Buchanan, 2001), the concept of human-centered design was encapsulated by the user-centered approach (ISO 9241- 210:2019). However, the original human-centric paradigm seems to consider a stronger focus on the specificity of cultural diversity when interacting with a design artifact, be it a policy, a service, or an interface. It works with concepts such as human purpose, participation, representation, and tradition (Buchanan, 2001;). On the contrary, the user-centered paradigm is concerned mainly with user practice and user modeling, focusing on the relationship between users and technology without questioning how and why technology might be of service in supporting human activity (Gasson, 2003).

To summarize, the human-centered design paradigm's characteristics are as follows:

- Humans are at the core, as defined by their multiple diverse cultures, practices, and ethnicities.
- It is an essential instrument for implementing and embodying the principles of human rights and human dignity in everyday life.

- Serves human beings and their context in their various activities.
- Establish new forms of participation and representation.

2.4 Citizen-Centricity is Complex and Multifaceted

Despite the growing popularity of the term “citizen-centered” applied to services, policies, and even governance models (Bergvall-Kåreborn & Ståhlbrös, 2009; van Velsen et al., 2009), it seems that governments struggle to be more citizen-centric. Følstad et al. (2004) argue that the lack of user involvement might be one of the reasons for governments to fall short of this promise. However, both Kotamraju et al. (2012) and van Velsen et al. (2009) agree that much of the criticalities are to be found in the differences between governmental services and their commercial counterparts.

Public services address heterogeneous user groups and therefore cater to different cultures (Sandberg & Pan, 2007), capabilities (Wang et al., 2005), political convictions (Oostveen & Van de Besselaar, 2004), and disabilities (Legge 9 gennaio 2004). Citizens access complicated content, which is often linked to policies, and its ownership is shared across public institutions, requiring not only interoperable systems but also interoperable capabilities (Interoperable Europe Act, 2022). In addition, in public services, the provider-user relationship is complex and often characterized by friction and tensions (Brinkman et al., 2023; Tromp & Hekkert, 2019). Notably, even the least repressive and most democratic governments are coercive institutions: they seek to provide for citizens' needs, even if this means going against their wishes - e.g., paying taxes (Kotamraju et al., 2012). Lastly, governments are held accountable for the present and for the future, extending the scope to include intergenerational justice (Glotzbach and Baumgärtner, 2012; Gall et al., 2021).

We can identify some distinct properties of citizen centricity, namely:

- The relationship is ambiguous and, at times, conflicting.
- Civil, political, and social rights are intrinsically embedded.
- It is held accountable for accessibility, usability, and dignity of all.
- Address the plurality of human voices, providing international and intergenerational justice.

3. Comparative Analysis

Through a systematic literature review, four human-centered design paradigms were scrutinized. From the analysis, we identified three main characteristics that sit at the intersections of the four paradigms. We list them as follows:

- The involvement of not-experts in domains first led by experts only (Norman, 1988; Shah et al., 2000);
- The enhancement and improvement of processes and services (Marti & Bannon, 2009; van Velsen et al., 2009);
- The transformation of organizations from within, aligning it to people’s needs and requirements (Boy, 2017; Sheth et al., 2000).

Secondly, we interrogate each paradigm on the relationship it establishes, the audience it refers to, its scope, and the value it embeds. Two distinct clusters emerged with defined qualities. As illustrated in Table 1, the first cluster relates to context-dependent instances, whereas the second cluster concerns fundamental rights-dependent instances. The first customer-user cluster refers to situatedness and works with known socio-technical problems. Both customer and user centricity establish an exclusive, bidirectional relationship between customer/user- firm/product, are transaction-oriented and solution-driven (Marti & Bannon, 2009), and technology is key to establishing long-lasting customer-firm relationships (e.g., Apple products or Amazon services). On the other hand, the second cluster of human

and citizen centricity encompasses humans as well as non-human actors (e.g., the environment) because it considers fundamental human rights (e.g., access to clean water and sanitation, etc.). It is multimodal and problem-discovery driven and establishes a multi-directional, inclusive, and diversified relationship across actors' systems (Brinkman et al., 2023; Gasson, 2003). Ultimately, its humanism emerges from the centrality of positive social impacts, such as in the Cool neighborhood (New York, 2017) and Climate shelter projects (Barcelona, 2021).

Table 1. A Comparative Analysis of Human-Centered Design Paradigms.

Clusters	**Cluster 1: Context-dependent**	**Cluster 2: Rights-dependent**
Human-centered design paradigms	User and customer centricity	Human and citizen centricity
Relationship	Bidirectional - exclusive and contextualized.	Multi-directional - inclusive and diversified.
Audience	Focuses on the user or customer which is specified and determined.	It encompasses "humans" as well as "non-humans" actors as it acknowledges human rights.
Scope	Discrete, works with socio- technical known problems.	Complex, deals with wicked and unknown problems.
Values	Transaction-oriented and solution-driven.	Multi-modal oriented and problem-driven.

Each set of clusters contributes to shaping different normative and value models. Consequently, the methodology might not be transferred easily across or even result in negative impacts on the new context (Denhardt and Denhardt, 2000). In public sector endeavors, simply applying a user-centered approach to solve complex challenges without reconsidering the whole set of processes, tools, and methods might be counterproductive. Citizen and human centricity address specific sets of issues, which are positioned at the extreme of the value spectrum of the user and customer-centricity paradigms. Whereas the former might be more appropriate for complex policy reforms, the latter might be more useful for discrete service redesign instances. Rather than considering the terms human, user, customer, and citizen interchangeably, it is crucial to investigate their synergies and divergences as they embody different normative and value models.

4. Conclusions

Considering the growing interest in applying design thinking to policy and services, we scrutinized four human-centered paradigms to clarify differences and synergies. Two clusters were proposed according to similarities and differences in relationship, audience, scope, and values. The first customer-user cluster is context-dependent, whereas the second human-citizen cluster is rights-dependent. Further research into the methods, practices, and processes of each might be required to improve the robustness of our comparative analysis. From this analysis, additional research questions arise: Which position do these clusters play in the public sector, particularly when introduced to the policy-to-service process? Which capabilities are necessary for design professionals to deal with the politics of the policy process and the normative culture of public institutions? Starting from this comparative analysis, we will conduct PhD research to address the knowledge gap at the boundary cracks between leadership, design thinking, and strategic public policy reforms.

KEYWORDS | EATING, RELATIONAL, EMBODIED, SOCIO-MATERIAL, PARTICIPATORY DESIGN

ABSTRACT | Designing for the complexity of the socio-environmental challenges we are part of requires a shift from individual-centered methods to more respectful and caring practices. As a response, Participatory Design (PD) is expanding its repertoire to embrace relational and processual approaches motivated by the curiosity to articulate a more caring, response-able attitude toward others, humans, and beyond. This research project aims to contribute to this shift by examining the potential of thinking and doing (with) eating as an embodied experience in PD spatial transformation projects. My research approach intentionally translocates the knowledge-making process from the brain to the gut, taking cues from our everyday metabolic engagement and the material relations they create. Through eating, this approach aims to emphasize body experiences as a primary source of knowledge. Preliminary findings highlight a profound link between gut-driven engagement and researchers, designers, and participants' capacity to address complex societal and environmental issues, advocating a shift towards gut-centered PD.

1. Introduction

In the realm of Participatory Design, this paper delves into the nuanced intersection of bodily desires, collective action, and design processes to reimagine how communities can live together. Drawing inspiration from the conference theme "Ways of Living Together," my research addresses the challenges of engaging communities in decision-making, confronts the inherent difficulty in mobilizing active participation, and proposes an approach rooted in exploring bodily desires, explicitly focusing on eating.

Participatory Design (PD) is a collaborative approach that involves stakeholders in the design process, aiming to create more inclusive and sustainable outcomes. It has gained traction in various fields, including urban planning, community development, and healthcare, as a means to address complex societal challenges together with communities (Huybrechts et al., 2022; Huybrechts & Teli, 2020). Rooted in the principles of Participatory Design, our research reflects on bodily desires (Groys, 2022), mainly eating (Mol, 2008), as a means to activate self and collective reflection and action. The research explores how incorporating bodily experiences, centred on processes around digestion, can facilitate deeper connections and more intimate relations between human inhabitants and more-than-human participants (Akama et al., 2020; Akama & Yee, 2016; Baek et al., 2018; Kasulis, 2002; Light & Akama, 2012, 2014), positioning food as a dynamic catalyst for caring and response-able PD.

2. Thinking and Doing with *Eating* as an Embodied Experience in PD

Designing for the complexities of socio-environmental challenges requires a shift from individual-centered approaches to more respectful and caring practices (Pihkala & Karasti, 2022). Participatory Design (PD) is undergoing an expansion of its repertoire to embrace more relational and processual approaches, driven by a curiosity to articulate a more caring and response-able attitude toward others, humans, and beyond (Huybrechts et al., 2022; Huybrechts & Teli, 2020). This research project aims to contribute to this shift by examining the potential of *thinking and doing with eating* as an embodied experience in PD spatial transformation projects (D. Haraway, 1988; D. J. Haraway, 2016). To connect beyond participation, *reaching out by reaching in.* Envisioning ways of doing PD based on explorations to bring ourselves and the people we work with closer to our bodies, closer to our guts, as a way to avoid distant perspectives, forefront socio-ecological relations, stimulate acting, and enable inhabiting among compromised worlds (Braidotti et al., 2018) (Figure 1).

My research approach intentionally *translocates* the knowledge-making process from the brain to the gut through *eating*, taking cues from our everyday metabolic engagement (Mol, 2021) and the socio-material relations they create (Barad, 2003). The reasons for choosing to eat are multifaceted – personal fulfillment, practical considerations, approach exploration, philosophical inquiries, ontological reflections, and pleasurable experiences all play a part. Eating enables us to deeply immerse ourselves as designers in cultivating meaningful connections within our social, cultural, and natural worlds. Eating is an activity we perform every day. Eating is essential for our sustenance and nourishment, but it is also a fundamental bodily desire. As Boris Groys (2022) suggests, bodily desires are mechanisms by which we are brought back to ourselves. Bodily desires connect our thinking with our body, connecting us with the fleshy side of being human. This is also the case with eating. It allows us to engage with the materiality of our existence (Van Daele, 2022). It reminds us of our interconnectedness with the world around us (Mol, 2021).
My experience as a woman growing up in a food-loving family and my role as an architect in transforming community kitchens in Caracas, Venezuela, are feeding the way I approach Participatory Design. Following a *gut feeling* – could also be named the ethnographic hunch (Pink, 2021) – about the very material possibility of carrying out a more caring (De La Bellacasa, 2012) and engaging PD by centering its processes around eating. Annamarie Mol's ethnographic approach theoretically supports this gut feeling. In her book, "Eating in Theory," she explores how bodily sustenance processes like eating and digesting foster an alternative way of "being, knowing, doing and relating" that facilitates a deeper understanding of our interconnectedness and socio-material relations with other living beings, promotes collective

responsibility and fosters sustainable practices (Barad, 2003). She also delves into the situatedness of eating, the positionality of the eater, and the mutual transformation coming from this engagement:

> "Knowing may also come about when, in a specific situation, a specific person attends to selected bits of the world that, as she ingested them, affect her in this or that not-quite-predictable way" (Mol, 2021, p. 61).

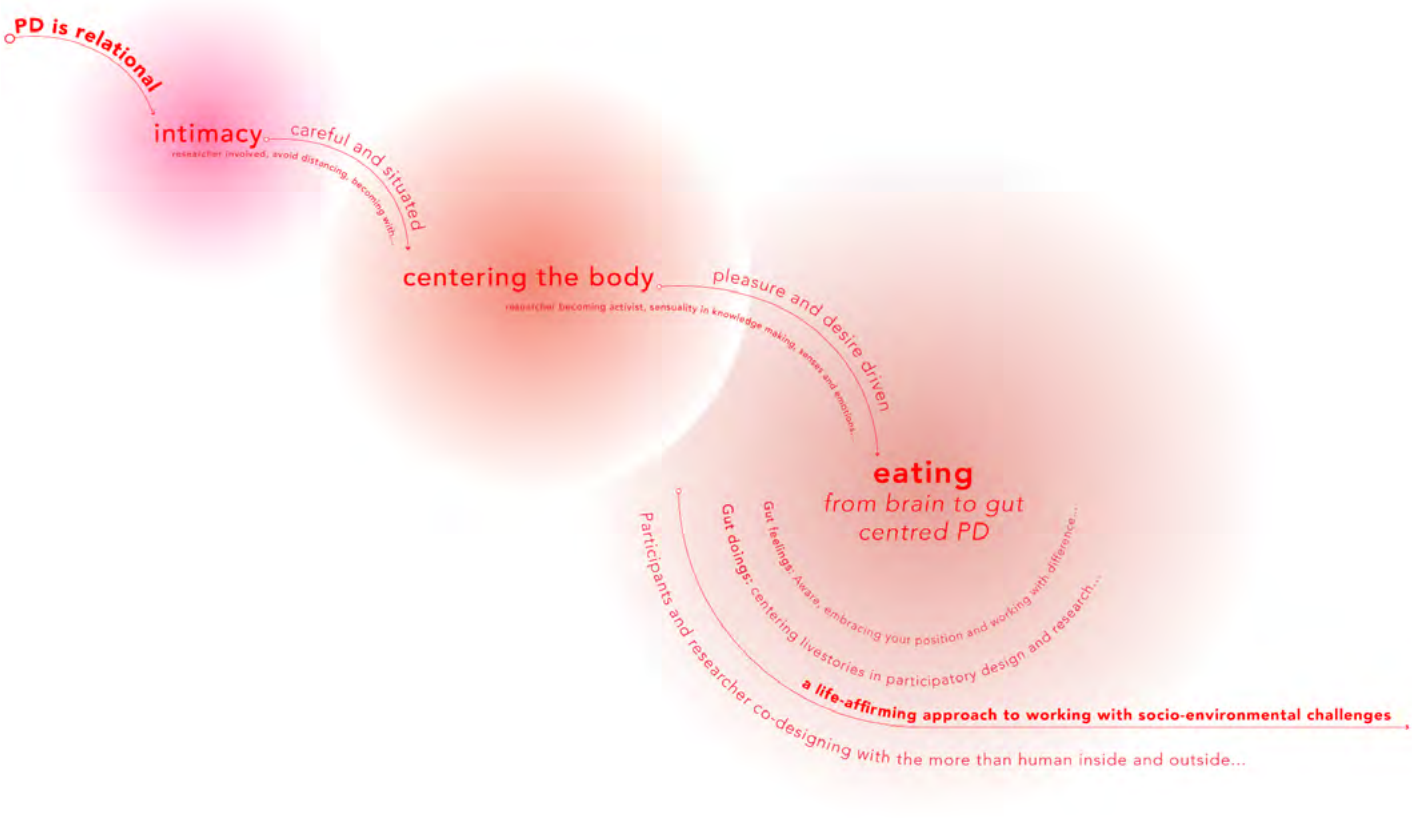

Figure 1. From brain to gut-centered Participatory Design (PD). Eating as a pleasure and desire-driven approach for a careful and situated PD. Eating is a mechanism for PD researchers to centre the body, engage with the sensuality of knowledge-making, avoid distancing, and become involved in the process. Eating as a life-affirming approach to working with socio-environmental challenges.

3. Digestion Analogies for Other Ways of Knowledge-Making in PD

In my research, I hope to disrupt dominant and anthropocentric ways of knowing and embrace what it means to take relationality and emergence seriously (Pihkala & Karasti, 2022). I aim to disrupt dominant and anthropocentric ways of knowing by embracing the embodied knowledge that emerges from our everyday metabolic engagements, mainly through eating. This approach challenges traditional notions of knowledge production and highlights the interconnectedness of human and non-human actors in the design process. This research explores thinking with (De La Bellacasa 2012) our gut with the "explicit purpose to make things 'thicker.'" The specificity, situatedness, materiality, relationality, and transformation capacity already embedded in eating make it a rich and provocative field for PD researchers and designers to engage with. In my work, this translates into three analogies between participatory design stages and the process of digestion, allowing ways of thinking and doing with our guts rather than our minds (Figure 2):

3.1 Auto-Ethnographic Phase: In-Digestion

The first phase, *in digestion*, allows the researcher to recognize her position as an outsider and gain awareness of herself as the body slowly senses and makes sense of the socio-material conditions she is working with. Embracing bodily discomfort becomes a means to process something not yet metabolised. This phase sets the stage for response-able and situated research and a deeper engagement with the site and its actors through digestion.

3.2 Engagement Phase: Digestion

During the *digestion* phase, time allows my body not to "bounce back" but to transform with the site. The researcher engages with the site and its actors through a process of breaking down to aid assimilation. This involves collectively crushing, squishing, cutting, and chewing parts of the site, dissolving boundaries between in and out, land and self, human and beyond. As the process unfolds, connections are created, and as we eat, the gut becomes the locus of thinking and knowing, facilitating shared understanding and action. A process aiming to reveal experiences, imaginations, *past, present* (D. Haraway, 2010) , and future ways forward.

3.3 Outcome Phase: Excretions

The final phase, *excretions*, involves the results of making and coming to be with expanded and deepened relationalities with other beings. This phase encompasses socio-material practices, meanings, projects, and products that emerge from an "enlarged sense of interconnection between self and others," shared concerns, and collective commitments.

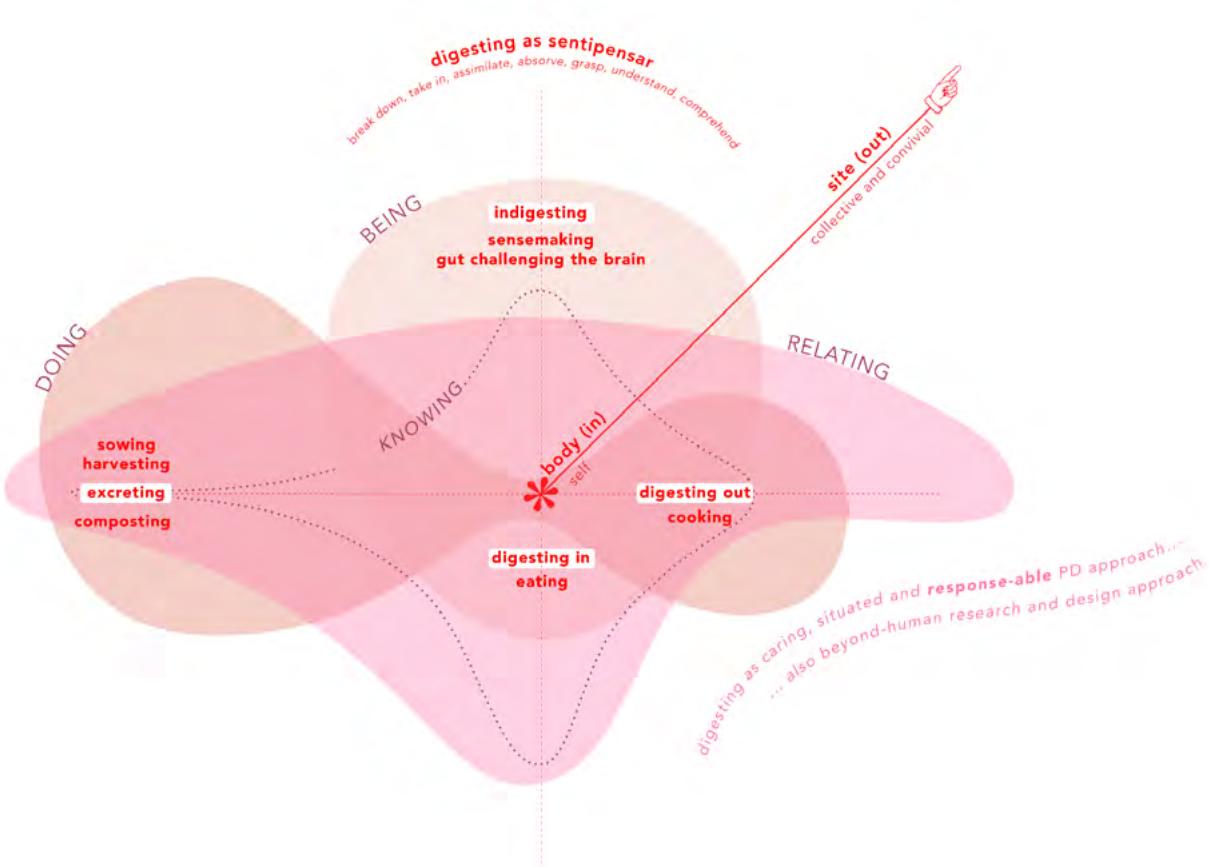

Figure 2. Analogies between participatory design stages and the process of digestion. Three stages of digestion – indigesting, digestion in and out, and excreting – and its relation with a transformational capacity going from the self (inside of our bodies) to the collective (outside: land and others). It is inspired by Annemarie Mol's *Eating in Theory*, in which being, doing, knowing, and relating traverse with different intensities between in and out in the digestion stages.

4. Progress to Date and Plans for Further Research

In my practice-based research, I have worked in different contexts ranging from social housing neighbourhoods and former extraction landscapes in Limburg, Belgium, to community kitchens in the self-built settlements of Caracas, Venezuela. Thus far, I have engaged in three different trajectories through indigestion and digestion from a (self)ethnography perspective centred on eating. Concrete actions include spending time on site, cooking, eating, *sobremesas*, picnics, potlucks, interviews, relations maps, photography, participants photography, gut-guided walks, site sense-making with our guts, composting and planting (Figure 3). As I approach half of my PhD trajectory, I plan to work further in the third stage of digestion, excretions. I will explicitly engage with the materiality and processes of space transformation coming from gut-centred knowledge in the form of, for example, collective infrastructures for cooking, composting, and gardening. I would also like to open a new trajectory to explore the potential of engaging more deeply with more than human actors through a gut-centred PD approach, increasing their agency over imminent spatial transformation projects, specifically urban renewal, so far centred around human concerns.

In working with different communities and landscapes, the research becomes a container (Le Guin & Haraway, 2019), a collection of situations in which our guts have a knowledge-making role—collecting experiences and devising spaces of possibility to materialize the world we want to live in. Thus, going through this collection offers other PD researchers and designers the possibility of translocating knowledge coming to exist from moments filled with specificity to other moments or situations, taking digestion as a body-centred, engaged PD approach, and producing other - also very site-specific outcomes - excretions. However, challenges arise in translocating knowledge respectfully without appropriating or imposing and in navigating the implications of this approach for how we relate to others and transform our ways of living and the spaces we inhabit. I would like to take part, with fellow designers and researchers, in answering these questions. The CUMULUS community and the PhD network have proved to be an engaging scenario to discuss the opportunities and challenges of thinking and doing with our bodies - rather than our minds - and to devise ways of increasing the agency of more than human actors in our processes.

My preliminary findings suggest at least three reasons for PD researchers and designers why need “pay attention to how matter and discourse combine in the visceral body.” First, it provides an embodied way of overcoming dualistic thinking: body and mind, self and others, emotion, and cognition, as it “alerts us to the viscerality of being embodied and entangled in human and non-human nets of materiality and meaning” (Probyn, 2015). Second, it helps us adopt an experimental and transformative rather than a descriptive orientation, as it enhances our willingness to ‘take in’ (quite literally) the world in the act of knowledge-making (Gibson-Graham, 2011, p. 22). Third, it highlights a profound connection between gut-driven engagement and the researchers’, designers’, and participants’ capacity to address complex societal and environmental issues. Therefore, the colloquium could be an opportunity to think together about how centering the body and our guts could aid in developing capabilities to become more caring and response-able researchers (De La Bellacasa, 2012).

Figure 3. Going through the three stages of *digestion* during my fieldwork in the 'El Sinaí' community kitchen in Caracas, Venezuela. This case will be appropriately expanded upon during the presentation at the CUMULUS conference.

KEYWORDS | NEW PUPPETRY, CONTEMPORARY, PARTICIPATORY ART, INTERPRETATION

ABSTRACT | Essentially a folk art, puppetry existed long before Modernism and was used to communicate ideas and express human emotions. Puppetry has carried on the essential characteristic of the country that produces it, reflecting the national temperament and psychology of its society. In many traditions, puppets are articulated objects engineered to receive and express motion. Through this research, the researcher focused on the role of puppetry from a contemporary perspective, especially in its relationship with Participatory Art. In the study case of "Presence in Absentia," the concept of Contemporary New Puppetry is more usefully thought of through the eclectic notion of performing objects rather than the more reified idea of puppets. It offers assemblages on the stage of objects, human performers, and projection. Although the original proposal of this project was based on Conceptual Art and a collaborative mindset with the Performing Art practitioners at the site-specific work, along the way, the conception was shifted into another direction, Participatory Art. Moholy-Nagy, one of the Participatory Art pioneers, believed that everybody has talent, that is, trusting in the creative powers of ordinary people. Participatory Art challenges not only the artists/practitioners and audience intellect and intuition in the strategic choices to be made but also in the physical involvement needed to fulfill the Participatory Artwork, which, in this case, would refer to the contribution of audience in conducting and directing the sound elements of the performance. Through this project the involvement of the audience physically during the performance made this project fully come into being. Contemporary New Puppetry in this project could be a sample that the predominant use and vision of the puppet today is no longer represent an object newly imposed from the outside set to overtake us, but rather something with which we are deeply connected and through which we strive to express, understand, and negotiate our interrelationship with each other in with the non-human world, or in this case is the world of puppetry.

1. Introduction

“Art crystallizes the emotions of an age; art is a mirror and voice,” wrote Laszlo Moholy-Nagy (Almenberg, 2010). As the concept of art has been changing through the centuries, its purpose has been to represent reality, communicate emotions or ideas, create a sense of beauty, or explore the nature of perception (Martinique, 2016). Essentially a folk art, puppetry existed long before Modernism and was used to communicate ideas and express human emotions.

Puppetry has carried on the essential characteristic of the country that produces it, reflecting the national temperament and psychology of its society (Currell, 1974). In many traditions, puppets are articulated objects engineered to receive and express motion. It also acts as an existential mirror, a reflection of the precariousness of our condition as living subjects (Guy, 2013). Asia is the source of many of the ideas and techniques of the puppetry of the West since it was highly sophisticated at a very early date (Currell, 1974). Afterward, puppetry was well established by the thirteenth century in many parts of Europe, and free exchange between the countries there produced similar trends and styles (Wijaya, 2023).

Through this research, I focused on the role of puppetry from a contemporary perspective, especially in its relationship with Participatory Art. The contemporary views of puppetry, or what Orenstein called the “New Puppetry,” predominantly express interrelationships rather than binaries and oppositions, they reflect our contemporary struggle to understand our now deep involvement with technology embedded. As we are in it, the new technologies that have also made us more globally interconnected (Orenstein, 2017). Since the role of art has been changing over time, acquiring more of an aesthetic component and A socio-educational function (Martinique, 2016) will be possible through the “process” of producing art. And relying more on the freedom of interpretation of the audience/participant that runs towards Participatory Art.

2. Study Case on Participatory Art

2.1 Contemporary New Puppetry

Fundamentally, humans directly perceive through senses, physical objects together with their properties. If perceptual experience is representational, it only appears that the audience directly perceives the represented physical objects (Suojanen, 2020). In doing so, we are becoming very at home with the idea of projecting character through objects that we see and use as extensions of ourselves (Orenstein, 2017). In terms of puppetry, there are today more and more international artistic collaborations and cultural borrowings and exchanges taking place in every direction (Orenstein, 2017). Participatory Art can reflect this purpose better than any other kind of art since it wants to highlight this creative capacity within each (Almenberg, 2010), i.e., participant or audience. It is important to transform the cultural sector of puppetry and presenting performance based on the participants’ core competencies and skills without neglecting the sensory perception and experience of the audience.

As a researcher, similar to Almenberg, I also believe that we live in an extremely fragmented world and that the future belongs to those who can combine and recombine, assemble, and reassemble something at least individually meaningful out of all those fragments, which is what creativity is all about (Almenberg, 2010). Historically, traditional puppetry has become a powerful teacher of morals, values, and cultural expressions; Contemporary New Puppetry is more usefully thought of through the eclectic notion of performing objects rather than the more reified idea of puppets. It offers assemblages on the stage of objects, human performers, and projection (Orenstein, 2017), which later can be discussed through the collaborative project of “Presence in Absentia.”

2.2 Performing Art Project

As part of the interdisciplinary perspective of the New Puppetry research, I collaboratively worked on a specific project with an installation artist and performing art practitioner from Southeast Asia. The main objective of this project was to present puppetry in a contemporary perspective, an experimental project of New Puppetry in the form of Performing Art. Even when cultural conservatives mourn vanishing traditions, a generation of Southeast Asian practitioners are seizing the codes of performance culture, inhabiting received forms and re-making them to speak to both local particularities and global issues (Cohen, 2017). The notion was suitable for the Performing Art project since the artists were all focusing on a new form of puppetry. The artists would like to evoke creativity in themselves and the audience through the interpretation of light, shadow, and reflection in the site-specific work.

The concept of "Presence in Absentia" was to maximize the potential of New Puppetry without presenting the main objects, the 'puppets,' but instead representing them with the 'performers' who acted physically as the puppets with the mind of the puppeteers themselves (puppetry without puppet). This project relied on the artistic innovation and interpretation of the artists and performers on how we could represent the subject explicitly by utilizing gesture, movement, and sound in the installation space. Through the collection of elements on stage, collaborative practices, and themes that often deal with connecting the past to the present, Western and non-Western, New Puppetry strives to find and understand integration and interconnection (Orenstein, 2017) that could be shown in the project.

Figure 1. Exploring the puppets' movements and transferring the knowledge to the practitioners' bodily movements.

As the main researcher for the "Presence in Absentia" project, the first phase of this research was to share the knowledge of traditional puppetry within different countries, Western and non-Western, to find the connection and build new interpretations from the participants who were also the practitioners. From Indonesian Wayang Golek puppetry to Austrian Marionette puppetry, the performers experimented seriously with the various gestures and movements in their next phases, Figure 1. They could discover or

invent their techniques and choreography so that they could represent new hybrid puppets' movements and present them through their performance.

2.3 Participatory Art Matter

The original proposal of this project was based on Conceptual Art and a collaborative mindset with the Performing Art practitioners at the site-specific work "Undivided Vision." However, along the way, the conception was shifted into another direction, the Participatory Art. Conceptual Art seems to have been more focused on the participation of the spectator in the execution of a work thought by the artist. However, the next phase of the "Presence in Absentia" project expressed the constantly changing relations in Participatory Art. This project later invited the audience/spectator to contribute and experience their creativity. Participatory Art challenges not only the artists/ practitioners and audience's intellect and intuition in the strategic choices to be made but also in the physical involvement needed to fulfill the Participatory Artwork (Almenberg, 2010), which in this case would refer to the contribution of the audience in conducting and directing the sound elements of the performance, Figure 2.

Figure 2. Performers' interpretation of puppet-based bodily movements and how they worked together with the audience through sounds in the site-specific work.

The basic choreography was based on the interpretation of the puppet's movement from each performing art practitioner. Since their background were diverse (dancers, actors, performers), they interpreted the idea of New Puppetry from the researcher in different ways; some focused on the movement of Indonesian Wayang Golek puppets, and some chose to focus on the movement of Austrian Marionette puppets. The original sound of the site-specific work by the installation artist was the sound of dripping water in a quiet and meditative ambiance. Eventually, the performers played along with the light and shadow by utilizing the space and adding the external sound from the Indonesian musical instrument Angklung that was prepared by the researcher beforehand. This traditional instrument was made of Bamboo, and each item could only give one specific note. The researcher only prepared three instruments, which means only three notes were available since the main purpose was not to play music but only to produce sound.

The participatory element of this project was that these instruments would be moved or played by the audience, not the artists or performers. Thus, the audience would have the choice to be involved physically in this performance. Following the belief of Moholy-Nagy from the Participatory Art perspective, I believe that everybody has talent, that is, trusting in the creative powers of ordinary people (Almenberg, 2010). Through the "Presence in Absentia" project, the involvement of the audience during the performance made this project fully come into being.

3. Conclusion

Through the "Presence in Absentia" project, the site-specific work of the installation artist was transformed into an imaginative space, a space where the performers could become something else, which, in this case, become puppets. It was almost like what Leonora Carrington described in her book, The Milk of Dreams, about a magical world where life is constantly re-envisioned through the prism of imagination, a world set free, brimming with possibilities (La Biennale di Venezia, 2022). Also, in this world, the audience could transform themselves as the puppeteers who controlled the movements and ambiance of the stage. This contribution has shown that artistic strategy is at play. It was the main aspect of Participatory Art, where the pieces designed and/or made or found by the artists and practitioners were rearranged by the audience into a pattern of his/her choice (Almenberg, 2010). Moreover, Contemporary New Puppetry in this project could be a sample that the predominant use and vision of the puppet today is no longer represent an object newly imposed from the outside set to overtake us, but rather something with which we are deeply connected, and through which we strive to express, understand, and negotiate our interrelationship with each other in with the non-human world (Orenstein, 2017), or in this case is the world of puppetry.

DESIGN AND PROJECT LEARNING: A SYSTEMATIC LITERATURE REVIEW AND DISCUSSION ABOUT THE FUTURE OF THE FIELD.

Maura Flores*[a], Gabriela Pizzato[a]

a Federal University of Rio Grande do Sul and Unisinos University, Brazil
* mauraff@unisinos.br

DOI: 10.63442/CWWI8478

KEYWORDS | DESIGN, EDUCATION, EXPERIENCE, UNDERGRADUATE

ABSTRACT | This article stems from the inception of a doctoral study, wherein the research aims to analyze students' experiences in learning design within undergraduate Design courses. Motivated by global and design-related shifts and considering the challenge of teaching design in the current context of social and technological changes, the authors have conducted a systematic literature review to investigate the current state of knowledge in the field of design education. To this end, the research began by defining the research question, followed by the development of search strategies and, subsequently, the delineation of parameters for data collection across three different databases. Furthermore, the article presents the processes of information gathering, the outcomes derived from the applied filters, and the selected documents that best align with the research theme. Through the analyses conducted, it is understood that for the student's learning experience in design to be memorable and for design schools to produce professionals equipped for the challenges of contemporary society, it is imperative to contemplate new teaching models, skills to be acquired, and to explore future perspectives in design culture.

1. Introduction and Contextualization

One of the most crucial steps in academic research planning, according to Gil (2019), is constituted by literature review, which can be defined as a report on what has been published concerning the topic being researched to inform the reader about theoretical contributions and results of other studies conducted in the addressed area.

Lakatos and Marconi (2003) and Gil (2002) also address the importance of literature review as a fundamental step in building scientific knowledge, emphasizing the need for a systematic and rigorous approach in the analysis and interpretation of bibliographic sources.

Within the context of the Systematic Literature Review to be presented in this study, its execution period spans from November 2023 to January 2024, intending to investigate relevant themes for the research from various sources.

For this development, the research began by defining the research question, followed by the elaboration of search strategies, including a preliminary study to validate the search terms, as well as parameters to define sources and initiate data collection from databases gathering documents in the scientific field (Elsevier, 2024).

2. Development of Systematic Literature Review

The proposed research topic relates to Design, Emotion, and User Experience in educational and learning contexts. Sequentially, the PICO approach was utilized, which, according to Higgins and Green (2011), is a structured method responsible for organizing research questions into four main components:

- Population: Undergraduate students in Design courses;
- Intervention: Techniques, experience models, learning methods that prioritize experiences;
- Comparison: Traditional design teaching methods, models that do not emphasize experiences, teaching experience versus learning experiences;
- Outcome: Relationship of teaching models or experience reports discussing students' experience in learning design or creative activities in undergraduate design courses.

2.1 Search Strategies

For this Review, a preliminary search was initiated in English on the Google Scholar website (2024) to define and validate search terms and their combinations, which were those represented in Figure 1.

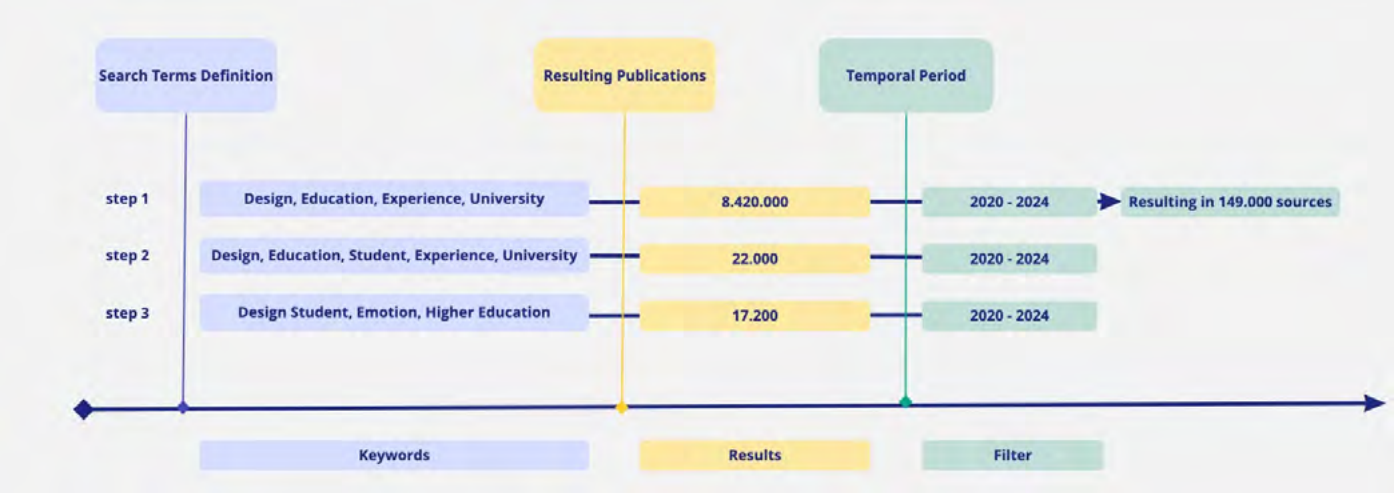

Figure 1. Representation of the three stages that made up the preliminary research.

Many of the results relate to the role of the teacher in these processes, discussing more teaching rather than learning, necessitating the use of a search term like "learning." Hence, a new search was defined with the descriptors listed below.

- "higher education," "learning," "design," "experience" - resulting in 49,200 sources. Generalization was observed due to the broad meaning of the term design, which yields results from various fields, including healthcare. In this regard, efforts were made to validate a new combination of terms.
- "higher education" and "experience learning design" - yielding a result of 34 articles, with topics more closely related to the area of interest of this research.

2.2 Search Terms

The construction of the search string was, therefore, based on the mentioned contextualization and validation, defining the following terms and their synonyms (Table 1).

Table 1. Defining search strings.

Descriptors	Synonyms
“higher education”	Education
	Educação
	High Education
	Universidade
	University
“experience learning design”	Aprendizagem de Projeto
	Experiência
	Experiência do estudante
	Learning design

Although the search terms were defined in English, to ensure a broader search considering the number of academic productions in this language, whether original or translated, synonyms in both English and Portuguese were also chosen.

These terms were used in Parsifal, a website that organizes information from Systematic Literature Reviews. According to its website, it assists in the identification, selection, and evaluation of systematic reviews, extracting, structuring, and providing information, as well as its methodological characteristics objectively (PARSIFAL, 2024).

For this systematic literature review, three databases were used, namely Portal de Periódicos Capes[1], Scopus[2], and Science Direct[3].

2.3 Inclusion and Exclusion Criteria

It was also necessary to define criteria for the inclusion and exclusion of publications to ensure that searches were in line with the research needs and that the collected sources met the expected quality for subsequent analysis. In this sense, the requirements are characterized as follows:

- Articles, book chapters, and case studies published from 2020 to the present moment (2024);
- Articles, book chapters, and case studies in Portuguese or English and related to the areas encompassed by this research: Design, Experience, Education.

On the other hand, publications will be excluded from further analysis if they:

- Are duplicates;
- Articles lacking abstract and/or keywords;
- Articles with unavailability of the work in its entirety;
- Articles showing no signs of relevance to the focus of this research identifiable from the title and keywords.

2.4 Identification, Selection, Eligibility, and Inclusion

The PRISMA protocol (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) is used as a reference, defined by Moher et al. (2009) as a set of guidelines aimed at improving transparency and quality in the development and presentation of systematic reviews, providing a detailed roadmap for reporting the essential elements of a systematic review, helping authors ensure the integrity and clarity of the research process.

Thus, following PRISMA recommendations, the results obtained from scientific databases are subjected to a flow of procedures segmented into four classifications, as described in the table below (Table 2), which relates stages and procedures:

[1] www.periodicos.capes.gov.br

[2] www.scopus.com

[3] www.sciencedirect.com

Table 2. Indexed electronic databases.

Phases	Procedures
Identification	Gathering results from each database
Selection	Exclusion of duplicate articles, outside the period of interest and that do not meet the inclusion and exclusion requirements based on the analysis of keywords, title and abstract
Assessment	Reading the introduction and conclusion of the selected articles, also considering the exclusion criteria
Synthesis and inclusion	Reading, in full, the articles selected based on the proposed quality criteria

Based on the defined search strategy and specified criteria, the results from the three listed databases provided a total of 3728 records for initial selection, comprising 11 records from the Portal de Periódicos Capes, 189 from Science Direct, and 3528 from Scopus. The Parsifal software was utilized for managing these records.

Through this review, 166 studies were accepted, necessitating a further review of their titles and abstracts, subsequently resulting in 60 records meeting the criteria established for the evaluation stage.

At this stage, these 60 documents underwent a review of their titles and abstracts, resulting in a total of 16 records for the fourth and final stage, Synthesis and Inclusion.

2.5 Synthesis and Inclusion of Results

From the 16 selected studies meeting the requirements presented for this Systematic Literature Review, they are classified into three different categories: studies closely related to the research area, studies related to the area but with a more generalist or less in-depth perspective on the research themes, and some texts that stimulate further investigation into what has been presented (especially concerning Participatory Design and Design Thinking). Additionally, articles classified as having a stronger connection with the criteria of the Systematic Literature Review provide more contributions to discussing the future of design education, not so much through students' experiences but towards rethinking some teaching criteria in the field.

3. Design Education: Discussion About Results and Future of the Field

The synthesis of the mentioned studies establishes significant connections, particularly in the category emphasizing core aspects of this research, enhancing understanding of undergraduate design learning experiences. Notably, Wakelam et al. (2020) highlight predictive analysis in small classes as foundational for effective teaching strategies.

Furthermore, Trimmer (2020) advocates for innovative curriculum development integrating design thinking and student-centered research, and Kaviani (2020) emphasizes curriculum design's meaningfulness and motivation through a phenomenological approach. Bigos & Michalik (2020) stress emotional competencies in entrepreneurial intentions, which are vital for socio-emotional

skill development in design students. Jivet et al.'s (2020) study promotes autonomy for effective learning, while Crowther & Briant's (2021) longitudinal research delves into factors affecting long-term student performance. These studies highlight the importance of multidisciplinary approaches in designing educational programs.

Wasson & Kirschner (2020) introduce European learning design approaches, while Blumenstein (2020) explores the synergy between learning analysis and design. Heggart & Dickson-Deane (2022) examine essential skills for learning designers, and Henriksen et al. (2021) explore creativity and risk-taking in design education, collectively deepening understanding of undergraduate design learning experiences. Bishop et al.'s (2021) comprehensive resource addresses instructional design topics beneficial for educators and researchers aiming to enhance educational practice.

Engelbertink et al. (2020) highlight the necessity of active collaboration between students and educators in design education, stressing the importance of involving students in the design process. Similarly, Tsai et al. (2023) investigate the impact of combining design thinking with constructivist learning on motivation and problem-solving abilities. These studies underscore the significance of student-centered approaches for stimulating learning environments. Integrating methodologies like design thinking and constructivism empowers educators to create dynamic learning environments that nurture practical skills and creativity among design students.

In the context of understanding the current state of design education, the authors discussed here delve into its concept, propose curricular changes, and envision the future of the field. Buchanan (2020), as interviewed by Frascara (2020), argues that education transcends mere skill training. It entails intellectual preparation for lifelong learning, fostering mental capacities to tackle new situations with ingenuity, imagination, and creativity.

Buchanan apud Frascara (2020) identifies the four dimensions of creativity as essential elements in design education: inventiveness, receptiveness to discovering new facts, innovativeness, and openness to intuition in perceiving principles and values that provide organization, coherence, and interdependencies in surrounding systems. Another seminal study in this discourse is Findeli's (2001), which reconceptualizes design education through theoretical, methodological, and ethical discussions, proposing an archetypal curriculum model comprising art, science, and technology components.

It is preliminarily concluded that doctoral research in this area necessitates examining various university models to understand their structures concerning student learning needs and contextual demands. These aspects also warrant further exploration to establish principles, guidelines, tools, and methods for their study, fostering the evolution of universities and undergraduates in a rapidly changing field. Furthermore, this discourse on the student experience in learning design enriches the understanding of design education's pivotal role in nurturing creative and innovative professionals. Reflecting on design practice and applying design principles in contemporary and future contexts are integral components of the educational process, equipping students to address the multifaceted challenges of the current market and society.

KEYWORDS | DATA VISUALISATION, CIVIC ENGAGEMENT, VERNACULAR DESIGN, ECO-FEEDBACK, BEHAVIOUR CHANGE

ABSTRACT | Studies have shown that data visualisations designed into eco-feedback technology have the persuasive capacity to change consumer habits that lead to significant financial and environmental consequences. There is, however, growing concern over their ethical, equitable, and psychological implications. This study looks at vernacular data visualisations — analogue representations of self-tracking data collectively designed by non-experts — and how they can be used as a bottom-up strategy for civic engagement and forming new habitual behaviours. Using consumer food waste as a case, this research was deployed as a nine-week, longitudinal, mixed-method study amongst working parents and their children in Australia (104 participants with a control group). Using theories in consumer behaviour psychology as a framework together with the literature in data physicalisation, play, and vernacular design, the participants were provided with a design probe that contained: 1) visual nudges and information demonstrating how to build food-saving habits and 2) a paper-based self-tracker to encode and share how they used the items in Part 1 using their own material and visual fluency. By triangulating the results through thematic, content, and paired samples frequency analysis, the results revealed that the group with access to the trackers was able to sustain newly formed habits for longer. Using visual metaphors like ninjas and sheep facilitated a deeper understanding of their unique household dynamics and instilled a sense of autonomy and accountability. This paper presents vernacular visualisations as democratic behaviour change interventions that have a place amidst their digital counterparts.

1. Introduction

The use of eco-feedback technology has become ubiquitous in Western households, with institutions providing consumers with digital self-tracking tools aimed at examining behaviours that can have both financial consequences and harmful impacts on the environment. For example, these apps and online tools[1] can track expiring food in the fridge and explain how much money, water, and energy is wasted resulting from disposing edible grocery items. These digital self-trackers use data visualisations — charts, graphs, and icons that transform abstract concepts into easily interpretable representations — as a primary means of persuasion (Dragicevic et al., 2020; Bohman, 2015). Several studies support the potential of these design-based interventions in expanding the capacity for self-knowledge, increasing awareness of social issues, and motivating individuals to adopt specific behaviours (Chalal et al., 2022; Lim et al., 2021; Tai et al., 2020; Kouroupetroglou et al., 2015; Normark & Tholander, 2015; Froehlich et al., 2010).

However, growing concern about the ethical implications of these quantitative trackers as a top-down initiative reveal that they can facilitate high levels of surveillance and extend regulatory control of authorities over the general public, resulting in a lack of agency in decision-making about one's own behaviours (Sanders, 2017). Furthermore, digital self-trackers can perpetuate existing social and economic disparities (Lifkova 2019). Requiring access to expensive technology and advanced levels of visual literacy, digital self-trackers can often exclude individuals from low-income households and children. Children, in particular, have the potential to benefit from understanding the mechanics of self-tracking as they have been found to be effective agents of collective behaviour change (Burrows, 2017; Robinson et al., 2011). Finally, digital self-tracking data visualisations can be an unreliable measure of lived experience. Referred to by Porter (2020, p.87) as 'technologies of trust,' over-reliance on data visualisations can arise from their impersonal, objective, authoritative appearance. Normative visualisation design practices that use geometric shapes can promote unhealthy self-scrutiny and fail to capture the complexities of everyday reality essential to understanding human behaviour (Snyder et al., 2019).

To address these issues, this study looks at an analogue, participatory approach to designing self-tracking data visualisations. Used in tandem with digital tools, this method aims to mitigate reductionist assessments of the self and unproductive behaviour changes like removing the pleasures of eating (van Dijk et al., 2015). Designed as a probe, this approach looks at the intersection between data physicalisation, play, and vernacular design and grounds the research on theories in consumer behaviour. Data physicalisation, a practice that encodes data through bespoke, meaningful objects, can engage designers and audiences in novel ways by encouraging reflection on behaviour (Khot et al., 2020; Lupton, 2017; Botros et al. 2016; Nissen & Bowers, 2015). These often-idiosyncratic forms leverage on the *eudaimonic* function of play, which suggests that even if play is not tangibly productive, it can elicit high levels of creative, independent behaviour (Sharp & Thomas, 2019). Theories in play are also closely linked to vernacular approaches to design, where non-experts rely on their intuitive visual fluency and access to materials instead of standards set by existing systems of power to address specific pain points (Hearst & Rosner, 2008).

Food waste coming from working parents and their children was used as a case in this research. Also known as Over Providers, this group was identified as being the largest contributor to the $36.6 billion dollar per year food waste problem in Australia (Karunasena & Pearson, 2022). Aiming to answer the question, "How can designing vernacular data visualisations in self-trackers influence consumer food-wasting habitual behaviours?" this paper critically examines theories in consumer behaviour psychology to provide a theoretical framework for designing the probe and evaluating the results. It then triangulates results to provide a new framework for designers to use in creating democratic interventions that develop environmentally- and mentally-beneficial habitual behaviours.

2. Theoretical Framework

Grounding the research in behaviour change theory was critical for designing effective, long-lasting habitual behaviour change interventions. Using principles from Willmott & Rundle-Thiele's (2022) TITE process to guide theory selection (T), iterative schematisation (I), testing (T), and explicit reporting (E), three consumer behaviour models were critiqued and selected. The Theory of Planned Behaviour or TBP (Ajzen, 1991) was valuable in explaining how perceived behavioural control (an internal assessment of one's own ability to perform a skill) and subjective norms (the extent to which social pressure from people of importance can influence behaviour) could lead to behavioural intention. However, the TBP did not account for affective factors nor contextual cues that trigger habitual responses. The Habit Alteration Model, or HAM (Pinder et al., 2018), was also considered useful in defining habits and understanding the stages of context-response links. While the model was able to sufficiently pinpoint where self-tracking feedback could be beneficial, it focuses largely on actions at a given point in time rather than wider contexts. Lastly, the Motivation, Opportunity, and Ability or MOA framework (Binney et al., 2006) was also considered for its strength in identifying situational factors (Opportunity) and articulating the difference between external and internal motivation. While it provided a pragmatic overview of behaviour formation, the MOA does not consider whether behaviour needs to be performed multiple times or be part of a broader set to provide benefit (Parkinson et al., 2016). It was, therefore, essential to use a combination of the three theories in understanding how design can influence habitual behaviour (Figure 1).

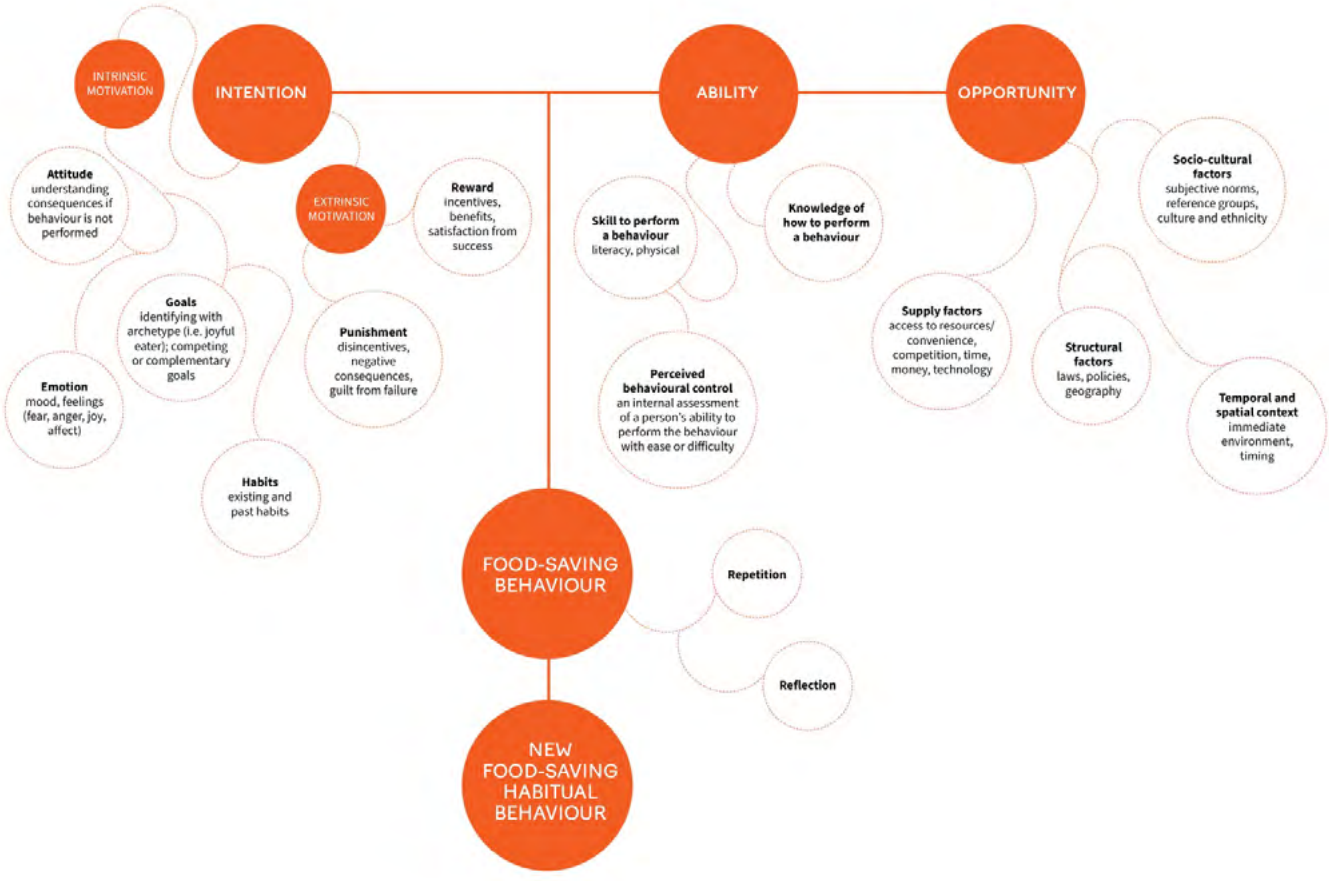

Figure 1. Framework amalgamated from the Theory of Planned Behaviour (Ajzen, 1991), the Habit Alteration Model (Pinder et al., 2018), and Motivation, Ability, and Opportunity Framework (Binney et al., 2006).

3. Methods

In order to effectively understand and measure habitual behaviour around household food waste, this study used a longitudinal, mixed-method approach that involved triangulating three research instruments:

1. A two-part design probe (Figure 2): Part 1 consisted of playful prompts2 to increase abilities, shape attitudes, and provide opportunities to enact the top three food-saving behaviours endorsed by the End Food Waste Cooperative Research Centre: eat leftovers, store food properly and prepare the right quantities of food (Ananda et al., 2021). Part 2 consisted of paper-based habit trackers deployed in participants' homes. A nine-week deployment period was chosen based on empirical evidence demonstrating that habitual behaviours take 66 days to form (Tull, 2022; Lally et al., 2010). Allowing participants to design, reflect on, and share bespoke data representations of how they used items in Part 1, the self-trackers aimed to enable social influence, reflection, and repetition of behaviours. The results were analysed through ethnographic content analysis.

2. Surveys: Distributed at three points of measurement using 5-point Likert scales, these assessed participants' frequency of performing food-saving behaviours before the probe, immediately after the probe, and one month after the probe through a paired samples frequency test.

3. Semi-structured interviews: These two online household interviews gathered qualitative data on participants' initial motivation levels, clarified survey and probe results, and explored the reasons behind the design of their chosen encoding system. Transcripts were analysed through thematic analysis.

[2] This included a roll of Use it Up tape to mark a section of their fridge or pantry where food needed to be used up, googly eye stickers to mark individual items of food in the fridge, freezer, or pantry that needed to be used up, making them more visible, the Use it All book where participants could find suggestions on ingredient combinations and maximising their use, and a meal planner and shopping list that participants could share within the household. The planner also included tips on getting children involved in meal planning and preparation, information on food waste, and advice from recruited role models.

Figure 2. Items in the design probe.

All 104 participants were recruited using snowball sampling and divided into three groups:

- Group A: Over Providers[3] with self-trackers (N=12 households, 46 participants)
- Group B: Over providers without trackers (N=12 households, 46 participants)
- Group C: Considerate Planners[4] (N=6 households, 12 participants)

The participants in groups A and C posted the trackers back to the researcher via a post office box every three weeks. The trackers were then scanned, de-identified, and uploaded to a shared Miro board for each household to view. The experiment group (Group A) was given parts 1 and 2, while the control group (Group B) was given only part 1. Group C was also given parts 1 and 2 to serve as social influencers to the experiment group.

4. Results and Discussion

4.1 The Self-Tracker Led to the Formation of New Food-Saving Habitual Behaviour

The quantitative analysis of the paired samples frequency test showed that both Groups A and B increased the number of times in which they performed food-saving behaviours. However, Group A showed that they were able to sustain or increase the frequency of the behaviours a month after. Only the results for "Almost all the time (over 90%)" from the survey were considered as this points to behaviours performed regularly, which is consistent with the definition of habitual behaviour as repeated, default responses in a given context (Wood & Runger, 2016). Figure 3 shows the frequency graph of "Behaviour 1: Plan meals to be cooked for a set number of days", illustrating that less households in Group B were able to maintain this behaviour a month after the probe was deployed.

[3] Over Providers, typically represented by working parents and their children, have the highest weekly food waste (6.33kg). While they plan their food shopping, they tend to purchase and cook more than is needed and often negotiate the unpredictable tastes and appetites of their children (Karunasena & Pearson, 2022, p.7).

[4] Considerate Planners, best represented by older couple-based households, many with children that no longer live at home. This segment engages in waste reduction behaviours across planning, shopping and cooking practices and show pride in being organised (Karunasena & Pearson, 2022, p.7).

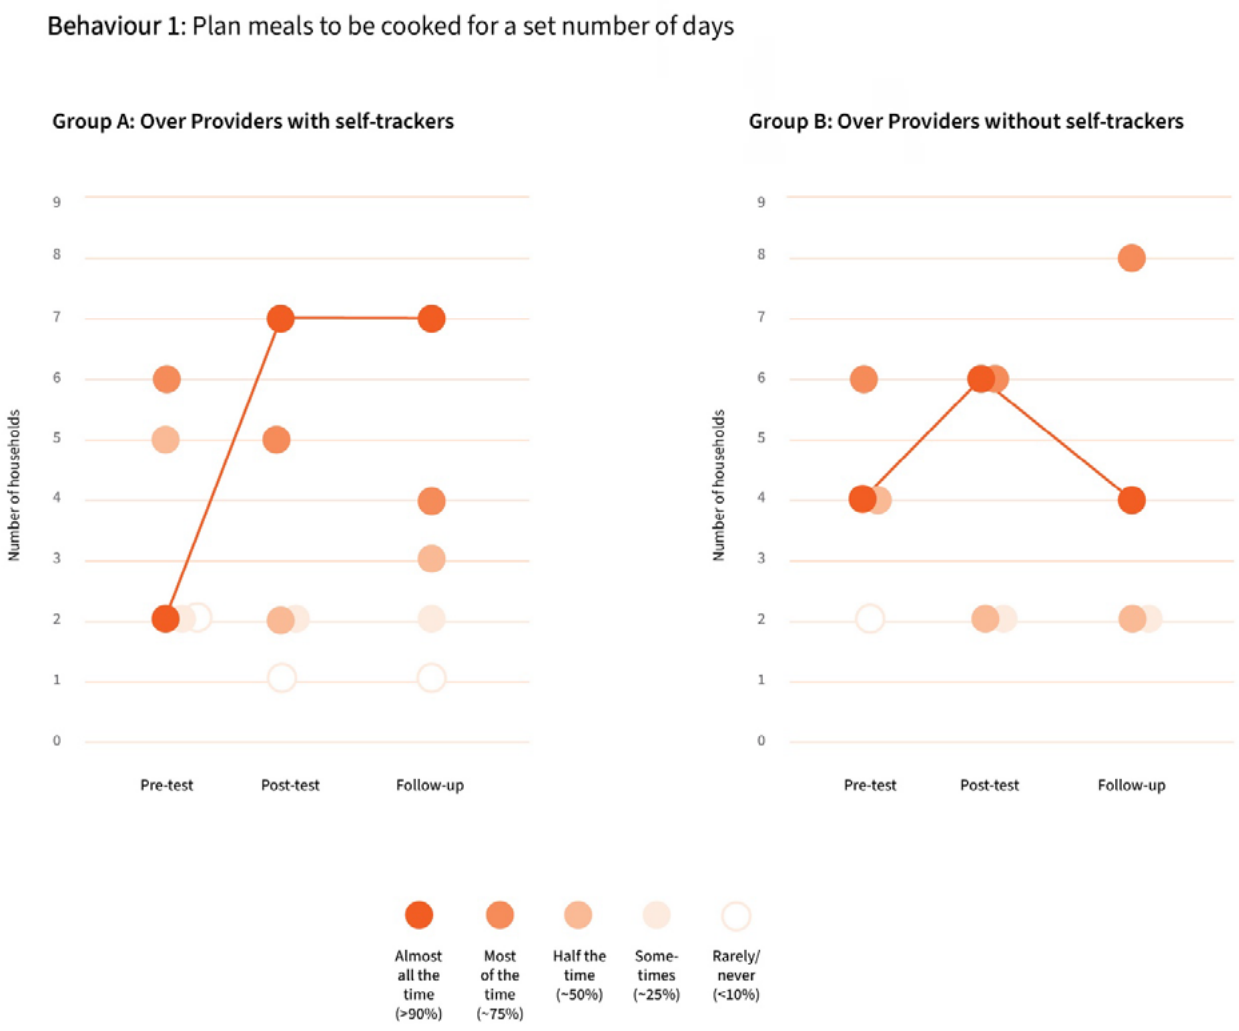

Figure 3. Paired samples frequency comparison of meal planning behaviour between Groups A and B.

4.2 The Self-Tracker Instilled a Sense of Autonomy and Accountability

The analysis of the probe responses showed how a vernacular approach led to having a sense of autonomy, with two-thirds of the households choosing to stray from conventional graphs and charts (Figure 4). This sense of autonomy can be attributed to the playful tracker design and the eudaimonic function of play to support agency, allowing people to choose, act, and express themselves in ways that were meaningful to them (Altarriba-Bertran et al., 2020).

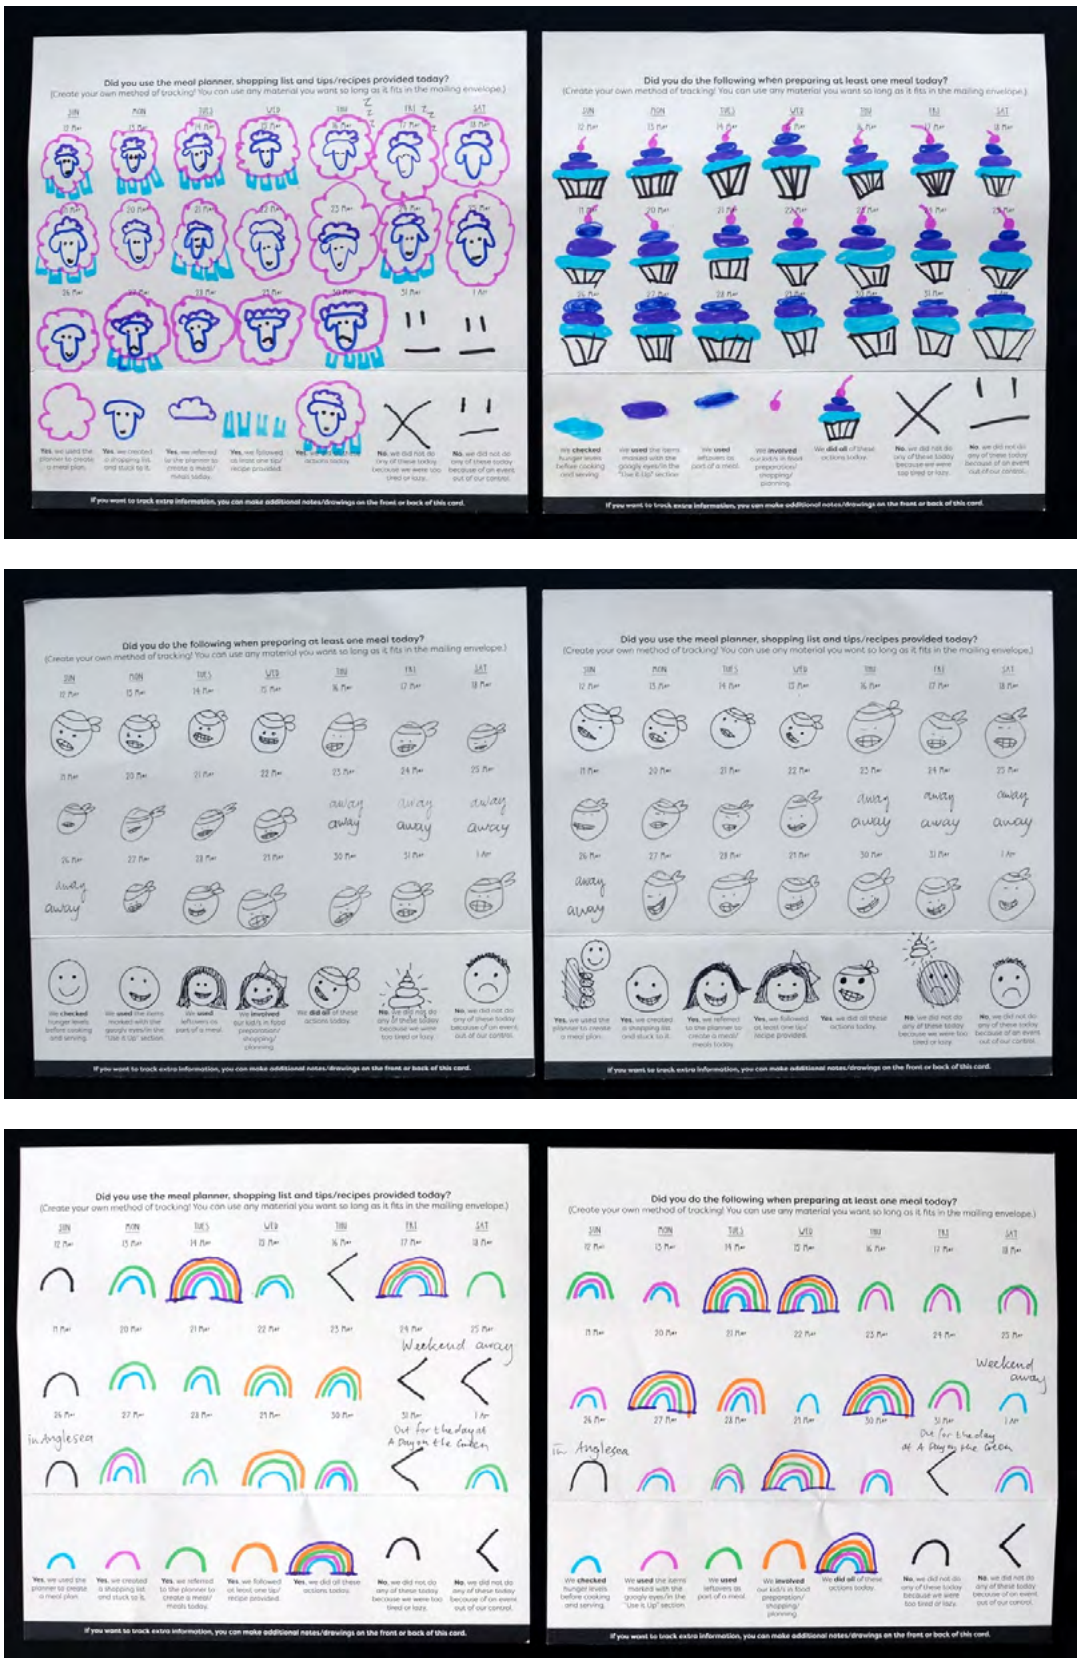

Figure 4. A sample of participants' visual representations of food-saving tracking behaviours.

The thematic analysis of the semi-structured interviews revealed that using personalised visual metaphors also led to a deeper understanding the effort required by individual family members in collectively reducing food waste. Through familiar figures like cupcakes, ninjas, sheep, and rainbows, participants were able to map their own behaviours to properties of these items. For example, a ninja was chosen by one of the children in an Over Provider household because of a ninja's need to make deliberate, precise actions to

achieve a mission — an apt representation of how many seemingly small, everyday actions lead to household food waste reduction (van Geffen et al., 2020). Using one's own visual abilities is not just a performative act of reproduction but involves the construction and transformation of meaning, resulting in emotional, physical, and cognitive investment (Sanders & Stappers 2014). These bespoke representations allowed participants to see themselves as creators of their own stories and created deeper connections with the data.

Participants also felt responsible for their own actions instead of being dictated to by an institution:

> "I felt more responsible and was called out more because they were our own trackers and creations." (Over Provider 12)

Conversely, families belonging to Group B expressed that they would have liked to have more visual reminders to hold them accountable for their actions. This finding is consistent with the concept of self-determination (Binney et al., 2006), an innate human proclivity to be the agents of their own behaviour.

It is also worth noting that participants reported that emotions such as enjoyment, enthusiasm, guilt, and worry from recording their behaviours through a vernacular approach were factors that engaged them in the nine-week study. Additionally, the predominant use of anthropomorphism (i.e., smiley faces), as opposed to food-related items, implies that behaviours are largely driven by emotion and feelings rather than what the behaviour is about. This confirms Wang et al.'s (2019) argument that emotional or affective engagement is key in determining the value of physical data visualisation: affect can enable data-driven objects to rate higher in terms of user experience (more pleasurable and meaningful) and can directly influence motivations, actions, and learning.

4.3 The Self-Tracker Played a Role in External Motivation

Scrutinising the results against the theoretical framework revealed that socio-cultural factors and spatiotemporal environments acted as external motivators rather than macro-level social factors. Socio-cultural factors had a closer relationship to emotions associated with rewards and punishment (e.g., participants reported feelings of pride and satisfaction from using the entire vegetable because it was 'doing the right thing' according to cultural norms). The immediate environment (e.g., seeing the tracker on the fridge in the kitchen while cooking) and the tracker's physical format allowed for behaviour to happen in personal contexts, instigating conversations about the causes and consequences of food waste between parents and children and enabling children to participate without the use of digital devices.

Based on the results, the theoretical framework was modified, and a new design framework for habitual behaviour formation was presented (Figure 5).

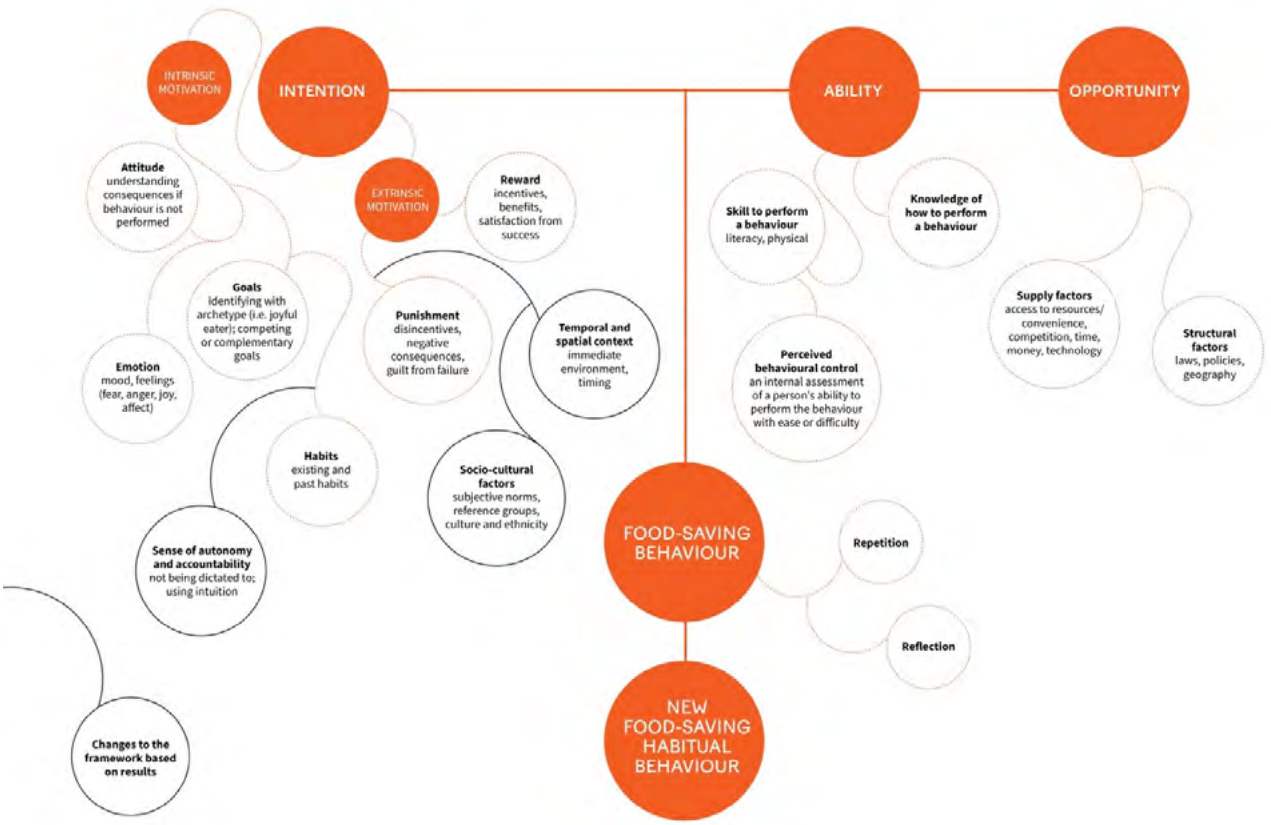

Figure 5. A new design framework for habitual behaviour formation.

5. Conclusion

Designing data visualisations in self-trackers using a vernacular approach had a significant capacity to influence habitual food-wasting behaviours in households. While the study could be implemented across a broader population for more robust statistical results, it strongly suggests that behaviour change theory is fundamental for designers to construct interventions, unpack active ingredients and identify common factors contributing to observed outcomes (Willmott & Rundle-Thiele, 2022). This research concludes that vernacular visualisations can augment existing frameworks and enhance the potential of data visualisation design to increase motivation, allow access to broader audiences, instigate conversation, and enable agency.

KEYWORDS | TEXTILE WASTE, NEOMATERIAL, TEXTILE RECYCLING, MATERIALS DESIGN, PROCESS INNOVATION

ABSTRACT | The textile sector represents one of the most important industrial supply chains in Italian manufacturing and, at the same time, is characterized by a significant ecological footprint.

In particular, end-of-life management of products is a significant challenge, both because of the textile composition composed of mixtures of synthetic and natural fibers - which hinders recycling operations - and because of the increasing volumes of material given the dynamics of fast fashion and changing production patterns. Currently, only 1 percent of textiles produced globally are reused, and the percentage of waste is expected to grow.

The increasing visibility of the problem has brought about a change in the perception of the fate of waste. The concept of waste today has taken on a positive connotation, being viewed no longer just as an inert object to be discarded but as a resource. Given the paradigm shift that sees waste as a new resource, it is crucial to outline a design framework that paves the way for a significant change of productive, economic, environmental, and cultural scope in the use of material resources. This approach becomes crucial to turn waste abundance into a design opportunity. The purpose of the research is to explore the potential applications of post-consumer textile waste, focusing mainly on textiles with mixed fiber composition and those whose material is difficult to identify due to the lack of labels, thus preventing the recycling process.

The objective is to study, test, and define a new process of producing neomaterials from post-consumer textile waste in mixed fibers and, from their qualitative and quantitative properties, define the most suitable application.

The research is supported by the main case study, Insieme Cooperativa Sociale of Vicenza. This entity (ex. L.381/91) is a non-profit organization (Onlus) that involves more than one hundred workers in a single project, giving a second chance to people and things that do not have one.

The research is structured into a desk research part and an applied research part. The former focuses on the analysis of the textile sector in the age of circularity, post-consumer waste management, and analysis of the relevant regulatory and economic framework. Important is the mapping of national and international case studies, which include all those entities operating in the textile waste and scrap recycling sector. The second phase focuses on the definition and application of the experimental methodology and is structured into the following phases: waste selection and sampling, material preparation and fraying, testing of material specimens, validation of the process, and analysis of qualitative and quantitative properties of the samples obtained.

The added value of the research will be precisely the promotion of new recovery actions that are struggling to emerge today, demonstrating the potentials of textile waste metamorphoses, intrinsic peculiarities, and otherwise little exploited properties. The research results can be used to devise targeted strategies to promote the application and dissemination of the developed process along with the related results obtained. This effort can help promote and increase the adoption of circular design and ecological transition principles within the area's manufacturing companies.

1. The Textile Industry in the Era of Circularity: from Production to Waste Management

The textile sector represents one of the most important industrial supply chains in Italian manufacturing and, at the same time, has a significant ecological footprint. The European Commission's Circular Economy Action Plan states that the textile sector is the fourth largest user of raw materials and water (after food, construction, and transport) and the fifth largest emitter of greenhouse gases, estimated to account for 10 percent of total global emissions (European Environment Agency [EEA], 2019). In addition, textile production has nearly doubled in the years between 2000 and 2015 (European Commission, 2020), and apparel consumption is estimated to grow 63 percent by 2030, from the current 62 million to 102 million tons (EEA, 2022). Many of these products, unsold in stores or worn only a few times, end up being thrown into illegal landfills, incinerated, or put into other routes (de Castro, 2021).
The problem extends to end-of-life management of products: the combination of increasing production and shortening the life cycle of garments has generated an exponential increase in textile waste. Currently, only 1 percent of globally produced textile materials are reused (Ellen MacArthur Foundation [EMF], 2017). The waste rate is set to grow: gross waste volumes are projected to increase to 8.5-9 million tons by 2030 due to increased consumption and population growth (Cobbing et al., 2022). In addition, due to some technological gaps, recycling operations are further complex for products composed of a mix of fibers.

2. From Vicious to Virtuous Circles: Waste as a Resource

These wastes constitute a fundamental and complex part of the life cycle of textile products and, at the same time, continue to be a pervasive element. The increasing visibility of the problem has brought about a change in the perception of their fate. The concept of waste has acquired a positive connotation, being considered no longer just as an inert object to get rid of but as a resource. This vision change allows the transition from a vicious circle to a virtuous one: waste and refuse from one production or consumption cycle become inputs for another process, different or similar to the previous one (Viale, 1994, p. 108). The outcome of this transformation is a rethinking of the cardinal positions of resources and waste as the starting and ending points of economic and production processes.
Consequently, it is essential to outline a design framework that paves the way for a significant change of productive, economic, environmental, and cultural significance in the use of material resources. This approach becomes crucial to turn waste abundance into a design opportunity to prevent a situation in which the waste issue can assume apocalyptic dimensions (Armiero, 2021).

3. Research Objectives and Methodology

Textiles today are the subject of great interest in recycling processes, motivated by significant environmental, social, and legislative pressures. In line with contemporary needs, the research aims to explore the potential applications of post-consumer textile waste, focusing mainly on textiles with mixed fiber composition and those whose material is challenging to identify due to the lack of labels, thus impeding the recycling process. The objective is to study, test, and define a new process of producing neomaterials from post-consumer textile waste in mixed fibers and, from their qualitative and quantitative attributes, determine the most suitable application.
The research is supported by the main case study, Insieme Cooperativa Sociale of Vicenza, a company that co-funded the doctoral fellowship. This entity (ex. L.381/91) is a Non-Profit Organization of Social Utility (Onlus) that involves more than one hundred workers in a single plan: to give a second chance to people and things that do not have one. Insieme Cooperativa Sociale collects, in the territory of Vicenza, 300 tons of textile inputs each year, specifically 100 tons per year of used garments collected in 18 municipalities and 200 tons of garments donated by citizens. Of this material, 65 percent manages to be recovered through reuse, recycling, or downcycling operations, while 35 percent becomes final waste. For Insieme

Cooperativa Sociale, it is essential to intervene in end-of-life waste management in such a way as to optimize all resources by implementing strategies aimed at maximizing the value of the material at each stage of its life cycle.
The research consists of two distinct parts: a desk research phase and another dedicated to applied research. The desk research focuses mainly on the investigation of the textile sector in the age of circularity, - assessing its environmental and socio-economic impacts - on post-consumer waste management, and the analysis of the relevant regulatory and economic framework. Of particular importance in this phase is the mapping of case studies at the national and international level, which include all those entities operating in the textile waste and scrap recycling sector.

The second phase, applied research, focuses on establishing the experimental methodology. The latter is framed in the following steps:

- **selection and sampling of waste**, starting with a big bag and sorted by (a) the presence or absence of the label and then (b) by prevailing material type;
- **preparation of the material and fraying**, the waste is stripped of non-textile components that could damage the machinery (buttons, zippers, various inserts) and subjected to a fraying reduction operation using the machine named "fraying machine";
- **experimentation of material specimens**, favoring treatments of a mechanical nature, to be replicated for each distinct group of frayed material and different reference batches;
- **validation of the process**, in the case of performing specimens, the process will have to be repeated to be validated;
- **analysis of qualitative and quantitative properties** of the material to define the most suitable application scenario.

4. Existing and Emerging Entities Engaging in Textile Waste Recycling

The reuse of textile scraps and waste has ancient roots: evidence of these practices dates back to the period between 1500 B.C. and 1500 A.D., where widespread recycling and reuse practices are traced not only for clothing but also for other purposes such as pots and pans, bricks, jewelry, insulation, etc. (Grömer, 2017). On the Italian territory, one of the most relevant examples is that of the textile district of Prato, which has been recycling wool from used clothes for more than 150 years - when these were called "rags" and recycling had no positive - meaning boasts numerous realities involved in studying, recycling or reusing textile material.
Today, these traditions are adapting to evolving textile composition, which is becoming more diverse, leading to innovations in recycling processes. This diversification has made it possible to identify three distinct approaches in recycling practices, influenced by the type of fiber input and output produced.
The analysis of the entities, divided into the three approaches, is intended to provide an overview of the promising emerging, productively diversified reality of companies or research groups that have reached different stages of development but are still relevant to the study.

4.1 Single Input Fibers that Remain Single

"Fiber-to-fiber" recycling processes are frequently marked by using mechanical practices. In conformity with ISO 5157:2023, such recycling processes are usually based on physical forces that can be used in isolation to recycle fabrics or fibers or as pre-processing for other recycling processes.
Manteco, a leading company in the Prato district, has launched MWool, a line of regenerated wool fabrics that meets the same stringent quality standards as virgin wool. Similarly, Beste, also in the Prato scene, is dedicated to regenerating natural fibers to reintegrate them into the fashion and related sectors. In Spain, Recover Fiber, based in Alicante, excels in processing cotton fibers from post-industrial and pre/post-consumer sources. The Recover™ recycling processes convert textile waste into high-quality recycled cotton fibers and blends, providing an end-to-end closed-loop solution.

4.2 Mixed Input Fibers that Return a Single

The case studies presented share an approach to chemical recycling, defined by ISO 5157:2023 as a process that uses chemical dissolution or chemical reactions to recycle polymers or monomers. A prime example is Renewcell, based in Sweden, which has introduced Circulose. Through the manipulation of clothing, Renewcell extracts cellulose dries it, and presses it into sheets, which are then processed into new textile fibers by third-party companies. Similarly, Infinite Fiber, based in Finland, has patented Infinna, a 100 percent material from post-consumer textiles, with at least 88 percent cotton, fully recycled and recyclable. The process of obtaining Infinna uses cellulose from fabrics, eliminating other matter, generating a virgin fiber that is similar to cotton and completely biodegradable.

4.3 Mixed Input Fibers that Remain Mixed

The case studies presented here address the complex challenge of recycling mixed fibers composed of post-consumer natural and synthetic materials. In these situations, the output does not belong in the textile sector because of the inferior material quality but finds innovative applications in other sectors. A significant example is Paris-based FabBrick, which uses patented technology to transform textile waste into semi-finished or finished products using a natural resin. In Campi Bisenzio, near Firenze, Manifattura Maiano converts textile scraps and industrial waste into thermoacoustic panels, which are then sanitized without water, chemicals, or adhesives. If the product is free of contamination, it can be fully recovered for recycling or reuse. In Ebeltoft, Denmark, Kvadrat stands out for processing post-consumer wool and cotton into panels and felt used as vertical wall coverings or as tabletops (Textile Tabletop). The felts, composed mainly of industrial wool waste and thermoplastic binder, are produced without the use of any artificial dyes or chemicals, exhibiting variations in color and fiber arrangement from batch to batch.

Table 1. Classification of case studies by type of fiber input, type of waste, output, and recycling.

Case study	Classification	Type of waste	Type of recycling	Website
Manteco (Italy)	Single input fiber that return single	Post-industrial, post-consumer	Mechanical	manteco.com
Beste (Italy)	Single input fiber that return single	Post-industrial, pre-consumer	Mechanical	beste.it
Recover Fiber (Spain)	Single input fiber that return single	Post-industrial, pre-consumer, post-consumer	Mechanical	recoverfiber.com
Renewcell (Sweden)	Mixed input fiber that return single	Post-industrial, post-consumer	Chemical	circulo.se/en/
Infinited Fiber (Finland)	Mixed input fiber that return single	Post-consumer	Mechanical, chemical	infinitedfiber.com
FabBrick (France)	Mixed input fiber that remain mixed	Pre-consumer, post-consumer	Experimental	fab-brick.com
Manifattura Maiano (Italy)	Mixed input fibers that remained mixed	Post-industrial, post-consumer	Mechanical	maiano.it
Kvadrat (Denmark)	Mixed input fibers that remained fibers	Post-industrial, post-consumer	Experimental	kvadrat.dk

5. Initial Results, Next Step, and Conclusion

Although virtuous examples emerge of realities operating in the sector, recycling - which starts from an upstream rethinking since separate collections - especially for post-consumer, remains a segment of the textile value chain to be built almost from scratch (Berardi et al., 2023). From the analysis of the case studies, three different approaches in textile recycling practices were intercepted, which change according to the type of fiber inputs and outputs obtained, namely:

- Output composed of **single fiber inputs that remain single**, e.g., a material consisting of a single fiber, which is processed, often mechanically, to become mono-fiber yarn again;
- Output made up of **mixed input fibers that return single**, e.g., a material composed of polyester/cotton, which is processed, often chemically, to achieve monomer or polymer dissolution;
- Output composed of **mixed input fibers that remain mixed**, e.g., materials consisting of a fiber mix, often of unknown origin, that is processed mechanically to obtain semi-finished products composed of the same original fiber mix.

The initial analysis shows that recycling materials composed of a mixture of fibers is still an unresolved challenge. However, this is attributable to the lack of advanced technologies on the market and the tendency to process only specific types of fibers, even when present in blends. In an attempt to provide an answer to the problem, the applied research part has started.
Specifically, the first phase included the sorting and sampling of waste from an initial starting lot. These wastes were divided, at first, between labeled and unlabeled garments, and these wastes, at a later stage, were divided by prevailing fiber type, i.e., into (i) mixed fiber textile material with wool percentage >60%; (ii) mixed fiber textile material with synthetic fiber percentage >60%; (iii) mixed fiber textile material with cotton percentage >60%. The unlabeled textile material was not included in one of the described categories because the type of fibers could not be understood, but it will also be processed in the next stages of experimentation. The second stage involved the removal of non-textile components from the garments, such as buttons, zippers, and various applications (which would damage the machinery). Next, the waste was frayed by groups, as per the subdivision described, using the fraying machine on Cooperativa's premises. Once all the necessary frayed material has been obtained, the next step will be the production of neomaterial samples, using technologies and processes either specific to the textile sector or from other sectors. The goal is to draw inspiration also from entirely different contexts to address the problem at issue in an innovative way. The added value of the research will be precisely the promotion of new recovery actions that are struggling to emerge today, demonstrating the potentials of textile waste metamorphoses, intrinsic peculiarities, and otherwise little exploited properties. The research results can be used to develop targeted strategies to promote the application and dissemination of the developed process along with the related results obtained. This effort can help promote and increase the adoption of circular design and ecological transition principles within the area's manufacturing companies.

* bianca.chiti@unifi.it

DOI: 10.63442/PPBY1614

KEYWORDS | CRAFT-DRIVEN INNOVATION, KNOW-HOW, MADE IN ITALY, KNOWLEDGE SHARING, OPEN INNOVATION

ABSTRACT | This industrial PhD. research, co-funded by industry, aims to highlight the potential arising from the integration between innovative technological processes and traditional manual techniques, transmitting know-how within the new product development of the upholstered furniture sector high-end, with a focus on small and medium-sized enterprises (SMEs) of the “Made in Italy.”

Simultaneously, the value of Open Innovation is underlined, hence the collaboration between the research world and the enterprise and the role of design as a mediator between this bidirectional flow of knowledge. Today, Italian manufacturing SMEs face complex and interconnected challenges exacerbated by environmental, economic, and social crises. In this context, synergies such as those described above are strategic tools for achieving sustainable innovation and enhancing the “Made in Italy” value.

The scientific literature supporting the contribution includes various research areas, such as the role of design in innovation, the craft-driven innovation approach, and the concept of innovation through tradition. Moreover, different ways of adopting technological innovations are explored, both in production phases and in dissemination within new product development.

In this phase, the research is based on User Research, exploring the co-financing company and its surrounding context to define specific business needs. Subsequent adoption of additional methodologies is planned to define the proposed research trajectories and achieve a pilot project to be tested in the host company. This study contributes to the scientific landscape by enriching the surrounding industrial field, validating the hypothesis that collaboration between digital and artisanal skills and between the research and business worlds represents a significant potential for the future of the sector.

1. Introduction

Today, industrial realities face global challenges where issues are increasingly complex and interconnected. Design, as a discipline, has always sought new ways to tackle these complexities and is now more involved in these major transformations than ever before. (Dorst, 2019; Fondazione Symbola, 2023)
These challenges, resulting from market developments, mass production, and environmental, economic, and social crises, severely test manufacturing companies, specifically the small and medium-sized enterprises (SMEs) of the "Made in Italy." (Assolombarda, 2021)
For instance, one of the models that many countries around the world are leaning towards today is driven by a market economy and a mass consumption society. (Brocchi, 2022)
In the above context, to maintain competitiveness and add value, the "Made in Italy," although associated with prestige, quality, artisanal innovation, and "know-how," must also be synonymous with circularity and sustainability. (Barbaritano, Bravi & Savelli, 2019)
Regarding these strategies, and specifically a reconsideration of production paradigms, SMEs, being aware that they cannot solely rely on their internal Research and Development expertise, are expanding their vision to allow external actors such as Universities to permeate their boundaries, adopting the Open Innovation (OI) approach. (Chesbrough, 2003; de las Heras-Rosas & Herrera, 2021)
These exchanges of bidirectional knowledge flows require an intermediary, namely the figure of the designer, who, as a mediator of complexity, allows for the construction of a simplified model of reality, observing and utilizing other disciplines as project inputs. (Germak, 2008)
This highlights a fundamental approach for the current research based on interdisciplinarity and cooperation, where design is defined as a tool to connect different actors in innovation (Magistretti et al., 2020)
The general objective of the research is to identify points of contact between the development of advanced technologies and the world of artisanal experience, exploring how this traditional and ancient knowledge contributes to new product development (NPD) to bring innovation within manufacturing enterprises.
The project was funded by EDRA S.p.A, an Italian family-owned company based in the province of Pisa, specializing in the creation of high-end upholstered furniture. EDRA employs both industrial machinery and manual techniques. This adoption constitutes specific know-how that is both passed down internally and developed together with external collaborators. The company's supply chain is mainly confined to the Tuscan territory and consists of long-standing relationships. Thanks to these relationships, EDRA develops innovative technologies and methodologies often subject to patents and thus represents a potential case study of innovation in the "Made in Italy" and the context of Italian family businesses. Being a family business, it is even more interesting, based on the existing literature, to investigate how know-how is strategic in innovation. (De Massis, et al., 2016).
Therefore, such innovation must not be an end in itself but must be meaningful with social and environmental repercussions. The present research thus focuses on re-evaluating the importance of the hand industry, with its risk workmanship (Pye, 1968) and the concept of "Craft Driven Innovation" (CDI) (Veliz Reyes et al., 2019), which combines craft skills and learning through learning by making, implementing the most up-to-date technological components. These approaches are reflected today in the figure of a contemporary craftsman who adopts technology to support traditional practices. (Micelli, 2011)
According to De Massis et al. (2016), the main area of "Innovation Through Tradition," based on the "Know-How" and historical-cultural tradition, is considered a useful strategy to bring quality and innovation.

2. Literature Review

The literature on the distinctive role of the design discipline in stimulating innovation is extensive, and different ways of innovating through design are addressed based on the drive adopted, such as Design Thinking or Design Driven Innovation. A further perspective on the role of design in knowledge acquisition emerges from an analysis of the literature on Open Innovation. (Lambert, & Flood, 2017)
Indeed, it has been emphasized how the involvement of design and researchers within companies can help

imagine future scenarios to meet current challenges. (Magistretti, et al., 2020) In this context, for example, the European Commission (policy no. 3, 2021, Industry 5.0 A Transformative Vision For Europe) suggests shifting from a scenario based on overproduction (Industry 4.0) to an environmentally and socially sustainable one defined as Industry 5.0. (European Commission, 2021) Furthermore, the 2030 Agenda promotes technological development, research, and innovation, recognizing culture and creativity as drivers of sustainable development. (European Commission, 2022) To foster the relationship between enterprises and research entities, there are actions guided by research projects with objectives like those outlined in the National Recovery and Resilience Plan (PNRR), particularly within Mission 4: Education and Research "M4C2" - from research to enterprises - "Strengthening research and the dissemination of innovative models for basic applied research conducted in synergy between universities and companies." (Italian Government, 2021)

Beyond the main contributions concerning design, it is relevant to explore the literature on traditional knowledge and its relationship to innovation. Regarding this phenomenon, numerous studies have revealed the role of the so-called innovation strategy through tradition, through the "Innovation Through Tradition" approach (De Massis et al., 2016), where the influence of knowledge maturity on the value of innovation is analyzed, (Petruzzelli, Ardito & Savino, 2018) and tradition is considered as an accumulation of know-how, contributing to the identity formation of individuals, organisations, and territories. (Magistretti, et al., 2020)
The "Computing Craft" study (3D printing for architectural, structural elements in clay, robotically supported) is a project that explores the CDI approach and shows how craftsmanship allows the identification of innovative approaches to robotic manufacturing in architecture, thanks to its ability to understand and experiment with materials. (Veliz Reyes et al., 2019)
Similarly, the DefeXtiles research project (3D printing quasi-woven textiles via underextrusion) exemplifies the proposed CDI approach, where underextrusion, a technological gap, can be exploited to quickly print thin and flexible textiles. This approach reflects how, within NPD, a craftsperson's attitude and mindset towards technology can lead to significant and radical innovation. (Forman, et al., 2020)
Considering manual techniques as an element of inspiration is not the only aspect addressed in this research. Indeed, biology-inspired design uses analogies with biological systems to achieve solutions for sustainable development. (Helms, Vattam & Goel, 2009)
The literature on design sciences from a project perspective indeed presents numerous bio-inspired design case studies, such as the "Biomimicry Chair" project - 3D Printed Soft Seat, Lilian van Daal, 2014. In response to traditional upholstered furniture, impactful in production and disposal, this mono-material product in nylon, inspired by the structure of plant cells, utilizes additive manufacturing as the sole production technique, where varying local structures achieve different properties to meet the requirements of different elements, such as legs or seating. (Sauerwein, et al., 2019)
This approach is reflected in Hybrid Design, which allows the creation of hybrid artifacts halfway between nature and artifice, where the design is inspired not only by nature but by its conception of logic, and thus interdisciplinarity is fundamental. (Langella, 2021)
As diverse skills are required, communication challenges arise, highlighting once again the importance of the designer's role as a mediator of knowledge. (Germak, 2008)
Craftsmanship is primarily about tools as well as materials, and digital tools are transforming the way things are made, where they are made, and how they are communicated.
Adopting such tools must, therefore, result in an enhancement of certain knowledge on a multitude of levels, both for the design and production process by acting on the generation change and also for the dissemination of know-how by enhancing certain intangible values.
In this section, the research emphasizes how technologies such as eXtended Reality (XR) are increasingly applied as they benefit from the phenomenon of Immersive Experience Design. (Elmezeny, Edenhofer, & Wimmer, 2018)
In the context of XR, the DISTANCE project (Digital Immersive Technologies and Craft Engagement) allows artisans to apply their tactile skills and material knowledge in a digital immersive space, with the opportunity to collaborate and share experiences. In this case, it is emphasized how crucial it is for creative professionals to acquire digital skills, both for creative production and collaboration. (Panneels, et al., 2023)

3. Methodology

This research is based on the general objective of evaluating the potential of integrating innovative technological processes with traditional manual techniques, preserving and transmitting intangible knowledge and values within the entire NPD process in the upholstered furniture sector.
Being a Ph.D. co-financed by a company, eighteen months at the company, EDRA S.p.A. is planned, where alternative investigative strategies aimed at qualitative research, such as ethnographic research (Creswell, 2017) and the collection of case studies (YIN, 2009), will delve deeper into the company's needs to act more efficiently and targeted. The first investigative tool applied is ethnographic research, in which the company is studied as a whole, actors, and context for an extended period, collecting observational and interview data (Creswell, 2017). To these participatory observations, which involve a high level of involvement, other documentary sources such as books and publications are integrated.
This exploratory and qualitative approach will be added to the activity of collecting and analyzing information on how people experience User Research (UR). (Rohrer, 2014)
Tools such as interviews and surveys will first be submitted to the top management of the main corporate areas, followed by more targeted surveys of the employees of each area and then to the end customers.
This first phase will make it possible to bring to light specific problems connected to the company, both those directly expressed and, above all, those unexpressed, and thus identify which of the potential research trajectories listed below to undertake to realize a pilot project aimed at the development of the expected outputs, which can be adopted within the company and thus 'tested' within the company (Fig.1).

3.1 Research Trajectories:

- Innovative production based on the interpretation of existing technologies through a vision inspired by manual techniques, developing new design and production methods identified in the terminology of "Craft Driven Design";
- Development of an innovative approach to design that combines craftsmen and artists with the designers of the future through a methodology identified in the terminology "Craft Inspired Design";
- Definition of new ways of conceiving upholstery through the adoption of interdisciplinarity and an experimental approach, with a focus on sustainable materials/structures, bio-inspired and/or technologically advanced;
- Transferring and enhancing the company's know-how on various levels, design, production, and communication, to raise awareness among future designers and end-users towards the firm's identity.

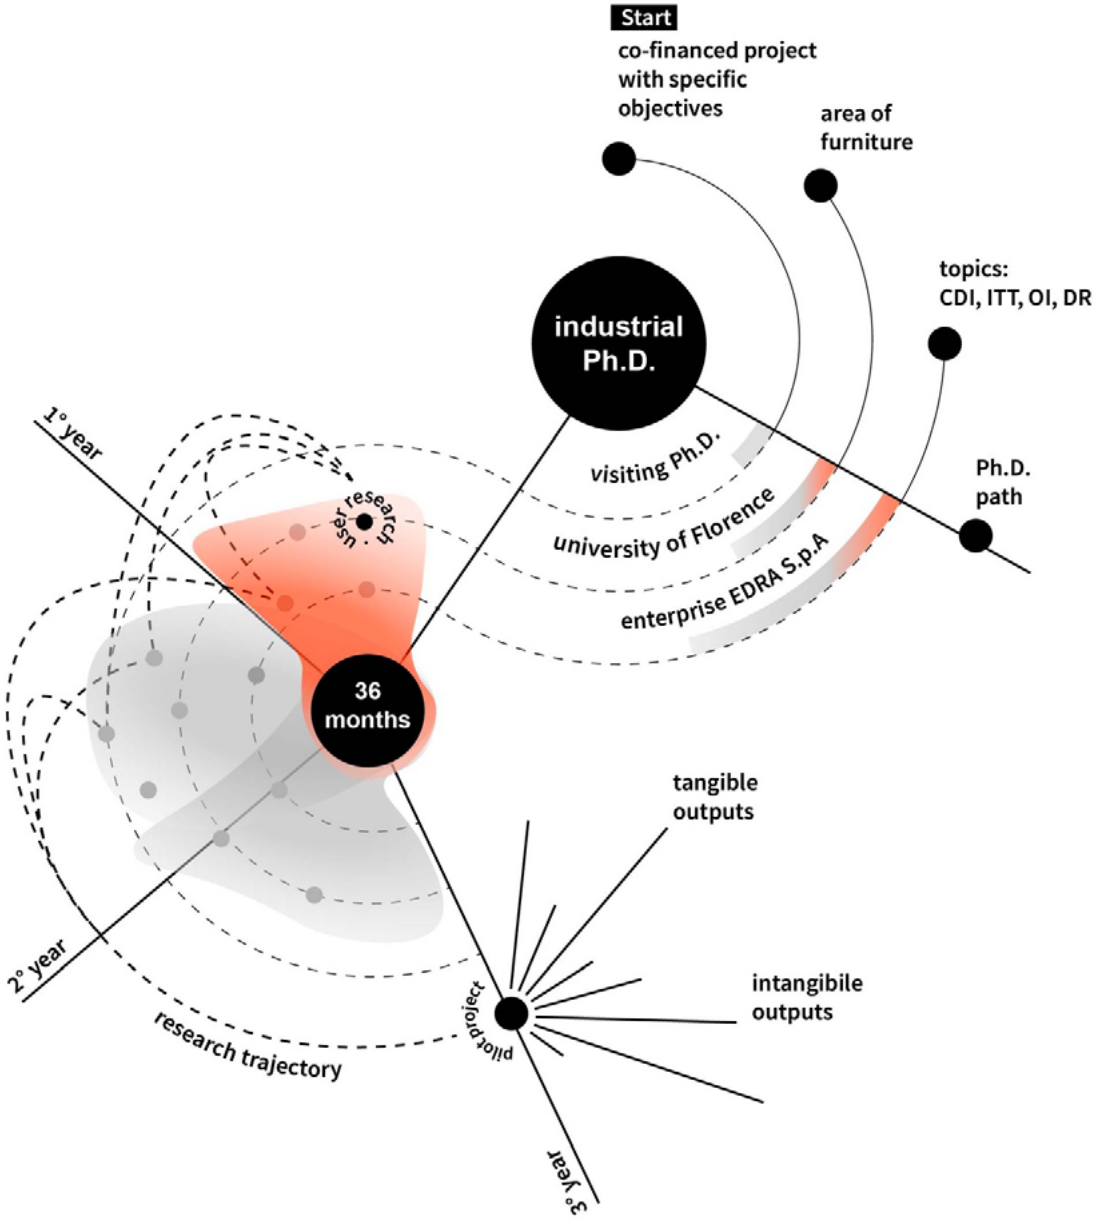

Figure 1. The graph shows the path of the industrial Ph.D. Starting from a co-funded project with pre-established objectives and an established context of intervention, to which topics are added (CDI: Craft Driven Innovation; ITT: Innovation Through Tradition; OI: Open Innovation; DR: Design Research) The development of the course extends over 36 months of which: 6 Visiting Ph.D., 12 University of Florence and 18 within Edra S.p.A. The highlighted area describes the current state, while a pilot project is envisaged that will extend through tangible and intangible outputs.

4. Expected Results

Based on the pre-set objectives in this research project, the valorization of know-how through the CDI methodology is anticipated. As analyzed in Section 2, this methodology, which combines craft skills and learning through practice with the latest technological tools, will be applicable in the corporate context and will branch into the research trajectories mentioned above.
Furthermore, an increased awareness among future designers and end-users towards the company's identity and the issues emerging from the research problem is expected. Indeed, within these scenarios, sustainability will be achieved in multiple areas, including social, environmental, and cultural, for example, through respect for materials, resources, and intangible values.
Through qualitative and quantitative analysis using User Research (Rohrer, 2014), a vision of the company's issues will be obtained both macroscopically and microscopically, directly confined to the reference

company and also extended to broader contexts. This will then allow for the implementation of such context by identifying the most critical practices to act upon.
Subsequently, additional methodologies will be adopted capable of directing the research trajectories toward a pilot project "tested" within the enterprise, aiming to confirm the research question by introducing new practices or solutions for improvement or innovation.

5. Conclusions

The research is currently in an initial testing phase with the project 'Craft Driven Innovation. The 'Know-How' at the basis of industrial innovation,' in the context of the doctoral fellowship 'Innovative Methods of Industrialization with Manual Techniques,' aims to meet the research question based on the innovation of production techniques by emphasizing the role of manual skills through scientific interpretation.
From the initial investigative approaches described in Section 3, within the company and the surrounding reference context, the need to demonstrate how the capabilities of the design discipline can bring innovation, intertwining the know-how belonging to the "Made in Italy" and technological advancement, is evident.
The project will be the starting point for other company activities aimed at practical experimentation by adopting advanced technologies. This will lead to an expansion of academic awareness of the industrial context with the possibility of materializing the added value of the research. Thus, the contribution enriches the scientific and industrial landscape, validating that the collaboration between digital and craft skills and between the research world and the business world represents a significant potential for the future of the sector.

About the Authors:

Bianca Chiti is a designer, Ph.D. Student in Sustainability and Innovation for the Design of Built Environment and System Product - Curricula Design at the Department of Architecture of the Università degli Studi di Firenze (DIDA-UNIFI). She works for Lab Design for Sustainability (DIDALABS), collaborating on national and European projects. His research is interested in the topic of industrial innovation within the development of a new product in the furniture sector, thanks to the industrial doctorate formula.

DESIGN AND RESEARCH FOR A FASHIONABLE PROTOTYPE FOR PATIENTS WITH FECAL INCONTINENCE.

KEYWORDS | FASHION DESIGN, TRANSDISCIPLINARY DESIGN, FECAL INCONTINENCE, ADOLESCENCE

ABSTRACT | The negative impact of Fecal Incontinence (FI) on the quality of life of adolescents and their families and healthcare systems is well established. Moreover, it has been observed that FI leads to a decline in the psychological well-being of affected adolescents. Fashion Design can positively impact society by integrating creative design and social innovation. However, particularly in the intimate fashion field, the adolescent segment is an unexplored area of scientific research.

This paper addresses the theme's importance, focusing on the research design for developing an innovative and fashionable prototype for FI as part of an ongoing Ph.D. work. The current research proposes a mixed methodology through a case study, using Portuguese adolescents diagnosed with FI aged 8 to 14 as a sample.

This paper aims to contribute to the literature review of incontinence-related design products research and describe a sample of existing products on the European market. Finally, it states the importance of a transdisciplinary dialogue in creating products to enhance the quality of life for those diagnosed with FI.

1. Introduction

Fashion designs assume a purpose by creating aesthetically pleasing products capable of triggering emotions and sensations (Lerpiniere, 2013).

The importance of studying the evolution of intimate fashion design, especially in the children's segment, cannot be overstated. It can unlock new knowledge in fashion design and open new research areas on the emotional experience that aesthetics can bring to fashion products at younger ages. The research on the aesthetic preferences of children and adolescents for their intimate apparel needs to be deepened. According to a recent study by Rocha et al. (2020), age is an essential factor influencing our aesthetic preferences and development. Despite other variables that can also affect our aesthetic preferences, it was found that different stages of aesthetic development are achieved at different ages. Thompson (1991) highlights the fundamental role that childhood and adolescence have in individual construction, where emotional and conscious beings are developed. For those reasons, a deeper theoretical reflection on the symbolism the experience assumes in the relationship with intimate apparel at young ages, mainly adolescence, is essential to further research. Additionally, a study that contributes to developing a prototype capable of addressing the problems arising from incontinence, particularly fecal, can have far-reaching benefits for the user, the caregiver, and the healthcare system. By conducting such research, we can create products that will improve the quality of life for those who use them and positively impact society.

Incontinence can be categorized as urinary or fecal. This paper presents the design of an ongoing Ph.D. research that proposes a higher incidence of fecal incontinence, as it is a growing problem. Child fecal incontinence can be challenging for children and adolescents between the ages of 4 and 17 (Ferreira-Maia et al., 2016; Robin et al., 2018; Rajindrajith et al., 2021). The involuntary loss of stool can cause embarrassment and discomfort. The initial treatment usually involves drug therapy, which may include laxatives, along with a fiber-rich diet. Additionally, establishing a daily routine to re-educate the anal sphincter muscles can help manage the condition (Rajindrajith et al., 2021).

FI belongs to the group of gastrointestinal disorders. According to a recent study by Rajindrajith et al. (2021), fecal incontinence can be classified into two categories: fecal incontinence (FI) and Organic Incontinence (OI). The first category has a higher prevalence, especially among males. The study also suggests that constipation is one of the primary reasons for fecal incontinence. Another study conducted by Scarpato et al. (2018) in school settings (sample of 13,750 children and adolescents) in European Mediterranean countries showed a prevalence of gastrointestinal disorders of 20.7% in children between 4 and 10 years old and 26.6% in adolescents between 11 and 18 years old, among these cases 11.7% and 13.1% respectively were related to constipation. Levy et al. (2017) conducted a systematic literature review and found that the prevalence of constipation varies across different regions worldwide. In North and South America, the prevalence of constipation in children and adolescents ranges between 10% and 23%. In Europe, the prevalence is lower, between 0.7% and 12%, only in the group of children. In Asia, the prevalence ranges between 0.05% and 29.6%.

Fecal incontinence is a common problem among children and is one of the main reasons for referral to gastrointestinal consultations (Ferreira-Maia et al., 2016). Inan et al. (2007) state that fecal incontinence is common in childhood and should be considered a common problem. According to Levy et al. (2017), constipation (most often resulting in FI) has an estimated average prevalence of about 15% of the child population. There is a consensus that this pathology affects the quality of life of children and families, impacts healthcare systems, and contributes to a decrease in the psychological well-being of these children (Joinson et al., 2006; Rajindrajith et al., 2013; Rajindrajith et al., 2021).

The ongoing research presented in this paper sets out the main objective of developing and testing a fashionable prototype that can enhance the quality of life of adolescents diagnosed with FI.

2. A Review of Incontinence Products

Despite the significant evolution of products for incontinence, from a design point of view over the last decades, there are no aesthetically attractive solutions, especially in the children's segment. Although an undergarment does not solve the incontinence problem, particularly fecal, a tailored fashion design product can solve or mitigate several initial problems, mainly using smart and functional textiles.

Three significant issues related to fecal incontinence are identified in an initial analysis: storage, odor, and tactility. Involuntary stool loss results from the loss of anal sphincter movement, and children and adolescents are often unaware that they are defecating, which makes stool storage problematic (Levy et al., 2017).

It is essential to understand how to reduce the time the child's skin is in contact with feces while following the daily hygiene routine suggested in therapy.

Moreover, the unpleasant odor of feces leads to stigmatization and exclusion (Joinson et al., 2006; Rajindrajith et al., 2013). Many of these children lose their sensitivity to fecal odors and cannot identify them after some time. When designing a new solution, neutralizing the odor released and accumulated in intimate fashion clothing should be considered. McNichol et al. (2018) state that frequent skin exposure to feces can cause 'incontinence-associated dermatitis.'

An initial literature review on research into textiles applied to developing products for incontinence reveals different lines of research. Still, most of them are aimed at monitoring and alarming urinary incontinence. Liu et al. (2012) have presented a novel solution for incontinence monitoring, incorporating conductive yarns on a seamless textile structure with an alarm system. The authors also state that smart and functional wearable textile product research requires collaboration across multiple disciplines, including aesthetic design, biomedical engineering, science, and technology, reinforcing the need for transdisciplinary dialogue in developing this type of product. Also, in a study published in 2020, Gaubert et al. focused on improving enuresis alarm systems. They aimed to make the systems more comfortable for children and increase their acceptance. They achieved this by replacing the rigid alarm with a flexible one. The new system includes a humidity sensor and wire that are fully integrated into a textile structure.

2.1 Existing Products

An analysis was conducted on the existing products that primarily address incontinence, which can be urinary, fecal, or both. The main objective was to understand the current product offerings better.

Table 1 showcases a sample of existing products available on the European Market. The products are compared by gender (female, male, or unisex), age group (child or adult), type (pants, boxers, diapers with flaps, diapers-pants, pads), response to physical and sensory problems arising from incontinence such as storage and odor, and product life cycle (disposable or reusable). The survey also includes washable and reusable products for urinary incontinence that can inspire designing a product that addresses fecal incontinence.

Table 1. Sample of existing products on the European Market.

Product	Gender	Segment	Typology	Answer	Life Cycle
Happyjam, Dodot	Male and Female options	8y to 12y (27-55kg)	Overnight Diaper	Odor Control, Nocturnal Enuresis, Ultra Absorbency (12h), Comfortable textiles that allow the skin to breathe, Elastic waistband for better fitting, and that maintains protective barriers for possible leakage.	Disposable
Underjams, Pampers	Male and Female options	Size S/M (17-29kg) Size L/XL (26-39kg)	Overnight Diaper	Odor Control, Nocturnal Enuresis, Ultra Absorbency (12h), Comfortable textiles that allow the skin to breathe, Elastic waistband for better fitting, and that maintains protective barriers for possible leakage.	Disposable
DryNites, Pampers	Male and Female options	4y to 7y (17-30kg) 8y to 15y (27-57kg)	Overnight Diaper	Odor Control, Nocturnal Enuresis, Ultra Absorbency (12h), Comfortable textiles that allow the skin to breathe, Elastic waistband for better fitting, and that maintains protective barriers for possible leakage.	Disposable
McKesson	Unisex	Adult + Senior	Daily Diaper	Odor Control, Nocturnal Enuresis, Ultra Absorbency (12h), Comfortable textiles that allow the skin to breathe, Elastic waistband for better fitting, and that maintains protective barriers for possible leakage.	Disposable
Protective Underwear, Tena Men	Male	Adult	Diaper-Pant	Odor control, enuresis, humidity control, and an elastic waistband are needed for better fitting.	
Active Fit, Tena Men	Male	Adult	Pad	Odor Control, Enuresis, Thin (4mm), Ergonomic, Humidity Control.	
Training Pants, Bambino Mio	Unisex	12m to 24m (11-13kg) 2y to 3y (13-15kg) +3y (+15kg)	Pantie	Enuresis, Water-resistant and inner par, Comfortable and stretchy waistband for active toddlers	
Confitex for Men	Male	Adult	Boxer Short	Ultra Absorbency, Discreet design, close to regular boxer short form, Comfortable and breathable textiles.	
Organics for Men, LeakWear	Male	Adult	Boxer Short	Ultra Absorbency, Discreet design, close to regular boxer short form, Comfortable and breathable textiles.	
Incontinence Boxer Short, Impetus	Male	Adult	Boxer Short	Ultra absorbency, discreet design, close to regular boxer short form, comfortable and breathable textiles, and odor control.	

Since feces in fecal incontinence can have a range of densities, from pasty to liquid, menstrual underwear was also considered a product that could contribute to innovation and design in this area. Small clots often accompany liquid menstruation on the surface of regular menstrual pads. Therefore, technology transfer from non-disposable products to menstruation into fecal incontinence products could partially solve the storage problem.

Menstrual pants are one of the most advanced products in intimate apparel, and they have an absorbent function. Impetus Group, for example, has developed the Period EcoPanty, which is absorbent, hypoallergenic, thin-layered, anti-odor, and reusable.

3. Methodology of the Ongoing Research

The ongoing research is exploratory and adopts a methodological approach that recognizes the various terminologies used in the fashion industry. The term "intimate fashion clothing" refers to underwear, undergarments, and intimate clothing.

The research employs a mixed-method approach to collect and analyze quantitative and qualitative data in different phases, as described below:

1. The first phase will be a case study using a qualitative methodology that will allow a more profound knowledge of FI medical disorder:
    - Semi-open interviews with a focus group of specialists, mainly from pediatrics, a pediatric gastroenterologist, a child psychiatrist, and parents/caregivers. To validate our data collection, a pediatrician will lead this expert group;
    - In-depth semi-open interviews will be conducted using an exploratory and phenomenological approach to understanding the main problems arising from fecal incontinence. These interviews will be conducted with a non-probabilistic sample by convenience, consisting of patients diagnosed with fecal incontinence aged between 8 and 14 whom two health institutions are following in Oporto. The Interpretative Phenomenological Analysis (IPA) will be adopted to interpret the interviews.
2. (Once the problems arising from FI are acknowledged, a study will be conducted on Portuguese adolescents aged between 8 and 14. The study assesses their aesthetic preferences and perception of aesthetics, comfort, and well-being. The surveys will be applied to a probabilistic sample of adolescents without the disorder. The sample will be selected from a randomized selection of schools in the metropolitan area of Oporto. This sampling method integrates the two stages of Piaget's child development (1964): concrete (8 to 11 years) and formal operative (12 to 14 years). The prototype can be developed more accurately by cross-referencing the perceptions and needs of adolescents with and without the disorder.
3. Prototype development;
4. To validate the prototype, it will be tested in a focus group with adolescents between 8 and 14 years old and a control group with children without the disorder.

This study involves minors who must voluntarily agree to participate. To ensure the study is conducted ethically, it will be reviewed and approved by the Ethics Committee of the University of Beira Interior and the Ethics Committees of partner hospitals. It is important to note that all minors who participate in the study must obtain prior consent from their parents or legal guardians. Additionally, all data collected will be protected by the Data Protection Act, which aims to preserve the anonymity and privacy of the participants.

4. Conclusions

Understanding the emotional relation with intimate fashion clothing in adolescence will allow this knowledge to design more visually pleasing fashion items that align with modern ergonomics theories and promote the user's comfort and well-being. Particularly in the case of FI disorder, the application of new knowledge from this research can be helpful to the creation of innovative intimate fashion products that improve intimate hygiene in adolescents. This research aims to develop a lower environmental and economic impact product. Additionally, it is expected that the research will generate interest in the field of children's intimate fashion clothing and pave the way for further studies in related areas such as the history of children's intimate fashion clothing, ergonomics, and children's anthropometrics, and the role of design in children's fashion products. Finally, as the research is conducted, it will be pertinent to realize the importance of transdisciplinary dialogue in product development, such as the one proposed.

KEYWORDS | ESD, SUSTAINABLE FASHION, HIGHER EDUCATION, IRAN, GERMANY

ABSTRACT | This doctoral research explores ESD implementation in higher education of fashion and apparel design in Germany and Iran using a design-based research (DBR) model. It encompasses multiple phases, with this paper covering the first two: a systematic literature review and qualitative document analysis of B.A. and M.A. fashion and apparel design curricula. The following phases will involve DBR iterative processes. Initial findings reveal limited research in Germany and Iran on this topic. Nine German universities have integrated sustainability-oriented aspects into their curricula, while five have not. In contrast, Iranian universities allocate only three modules to sustainability-oriented content, indicating varying levels of integration between the two countries.

1. Introduction

Programs embracing Education for Sustainable Development (ESD) not only enhance students' sustainability knowledge but also cultivate skills essential for their future careers (García-González et al., 2020; Brandt et al., 2021). Additionally, UNESCO's 2030 map mandates higher education curricula to embrace the ESD approach (UNESCO, 2020). Fashion education is no exception due to its significant global impact (McKinsey and Company, 2023). Given the various approaches to sustainable fashion transformation, product design education is paramount, especially with initiatives like the Digital Product Passport and the EU's provisional agreement on sustainable and circular products (European Commission, 2023). These developments underscore the need for education to align with ESD principles, equipping future designers and educators with essential knowledge for a more sustainable industry.

Considering Germany's leading role in European fashion markets (Oxford Economics, 2023) and the growth of Iranian fashion retailers and brands despite economic sanctions (Nabati, 2022), it is important to explore the implementation of ESD in fashion and apparel design B.A. and M.A. programs in both countries. Furthermore, the status of ESD implementation in several universities of fashion and apparel design programs in Germany and Iran has remained unexplored despite the need to shift to a holistic approach. This doctoral research aims to answer the following research question by researching fashion and apparel design programs in Germany and Iran: How to contribute to a sustainable clothing design by implementing ESD as a guiding principle in fashion design higher education? The research map consists of several phases, which will be described in the next section.

2. Methodology

This doctoral research utilizes a design-based research (DBR) model, integrating research and practice (Grunau & Gössling, 2020) through iterative interventions. It follows a six-phase process (Figure 1) derived from the DBR model (Oppl et al., 2022) to analyze the problem, identify, develop, and evaluate ESD implementation practices in fashion and apparel design programs in Germany and Iran.

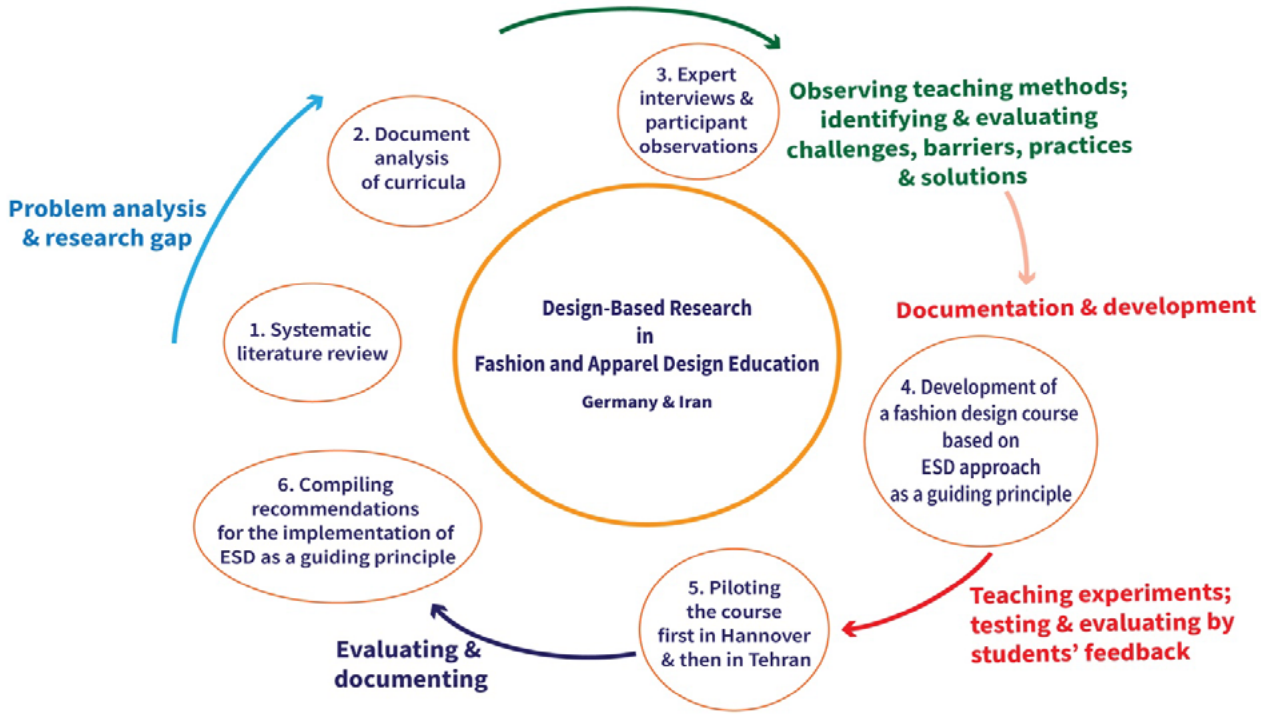

Figure 1. Concept map of DBR approach. Source: authors.

Mayring's deductive-inductive content analysis is a widely used method in various research phases, and MAXQDA software is commonly employed for data analysis. Phases one and two of the research have been conducted, and their results have been analyzed. After delving into the first two phases, an overview of other phases are described in this section.

2.1 Systematic Literature Review

Following Paul and Criado's systematic literature review guidelines (2020), ESD in higher education of fashion and apparel design in Germany and Iran was assessed through material collection, descriptive analysis, category selection, and material evaluation (Mayring, 2022). Publications in German, Persian, and English language were reviewed from January to September 2023, using specified inclusion and exclusion criteria (Figure 2).

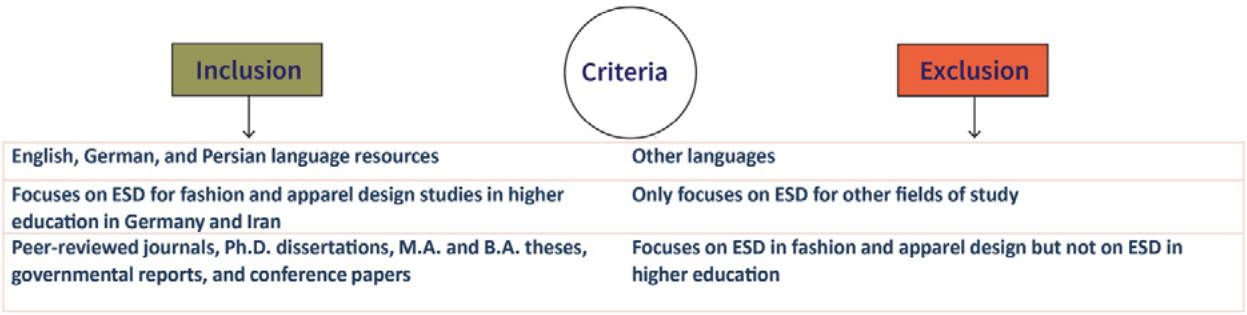

Figure 2. Inclusion and exclusion criteria. Source: authors.

The publications underwent a three-phase screening process, resulting in 13 publications for Germany and two publications for Iran on the implementation of ESD in higher education of fashion and apparel design programs. The results of this phase identify the research gap and analyze the problem (See Section 3.1).

2.2 Document Analysis of Curricula

Curricula from 14 German universities and the Iranian Ministry of Science, Research, and Technology were collected online. German universities offer distinct fashion design curricula, while all Iranian universities follow one curriculum. The gathered German (n = 23 documents) and Persian (n = 2 documents) curricula were translated and analyzed in English using MAXQDA software. Mayring's (2022) content analysis method was employed, initially selecting categories based on theoretical frameworks such as a didactic model (Ermer, 2018), triple bottom line (Gimenez et al., 2012), and ESD competencies (Rieckmann, 2022). The subsequent deductive-inductive analysis resulted in the elimination of categories like "participatory learning" and "transdisciplinary learning," while new categories like "sustainable product development," "sustainable textile chain," and "sustainable design strategies" emerged (Figure 3).

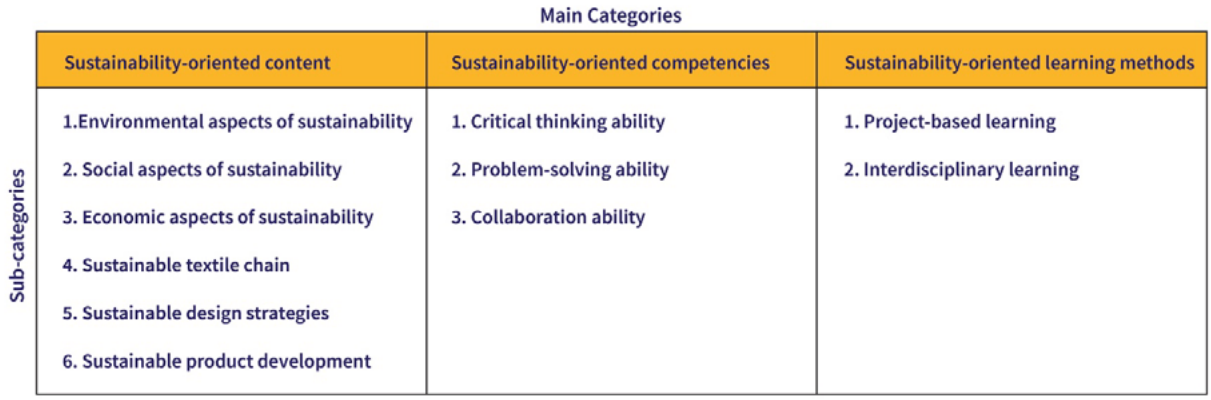

Figure 3. Categories formed during deductive-inductive content analysis. Source: authors.

Throughout the study period, the documents (e.g., the curricula of Iranian universities were replaced by the revised versions), and the coding process was reviewed and updated by the authors in monthly meetings from May to December 2023. In the results of this phase, the status of ESD integration in the curricula of fashion and apparel design programs is identified (See Section 3.2).

2.3 Expert Interviews and Participant Observations

The third phase of the DBR model involves conducting problem-centered expert interviews (Döringer, 2020) with fashion design lecturers and professors in Germany and Iran and fashion design students and graduates at Hochschule Hannover University of Applied Sciences and Arts (HSH), along with participant observations for fashion design courses at HSH in Hannover, Germany. To understand the adoption of ESD in higher education studies of fashion and apparel design, twenty professors and lecturers in Germany and eleven professors in Iran were contacted, resulting in interviews with nine in Germany and six in Iran so far. Interviews with HSH students and graduates aim to evaluate sustainability integration and gather feedback on teaching methods. Additionally, participant observations (Kawulich, 2005) were conducted for two winter semesters in 2022 and 2023, recording classroom interactions and course content. These activities aim to identify and evaluate practices for implementing ESD in fashion design courses. Moreover, the doctoral student gained teaching experience at HSH, developing and testing sustainability-oriented course concepts and teaching methods for fashion design education in Germany.

***

Phases four and five focus on developing and evaluating a fashion design course, using the ESD approach along with additional teaching experiments. The doctoral student will define the course content and structure based on analyzed data. Supervisors, experts in education and design, will review and provide feedback on the course framework before piloting at HSH and gathering student feedback. The course will then be revised for implementation in a fashion design program at a university in Tehran, supported by student portfolio assessment and course evaluation. These phases encompass development, piloting, evaluation, and analysis, with recommendations compiled from all phases on implementing ESD in fashion and apparel design higher education.

3. Results

3.1 Results of Systematic Literature Review

Ermer (2018) proposed a holistic framework for learning sustainability in fashion design. Ermer and Schwarzkopf (2021) analyzed curricula from five German universities offering a B.A. in fashion design, finding only one directly addressing sustainability. The EU-funded project Fashion DIET aims to implement ESD as a guiding principle in fashion and textile study programs. Researchers from four universities in Germany, Romania, and Bulgaria developed an ESD module with 42 courses for higher education, provided as an Open Educational Resource on the Glocal Campus platform (Grundmeier & Höfer, 2023).

In comparison, only two publications in Iran's fashion and apparel design context discuss sustainability. Davari et al. (2016) surveyed female students in textile, apparel, and industrial design programs, revealing a lack of awareness and anti-sustainability attitudes among peers. Rezvani Ahangar Kolaee et al. (2021) focused on female undergraduate students at Shariati Technical and Vocational University, designing courses to enhance sustainable clothing design skills. However, they did not address ESD implementation in the curriculum. Iran's fashion industry is heavily influenced by socio-political factors (Shirazi, 2019), impacting sustainability efforts. Navigating these complexities requires a nuanced understanding of cultural and political realities and the educational system.

3.2 Results of Document Analysis of Curricula

In the analysis of German university curricula, sub-categories are grouped into sustainability-oriented content, competencies, and learning methods. Social and environmental aspects of sustainability are more prevalent than economic aspects (Uni01-BA, 2019; Uni02-BA, 2022; Uni04-BA, 2017; Uni05-BA, 2021; Uni08-MA, 2021; Uni11-BA, 2014; Uni13-BA, 2022; Uni14-MA, 2023). Sustainable textile chain and product development have low frequencies after critical thinking ability (Uni01-BA, 2019; Uni04-BA, 2017; Uni13-BA, 2022), with sustainable design strategies being more common (Uni03-MA, 2021; Uni04-BA, 2017; Uni05-BA, 2021; Uni13-BA, 2022; Uni01-BA, 2019). Collaboration ability is the second most frequent sub-category under sustainability-oriented competencies, emphasizing teamwork (Uni02-BA, 2022; Uni03-BA, 2023; Uni05-BA, 2021; Uni13-BA, 2022; Uni14-BA, 2023). Problem-solving appears with varying frequencies, while critical thinking is less frequent (Uni02-BA, 2022; Uni05-BA, 2021; Uni13-BA, 2022; Uni14-MA, 2023). Additionally, sustainability-oriented learning methods, such as project-oriented and interdisciplinary learning, are prevalent (Uni01-BA, 2019; Uni02-BA, 2022; Uni03-BA, 2023; Uni05-BA, 2021; Uni13-BA, 2022). Some modules are titled “sustainability”, and six teach with a holistic approach (Uni01-BA, 2019; Uni03-BA, 2023; Uni13-BA, 2022; Uni02-BA, 2022).

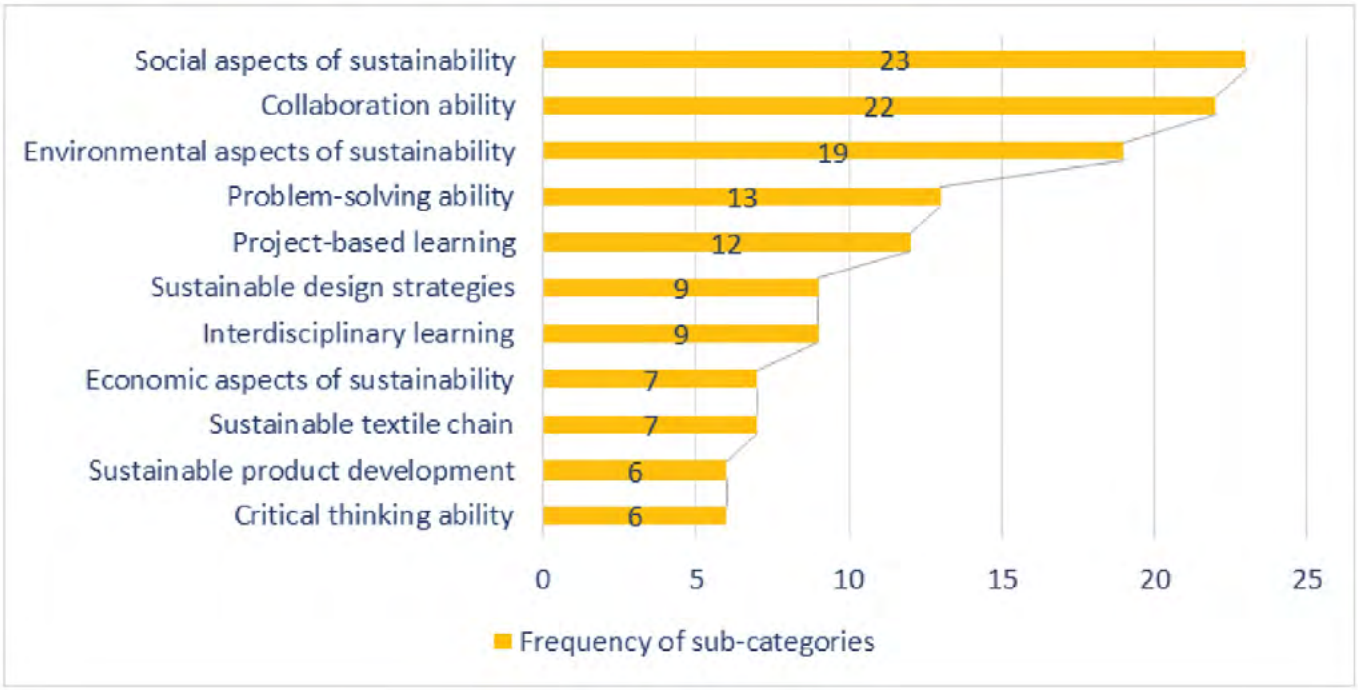

Figure 4. Frequency of sub-categories in the German universities’ curricula. Source: authors.

In Iranian curricula documents, only three modules were found teaching sustainable concepts, including green or sustainable textiles, environmental sustainability of the apparel and textile industry, sustainable design, and recyclable fibers (IrUni-MA, 2023; IrUni-BA, 2023). Conversely, 11 sub-categories were identified in the 11 German curricula out of the 23 analyzed documents (Figure 4), covering all three main categories. The remaining 12 documents from five German universities did not include relevant sustainability keywords.

3.3 Initial Results of Expert Interviews

So far, three out of nine expert interviews with lecturers and professors in Germany and four out of six expert interviews with professors in Iran have been analyzed. Regarding these interviews, it can be stated that universities in Germany adopt sustainability in fashion design courses, with each university employing distinct approaches, starting from the implementation of consumer education and circular fashion

practices to curriculum changes, which encourage collaboration with other departments and industry partners. At Iranian universities, efforts to integrate sustainability into fashion design courses are evident despite the absence of dedicated courses in the curriculum. Practical projects and workshops focus on, e.g., reducing fabric waste and historically sustainable methods.

4. Discussion

The initial phases of this doctoral research comprised a systematic literature review and a curriculum document analysis. The literature review revealed limited research on ESD in higher education of fashion and apparel design in Germany and Iran. In Germany, two projects addressed ESD implementation: the Fashion DIET project, offering an online ESD further education module applicable to higher education curricula, and Ermer's publications focusing on fashion design education. However, no papers on ESD integration in higher education of apparel design curricula in Iran were found.

Secondly, the comparative document analysis of curricula highlights the integration of sustainability aspects in fashion and apparel design programs in Germany and Iran. Significant progress has been noted in German universities, with nine institutions integrating sustainability-oriented aspects into eleven B.A. and M.A. curricula by 2023, compared to previous research indicating limited sustainability focus (Ermer and Schwarzkopf, 2021). While three universities in Germany offer modules directly related to sustainability and six adopt a sustainable and holistic approach, five have yet to integrate sustainability aspects. In contrast, Iranian universities have only three instances of sustainability-oriented content in their curricula, significantly fewer than in Germany. The disparity may be attributed to differences in the educational systems of both countries. Although recent revisions to Iranian curricula show progress in sustainability integration, there remains a notable lack of focus on sustainability. Addressing these disparities and gaps in ESD integration requires further research.

Thirdly, according to the analyzed expert interviews, universities in Germany incorporate sustainability into fashion design courses with different approaches. In Iran, efforts are made to integrate sustainability into fashion design courses. However, challenges remain, including the need for updated facilities and resources to achieve comprehensive integration. As some interviews have not yet been analyzed, one of the next steps will be to elaborate and compare further expert opinions.

5. Conclusion

This doctoral research assesses the status of integrating Education for Sustainable Development (ESD) in B.A. and M.A. programs for fashion and apparel design in Germany and Iran. While limited research exists on ESD integration in German fashion design curricula, none addresses Iranian universities. Notably, sustainability aspects are integrated into nine German university curricula, whereas Iranian universities devote only a small portion to sustainability-oriented content. However, five German universities have yet to include any sustainability aspects. This stage does not conclude the research; further phases will explore ESD implementation as a guiding principle in fashion and apparel design programs.

About the Authors:

Hanieh Choopani is a PhD student in Sustainable Fashion Education at the University of Education Freiburg and Hochschule Hannover University of Applied Sciences and Arts (HSH). She is also a part-time lecturer at the USE-LESS Centre for Sustainable Strategies at HSH.

Martina Glomb is a professor of fashion design at the Hochschule Hannover University of Applied Sciences and Arts, Germany. She specializes in design methods with a focus on slow fashion and sustainability in teaching, research, and transfer. As founder of the USE-LESS Centre for Sustainable Strategies, she has initiated various interdisciplinary projects and exhibitions with universities and practice partners, aiming to merge science, education, and design.

Dr. Anne-Marie Grundmeier is a full professor in fashion, textile sciences, and its didactics at the University of Education Freiburg in Germany. She is head of the Department of Fashion and Textiles and the Institute for Everyday Culture, Sports and Health. Her research interests are Education for Sustainable Development, aesthetic and (inter-)cultural education, and vocational education in the context of fashion and textiles.

Acknowledgments: The authors would like to express appreciation for the funding of this research through a PhD candidate scholarship by the DAAD, the German Academic Exchange Service.

MAPPING THE NEW NORDIC REGION'S START-UP ENTERPRISES FROM THE PERSPECTIVE OF LEADERSHIP CHARACTERISTICS, MINDSET, AND SKILLS: THE RELEVANCE OF SOFT SKILLS IN SHAPING ENTREPRENEURIAL ECOSYSTEMS.

Lili Ermezei*[a]

a Moholy-Nagy University of Art and Design Budapest, Hungary
* ermezei@mome.hu

DOI: 10.63442/VYDP7492

KEYWORDS | START-UP LEADERSHIP, INNOVATION COMPETENCE, SOFT SKILLS, ORGANIZATIONAL VIABILITY, ENTREPRENEURSHIP, DEVELOPMENT TOOL, ENTREPRENEURIAL ECOSYSTEM

ABSTRACT | This short paper expands the discussion on what cultivates a successful entrepreneurial ecosystem, outlining the importance of personal competencies such as soft skills and leadership dynamics. The increased appearance of high-value start-ups in the Nordic region demonstrates the impact of these ecosystems. The author argues that cultivating personal skills and leadership qualities is as pivotal to their success as the economic frameworks within which start-ups operate. Adding these competencies to well-grounded ecosystems may determine startups' sustainable, future-oriented success stories.

The paper aims to provide an overview of a research study on the role of leadership in high-growth start-up success, with a specific focus on 'unicorn' companies in the 'New Nordic' region (Denmark, Finland, Iceland, Norway, Sweden, and Estonia). Leadership in start-ups is identified as a crucial factor for performance. Yet, there is a lack of focused research on leadership within rapidly scaling ventures, such as unicorns – privately held start-ups valued at over one billion dollars. The paper will bridge this gap by examining entrepreneurial leadership, which merges leadership and entrepreneurship research. The study will explore the unique leadership attributes, psychological flexibility, identity, and resilience that predict entrepreneurial satisfaction and contribute to the success of unicorn start-ups.

The research emphasizes that existing studies on entrepreneurial ecosystems do not fully capture the transition from start-up to unicorn status, especially outside of Silicon Valley. This analysis calls for a more detailed understanding of the Nordic ecosystem's components and how they contribute to unicorn success compared to other regions, highlighting the impressive per capita rate of New Nordic unicorns.

1. Introduction: Start-up Leadership and Unicorn Start-ups

Start-ups are a vital component of the global economy, representing an ecosystem value that exceeds $7.6 trillion, overshadowing the individual GDP of many G7 countries (GSER, 2023). Despite the high number of start-up inceptions, their success rate remains modest. Leadership significantly affects start-ups' performance (Swiercz & Lydon, 2002); however, despite the amount of research on leadership in the start-up environment, there is little focus on the rapidly scaled-up ventures and their underlying leadership phenomena. The proposed study offers a new perspective on this. Understanding the factors of success and conceptualizing learnings is essential for developing the future of scale-up businesses.

Entrepreneurial leadership is a newly developed theory in leadership research because it provides insights into the intricate processes of leadership associated with establishing and expanding new ventures. The theory has emerged from two different academic fields: leadership and entrepreneurship research. Despite abundant research, scholars cannot agree upon a common definition of entrepreneurial leadership (Leitch & Volery, 2017). Given these gaps, exploring the founders' and founding teams' perceptions and interpretations of their leadership while involved in entrepreneurship ventures appears to be an important research topic. Psychological flexibility, entrepreneurial self-identity, and resilience are linked to entrepreneurs' satisfaction and performance (Van Hugten et al., 2021).

This short paper will delve into the geographical, social, and cultural dimensions underpinning high-growth entrepreneurship from the perspective of entrepreneurial ecosystems to enhance our understanding. Additionally, the researcher will propose incorporating certain soft skills and mental frameworks that may play a pivotal role in the success of business growth. These include *entrepreneurial leadership attributes, psychological flexibility, identity, and resilience.*

2. Definition of the Unicorn

The unicorn status of start-ups is a topic of much discussion in the startup community. This figurative term is applied to businesses valued at a billion dollars in less than ten years. The phrase was coined in 2013 by venture capitalist Aileen Lee to describe these kinds of ventures' exceptional success and rarity. Since then, it has been a widely used term on the start-up scene, and academic discussions about unicorns have increased; however, unicorn start-up leadership has not been the main topic of these discussions (Audretsch et al., 2021; Bertoni et al., 2019; Dellermann et al., 2017; Kwon & Sorenson, 2021; Van Burg et al., 2020; Welter et al., 2017; Wurth et al., 2021). The only studies conducted regarding unicorn companies focus on cases in Silicon Valley. This highlights another gap in the current literature that the proposed research aims to fill: to bring a Nordic perspective to the unicorn start-up equation.

2.1 Unicorn Start-ups in the New Nordic Region

The Nordic countries, commonly referred to as the Nordics, are a group of countries in Northern Europe and the North Atlantic Ocean connected both geographically and culturally. It comprises the autonomous territories of Greenland, the Åland Islands, and the five countries of Denmark, Finland, Iceland, Norway, and Sweden. In 2015, Estonia's prime minister, Taavi Rivas, referred to the nation as a 'new Nordic country,' and the Nordic Council of Ministers (2022) frequently discussed Estonia's future as a Nordic nation. For these reasons, this paper will refer to the aforementioned Nordic nations and Estonia as the 'New Nordics.'

With less than 30 million inhabitants, the New Nordic region is home to many unicorn start-ups and accounts for the largest number per capita. The Nordic region saw record private equity and venture capital investment levels last year. BOLT, Skype, Rovio, Pipedrive, Wolt, Unity, Just Eat, Klarna, King, Trustpilot, Supercell, Aiven, iZettle, Transferwise, Tradeshift, and Bambora are some of the New Nordic region's unicorn companies. A 2021 Joint Research Centre of the European Commission Science for Policy report states that the number of scale-up businesses in the EU, particularly unicorns, lags behind the US and

China (Quas et al., 2021). Comparing the number of unicorn start-ups per capita is an effective way to evaluate a region's success in terms of scaled-up start-ups. According to this assessment, the New Nordic region has the highest number of unicorn start-ups per person. In the US, for instance, there are 963 unicorn companies and 332.4 million people (CB Insights, 2022) – that is, 2.89 unicorns for every million people. Compare this to Estonia's unicorns per capita. With a population of 1.32 million, Estonia has ten unicorn companies (Tallinn. ee, 2022). This means there are 7.57 unicorns per million people, more than twice the unicorn density of the US.

3. 'Entrepreneurial Topography' – An Ecosystem Review

Examining entrepreneurial success metrics, it becomes evident that high-valuation startups (unicorns) share many characteristics with their more commonplace entrepreneurship counterparts. Davidsson (2015) has emphasized the integral role of the broader startup landscape in driving economic growth and employment across various nations. The rapid emergence of unicorns in the New Nordic territories, including Finland and Estonia, underscores a dynamic entrepreneurial surge that current literature struggles to document in real-time, reflecting a rapidly evolving landscape where even the most up-to-date data lags behind the pace of development.

Entrepreneurial ecosystems are increasingly used to understand the supporting elements of fast-growing startups in certain areas. These ecosystems blend local culture, social connections, funding, educational institutions, and supportive economic policies to help innovation-driven businesses succeed. Academics, policymakers, and business experts agree that these ecosystems are vital to building strong economies fueled by entrepreneurial innovation. However, the research on how these ecosystems work is still in its early stages and lacks a solid, unified theory. Essentially, the term 'entrepreneurial ecosystem' covers various ideas about how entrepreneurship flourishes in different places without explaining how these tech entrepreneur groups sustain themselves over time.

The current body of literature on ecosystem research offers limited insights into the relationship between ecosystems and highly successful startups or unicorns. The existing metrics for assessing ecosystem research have yielded a significant understanding of the factors that contribute to a startup's initial survival. Nevertheless, they do not explain how a company goes from nothing to becoming a unicorn, especially when it comes to geographic areas other than the well-known Silicon Valley ecosystem (Civera et al., 2019; Dilli et al., 2018; Neumeyer & Santos, 2018; Neumeyer et al., 2019). For example, Autio et al.'s (2018) study thoroughly analyses the frameworks that support early-stage startups and differentiates between various stages of ecosystem growth. However, it does not delve into the specific frameworks or factors that elevate startups to unicorn status or address the New Nordic region.

Spigel (2017) proposes that entrepreneurial ecosystems can take on diverse configurations. These ecosystems consist of interlocking elements and institutions that support entrepreneurship and provide the necessary resources businesses need as they evolve. The characteristics of these ecosystems are sustained and multiplied through their interactions with one another. In environments where these elements are closely connected, there is a significant exchange among a supportive entrepreneurial culture, networks of entrepreneurs, employees, and investors, and robust public programs and organisations.

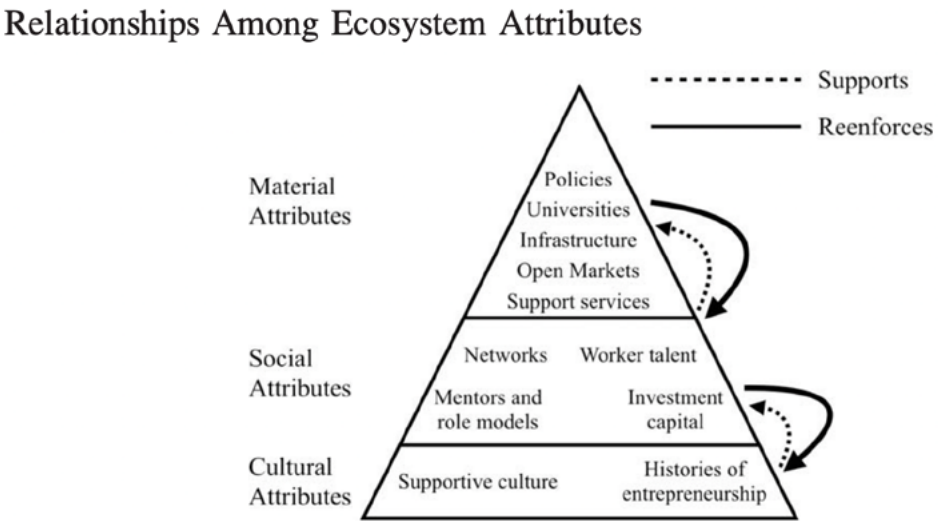

Figure 1. A Relational Approach to the Entrepreneurial Ecosystem Using Spigel's (2017) Model.

In Spigel's model, besides cultural, social, and material attributes, there might be relevance to introducing personal competencies or skills as additional attributes that contribute to entrepreneurial ecosystems. This paper seeks to expand on the existing notion of entrepreneurial ecosystems – comprising cultural perspectives, social networks, investment funds, academic institutions, and proactive economic policies that nurture innovation-driven enterprises. It intends to contribute to the dialogue by exploring how bringing certain mindsets and soft skills to the equation can further enhance these ecosystems. The following offers a review of soft skills such as entrepreneurial leadership competence, psychological flexibility, entrepreneurial self-identity, and resilience.

4. Entrepreneurial Leadership

Literature assessing entrepreneurial leadership in start-up environments found a connection to innovation behaviour and creativity. Entrepreneurial leaders are identified as the driving forces of creativity and innovation (Denti & Hemlin, 2012). Furthermore, this leadership approach influences organisational exploratory and exploitative innovation activities (Huang et al., 2014). Quantitative analysis outlined positive factors affecting entrepreneurial leadership in terms of efficiency and creativity at individual and team levels (Cai et al., 2018). As start-ups have changing life cycles, exploring leadership through different stages is essential. According to Swiercz and Lydon (2002), two sets of leadership competencies are crucial at various stages of the venture's growth: self-competencies and functional competencies.

Overall, Wise (2015) identified three significant leadership challenges associated with the start-up growth process. These are creating a vision, reaching optimal perseverance, and moving forward in the face of chaos. The suggested skills that aid in overcoming the difficulties include self-evaluation, coaching, and strategic thinking.

4.1 Psychological Flexibility

A person's ability to move toward what matters to them and cognitively control emotions that could otherwise hold them back is known as 'psychological flexibility.' Psychological flexibility is a key component of acceptance and commitment therapy, as outlined by Hayes et al. (2011). The following six skills are related to psychological flexibility from the perspective of acceptance and commitment therapy: 1) Acknowledging negative emotions and allowing them to pass through rather than running away from or fighting them; 2) Taking decisive action rather than procrastinating; 3) Defusion, the process of

disentangling ideas from feelings so that one can consider feelings objectively; 4) Mindfulness concerning maintaining attention on the here and now in the face of distracting, pessimistic thoughts; 5) Self-as-context refers to viewing things in a broader context, acknowledging that everyone makes mistakes and that you do not control everything; and 6) Values, which refers to having a strong sense of your values rather than being unsure of what you want (Rolffs et al., 2018).

In the business setting, the term 'emotional agility' has been used frequently (David, 2016) and studied in the workplace domain (Brassey et al., 2019). My aim in using the term psychological flexibility is to follow the most recent work in business research and explore the multi-fold process behind the notion that it is by nature both emotional and cognitive. Van Hugten et al. (2021) identified psychological flexibility as a significant new predictor of entrepreneurs' satisfaction. It is critical to comprehend entrepreneurs' satisfaction as it can influence the caliber and success of their business endeavours (Bradley & Roberts, 2004; De Cock et al., 2020; Dijkhuizen et al., 2018; Kibler et al., 2019). Compared to their 'unhappy' counterparts, 'happy' entrepreneurs are likelier to persevere and outperform them (Stephan, 2018).

4.2 Entrepreneurial Self-Identity and Resilience

Entrepreneurial self-identity, or in other words, identity centrality, is found to be one of the more essential entrepreneurship concepts (Foo et al., 2014). As entrepreneurs identify very closely with their venture, anything limiting their roles and activities would take a toll and negatively affect their self-worth. Entrepreneurial passion (EP) is conceptualised by positive feelings from identity-meaning activities and executions performed by entrepreneurs (Cardon et al., 2009). As self-identity leads to self-verification, EP is typically highly correlated (Vignoles et al., 2006). Engaging in activities where entrepreneurs strongly believe in their ability to succeed can increase passion (Baum & Locke, 2004). Entrepreneurial resilience can be a measure of entrepreneurs' performance in the early stages of their ventures. These early stages are often linked with a lack of resources (not only financial), and their reachable resources impact their viability (Blatt, 2009); hence, there is an increasing number of start-up accelerator programs and a growing number of start-ups attending them.

5. Conclusion

This paper aims to broaden the scholarly discussion about what makes a thriving entrepreneurial ecosystem – those supportive spaces comprising local culture, networks, funding, schools, and helpful government policies. It plans to show how important personal qualities and skills are for enhancing these ecosystems. These skills include leadership, psychological flexibility, and resilience. The many high-value startups in the New Nordic area highlight how powerful these ecosystems can be. The researcher suggests that nurturing the right personal skills is as crucial as setting up the economic environment for startups to flourish. Looking ahead, combining these individual strengths and strong ecosystems will help new businesses grow and reach their full potential, possibly becoming the next sustainable success stories in the start-up world.

KEYWORDS | INCLUSIVE SIGNAGE, PARTICIPATORY DESIGN PRACTICES, HIGHER EDUCATION, ACCESSIBILITY, DESIGN FOR DEMOCRACY

ABSTRACT | The research delves into the realm of accessibility within Higher Education, advocating for a paradigm shift towards inclusivity. It underscores the significance of participatory design methodologies rooted in Universal Design principles. Central to this exploration is a collaborative pilot initiative concerning inclusive signage at IST Lisbon, developed in cross-fertilization with Politecnico di Torino. Employing a robust methodology, the study conducts a thorough examination encompassing literature reviews, exploratory inquiries, and focus group engagements. Through this comprehensive approach, the research aims to elucidate both global best practices and localized challenges about accessibility. Particularly noteworthy is the emphasis on participatory focus group sessions, designed to delineate the role of signage and determine effective communication strategies within the project framework. By leveraging insights garnered from these deliberations, the study seeks to inform the development of comprehensive guidelines, thus steering the trajectory of the pilot initiative towards greater efficacy and impact. Ultimately, the overarching goal of this research endeavor is to advance accessibility and inclusivity within the realm of Higher Education. By fostering collaborative partnerships and embracing holistic design approaches, it strives to cultivate learning environments that cater to the special needs of all students, thereby fostering a culture of diversity and equitable access to educational resources and opportunities.

1. Introduction

The debate about the aspects that make the built and educational environment accessible in the Higher Education context started spreading on the threshold of the new millennium: in 1993, the United Nations formulated the Standard Rules on the Equalization of Opportunity for People with Disabilities, outlining an ambitious program for governments aimed at ensuring equality for individuals with disabilities. Subsequently, in December 2006, the Convention on the Rights of Persons with Disabilities (United Nations, 2006) was adopted, along with its Optional Protocol: "with its 50 articles, the Convention represents the most comprehensive document ever produced on the rights of persons with disabilities" (Barnes & Vehmas, 2020), aiming to ensure their independent living, active citizenship, equal opportunities, and social inclusion. Thus, a new awareness begins to emerge, a shared sensitivity about the role that Universities must play in defining a paradigm of best practices that actively and participatively promote the integration of students with special needs. On the one hand, academic interest is growing on the part of many Italian universities, which are independently developing complex and diversified training tools, carrying out in-depth studies and research around the issues of inclusion and accessibility of spaces and services provided to students. On the other hand, Sustainable Development Goals 4 and 10 contained in the UN Agenda2030, linked respectively to Quality Education and the Reduction of Inequalities, require immediate and circumstantial action.

However, even today, university campuses

> “are often ill-suited to accommodate users with special needs, and efforts to enhance their accessibility to services are typically limited to regulatory compliance. This results in the creation of dedicated spaces that, while designed for specific needs, are poorly integrated, thus erecting barriers within the university community" (Lacirignola et al., 2022)

Taking into account the diverse student population and the educational offerings within university spaces and reconciling these complexities with the framework of human rights principles of equal opportunity, accessibility, and social inclusion constitutes a pathway that can and must transcend mere integration. Creating a genuinely inclusive learning environment necessitates a transversal, multidisciplinary, and complex design approach wherein the principles of design for all give rise to integrated, effective, resilient, and tailored solutions for each member of the university community.

The ethical and practical imperative recognized by international institutions and organizations to initiate a design for all capable of ensuring equal access to all members of the academic community, bypassing the need for redesigning offerings specifically for special needs individuals (Trieglaff, 2022), appears to necessitate a shift in perspective: adopting a design approach that goes beyond mere resolution of immediate needs, focusing instead on the general well-being of the involved communities and the long-term impact of proposed solutions. The adoption of a humanity-centered design, rather than a human-centered one, allows for broadening the scope of intervention: while on the one hand, there is consideration of the needs, desires, and aspirations of individuals, with a humanity-centered approach, the focus shifts to larger groups, more complex systems of relationships,

> “including society at large, all living things, and the ecological system, as well as the design of work in general and services. This encompasses digital products and services as well, due to their significant but often invisible impact on power and energy usage and, of course, on the physical infrastructure required for their delivery to customers. While human-centered design remains appropriate for mass markets, humanity-centered design becomes crucial for addressing larger issues, such as aiding a community in self-improvement" (Norman, 2023).

2. Outlining the Context

Building upon a collaborative and cross-fertilized experience between Politecnico di Torino and Instituto Superior Técnico (IST), integrated within 'Técnico Sustentável – Ambiente Sociedade Economia' (TS), an initiative of IST-Ambiente, a transversal and interdepartmental structure in Environmental Science and Engineering and related areas, this contribution presents a pilot project of inclusive signage for a green area of the IST Campus Alameda, the largest Portuguese School of Engineering, Architecture, Science, and Technology.

The pilot project, guided by a humanity-centered approach (Norman, 2023), focuses on the necessity to reinvigorate the debate surrounding the Special Needs dimension within the university context, aiming for the advancement and implementation of truly accessible spaces, services, and teachings. This perspective adopts a participatory approach based on the Principles of Universal Design.

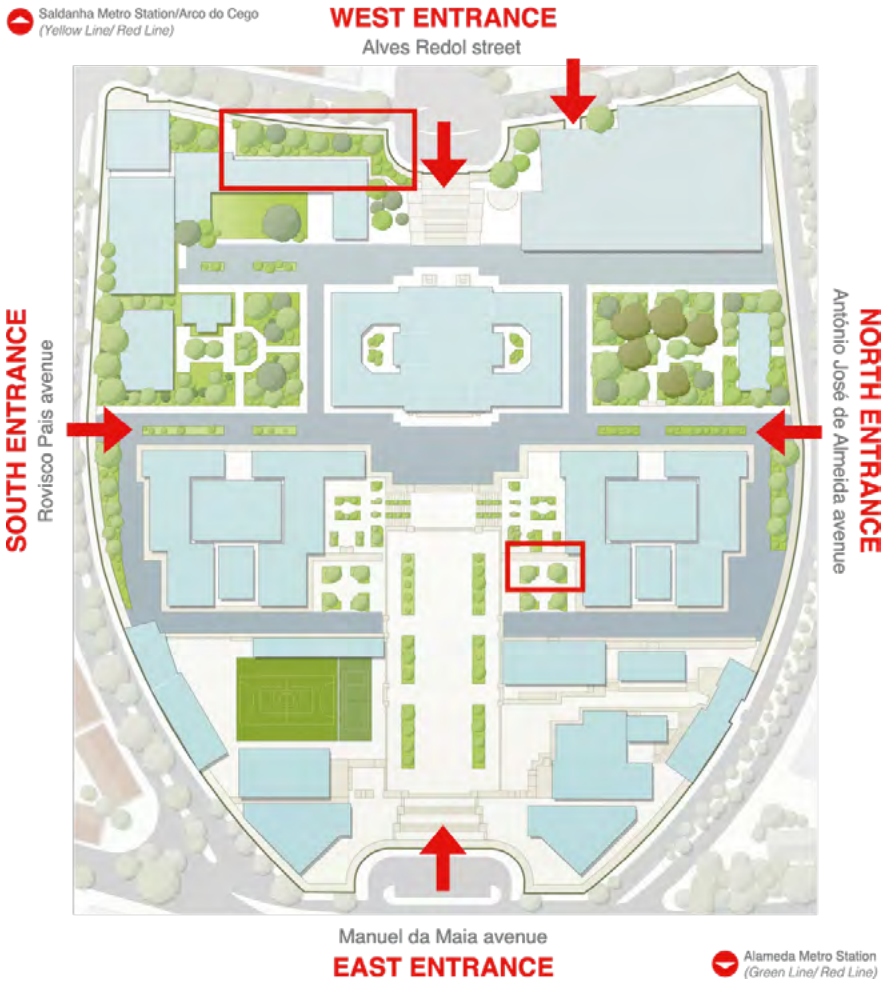

Figure 1. Map of the Main Campus Alameda.

The pilot project of inclusive signage integrates with the design of a meeting and debate space on IST's sustainability initiatives, developed by a group of students for a green area of the Alameda Campus (Figure 1). The project area, located on the western border of the campus, serves as a privileged space connecting the campus, the city, and the surrounding area, ideal for promoting the sustainability initiatives undertaken by IST. The design process for this space is led by students from the architecture field, civil engineering, management engineering, and communication design, coordinated by faculty members and researchers in architecture, within the framework of the European Horizon project 'A European Competence Framework for a low carbon economy and sustainability through education' (ECF4Clim).

3. Methods of Inquiry

The research method includes:

1. **An in-depth research phase.**
   The research phase starts with a thorough analysis of existing literature concerning accessibility within the university context, focusing on recent developments and international best practices. Concurrently, there is an acknowledgment of the need to conduct a case study research involving the analysis of similar projects carried out by other academic institutions globally, with a focus on the strategies employed and the outcomes achieved, to derive a comprehensive mapping of best practices to be adopted in the design phase.

2. **An exploratory investigation of the Institution.**
   The investigation directly focuses on the Institute through interviews with academic and administrative staff, field observations, and analysis of institutional documentation, with a perspective of close collaboration and support from the Responsible for supporting the SEN students. The aim is to understand IST's existing policies, resources, and practices for supporting students with disabilities and to identify areas for improvement through a top-down approach.

3. **A collection and analysis of data from the student community with disabilities.**
   The collection of data is essential to fully understand the landscape of needs among students with disabilities at the Alameda Campus and to effectively guide the design intervention. These data provide an empirical basis for identifying key needs and trends in supporting students with special requirements, enabling the adoption of targeted strategies and appropriate resources.

4. **Focus Group design.**
   To ensure a participatory and inclusive approach, it is envisioned that the formation of a focus group involving diverse members of the university community will be necessary. The aim will be to cultivate a conducive environment for investigating the specific needs of users of spaces and services provided by IST to gather direct insights on the pilot project of inclusive signage from a bottom-up perspective.

5. **Identification of the requirements framework.**
   In essence, identifying the needs and specific challenges faced by students with special requirements within the context of IST Lisbon is both feasible and imperative through interviews, field observations, and analysis of collected data. This process will aid in delineating a clear framework of priorities and intervention gaps to contribute towards creating a more inclusive and accessible university environment.

6. **Guidelines development.**
   Critical to ensuring a methodological and practical approach to the project is the development of guidelines for inclusive signage at IST Lisbon. Addressing user needs and adhering to best practices in university accessibility, these guidelines will translate research findings and consultations into practical solutions, ensuring coherence, stakeholder participation, and compliance with international standards.

4. First Results and Conclusion

From the initial research phase, a detailed overview of international best practices in university accessibility emerged, as well as the specific challenges faced by Instituto Superior Técnico (IST) Lisbon in promoting an inclusive environment for students with disabilities. Through the analysis of academic sources, institutional documents, and research reports, a comprehensive understanding of feasible scenarios was obtained by interpolating documented experiences from other institutions and insights gathered from the survey conducted at Técnico. It became evident that designing inclusive signage at Técnico requires a balanced approach that integrates parallel, bottom-up, and top-down processes.

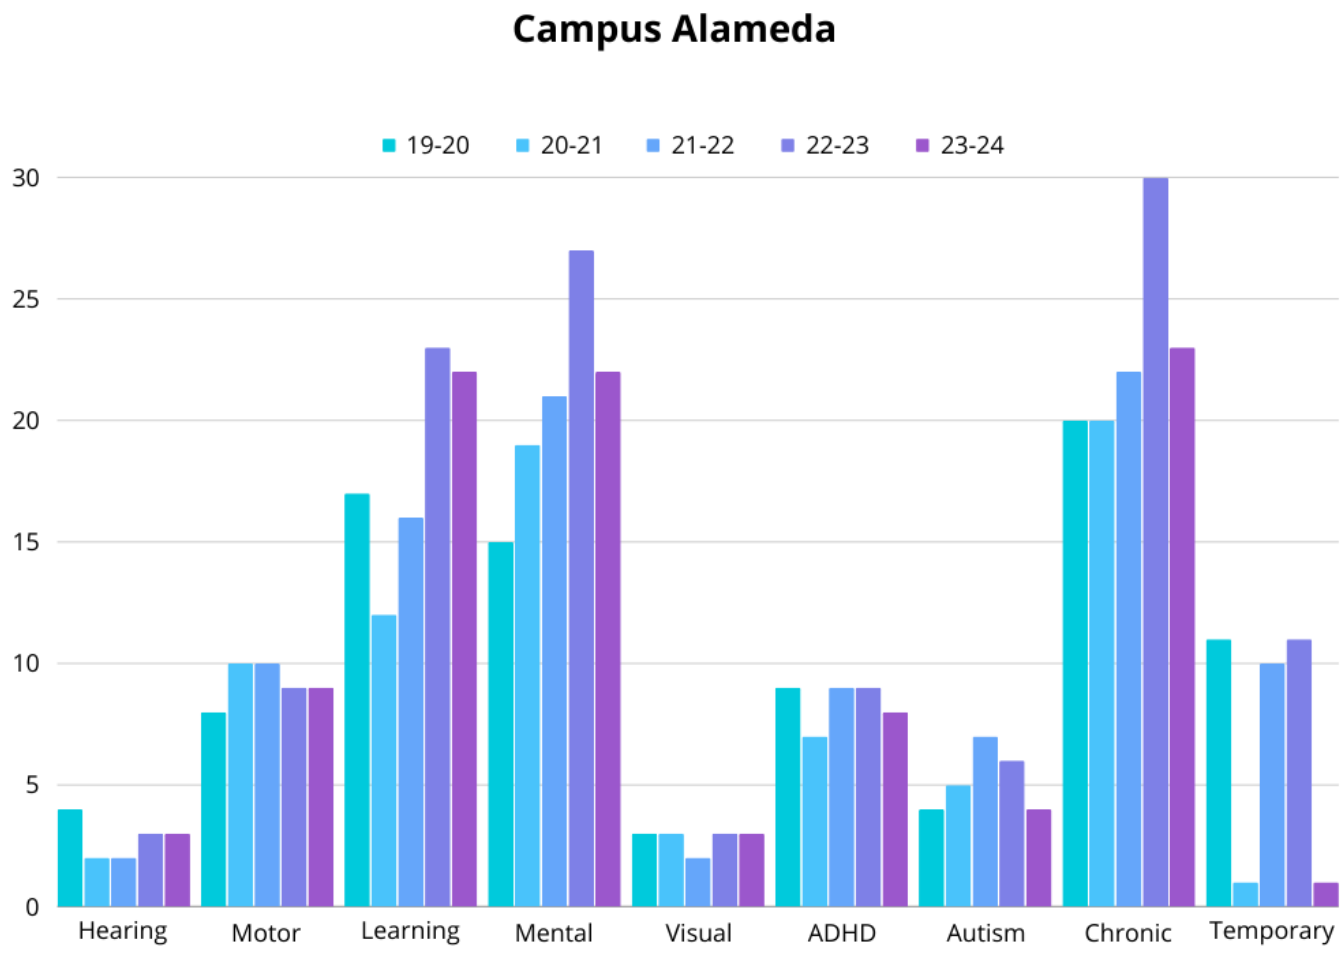

Figure 2. Trend chart students impaired, based over the time interval considered in the study (2019-2020/2023-2024).

Simultaneously, while the analysis of literature and case studies provides an overview of solutions implemented in other institutions, the direct exploratory survey at IST has allowed for an understanding of the specific needs of special needs users within the Higher Education context of IST. The knowledge framework of the institution highlighted the necessity of a participatory and inclusive approach in the design of signage: the importance of integrating the entire academic community in the phases that inform the pilot project of inclusive signage is evident from the analysis of reference writings, just as the urgency to create an internal focus group at the university becomes increasingly clear from the critical analysis of data collected at the institutional level.

The collected and analyzed data refer to the Alameda Campus, where the design intervention is located, covering a period of five academic years (2019-2024) and are related to the distribution over the last five

academic years of special needs cases in the university. The methodological analysis of the data was conducted by discriminating according to the course of study and various impairments according to ten categories of descriptors, including ADHD and learning disorders, motor, visual, and auditory limitations, mental illnesses, chronic and temporary illnesses, and autism.

From the data analysis, a focus group was structured homogeneously to reflect the observed growth trend. The six participants who joined the initiative were carefully selected to represent the categories of impairments with the most significant percentage increase: 35.2% learning disorders, 80% mental diseases, and 50% chronic diseases (the percentage increase is calculated from the academic year 2019/2020 to the last year with finished data (2022/2023), as the current measurement, although relevant, is still ongoing.

The process of forming the focus groups primarily involved the Academic Area Office and required coordination from three other administrative staff members to finalize its organization. The main objective of the focus group investigation was to determine the actual role of signage within the project, considering it not only as a tool for orientation but also as a means to provide information, stories, regulations, and various contents as a mediator between the user and the natural or built environment (Oddone et al., 2021). To achieve this objective, the focus group was organized to establish the most important communicative hierarchies to adopt. The focus group activities were divided into two phases: in the first phase, each member was individually involved in a site visit, while in the second phase, a collective meeting was organized during which various activities were conducted, including exercises to identify examples of accessibility, discussion of critical issues, and brainstorming of key elements for inclusive signage.

Subsequently, the focus group provided a series of fundamental inputs for the creation of a requirement/performance table useful for the implementation of the guideline system. Concurrently, the experimentation of the identified structure is still ongoing in the form of an informal micro-intervention to be placed on the Campus itself.

5. Future Work

As the research evidence obtained thus far concludes at this juncture, the forthcoming steps to be undertaken will be pivotal in informing the subsequent phases of the pilot project: from the analysis of results stemming from the focus group, it will be possible to derive a comprehensive and defined requirements framework, from which to extract the layout of comprehensive guidelines to initiate the design of communicative artifacts themselves. While ensuring the correct level of environmental integration and differentiation, each project should define a reference point from the local context, adding elements of reinterpretation and innovation (Bozzola & De Giorgi, 2017). However, only through a participatory and holistic approach, based on the principles of Universal Design and humanity-centered design, can one aspire to create an educational environment truly accessible to all. This essay has underscored the importance of adopting a participatory and holistic design approach capable of transcending mere integration, aiming to create a university environment that fully respects the needs of all students by promoting practices, policies, and educational environments that are genuinely accessible and inclusive.

About the Authors:

Giulia Beltramino is a PhD student and researcher at the Politecnico di Torino, specializing in Inclusion and Accessibility. Her background in Product Design and Visual Communication, along with further studies in Sustainable Development at IUAV in Venice, inform her work, which is centered on improving accessibility and fostering social integration at universities.

Claudia De Giorgi is an architect and Design Professor at Politecnico di Torino with a research emphasis on material culture and sustainable design, prioritizing a human-centered approach. Leading MATto, she championed regional innovation and was recognized with a Compasso d'Oro ADI mention for "Materialmente" in 2013. Since 2018, she has served as Vice Rector with responsibilities for Equal Opportunities, Inclusivity, and Quality of Life.

Daniela Bosia is an architect with a PhD in Building and Environmental Renewal; she is Full Professor in Technology of Architecture at Politecnico di Torino, Department of Architecture and Design – DAD. Her main fields of research are refurbishment of traditional and contemporary architecture, Humanisation of Healthcare Facilities, accessibility, and social inclusion.

Silvia Di Salvatore has a PhD in Architecture and is a researcher at MARETEC - Marine, Environment, and Technology Centre of IST, Portugal. She is the coordinator of the project "Técnico Sustentável – Ambiente Sociedade Economia", an initiative to integrate sustainability into IST through the three pillars: Teaching, Research, and Campuses.

KEYWORDS | BIODESIGN, BIOFABRICATION, LIVING MATERIALS, REGENERATIVE MATTER, SYMBIOTIC ENGAGEMENT

ABSTRACT | Climate change and natural disasters are causing globally increasing complex issues that require alternative strategies and approaches to design. Addressing the current ecological crisis generates unconventional perspectives that guide research and lead many designers to work in multidisciplinary spaces and collaboration with experts from the biological and natural sciences.

Today we are experiencing the spread of new design practices and approaches such as Biodesign and Regenerative Design, in which, through the integration of biological knowledge into the design process, new research directions and new perspectives are generated for the creation of hybrid artefacts that merge natural and technical systems.

The research initiated in December 2022, conducted at the deMIT 38th cycle PhD, in associated form between the University of Campania “Luigi Vanvitelli” and Iuav University of Venice, aims to critically analyse the intersection of design and biology disciplines. The aim is to investigate how resilient products that respect natural ecosystems and promote ecosystem benefits in urban areas can be developed through the use of living materials.

The research focuses on the development of Nature-based Solutions (NbS) and examines how biofabrication processes, mycelium growth on substrates, and the use of algae and plants can be applied to develop regenerative bio-based products. In particular, it investigates the development of responsive products and systems that can adapt to environmental variations and change their properties in response to specific external stimuli.

The research proceeds and plans to proceed following several phases: preliminary analysis, background, study of the state of the art, formulation of the hypothesis, experimentation and observation, and conclusion. The preliminary phase is useful to define the context of intervention, while the background phase focuses on reviewing the existing scientific literature on the topic. To identify the approaches adopted by designers, the collection and analysis of representative case studies will be started.

The research currently envisages defining the scientific framework of Biodesign practices and developing a BioDesign Tool characterised by a multi-level structure. This tool aims to support designers in the use of biofabrication techniques and facilitate the application of living materials for the development of products capable of reacting and adapting to complex situations in changing environments.

The current hypothesis envisages the creation of an open and scalable conceptual system that will make it possible to organize and make use of the available information. This is aimed at facilitating designers to recognise the specific characteristics of living materials and to design products capable of contrasting changing environmental conditions.

Following the formulation of the hypotheses, the research involves an experimentation and evaluation phase using workshops and tests.

The main objective is to collect data on the application possibilities of the developed model in the design context to formulate conclusions.

These tools could enable designers to acquire skills in the new approach based on cooperation with natural systems and regeneration, overcoming the traditional approach based on the exploitation of resources

1. Introduction: a Necessary Transition

In the current context, it is increasingly evident that there is a necessity to explore new directions of research and to develop actions that aim to effectively address environmental challenges and counter the complexity of ecological issues.
Human activities have caused a series of transformations that impact the entire planet and generate a considerable disruption of ecological dynamics and balance.
The amount of material produced by human activities, known as 'anthropogenic mass,' exceeded for the first time in 2020 the entire living biomass on Earth, which includes plants, bacteria, fungi, archaea, protists, and animals (Elhacham et al., 2020).
To successfully face the challenges of climate change, biodiversity loss, and ecosystem destruction in the coming decade (WEF, 2020), the European Union is implementing policies and plans for ecological transition. In the European Green Deal (European Commission, 2019), development plans converge that set a reference in the resistance to climate change.
Through specific strategies and policies such as the EU Biodiversity Strategy 2030 (European Commission, 2021a) or the EU Strategy on Adaptation to Climate Change (European Commission, 2021b), European governments aim to promote biodiversity and make cities more resilient to climate change.
Furthermore, mitigation and adaptation actions are promoted through the development of solutions that integrate nature into design through Nature-based Solutions (NbS) (EEA, 2021), which are a useful tool to pursue objectives such as the implementation of climate change mitigation actions (European Commission, 2015).

2. Background: Holistic Design Approaches

In recent decades, we have seen a redefinition of the paradigms of sustainability towards a perspective that aims to promote human well-being as well as ecological systems. Current post-anthropocentric visions (Wakkary, 2021) emphasise the creation of prolific systems where progress and improvement are intrinsically linked to the promotion of the health of both human communities and natural ecosystems. In this context, sustainability is no longer seen as a mere adaptation to available resources but as an active commitment to the creation of enabling conditions for interspecies coexistence in the same ecosystem (Latour, 2022).
These attitudes, which encourage an approach of mutual interspecies interdependence (Tsing, 2015), help to promote a deeper connection between society, designed technical artefacts, and the natural environment (Haraway, 2016).
Emerging concepts of sustainability promote a significant transition from an anthropocentric to a more holistic and interconnected perspective through practices that not only mitigate negative impacts on the environment but also actively contribute to the regeneration and empowerment of ecosystems.
The concept of Regenerative Design (Lyle, 1996) represents an approach that attempts to promote material and technological progress toward building systems that prosper in symbiosis with their environment.
This approach aims to guide the development of adaptive regenerative strategies in specific contexts (Gibbons, 2020) to contribute to the long-term well-being of the environment and living systems.
It also (Figure 1.) draws inspiration from the innate capacity of natural systems for self-healing and self-organisation (Mang & Reed, 2020). The methodology addresses the functioning of living systems, attempting to replicate resilience, flexibility, and adaptability. In this sense, biological systems, characterised by adaptive and reactive behaviours developed over time (Haeckel, 1904) and response mechanisms to external stresses and adverse actions (Haeckel, 1866), represent a design paradigm to be investigated to produce artefacts with responsive performance.
To address the complex challenges related to sustainability and the production of sustainable materials, the discipline of design is moving beyond conventional confines, searching for inspiration in the biological models and metabolic processes of nature. To develop new experimental, design, and production scenarios (Oxman, 2016), new practices such as Biodesign (Myers, 2012) emerge, combining design principles with biology, involving living organisms directly in the design process (Myers & Antonelli, 2012).

These are highly collaborative practices (Ito, 2016) that promote multidisciplinary approaches and integrate knowledge and technologies from other disciplines, such as materials engineering and natural and biological sciences, with design (Oxman et al., 2015).
The convergence of design and biology opens new perspectives for innovation and leads designers to access scientific laboratories and equipment (Willet, 2021) and to acquire fundamental skills and knowledge for the integration of biological principles into design (Langella, 2019; Perricone, 2021).
In the last decade, there have emerged several research centers, such as the Hybrid Design Lab, the Material for Transitions (MaDe/Trans), the Wet Lab at the MIT Media Lab, the Waag Society's Open WetLab, the Biodesign Lab, the Atelier Luma, the Biofilia-Base for Biological Arts, the SVA Bio Art Lab, the SilkLab and others, where individuals or organisations come together to collaborate and develop projects through the use of biomaterials and living organisms.
Many designers adopt do-it-yourself (DIY) practices to develop new designs and experiment with alternative techniques. Designers operate in temporary spaces or community bio-workshops, using their design skills to create the tools and machines needed to promote advanced, distributed, and shared production processes (Rognoli et al., 2015).
There is an increasing publication of open-source distributed learning educational programmes that promote recipes and models for the collaborative production of biomaterials through the use of low-tech tools (Ribul, 2013; Duenn, 2018)
At the same time, there is a diffusion of biotechnology movements that aim at the active involvement of ordinary citizens in biotechnology movements, dissemination, and democratisation of biology. Among the community, DIYbio Labs and online bio-networks can be found BioClub, Bioartlab Laboratories Foundation, Biohackerspace, DIYbio, Biologigaragen, DIYbio Belgium, DIYbiosphere, Dutch DIY Bio Group and others (Priola & Manfroni, 2024).

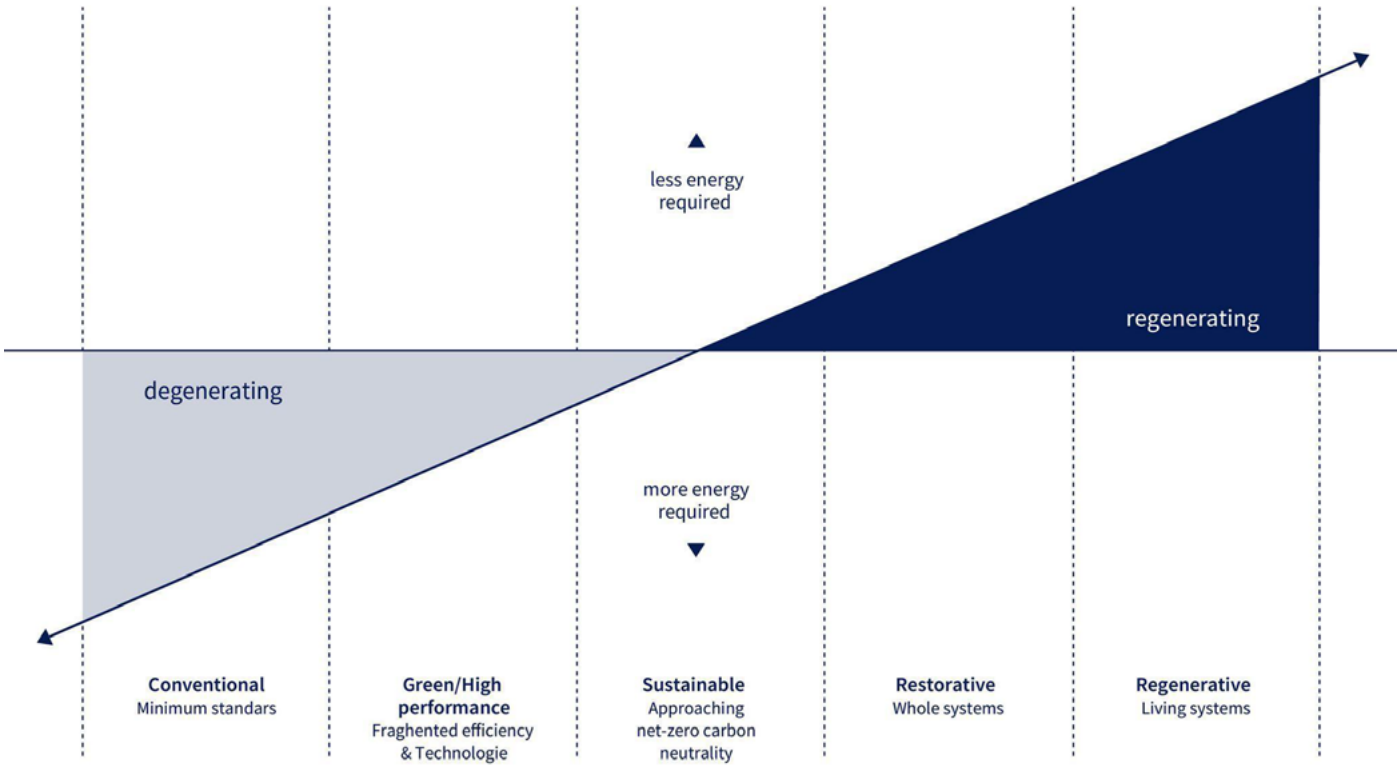

Figure 1. The trajectory of Ecological Design, © Regenesis Group, in (Mang & Reed, 2020).

3. Research Methodology

The research promotes a theoretical and practical change and promotes a design vision based on the interconnection and interdependence between all forms of life and the natural environment. It aims to

examine the intersection between design and biology, with a particular interest in the role of design as a driver of innovation in the development of new sustainable scenarios.
To start a critical reflection on the most recent regenerative research and experimentation practices in Biodesign, this study combines desk and field research methods, which are fundamental to improving the understanding and validity of existing data and results obtained in the different stages of research.
The research focuses on the following primary and secondary questions:

- RQ1. Is it possible to collaborate with living systems and integrate them into the design process to develop products that are biocompatible with changing ecosystem conditions?
- RQ2. Through the adoption of biofabrication techniques, will designers be able to facilitate the development of responsive and regenerative products?

To answer the research questions, it was hypothesised a research approach combining qualitative and quantitative methods, based on the development of six different phases (Table 1.).
Research phases 1, 2, and 3 (Preliminary Analysis; Background; State of the Art) provided an in-depth understanding of biodesign practices in Biodesign, Regenerative Design, and Nature-based Solutions (NbS). The exploratory Desk research approach involved the synthesis of documentary sources, while the literature review consolidated knowledge on relevant topics. The classification and analysis of case studies were crucial to understanding the challenges and opportunities related to the use of biofabrication processes in design.

In the next phase, it is expected to conduct practical experimentation with the prototyping of growth substrates under simulated conditions. Phase 4 (Hypotheses) will focus on the formulation of hypotheses and the development of a BioDesign Tool to deal with complexity in the creation of biofabricated products. Phase 5 (Experimentation and Observation), through workshops and tests, aims to validate the hypotheses by experimenting with solutions in structures that explore the interactions between bio-science and design. Finally, phase 6 (Conclusion) focuses on the discussion of the results that emerged during the research.

Table 1. Methodological approach and research phases.

Preliminary analysis	Context, scope of intervention, questions and research method
Background	Theoretical context framework and review of the Biodesign and Regenerative Design literature
State of art	Classification and analysis of case studies, biofabrication processes, prototyping of living materials substrates and testing in a controlled environment
Hypothesis	Formulation of hypotheses on the phenomenon, development of BioDesign Tool
Experimentation and observation	Experimental verification BioDesign Tool
Conclusion	Processing and delivery of research output

4. State of Art: Living and Regenerative Matter

In recent times, designers have become increasingly interested in investigating new biofabrication techniques to develop compostable and biodegradable materials (Collet, 2017). Bio-based materials (Figure 2.) include living materials, which involve the integration of living organisms and represent alternatives to materials made from fossil sources (Collet, 2021). Organisms such as algae, mycelium, and plants, which are used in these processes, are renewable, compostable, and biodegradable (Trebbi, 2021) and therefore offer new ecological perspectives in product design and production.

In recent years, designers have experimented with project possibilities through the application of alternative biofabrication methods based on living organisms (Cantucci, Ferrara & Lucibello, 2014; Karana et al., 2018; Karana et al., 2023). To identify the relationships and examine the methodological approaches adopted by designers in their research with biofabricated materials, the research identified and analysed international case studies developed since 2010. Specifically, the aim is to provide an overview of the various methodologies adopted in this context and to explore the role that designers play in the use of living materials.

The general objective is to provide an overview of the state of the art by presenting concrete examples and to offer an in-depth interpretation of trends and opportunities. The exploratory approach is based on a desk. Analysis of existing data, which will be organised in a dataset for a more efficient reading of the results. In this specific research phase, there were explored three of the most predominant methods of biofabrication of materials. Example cases were identified for each of the following material categories: algae, mycelium, and plants (Priola 2024). In recent years, algae have emerged as a promising alternative for the creation of products and materials, with examples such as the Algae Platform, Textile Lab, Colour Geographies, and Local Bioplastics developed by Atelier Luma. EcoLogicStudio (Pasquero & Poletto, 2020) contributed to projects such as HORTUS XL Tree.ONE, BIO.tech HUT (Figure 3.) and Photo.Synth.Etica. Plants are the basis of innovative projects such as Microgreen Shoe by Stella Harry Lee (Figure 4.), Rootfull by Zena Holloway, Biolace by Carole Collet, and InterWawe by Diana Scherer.

Mycelium is used to join waste organic fibers. Mogu developed sound absorbing panels, Studio Eric Klarenbeek & Dros the Mycelium Project Print and Grow (Figure 5.), Atelier Luma the Myco Structure, Jonas Edvard the Mycelium: MYX, Sebastian Cox and Ninela Ivaniva the Mycelium+Timber.

5. Conclusions: Current Results, Future Steps, and Expected Outputs

Currently, the doctoral research, which started in December 2022, has completed the phases of reference literature review and classification and analysis of representative case studies, which have enabled the identification of theoretical and methodological aspects related to Biodesign. The future research phases planned are prototyping living materials substrates and testing in a controlled environment, which is necessary to obtain data useful for the development of the BioDesign Tool. The research currently aims to define the scientific framework of Biodesign and provide a broad overview of the most relevant contemporary practices on the application of biofabrication techniques. Furthermore, it aims to develop support tools for designers in the field of creating regenerative products using living materials. The creation of these tools could provide designers with new skills and promote an approach based on cooperation with natural systems. The application of regenerative strategies in artefact development involves relevant considerations. To effectively address current design challenges while providing benefits for society and biodiversity, two crucial aspects in particular emerge.

The first implication concerns the need to take a multidisciplinary view in analysing phenomena and developing design solutions. This requires the adoption of new methodologies and shared operational tools in the development of Nature-based Solutions (NbS) and responsive products aimed at protecting and recovering ecosystems.

The second aspect concerns the consideration of the time factor, which means the period during which the outcomes of the project actions are expected to manifest themselves. To address the current emergencies and produce positive impacts in the medium and long term, it becomes essential to intensify.
project actions. These should not only aim to mitigate negative impacts but also enhance the regenerative capacities of the systems being addressed. This proactive approach prefigures a clear change of vision from the conventional approaches used in the design process, encouraging the development of solutions that can contribute positively to the future well-being of humans and natural systems.

KEYWORDS | SOCIAL ENTERPRISES, THIRD SECTOR, DESIGN FOR SOCIAL INNOVATION, DESIGN FOR SOCIAL ENTERPRISES, SOCIAL IMPACT

ABSTRACT | The current socio-economic complexity and the wide challenges that contemporary times present to design open up new opportunities for research in the field of design for social innovation.
In a perspective in which the dimension of environmental and social sustainability of design now appears inescapable, and in a national panorama characterized by the recent affirmation of the Third Sector and the social enterprises, designers operate strategically within complex design networks, generating not only new social forms but also new organizational models. However, the different activities involved in the social economy seem to face some challenges in the development and scalability of their initiatives. This productive sector finds itself responding to a rapid digital transition and reviewing its offer concerning its services as well as their organizational models. Based on these premises, the design could play a strategic role in promoting a cultural and mindset change in the Third Sector, which would enable the development of services, strategies, tools, and organizational models capable of fostering innovation and providing sustainability in the medium to long term.

The research, launched in October 2022 in the 38th cycle of the PhD in Design Sciences at the Iuav University of Venice, aims to investigate the relationship between design for social innovation and the Third Sector in Italy and, through the mapping of social impact enterprises and initiatives active on the territory, to identify the contribution and possibilities of design within these processes. In particular, from the analysis of the selected realities, it is proposed to investigate how and through which approaches methods, and tools designers operate in this field.

The research methodology conducted an initial phase of defining the scope of intervention, analyzing and reviewing the reference scientific literature relating to the social dimension of the design discipline and the current socio-economic context. The investigation continued through the selection of significant case studies through the use of qualitative methods (Desk Research Analysis) aimed at providing an initial overview. This phase aims to obtain significant data regarding which areas of design are most involved by companies, how designers operate within teams, and how much design-driven innovation is internalized in entrepreneurial processes.

Compared to the reference scientific literature, the research intends to offer an advancement in the knowledge of design methods in the field of design for social enterprises in Italy to describe their characteristics, approaches, and supporting tools. Therefore, to deepen how the design approach can be applied to the model of social enterprises, bridging the many organizational gaps and supporting their social mission.

Therefore, the research aims to elaborate a multi-level mapping of the relationship between design for social innovation and the Third Sector in Italy, which can contribute to determining the relevance of the topic in the contemporary panorama, provide new research perspectives, and support the different actors involved in these processes.

1. Introduction: the Social Economy Paradigm and the Relevance of the Italian Third Sector

The emergence of the Social Economy paradigm (Murray, Caulier-Grice, Mulgan, 2010) is assuming great relevance at national and international level.

The European Commission estimates that every day, around 2.8 million social economy activities in Europe offer concrete and innovative solutions to the major challenges facing our times. This potential can be fully exploited through the implementation of appropriate measures and policies (European Commission, 2021). In this sense, a relevant contribution on the topic was recently provided by the United Nations General Assembly through the adoption of the Resolution "Promoting the Social and Solidarity Economy for Sustainable Development" (United Nations, 2023).

This evolution manifests itself in the development of a broad hybrid zone within the socio-economic context, characterised by the proliferation of organisations capable of producing economic value while maintaining a predominant orientation towards the creation of social value and the pursuit of the general interest (Calderini & Gerli, 2020).

However, the different activities involved in the social economy seem to face some difficulties in the development and scalability of their activities and need more support from institutions to increase the production of their economic and social impact. This productive segment needs a rapid transition to digital and green and to review the offer of its services and organisational models without forgetting the need to value and give non-self-referential metrics to its impact (Giunta, 2023).

According to the survey conducted by Fondazione Italia Sociale, Deloitte Private, and TechSoup Italia (AA.VV., 2021)–regarding the need for innovation by Third Sector organizations–96% of the non-profit organisations surveyed perceive a strong need to innovate, with over 70% stating that they invest in innovation both to improve their product and service offerings and to optimize internal processes.
In both cases, the predominant approach is incremental, focusing on improving or adapting existing offerings rather than introducing new services, products, or processes.

In particular, according to the survey, only 20% of the Third Sector organizations involved claim to adopt service design approaches in the design and organization of their services.

Therefore, if Third Sector organizations want to carry out this task effectively, it is necessary to change, both from a cultural and a mindset point of view, to develop strategies, tools, and organizational models capable of promoting innovation.

2. Approaches and Challenges for Design in the Social Field: Design for Social Enterprises

The analysis of contemporary reality highlights the urgent need for the discipline of design to direct its attention towards current social challenges, actively contributing to the promotion of positive change.
In dealing with the current profound crisis, which brings about major changes in the prospects for socio-economic development, the relevance of design for social innovation (Amatullo et al., 2021) and the social sustainability of design represent indispensable issues for contemporary and future designers (Manzini, 2014). The world today has changed; the complexity of current global and social transformations has grown exponentially, and with it, the responsibilities of designers have increased. To make a positive impact on society, the contemporary designer adopts participatory strategies and practices of collective creativity to cooperatively find solutions with communities and generate new ways of acting (Meroni & Selloni, 2022).
Design for social innovation is a field that relates profoundly to the idea of a transition, as it deals with new

ideas (products, services, and models) that, by meeting society's needs, are capable of creating new relationships and collaborations, in other words, innovations that improve society's capacity to act (Caulier-Grice et al. 2012). Although the question of the social value of design is not a recent issue but a deeply rooted urgency within the design world (Sinni, 2020), the discipline's interest in cooperation with activities oriented towards promoting social innovation, such as Third Sector organizations and Social Enterprises, is more recent. Based on these reflections, the distinctive capacity of design for social innovation to create new relationships between different actors, redefining roles and enhancing competences (Tjahja & Yee, 2022), clearly emerges. In the virtuous dynamic of relationships, social enterprises emerge as key actors, participating both as natural agents of social innovation (TEPSIE, 2014) and as direct results of this dynamic process (Figure 1.).

By interweaving design and challenges of common interest, it becomes clear that it is precisely social enterprises that can effectively address these issues in a 'neutral field' (Figure 2.).

Interest in the field of social design focuses on the development of a recent approach known as 'design for social enterprises,' which aims to integrate user communities as catalysts for change (Selloni & Corubolo, 2017). Design for social enterprises incorporates a wide range of cross-cutting approaches, sensibilities, and tools, spanning product, service, communication, interior, interaction, and strategic design. Among these, service design and strategic design emerge as particularly crucial, focusing on the quality of interactions and the creation of innovative partnerships (Rosini & Barbero, 2023).

However, successful implementation of design for social enterprises requires a systemic approach. Through the combination of design methods and tools, it could support innovation within social enterprises, overcome barriers within incubation programmes, activate local entrepreneurial ecosystems, and enable entrepreneurship that is sustainable over time (Kwon, Choi & Lam, 2021).
Although there is evidence of the positive impact of design on social issues, it is necessary to fully understand how the design approach can be applied to the social enterprise model, bridging organizational gaps and supporting their social mission.

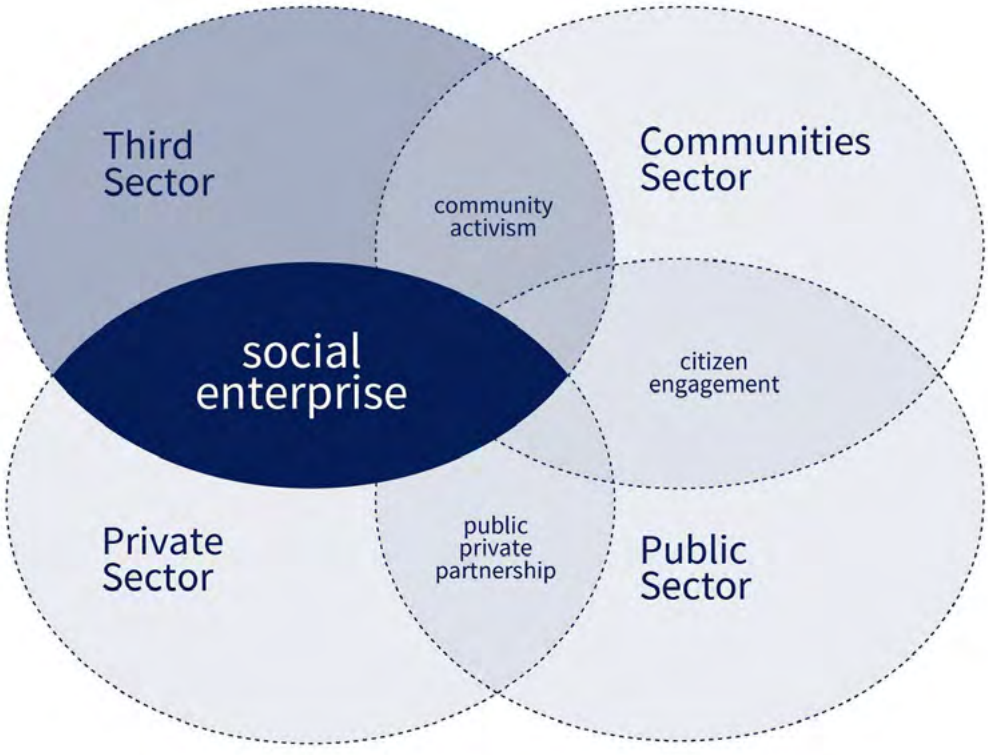

Figure 1. Graphic elaboration from: 'Social Innovator Sectors' (TESPIE, 2014).

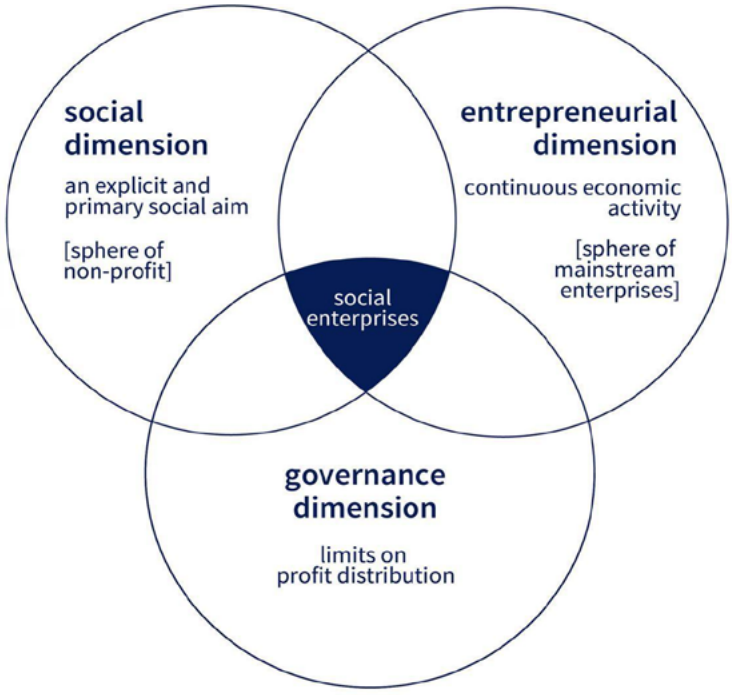

Figure 2. Graphic elaboration from: “The three dimensions of a social enterprise” (European Commission, 2015).

3. Research Methodology: Methodological Approach and Research Questions

The research aims to investigate the relationship between design for social innovation and social entrepreneurship in Italy. In particular, considering the criticalities that the sector encounters in developing longer-term strategies-the intention is to understand how the combination of approaches, methods, and tools related to design can support the development of these enterprises.

The research, therefore, poses the following questions:

1. How does design for social innovation interface with Italian social enterprises and the Third Sector, and what opportunities can be generated?
2. What is the relevance of social entrepreneurship on the national scene, and if or how much design is involved within these processes?
3. What design tools and approaches can be adopted to support and foster the competitiveness, diffusion, and sustainability of social enterprises over time?

To answer the research questions, the research involves advancing according to qualitative and quantitative methods and is structured through the following phases (Table 1.):

Table 1. Research Methodology and Phases.

preliminary analysis	context analysis and definition - scope of intervention	question processing and research method
background	framework and analysis of the scientific field literature	Social Design, Design for Social Innovation, Design for Social Enterprise; Social Economy, Social Innovation, Third Sector, Social Enterprise
state of art	identification and selection of nationally significant (Italian) case studies	social enterprises operating in the field of design for social innovation active in Italy; (desk research) overview
hypothesis	formulation of research hypotheses	definition of analysis tool mapping
testing and observation	field observation in selected realities	focus groups, semi-structured interviews and evaluation workshops; data collection and verification of research hypotheses
conclusions	processing conclusions and output delivery	discussion of results and main findings

Steps 1 and 2 –*preliminary analysis and background*– helped define the scope of intervention and the research topic. A qualitative method was used to examine the relationships between social entrepreneurship and design in both theory and practice.

For this phase of the research, the adoption of an exploratory approach was useful to gather data and information regarding established research and knowledge in this area through the analysis of scientific literature. This phase was useful for defining the state of the art, identifying possible gaps, and understanding possible research opportunities. Phase 3 –*state of the art*– focuses on the identification of significant case studies at a national level through Desk Research, useful to provide an overview of the existing realities in Italy, to which an initial survey questionnaire. It will then be submitted for the collection of primary data, then organised in a dataset. During this phase, ethnographic research will be conducted to understand the real situation in the Italian context. The objectives of this exploratory research are to obtain answers to the research questions and to determine the potential contributions to the study area. Subsequently, based on the established criteria, the most significant realities will be selected in which field research will then be conducted.
Starting with the data obtained from the previous phases, the *research hypothesis* will then be formulated in phase 4. To validate the hypothesis formulated, phase 5 –*verification and observation*– will proceed, during which workshops and tests will be organised, directly involving the previously selected realities. Finally, in phase 6 –*conclusions*– based on the results obtained, the hypothesis will be verified, and research conclusions will be elaborated.

4. Design and the Third Sector in Italy: an Initial Overview of Case Studies

In recent years in Italy, the phenomenon of social impact entrepreneurship has seen a great increase. The outcome of this process is generating a space in which profit and non-profit logics converge, generating a multiplicity of hybrid combinations (Symbola Foundation, 2021). This mapping of design in the Third Sector focuses on the Italian panorama and, through a qualitative-quantitative analysis of design in social impact entrepreneurship processes, aims to understand the relevance of design in this sphere and whether and how the combination of approaches, methods, and tools about design can support the development of such enterprises. In particular, it aims to collect information regarding:

- what is the legal status of the entity (non-profit, mutual, for-profit), and how does this influence the adoption of the design;
- in which areas of design innovation is mainly played out (product, communication, service, and strategic, space, digital, fashion);
- how designers are involved by companies (non-design; design as a driver; design as a process; design as strategy) (Danish Design Centre, 2015);
- how much design-driven innovation is internalized in business processes (in-house, outsourcing, quasi-in-house).

From the analyzed overview, the research identifies four typical modes of interaction between design and the Third Sector (Table 2.): (1) design of, (2) design for, (3) design with e (4) design and:

1. the organization is a social enterprise or a Third Sector entity that is involved in the design and production of products, communication artefacts, and clothing, and it involves designers in its team (*design of*);
2. the reality is a social impact enterprise (for profit) that is based on design and provides design support to the Third Sector through the tools and approaches typical of service design and strategic design (*design for*);
3. the initiative promotes programmes facilitating the matching between the Third Sector and designers, helping to increase the recognizability of the figure of the social designer and the valorizations of their skills (*design with*);
4. the reality develops multidisciplinary incubation processes aimed to finance and grow the social enterprise and enable its development through the adoption of design tools and/or the involvement of designers (*design and*).

As for the *design of* category, the study is investigating realities such as *Terra di Tutti*, a social enterprise specialising in the creation of products from recycled materials, which involves people from migratory backgrounds, social workers, and designers in craft workshops of creative reuse (Figure 3.); *Laboratorio Zanzara*, a social cooperative that encourages integration between designers and people with cognitive and motor disabilities. The designers develop products and communicative artefacts from the ideas of the people involved, which are then marketed in their shop(Figure 4.); *Quid* is a social enterprise that designs and produces clothes from discarded fabrics (95% from fashion surpluses), including people from pathways of labour fragility (60 % of employees). The *design for* category includes companies such as *Studio Shift*, a benefit company that provides research, eco-social business, and design-driven consultancy services for social enterprises and third-sector organizations; *Lama Impresa Sociale*, collaborates with enterprises, institutions, and the third sector to design sustainable processes and services, using design thinking and co-design in complex contexts; *Social Seed,* a company that, through the combination of different skills and approaches to design, supports and experiments with innovative solutions with social enterprises and Third Sector organizations. The *design with* category includes initiatives such as the *Bando Wonder*, aimed at designers and third sector organizations to foster the hybridization of skills, strengthening the connections between the two worlds to generate social innovation; *Design Sprint for ETS*, a project that has planned three co-design events on social innovation topics in 2023, to bring together young designers with expertise in Strategic and Service Design with three Third Sector organizations.

In the *design and* research category, the research is mapping realities such as *SocialFare*, a social enterprise that offers expert consultancy programmes for Third Sector organizations wishing to develop social impact projects in their territories, combining design approaches; *Avanzi-Sostenibilità per azioni*, operating as an ecosystem dedicated to social innovation, is committed to promoting the development of Italian companies facilitating initiatives and actively involving stakeholders.

5. Current Results, Expected Outputs, and Future Perspectives

The panorama outlined here is a partial outline of the realities mapped to date, and its dimensions go beyond what has been presented. The research, launched in October 2022, has completed the first phase of analyzing the relevant scientific literature and the state of art through the identification of 60 significant case studies, which were useful in focusing on and understanding the relevance of the topic.

In the future phases, the research will focus on an in-depth analysis of the cases identified in line with the objectives set through the elaboration of a survey questionnaire to be administered to the selected realities to collect the necessary data. In addition, exploratory interviews will be conducted with experts on the topic to identify their role in the development of social enterprises, explore their awareness of the relevance of design, and understand their relationships with other organizations to further develop the mapping and launch further investigations.

The expected research outputs, therefore, aim to provide an advancement of knowledge on the topic of design for social enterprises in Italy and to understand whether and how a design-driven approach could enable organizations to design solutions in a radically different way. However, in assessing the opportunity to connect the non-profit world with the discipline of Design, it is appropriate to identify new directions of development for social enterprises and to expand the recognition of the professional figure of designers working in this field. It is also essential to orient organizations to recognize the relevance of design practice so that it is no longer understood as an occasional activity but as an integrated practice in business activities. In this sense, the aim is to highlight the need to promote widespread awareness of the crucial role of design in the field of social enterprises and the centrality of this issue in the Italian landscape today. Design emerges in this sphere as an essential vehicle for rendering tangible visions of plural futures and bringing such futures to life, creating new ways of exploring and experimenting.

KEYWORDS | PUBLIC SPACES, PARTICIPATORY DESIGN, URBAN ENHANCEMENT, CITY IDENTITY, CIVIC ENGAGEMENT

ABSTRACT | The article addresses the value of participatory design as a methodology to be applied in the enhancement of a territory's cultural heritage and its urban public spaces. The goal is to preserve and promote territorial identity, transforming public spaces into inclusive and vibrant community places that stimulate social interaction.

Urban public space has a significant impact on people's quality of life, contributing to the formation of a community and the dissemination of culture and civic identity. Therefore, through participatory design, the community can closely collaborate with the design team to develop site-specific solutions that respect the characteristics and needs of the local community.

Co-design processes foster mutual learning: the community shares its knowledge and experience, allowing the designers to fully immerse themselves in the territory and its peculiarities. Concurrently, designers contribute to increasing the community's awareness of the value of its cultural heritage and community places. The community does not always recognize these values, which often remain undervalued and underused. For this reason, participatory design aims to overcome this challenge by involving the community in the design process.

The article examines two case studies - Restanza Workshop and RAISE innovation ecosystem - to further explore the role of participatory design between the past and the future and demonstrate how important it is today to generate new processes of territorial and cultural rediscovery and valorization.

1. Introduction

Participatory design is configured as a key methodology to implement during the regeneration and enhancement processes of a territory, its cultural heritage, and its urban public spaces (Gehl, 2010). It is presented as an activity that transcends the mere rational resolution of urban needs; rather, it is a reflexive practice that facilitates both the construction of relationships between stakeholders as well as the creation of new opportunities that positively impact society (Meroni, 2019; Meroni, Selloni, 2022). This methodology, if applied during the various stages of the design process, can foster the creation of more democratic, proactive, and inclusive societies, where the result is not only the realisation and implementation of new products or services but also and, above all, the value of the collaborative process that takes place during their design (Bannon, Ehn, 2012).

Urban public space, as a place of community and a stage for interaction, plays a crucial role in people's quality of life, contributing to the rediscovery or construction of a sense of community, culture, and civic identity (UN-Habitat, 2016). Therefore, its enhancement not only increases its physical and social attractiveness but also contributes to the psycho-physical well-being of the community.

In this scenario, participatory design becomes a precious resource to the community, which, actively involved in the design process and supported by the design team, designs specific solutions that reflect the local context. During participatory urban design processes, mutual learning and enrichment take place: the community, by sharing its experience with the designers, enables them to acquire new knowledge, while the latter, through deep observation and immersion in the context, contributes to increasing the community's awareness of its own cultural heritage and collective spaces.

In fact, despite the wealth of stories, culture, memories, and traditions of a specific place, the community does not always fully grasp the intrinsic and intangible value of its heritage and social spaces, thus not realising that preserving these values is crucial to passing them on to future generations. In co-design processes, therefore, designers assume the role of facilitators, directing and enabling the conditions whereby collaboration between multiple heterogeneous actors can take place (Chambers, 2002).

Notably, since an in-depth knowledge of the local context becomes fundamental for site-specific projects (Tamborrini, Strabellini, 2018), they support the community in highlighting not only the issues but also the potential of its territory, which is an essential value from which to start to intervene on urban public spaces.

The importance of participatory design in territorial valorisation processes emerges in the analysis of two case studies of urban co-design, chosen as exemplary experiences among those in which the author personally took part during her PhD research: *Restanza* workshop, focused on the rediscovery of traces of the past; and *RAISE* innovation ecosystem, aimed at the creation of Smart Cities, on which the author works with the Design research team of the University of Genoa.

2. Restanza Workshop

Restanza represents a paradigmatic experience of participatory design aimed at exploring and enhancing the rich cultural and territorial heritage of the small medieval village of Terzorio, located in the hinterland of the province of Imperia in the region of Liguria. The entire project was curated by a group of PhD students and researchers in design and landscape architecture from the University of Genoa as part of the "*Alfabeto d'Entroterra*" project promoted by the Associazione Radice Comune and winner of the Compagnia di San Paolo Foundation's call for proposals "Guidelines for collaborative practices of active civic participation," obtaining funds for the territorial regeneration of the village.

The title of the workshop emphasises the feeling of being both anchored in a place and disorientated and acting consequently in such a way as to protect it and, at the same time, radically regenerate it (Teti, 2022), working in a direction that counteracts the depopulation of villages.

Indeed, the workshop took place in this village as it was an ideal place to launch a participatory process of territorial regeneration. It is a town with approximately 230 inhabitants, rich in traditions to be perpetuated, stories, and natural beauty, whose peculiarity lies in its immense quietness due to the total lack of services, which had to close during the Covid19 pandemic, leaving residents and tourists without indoor places to socialise and spend their leisure time.

The only public space potentially accessible to the community as a new meeting point was the lower floor of the Medieval Tower, a place where, until a few days before the workshop, there was the village's historical documentation archive, which was in a decidedly dilapidated and irretrievable state due to neglect and infiltration of the Tower.

For the aforementioned reasons, the workshop aimed to promote the territorial regeneration of the village, starting from the enhancement of the cultural heritage, the natural landscape, and the Medieval Tower, the identity symbol of Terzorio, which currently houses the council chamber on the upper floor and a space to be reused and made available to citizenship after the removal of damaged documentation, on the lower floor.

The four-day workshop was held in December 2023 and involved twenty participants from all over Italy, including designers, students, PhD students, and professionals, who stayed in the small village for the entire territorial regeneration process to connect as much as possible with the territory and the local community. A few days before the workshop, the organizing team, supported by the municipal administration, publicized the initiative that would be held shortly thereafter to recruit as many citizens as possible to participate in the project. Thanks to the great ferment in the village, the recruitment phase was easier than expected. From the beginning, some members of the citizenship enthusiastically joined the already large group of participants, thus creating an interdisciplinary co-design team (McKercher, 2020) of about thirty people.

On the first day, through a series of inspections and interviews with citizens (the ones already in the team and others who met in the village streets), the process of documenting, reconstructing, and preserving information on Terzorio's tangible and intangible heritage began. After collecting the data, the hybrid team conducted a focus group during which, using brainstorming and a large canvas to be filled in with post-it notes, four themes of interest were identified: the emblematic stories of the village, places of sociability, rites, and rituals, and culinary traditions, inserting as much information as possible for each category.
As a result of this process, the hybrid team was able to retrieve and map the historical memories and local traditions of Terzorio, which were the foundation of the work that was to follow.

Over the next three days, the co-design team, according to the inclinations of each participant, divided into three sub-groups:

- Graphic Communication: directed by the graphic designer Mauro Bubbico, the participants explored and elaborated the information related to the four topics of interest, creating for each of them a small booklet to be donated to the community as a sign of a rediscovery of cultural heritage and strong territorial identity;
- Land Art Performance: led by landscape architect Fabio Manfredi, the team conceived, realized, and filmed with a drone a symbolic performance among the water cisterns on the Terzorio hillside. It involved all workshop participants and citizens who had not yet taken part in the experience, leaving them an aerial film to rediscover the local tradition of water rationing as well as the beauty of the natural landscape;

- Community furniture creation: supervised by designer Francesco Fusillo, the group applied their know-how to design and construct furniture for the Medieval Tower, starting from simple wooden boards. Benches, bookcases, tables, stairs, and coat racks gave new life to the disused ground floor of the Medieval Tower. Moreover, technical drawings were made for each piece of furniture and were donated to the community to enable them to make new furniture equal to that designed together.

Ultimately, the co-design activity encouraged the creation of a custodian community capable of rediscovering, documenting, and handing down its cultural heritage while at the same time enhancing the space of the Medieval Tower with artefacts that make a place that has long been inaccessibly usable, thus leading to the revitalisation of a village that seemed hibernated in time.

3. RAISE Ecosystem

RAISE innovation ecosystem, an acronym of 'Robotics and AI for socio-economic empowerment,' conceived by the National Research Council, the Italian Institute of Technology, and the University of Genoa, financed with MUR funds through the PNRR for the three years 2023-2025 and coordinated by the Liguria Region, aims at promoting regional and national cooperation between the research system, the production system and institutions through the design and commercialization of technological solutions based on robotic systems and artificial intelligence.

In this perspective, RAISE, by actively involving its local resources and expertise, enhances the strengths of the Ligurian territory, responding to the real production and social needs of the Liguria region.

In this project, the research group of the Department of Architecture and Design of the University of Genoa - of which the author is a member - composed of professors, researchers, and PhD students in urban planning, sociology, architecture, and design, participates in Spoke 1 "Accessible and Inclusive Urban Environments and Services," which intends to design and implement intelligent and responsive technologies, devices and services for the urban context, to empower the usability of urban services and increase the perceived sense of wellbeing in city life; in detail, the interdisciplinary team is working on work package 5 "From inclusive technologies to inclusive smart cities," focusing on the identification of design solutions to implement urban regeneration strategies through the active involvement of citizenship in the design processes and a fruitful interaction with public administrations.

During the first year of the project, further to the desk analysis preparatory to the in-depth study of the reference framework concerning urban furniture, installations, smart and responsive products and services for a more inclusive, active, and attractive urban space, both from a physical and social point of view, the UniGE-dAD team started a field analysis focused on the detection of the needs and requirements of residents in the urban environment, by carrying out the *ResponsiveSpaces* workshop. To conduct this analysis, the district of San Salvatore in the municipality of Cogorno, in the province of Genoa, was identified as ideal as zero case study thanks to its heterogeneous characteristics.

San Salvatore is a small-sized urban context, which can be assimilated to the urbanistic concept of the 15-minute city, according to which all the main daily needs of residents can be met by walking or cycling within 15 minutes (Moreno et al., 2021; Manzini, 2021). Moreover, the entire area is particularly interesting as it has numerous services, commercial activities, sports facilities, cycling and nature trails, and historical and ecclesiastical buildings, which make it versatile for analysis in various contexts. Due to its diversified urban structure, the area is well suited to become an incubator for urban prototype solutions that use robotics and artificial intelligence, which can also be subsequently replicated and declined in other contexts of the Ligurian territory. In addition, in the San Salvatore area, there is also the diocesan campus ‘Villaggio del Ragazzo,’ a large organisation that manages educational, social-health, labour, and vocational training services, which has offered its spaces for possible prototype experimentation. Initially, the interdisciplinary team made on-site visits to observe and extrapolate the strengths, weaknesses, opportunities, and threats (SWOT) of the area examined. Subsequently, the *ResponsiveSpaces* workshop was held to identify the major criticalities and needs and possible solutions or wishes of citizens. Around forty stakeholders from the area, citizens, users, or workers in the ‘Villaggio del Ragazzo,’ members of the local administration, and members of the PAs of the surrounding towns actively participated in this workshop.

Initially, the participants were interviewed one by one by the researchers through semi-structured interviews aimed at extrapolating the major needs in the urban environment; subsequently, several focus groups on specific topics were carried out to reason together on which needs to intervene and to think about solutions and design scenarios to be launched with the community in the next months. Ultimately, the active involvement of citizens in this preliminary phase was essential to understand what needs should be met by intelligent and responsive urban devices and furniture and to define a common vision on the next steps to implement.

Figure 5. A focus group with San Salvatore citizens, students, and frequenters of the 'Villaggio del Ragazzo' during the *ResponsiveSpaces* workshop.

4. Conclusions

The successful implementation of participatory design in both case studies generated significant civic engagement for the community, progressively triggering fruitful community reactivation and empowerment (Selloni, 2017), regardless of the outcome obtained.

Within the *Restanza* case study, community involvement was indispensable for the creation of a 'caretaker community' committed to the reconstruction and preservation of the community's historical memory. This approach was an effective tool to mobilize citizens to preserve the past and their cultural heritage while promoting a sense of territorial identity and revitalising community life. In addition, the handing back of the Medieval Tower to the community and its furnishing had a positive impact on the entire village, since today it has become the main meeting point for citizens and local associations.

This workshop has proven to be a successful intervention in the discovery and re-appropriation of territorial peculiarities, so much so that it could become an exportable and scalable model for those villages presenting analogous conditions.

In the RAISE project, on the other hand, the involvement of local stakeholders in the empathisation phase with the territory and the users' needs by carrying out focus groups favored the sharing of future visions for the use of the collective spaces of the Villaggio del Ragazzo and its surroundings. In the next phases of the project, participatory practices will intensify as smart site-specific furniture will be co-designed, prototyped, and tested. This process will lead to the realisation of an urban project that will see intense civic engagement and the building of a more cohesive community aimed at fulfilling the same goal.

Ultimately, the active participation, enthusiasm, and, at times, emotion on behalf of the community members during both participatory processes testify to the effectiveness of this methodology aimed not only at enhancing the cultural heritage and urban public spaces but also at increasing a sense of community, new opportunities, and greater community well-being.

ABSTRACT | In the information age we are living through, marked by increasing complexity and rapid changes in social and technological contexts, the ability to understand and face reality must always be challenged and nurtured. As humans, the need to dedicate time to lifelong learning of the self is more critical than ever, and there is a need to invest time and resources in improving the education offered by the public sector.

The aim of the research is aimed at assessing the potential role of designers - by nature multifaceted and transdisciplinary - in the ongoing changes in the learning society. Specifically, it aims to study the integration of design methodologies in educational programs dedicated to lifelong learning (LLL) and the development of soft skills aimed at stimulating logical-critical thinking and awareness of one's learning process. A secondary objective moves from problematizing the impact of Service Design and aspires to align design pedagogy with the needs of the public sector.

The preliminary analysis of the existing literature in education takes the European context into account and examines both the push for standard-setting in teaching and assessment from a collective perspective of aligning the skills needed to prepare for the labor world and the opportunities for profiling and adaptability brought by technological evolution. Moreover, from the primary study on the state of the art of designers in the public sector, an imbalance is highlighted between the expectations of service & systemic designer training and actual integration into the job market, even though especially in education-new job figures such as the instructional designer are becoming more popular.

The proposed methodology for initiating the research articulates operations in three phases, each of which envisions expected results. The first phase makes use of tools such as desk analysis and survey research to identify gaps and needs in LLL and soft skills growth programs; the second phase synthesizes in a diagram the intersections between the linguistic analysis of the training objectives of a corpus of design curriculum, the impressions of teachers and learners that emerged from focus group sessions, and the public sector needs found in the first phase; the third phase is concerned with the development through co-design and evaluation through user testing of design-to-public sector bidirectional instructional unit prototypes. By examining the intersection of design and education, this study seeks to elucidate the significance of the designer's role in shaping educational experiences. It also draws parallels with historical movements to contextualize contemporary efforts to innovate educational practices.

In conclusion, doctoral research aims to improve the expertise of design students to prepare them to encounter work in the public sector and aspires to foster interdisciplinary exchange between disciplines, too, first of all, individual and consequently relational and collective improvement in the complex society.

1. Introduction

The world we live in is becoming an increasingly complex and rapidly growing technological ecosystem that risks eluding human understanding (Han, 2022). Approach to reality is as changeable and uncertain as is the infosphere (Floridi, 2020a), and the challenges brought by the information (Fischer, 2000) invite us to never stop our learning process. In the learning society (Field, 2000) in which we are situated, it is necessary to "promote a knowledge capable of grasping global things" (Morin, 2001, p.7).

The need for continuous learning and skill development is more critical than ever. There is a need to "pursue our pedagogical effort" (Meadows, Meadows & Randers, 2022), going beyond the current educational system (Morin, 2015), to provide skills suitable for governing complexity (Gorzeń-Mitka, 2015). In this process, the impact training of educators is imperative due to the transition of the teacher into the role of capacity builder (Black, 2003).

Stating its nature as a complex phenomenon (Avilés, 2023), an urgent field of intervention is education. Traditional educational approaches often fall short in preparing individuals to navigate this complexity, particularly in the workforce of the public sector, where technologies advance rapidly (Farias-Gaytan, Aguaded & Ramirez-Montoya, 2023), while human skill development lags (OECD, 2023a).
Especially in the area of services and information offered by the public sector, workers face "an accelerating rate of change in the knowledge and skills necessary to remain competitive" (Fischer, 2000), and it becomes crucial to train proactive figures capable of empowering, not just teaching.

With its hybrid nature as a third culture (Cross, 1982) agent, the approach of design can become an active actor in this changing process to educational approach and skills development.
This research project aims to explore the multifaceted role of designers in addressing these challenges in the public sector, focusing on two main areas: the integration of design methodologies in educational initiatives to foster lifelong learning (LLL) and soft skills development and the advancement of design pedagogy to better match with public sector needs.

2. Literature Review

2.1 Transformations in the Public Education Context

Since 2018, the European Union has set out guidance for educational operators (e.g., teachers and policymakers) to foster the development of lifelong learning pathways. Eight key competencies have been stated for the structural education of any learner, from primary school to adult and lifelong learning (European Commission, 2019).

The indicated competencies mainly focus on strengthening soft skills suitable for providing the basis "for developing one's knowledge and potential and for participating in society" (OECD, 2023b). The goal of any educator should be to stimulate a critical, resilient learning process (Bocciolesi, 2017), capable of dealing with any change with a systemic vision, given the extremely volatile nature of the labour market nowadays (European Commission, 2011).

Specifically, the three main soft skills identified by the Organization for Economic Co-operation and Development are Curiosity, Systematic Thinking, and Learning to Learn. The latter refers to awareness of one's degree of knowledge and self-organization of one's learning process (Freitas, 2021). Consequently, the directionality of pedagogy is overturned: the learner becomes a trainer of himself, and the teacher "must never degenerate into automatism" (Lucisano & Salerni, 2022, p.27), considering himself a learner to evolve.

In this scenario, assessment models are also being standardized: Bloom's Taxonomy (Bloom, Engelhart, Furst, Hill & Krathwohl, 1956) is a benchmark metric in the assessment of learning objectives described in a formative curriculum. Demonstrating the importance of the Learning Learn soft skills, in one of its latest revisions, Bloom's Taxonomy was updated with the addition of the criteria Metacognitive Knowledge, which states as follows:

> "Metacognitive Knowledge is importance of students being made aware of their metacognitive activity, and then using this knowledge to appropriately adapt how they think and operate." (Krathwohl, 2002, p.124)

While on the one hand, there is a tendency towards the standardization of competencies and assessment models, on the other hand, technological trends are pushing towards the customization of digital training environments (INDIRE, 2023), as well as the emergence of adaptive ecosystems capable of enhancing the individuality of each learner.

2.2 Wicked problem in Design Curricula for the Public Sector

In front of a scenario that is complex, technological, and heavily saturated in innovation, design has always shown itself to adapt "to embrace the theoretical and methodological premises that have enabled innovations" (Riccini, 2013, p.41).

Although designers have begun to be involved in policy-making strategies, there is still a gap between service & systemic design graduates' preparation and actual integration into the job market (Morelli, 2021). Service design can be seen as the framework that has undeniably led to a democratization of design mindset in contexts other than design, but which is nevertheless experiencing a wicked pedagogy problem (Schell, N.D.) for the following reasons:

- risk of reducing the action of design and planning to a form of 'toolism,' i.e., the use of tools not adapted to the needs of the learner or the context (Auricchio & Göransdotter, 2021);
- risk of homologating design methods (Auricchio et al., 2021), disregarding the cultural and ontological differences that could instead enrich the debate and development of methods and thinking in design in general;
- design thinking is often applied in quick sessions but is hardly ever chosen as a long-term training practice (Schell, N.D.)

Furthermore, according to reports from the Service Design Network (Mager, 2016), no discipline specifically trains designers to interact with the public sector.
Yet, given the social and public benefit mission aimed at training the workforce that will need to integrate with the economic sectors of the future, design universities should be one of the key stakeholders in the public sector.

Given these challenges, we need to understand whether universities that offer courses of study in the domain of design, either systemic or service design, are ready to prepare their learners for the encounter with work in the public sector. To validate this, it is necessary to assess both the effectiveness of design methods (Cash, Daalhuizen, Hekkert, 2023) and the learning objectives oriented towards both hard skills and soft skills provided by universities of design (Soares, Carvalho & Dias, 2020). In this search for a pedagogy of design, a possible method of exploration should start from an accurate study of the foundational principles expressed by the founders of the Italian design education (Pansera, 2015). According to Aldo Calò, a school of design should

> "arouse in the students a technological problem that puts them in a position to organize technical-scientific data according to concepts of form and content" (AA.VV., 1972, p.45)

Recalling the demands of European standards concerning teaching strategies to reduce functional illiteracy (United Nations Development Programme, N.D.) and to improve logical skills required by STEM programs.

Only recently, in both the private and public sectors, there has been a growing demand for instructional designers (Fondazione Scuola Beni Attività Culturali, 2024), professionals skilled both in structuring formative content and taking into account their technological implementation.
Understanding whether this trend will be able to take hold in the long term will be important, assessing whether the designer can coordinate and design a learning process. It is essential to understand whether the design has the right credibility to enter into Lifelong learning-oriented programs and the development of soft skills learning paths.

Taking into account the considerations expressed so far, the questions of this doctoral research are the following:

1. Which are the competencies suitable to support the transformation in education by the public sector?
2. Is the designer able to coordinate and design a learning process?
3. How could a designer be trained to support education programs in the public sector?

3. Methodology and Expected Results

To attempt to answer the research questions, the doctoral research is planned following this three phases methodology:

1. Understanding and revealing opportunities
   - Desk analysis and case studies analysis to define a taxonomy of programs of lifelong learning currently carried out in the public sector to foster the development of soft skills in Europe.
   - Choice of three fields of intervention (e.g., policy-making, culture, tourism, justice, health) as research samples, according to which sectors are most in need of soft skills.
   - Survey research to at least one hundred operators from each sampled area in the public sector to detect needs and gaps in current programs.
   - Qualitative interviews with a sample of at least five HEI teachers from each European region to detect opportunities and challenges.

2. Comparing and mixing
   - Language analysis of a corpus composed of a collection of learning outcomes extracted from HEIs study programs in service and systemic design to map the competencies with which design students in Europe are being trained.
   - Diagrammatic model to match goals and needs of competencies revealed by the analysis of the sectors and the competencies revealed in design curricula.

3. Modeling, exchanging, and integrating
   - Pilot of an instructional unit created ad hoc for public sector audiences through co-design techniques with design educators, stakeholders from the public sector, and specialists identified in the previous stages.
   - Pilot of an instructional unit created ad hoc to enhance the curricula of design HEIs and aimed at preparing for work in the public sector through co-design techniques with design educators, stakeholders from public sector, and specialists identified in the previous stages.
   - Prototype development of hybrid environments made by a set of physical and digital products useful for pilot testing.
   - User test to evaluate the prototype and define improvements and scenarios of the model.

At the end of the research path, the expectations are to have investigated how the figure of the designer can be promoted within the public sector and conventional educational environments and to assess the state of the art of design pedagogy in Europe.

4. Conclusion

To conclude, following the steps of this doctoral research could be a stimulating trigger to question the impact of design, even if the inadequacy of design to deal with such a complex context as the public sector, which is different from the private sector with which it is accustomed to deal, might emerge. The scenario envisioned highlights how the role of the designer in the public sector, as a designer of experiences, services, interfaces, physical or digital products, and as an intermediary with data, assumes ethical and political significance. The designer can contribute to creating relational spaces of education and participation in which the user is seen both as a “collective subject" (Deni, 2021, p.63) and as the custodian of his or her own “individual human project” (Floridi, 2020b, p.24). The conjunction between design and pedagogy is in the common nature of applied science: just as the educational decision calls into question a multiplicity of knowledge and sciences with their autonomous statutes (Lucisano et al., 2022), the study and practice of design has resorted to the adoption of different sources and subjects (Pansera, 2015). Nevertheless, it could be pointed out that this is not the first time that these two disciplines have been tried to be juxtaposed. In the 1970s, the radical design and educational movement Global Tools proposed experimental and innovative teaching methods driven by the idea that "life is a permanent and global education" (Borgonuovo & Franceschini, 2018, p.4). Designers should constantly go in search of comparison with other disciplines and present themselves with pride, listening disposition, and respect in disciplinary contexts where so far they are not recognized.

KEYWORDS | SMART TEXTILE, HEATED GLOVES, 3D KNITTING TECHNOLOGY, 3D SCAN, WELL-BEING

ABSTRACT | One of the long-term goals of smart clothing is to adapt the human body, just as regular clothing does. Looking at smart garments from the perspective of their entire life cycle is necessary for their sustainability. 3D technology can be a suitable choice due to its variability and adaptability. The main concept of my paper is the design of two independent gloves, where the subtle inner layer is heated, and the outer one is changeable (sky gloves, city gloves., etc.). The first crucial goal is a suitable solution for integrating the conductive paths without interrupting the yarn is crucial in the research and development of smart heated knitted gloves. The conductive path needs uniform resistance. The conventional knitting technique is not suitable for our goal because the heated segment must be divided into several areas of particular gloves. It means there are some interruptions of the conductive path. A 90° rotation of the glove could solve this problem. The second essential part is to knit the gloves to the customer's specific requirements. It is crucial that the gloves fit perfectly and there is no unnecessary heat loss. 3D scanning obtains data about dimensions and shapes. The following converting into knitting language using a compiler could be a very useful solution. The importance of the compiler is even greater when making gloves for people with atypical dimensions anomaly or people with vascular diseases (Raynaud's syndrome, etc.).

1. Introduction

Smart textiles are an interdisciplinary field where products have to meet a large number of parameters to have the potential to achieve competitiveness. 3D knitting is a very effective and variable technology to produce traditional garments and clothing accessories, but it appears to be a great opportunity for the production of smart garments and smart clothing accessories as well. The advantage of 3D technology is the highly efficient production with minimal waste; garments are fully formed, eliminating the need for sewing and other manufacturing operations. The disadvantage is the difficult and time-consuming programming requiring highly skilled and experienced personnel.

This work focuses on smart heated knitted gloves designed for individuals with vascular diseases, such as Raynaud's syndrome, as well as to increase thermal comfort for sport and everyday gloves as well as work gloves and gloves for well-being. In developing knitted heated gloves, it is necessary to knit a conductive heating element with the uninterrupted yarn. The pattern of the glove is also significant. Most heated gloves are very bulky. The developed glove is intended to be used in the so-called layering approach. It means creating a very subtle inner glove with a seamlessly integrated heating element. It will be possible to wear any other glove over the inner glove, e.g., knitted or woven city gloves, ski gloves, work gloves, or rescue gloves. That´s the reason why the developed heated glove needs to be tailored perfectly. In the field of smart textiles, customization, and personalization (Arora et al., 2008) are necessary features, especially for some products in the field of rehabilitation. (Kettley, 2016) The big potential of 3D knitting is customization. According to the time demands and the final cost, the easiest way of customization is the color change option, then the knit pattern change option. Last but not least is the option of size change to meet the customer's needs; however, that is a rather difficult process. 3D knitting has the potential to be a suitable technology for customized clothing or footwear.

2. Knitting Yarns

Within my research, I am involved in cooperation with a company that manufactures conductive yarns and is currently testing insulated hybrid knitting yarns, which contain light copper-silver plated 30 µm microwires that have not been commercialized yet. The tested yarns are listed in Table 1. The hybrid yarns are plied from textile polymer continuous filaments and metallic microwires. Hybrid yarns have almost the same mechanical properties as textile yarns (can be used for sewing, weaving, and knitting), can be soldered and crimped, can be produced in insulated versions, and have high resistance to wash cycles. Disadvantages are that they are not conducive all around their circumference like metalized threads (sometimes more difficult to contact, better for threads with more wires), stainless and constant threads have higher stiffness deformability and are worse for sewing.

In the picture, there is a knitting pattern where the basis is cotton, and the conductive elements are knitted with the intarsia technology, first also with cotton yarn until the conductive yarn is used after the optimal machine setting. The advantages of knitting are also the almost unlimited possibilities in combining knitting yarns to achieve the desired result. Underlay technology can be used so that the conductive yarn does not touch the skin. Conductive yarns are backed with conventional yarns when knitting hybrid conductive yarns are very similar to conventional knitting yarns, but from the point of view of comfort, backing with, e.g., merino yarn is still preferable but not necessary. This technology allows the insertion of non-textile materials such as lines or tubing. Special materials can also be inserted into the knitted fabric in the form of spacer fabric; this type of weave takes the form of a soft cushion. The great advantage of knitting lies in the possibility of combining these patterning methods within a single sample or product. Hybrid yarns have almost the same mechanical properties as textile yarns (can be used for sewing, weaving, and knitting), can be soldered and crimped, and can be produced in insulated versions with high resistance to washing cycles.

Table 1. Tested conductive threads.

Thread	Ductility	Amount of microwires
53P	18,03	4
143P	16,58	8
144P	29,94	8

Figure 1. Knitted antenna samples with tested conductive and cotton threads.

3. Trends in the Current Garment Manufacturing

3D knitting technology brings many possibilities in design, shaping, and patterning. Knitwear development programs include visualization of garments, but it is now impossible to visualize all pattern and shape elements. The main problem in this area is the difficulty of programming and understanding the knitting technology. Designers and garment students often are not familiar with the technology, and therefore, communication with knitters is difficult. The whole product development is very time-consuming and complex. There is no communication link between the knitting software and the students' or designers' design. A solution to these problems may be the use of a converter, which is currently being developed at Carnegie Mellon University (Narayanan et al., 2018). The converter would cause the data from the 3D scanning or photogrammetry to be used to obtain accurate dimensions and anatomical shapes and then converted into a knitting language and used to create a garment or clothing accessory, in this case, a glove. Small samples ranging from very simple shapes to very complex ones were mainly knitted through these compilers (McCann et al., 2016). The use of such a compiler could lead to the creation of a perfectly fitting

garment accessory and, at the same time, greater automation and simplification, referring to one of the current trends in the fashion industry, namely Fashion 4.0 (Bertola & Teunissen, 2018; Särmäkari & Vänskä, 2021), which is directly based on the principles of Industry 4.0 (Forno et al., 2021). Above all, Industry 4.0 aims to address current challenges: meeting consumer needs sustainably and productively, which includes sustainability, adaptability, agility, and introducing the product on the market (Jin & Shin, 2021). This trend is also, very actual in 3D knitting, where seamless technology eliminates the need for stitching products. This leads to a reduction in the amount of manual labor while increasing the number of programmers and highly trained knitters required. At the same time, this would ideally increase production and, in turn, reduce waste to a minimum.

Another reason why the conversion seems to be the ideal tool is the absolute shape and dimensional customization. Conventional gloves are produced in a certain finger-to-palm ratio. If a person has long fingers or, on the other hand, very short fingers, there is a good chance that the gloves will not fit. The other option is custom glove manufacturing, where the circumference of the palm and the length of the middle finger or the length of the middle finger with the palm is commonly measured. Even this option may not be optimal. Some people also have shape anomalies, extremely oversized or missing finger links. This is a problem with conventional gloves, plus with a heated glove, these problems are multiplied. Since the heated elements do not directly touch the skin, there is the unnecessary heat loss. Therefore, 3D scanning, which can ensure a perfect fitting glove, appears to be an excellent option. In addition, for people with Raynaud's syndrome, which causes decreased blood flow to the fingers or fingertips, an individual approach is also very important in the design of the conductive heating elements so that the heating is located in the most critical areas. In certain places, the heating can be stronger and vice versa.

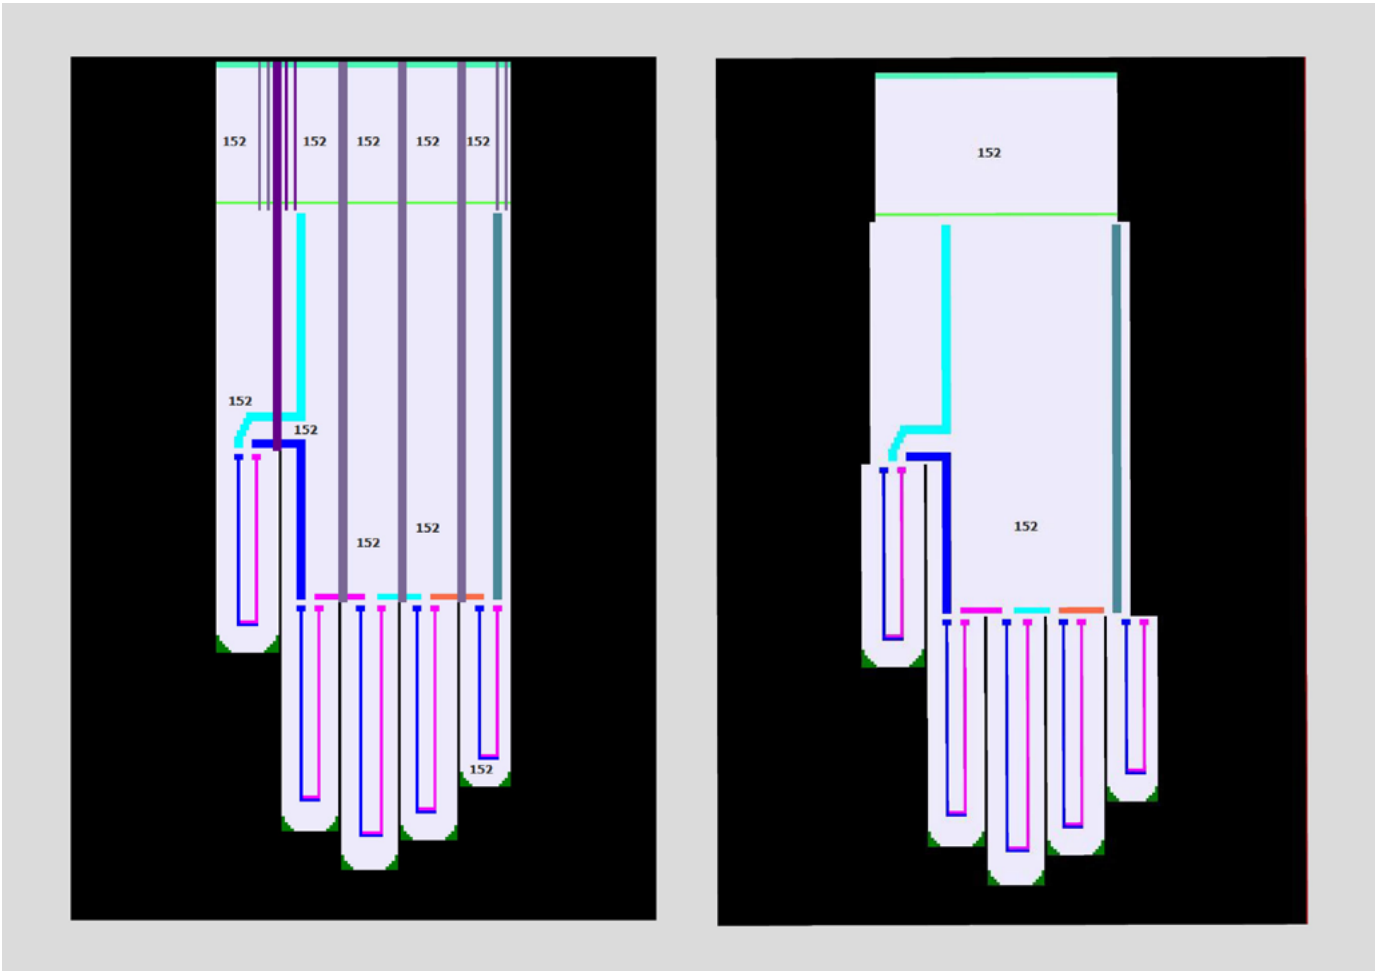

Figure 2. Conductive path design in APEX4. Each color corresponds to a different yarn carrier, i.e., the conductive path is interrupted.

4. Methodology

This work is based on the principles of Engineering Design Science (EDS). EDS is used in engineering to help design and build things. EDS supports engineers and designers in organizing their knowledge and understanding how the different parts of a design fit together. It also helps them solve problems and come up with new ideas. EDS is based on engineering research and experience and is used to streamline the design process. The systematic approach of EDS offers a rational and methodical path for design efforts. (Eder & Hosnedl, S., 2007, 2010a; Eder, 2010b)

Table 2. Scope of sorts of designing (Eder, W.E. and Hosnedl, S., 2008, 2010).

Objectives, Design Conditions	**Design Engineering**	**Artistic – Fashion – Architectural – Industrial Design**
The object to be designed, or the existing (designed) object	Transformation Process and/or Technical System; primary: functioning, performing a task	Tangible Products; primary: appearance, functionality

Design process (for the object), methodology, generating the design intent	Theories of designing, Engineering Design Science, formal design methodologies	Intuitive, collaborative, interactive designing
Properties of the object as output of designing	Mediating and Elemental Design properties, to establish observable properties	Observable properties to achieve customer satisfaction
Design phenomenology	Empirical, experimental and implementation studies	Protocol studies
Responsibilities	Professional, ethics, reliability, safety, public legal liability, enterprise, stakeholders	Organisation, stakeholders (Architecture adds organizational and contract responsibility Artistic – Fashion – Architectural – Industrial Design)
Location	Design/Drawing Office	Studio

5. The Development of the Heated Glove

The main objective is a personalized product for a specific person and, above all, the development of the glove with an uninterrupted conductive path to avoid interruption of the electrical circuit. Another goal is the integration of smart technologies to sense human and ambient temperature through embroidery or knitting. The individual adaptation of the glove to the customer's specific needs is important. The product under development may find many potential users to reach a various target group: a very specific group of people with Raynaud's syndrome, medical professionals, or general users who want to increase their thermal comfort at very low temperatures.

Figure 3. Samples of gloves with interrupted conductive paths.

In the first phase of the development, yarns were selected, followed by density testing. When the density was appropriate, we could proceed to the next step of programming the glove: this involved entering dimensions, programming structures, and color patterning, in this case, conductive yarn patterning. The first samples of the gloves were knitted conventionally. At first, the fingers were knitted from the fingertips. Then, the palm was knitted, followed by the thumb, also from the fingertips, and then the glove was knitted up to the hem in the form of a tubular piece. The conductive path was worked in intarsia. Intarsia is a knitting technique that is used for knitting with multiple colors or multiple yarns. In this first method, the conductive path was divided into several areas, namely fingertips, the area where the fingertips meet the palm, and the back of the hand, which was undesirable. For this reason, heating elements were simplified and left only in the fingers´ area. Moreover, when considering that when it comes to heating the hand, the most crucial is the heating of the fingers, where the cold occurs. Thus, the simplification of the glove warming was not a problem. After several further attempts, this method of knitting could not be fine-tuned to avoid interrupting the yarn. It was necessary to find another way to knit. An unusual way was then devised where the glove was turned 90° and knitted in width. The first sample of this knitting method was knitted as a flat sample only. This sample has shown that such a knitting technique would be suitable for knitting the heated glove and should not break the yarn.

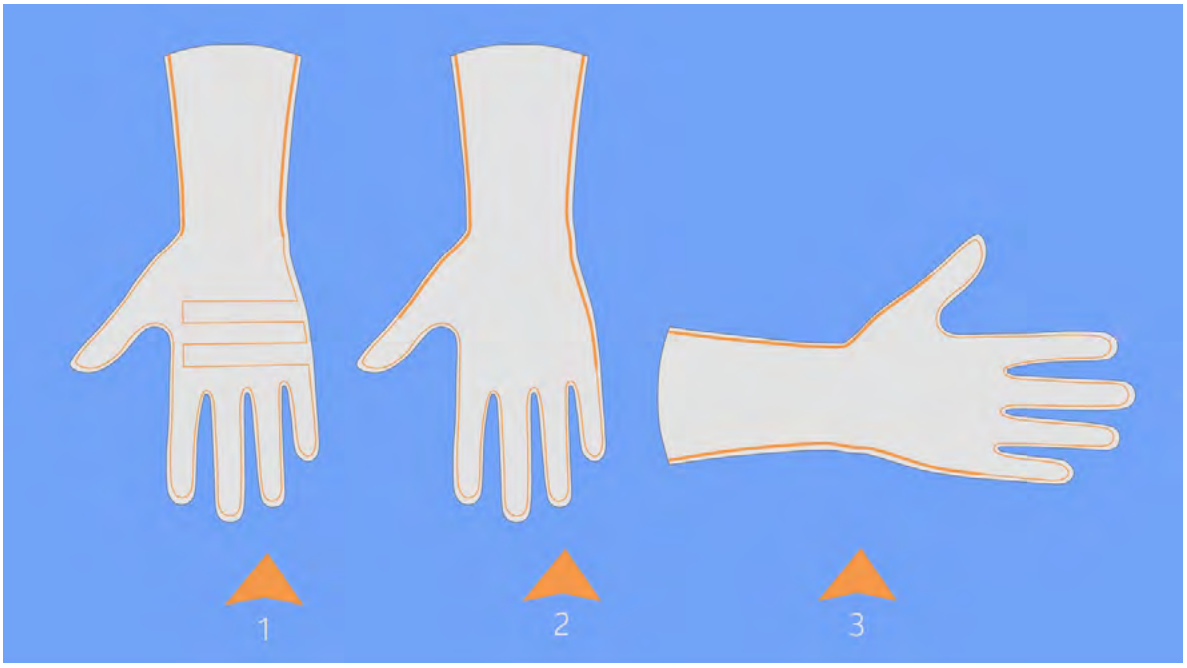

Figure 4. Development of the design of the heated inner glove. (The orange line indicates the heated conductive path. The direction of the arrow shows the direction of knitting.)

The advantage of intarsia is that we can knit thin multi-colored knits, on the other hand, each part is knitted with a different conductor. The heated segment must be designed following these rules so that the conductive path is not interrupted, which would result in resistance breaking, and therefore, unwanted uneven heating or interruptions would have to be encapsulated or ultrasonically welded, which is not desirable.

6. Sustainability

Each conventional glove is designed for a specific activity, and if we wanted to heat each type of glove, a large number of rechargeable batteries would be required as each product usually requires a different battery, which does not seem sustainable. The research and development of the heated glove focuses on the entire life cycle of the product, from raw material sourcing to disposal and recycling. The most important trend not only in this area is quality. The quality of the raw materials, but also the quality of the assisting inputs, the quality of the technology, the quality of the production or the environment, and the quality of disposal and recycling are important. We, therefore, work with high-quality materials and design all components to be replaceable or repairable. The concept of heated one-layer gloves allows us to reduce the number of batteries needed. So, the user only needs 1 or 2 pairs of batteries, and all their gloves can be heated.

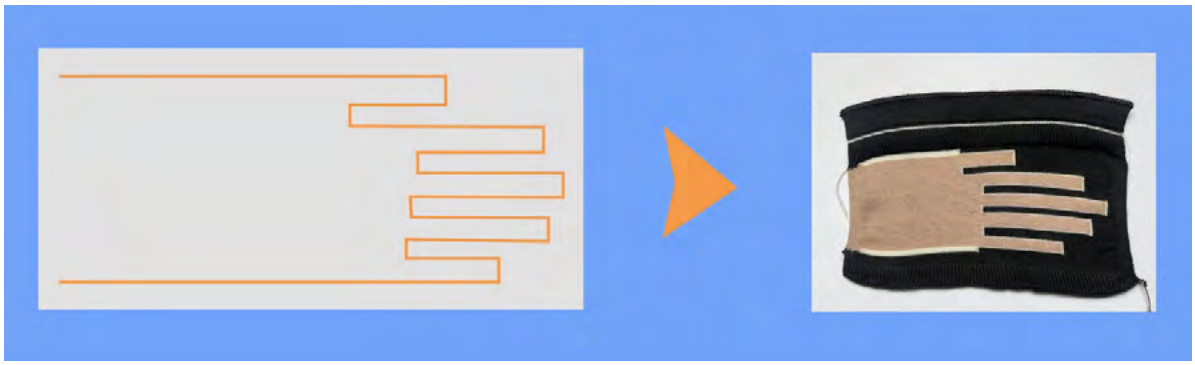

Figure 5. Flat pattern design with conductive path and knitted flat pattern. In this pattern, we used a 90° rotation of the glove.

7. Conclusion

This paper has demonstrated an approach that we want to further enhance the development of heated knitted gloves. The cornerstone is to divide the glove into two separate layers, with the inner layer being heated. In the first phase, one of the optional possibilities is to obtain the dimensions of the hand using a 3D scan, and then the data could be processed by a converter (Narayanan et al., 2018) and used in APEX4 (SHIMA SEIKI, 2023). Once the density tests have been knitted, accurate hand-dimension data can be used. The glove will be knitted unconventionally, i.e., rotated 90° which will allow the use of the intarsia pattern throughout the glove without interrupting the conductive path, as in the flat sample in Figure 5, where the conductive yarn is demonstrated with a white merino yarn.

ABSTRACT | This paper explores the potential of intercultural collaboration through design in the context of the social inclusion of refugee youth.

The practice-based aspect of this research is undertaken with Open Doors Hungary, a community-based design project that creates a programme for unaccompanied minor refugees. The aim of Open Doors is to help refugee youth integrate into Hungarian society and develop their means of communication and quality relations with the host society.

Refugee youth arriving in Hungary face serious problems: the loss of home and community, the traumas suffered during the journey, the cultural differences, and the lack of a common language make their social integration extremely challenging. Xenophobia and stereotypes against foreigners exacerbate these challenges. Social inclusion requires frequent contact with the local society, and refugee youth need new tools (cultural knowledge, language skills, intercultural skills) to overcome their disadvantages.

Since 2013, the author has been working with refugee and migrant youth using participatory design tools such as regular creative sessions, workshops, and eight camps based on the integrating role of creativity and art. During these sessions, young refugees and their Hungarian and European peers got to know different visual communication tools and created common messages in the form of videos, animations, photos, posters, booklets, and murals. Through these activities, refugee youth become part of the design process; the result is based on their choices.

Combining the findings of the theoretical research and field experiences, this paper states that design thinking and participatory design methods allow interactive cultural exchange, sharing of values, safe and open discussions, and community building. As a global language, visual communication can be a tool for intercultural communication, storytelling, and self-expression. The opportunity for refugee youth and their Hungarian peers to work in intercultural teams develops new competencies and creates shared ownership and community.

1. Introduction

The ability to work in intercultural teams is an essential skill for anyone in our more and more globalised environment (Murdoch-Kitt & Emans, 2020). For migrants and refugees, it is a basic necessity when they try to settle in a new country.

The global increase in the number of asylum seekers and refugees over the last decade has been one of the challenges for our society. Hungary - due to its geographic location - has been one of the main transit countries towards the European Union (IOM, 2023). Barriers to integration are exacerbated by xenophobia and stereotypes against foreigners present in some parts of Hungarian societies, thus creating conflicts between members of the host society and newcomers. (Gyulai, 2014; Kováts & Soltész, 2022; Sík et al., 2016)

The author - coming from a graphic designer background - together with her architect partner, is the co-founder of Open Doors Hungary, a community-based social design project working for intercultural dialogue with the tools of visual communication, placemaking, and design with refugee and Hungarian youth since 2013.

Unaccompanied minor refugees in Hungary face unique challenges. Protected by the childcare system upon entry before turning 18, their perilous journey and the uncertainty of the asylum process can worsen "post-traumatic stress disorder," often stemming from the loss of roots and human connections. Cultural disparities and language barriers further complicate their social integration. Effective social inclusion demands regular interaction with the local community and the acquisition of new tools like cultural knowledge and language skills (Magyar Helsinki Bizottság, 2023). However, due to their legal status, refugees are excluded from basic democratic processes, and minors living in childcare centers have limited autonomy in decision-making.

This paper, as part of an ongoing PhD-in-practice research, focuses on the participatory aspects of visual communication and design, integrating theory and practice, employing a mixed-methodology approach. It involves a literature review on participatory design methods and intercultural collaboration, alongside examining the experiences of young refugees and their Hungarian peers.

The literature review will establish the context, exploring the role of participatory design and collaborative methods. Additionally, the author draws from 10 years of field experience, employing participatory and community-based design methods. The study aims to comprehend how participatory design can facilitate intercultural collaboration and contribute to the social inclusion process for young refugees.

2. Participatory Design with Refugees

Participatory Design emerged from the social and civil rights movements of the 1960s and 70s, where individuals in Western societies advocated for greater decision-making power (Simonsen & Robertson, 2013; Spinuzzi, 2005). For refugees and migrants, participating in design processes offers a unique opportunity to engage in decision-making, providing valuable lessons about democratic values.
For outsiders - due to language barriers and cultural differences - it is difficult to access refugees' experiences and insights, but it is essential to understand their needs. Participatory design can be a tool to deduce tacit and latent knowledge. (B.-N.Sanders 2002)

Participatory design methods were used successfully with different groups of migrants and refugees: designing refugee shelters (Albadra et al., 2021), language learning tools (Abou-Khalil et al., 2019; Weibert et al., 2019), digital ‘safe spaces’(Bustamante Duarte et al., 2021), or health-related services (Nazzal et al., 2014).

For outsiders - due to language barriers and cultural differences - it is difficult to access refugees' experiences and insights, but it is essential to understand their needs. Participatory design can be a tool to deduce tacit and latent knowledge. (B.-N.Sanders, 2002). Using different digital and physical visualisation tools, they agree that physical prototypes play an important part in finding mutual understanding between different stakeholders (Abou-Khalil et al., 2019; Albadra et al., 2021).
According to the reviewed literature, most co-creation and participatory design workshops with refugees happen within a relatively short, limited timeframe, and usually, they only stay in the research phase or only produce low-fidelity prototypes ((Abou-Khalil et al., 2019; Albadra et al., 2021). It is also found that there is a need for long-term community-based collaboration (Talhouk et al., 2019) and iteration of the process (Spinuzzi, 2005).

The designer's role needs to expand and adapt, serving as a mediator, facilitator, and design professional (Manzini & Rizzo, 2011). Participatory design fosters mutual learning among the designer, participants, and other stakeholders.

While end-user involvement is increasingly vital in various visual communication-related fields like UX/UI research and service design, participatory methods remain relatively neglected in graphic design (Taffe, 2012). Participatory design projects involving refugees and migrants are prevalent in placemaking and human-computer interaction (Abou-Khalil et al., 2019; Albadra et al., 2021; Almohamed et al., 2018; Talhouk et al., 2019; Weibert et al., 2019). Although there are some publications collecting projects created to foster peace and global understanding (Pater, 2016; Smith, 2022), to involve users in the graphic design process and rethink the role of the designer (Armstrong & Stojmirovic, 2011; Pater, 2021), or to collect tools for intercultural collaboration (Murdoch-Kitt & Emans, 2020; Mercer et al., 2023), the potential of using graphic tools directly with refugees remains largely unexplored.

3. Visual Tools in Participatory Design

"Words divide, pictures unite." (Neurath, 1936)

Visual communication, the language of images, has the potential to bridge language barriers and promote intercultural understanding - which is extremely important when the participants of the communication process do not share the same language or culture.

Visuality, as Mitchell (1986) suggests, taps into a primal layer, bypassing the intermediary step of mental images becoming verbal concepts. Unlike words, visuality connects directly to reality. While perceiving and recognizing images is universal, decoding their meaning is not (Kostelnick, 1993). Comprehending visual language is a social process contingent on social, historical, and geographical contexts, as well as prior experience and knowledge.

Visual tools are often used in participatory design projects, and they can be effectively used as conversation subjects, conversation prompts, or experiences to start social dialogue (Manzini, 2015; Manzini & Rizzo, 2011).

4. Practice-Based Collaborative Methods

Over the past decade, the author has organised ten creative camps and countless creative workshops involving young refugees, migrants, and their Hungarian and European peers. Participants learned various visual communication tools and collaborated on crafting shared messages. Through design thinking and the creative process, these gatherings fostered interactive cultural exchange, value-sharing, open discussions, and community building.

These workshops and camps aim to facilitate intercultural collaboration among participants from diverse backgrounds, with creative professionals offering design frameworks and technical guidance. By involving participants in all stages of the design process—from research to ideation to realization—a shared understanding of each design product is ensured. This approach was consistently applied across different projects:

1. *Getting to know each other & team building* - as an important part of the process, non-verbal and visual tools ensured that participants could learn each other's names, learn basic facts about each other, and enable them to talk to each other even though they do not share a common language.
2. *Learning & practice* - each thematic camp and workshop included a learning phase where participants got to know a new technique or visual tool: manual techniques of composition such as painting, drawing or collage, creation of signs and pictograms, large-scale murals, board games, printing techniques such as screen printing, zines, photography, videos, and animations.
3. *Project & presentation* - with the learned tools, youth in mixed groups were able to create projects that enabled them to form messages together and create common products based on shared values.
4. *Evaluation and follow-up* - providing an opportunity for youth to reflect on the learned tools, give feedback, and have ideas about the possible continuation.

During the workshops and participative design projects of Open Doors, we can talk about different levels of participation:

Participant as a consultant

Sharing insights and giving feedback is crucial for refugee youth, where challenges such as differing visual symbols and narrative practices across cultures arise. Involving participants in decision-making fosters mutual understanding and helps avoid harmful stereotypes (Lipton, 2002; Pater, 2016). In the Open Doors, Community members were extensively consulted to ensure events met their needs. During COVID-19 lockdowns, interviews revealed a desire for outdoor programs and cultural exploration. Through co-design, Cultirider—a mobile community space—was created, allowing Open Doors members to visit rural Hungary and collaborate with local communities.

Figure 1. Cultirider mock-up and first Cultirider event in 2022, Ágasegyháza (photos by the author).

Participant as a content producer

The next level of involvement goes beyond participants merely providing insights and sharing needs before the design process; they become creators in the creative process itself. Design offers an open-ended framework where participants contribute content, making the final product a co-creation between the

designer and participants. Using graphic tools like screen printing, participants can personalise pre-prepared patterns, resulting in visually coherent outcomes. These patterns are developed during community brainstorming events, with some incorporating visuals drawn by multiple community members. For example, during the Bokréta Fesztivál in 2019, members of Open Doors Hungary's intercultural community space co-designed frames featuring drawings of each participant's favourite flower, later edited into a single pattern. This technique ensures participants' designs are used with minimal abstraction.

Figure 2. Bokréta Fesztivál screen-printing workshop, 2019 (photos by the author).

Participant as a co-designer

In the third step of the process, participants transition from final users to active collaborative co-designers and co-producers, leveraging their local knowledge, competencies, and solution ideas (Manzini & Rizzo, 2011). Open Doors projects provided refugee, migrant, and Hungarian youth with opportunities to work together in small intercultural teams, co-designing and co-producing various project works. For example, in international media training camps like "Open Doors Youth Voices" and "Change for Media - Media for Change," participants collaborated on producing media products. They acquired technical skills in video and animation production, allowing them to create their project works. Discussions during workshops focused on important life topics, resulting in visual representations. Films such as "Open Doors Stories" portrayed the travel experiences of Hungarian and refugee youth through narrated animations, while "Are we equals?" highlighted the differing journeys of European citizens and refugees. Additionally, "My Big Change" featured honest accounts of significant life changes from young people around the world in the form of a short documentary.

Figure 3. Change for Media-Media for change, media training, 2017 (photos by the author).

Participant as a multiplier

Repeating the design thinking process allows participants to learn and pass on knowledge. Over its 10-year span, Open Doors Hungary has seen refugee youth emerge as workshop leaders, engaging others in the design process. In collaboration with the Artemisszió Foundation, Open Doors initiated the Miradoor Creative Hub to train motivated migrants and refugees in Hungary to lead workshops. These community members have organised workshops for Hungarian and international participants, such as Afghan paper kite making, Nigerian calligraphy, and Somali cooking. Through these workshops, migrant and refugee youth not only share their skills and boost their confidence but also promote their culture, aiding their identity appreciation and inclusion in society.

Figure 4. Afghan paper kite workshop, 2022 (photos by the author).

5. Results

Visual tools - tangible results
The visual tools during the workshops of Open Doors, such as drawings, collages, storyboards, and mockups, proved to be a significant help for intercultural teamwork between refugee youth and their Hungarian and European youth.

Iterative process - long-term commitment
Open Doors has maintained a growing intercultural community since 2013. The long-term relationship with the target group has ensured the improvement of appropriate participatory design methods and communication tools. The iterative process allowed participants to become multipliers of the process and implement design thinking in other areas of their lives.

From participation to community
The long-term work working with the same (but organically growing) community allowed participants to create deeper connections, find friends, and form a diverse community along similar value.

Local projects - global topics
Through the 11 years of its work, Open Doors provided a framework for small-scale local projects involving a diverse community of refugees, foreigners, and Hungarian and European youth coming from different backgrounds to share ideas and find common interests and values so they could become part of a larger network.

6. Conclusion

This practice-based research aimed to explore the potential of participatory design methods in direct work with young refugees and migrants. Existing literature demonstrates the successful use of participatory design methods with refugees, particularly in visualising and prototyping future solutions. However, the involvement of end-users in the graphic design process remains relatively overlooked.

Fieldwork within the Open Doors project revealed a demand for long-term community-based solutions among participants. They can engage in various roles (consultant, content producer, co-designer, multiplier), offering mutual learning opportunities for all stakeholders.

The author plans to summarize the methods and findings in a methodological handbook and a visual communication card pack as the next steps in this ongoing PhD-in-practice research. These resources facilitate collaborative design processes in intercultural teams and can be shared with designers, social workers, and institutions.

KEYWORDS | DESIGN, SOCIAL INNOVATION, ASSESSMENT, SME, SUSTAINABILITY

ABSTRACT | The present PhD study explores the role of design in social innovation assessment within Italian small and medium enterprises, delving into its dynamics in the corporate culture. The examination deeps the analysis of existing frameworks and methodologies, aiming to develop design-driven assessment approaches for SMEs, leveraging participatory design principles. The study has the goal of understanding how these approaches actively drive organizational changes, foster social innovation, and enhance business competitiveness, developing alternative futures that advance the understanding of shaping more socially sustainable SMEs in the Italian business landscape.

1. Introduction

Small and medium enterprises play a crucial role in driving economic growth, fostering innovation, and creating employment opportunities in Italy (Cataldo et al., 2021). With the evolving business environment, there is an increasing need for SMEs to participate in social innovation.

Considering the urgent societal challenges identified in the United Nations Sustainable Development Goals, there has been a move towards adopting a more sustainable way of life that includes environmental, economic, and social dimensions (Moursellas et al., 2022). In Italy, social innovation is a key factor in the innovation ecosystem. Based on research and innovation policy, it offers great potential for addressing societal problems and promoting advancements toward achieving the Sustainable Development Goals (Eichler & Schwarz, 2019; Piccarozzi, 2017).

As a result, an increasing requirement is to consistently oversee the advancement and outcomes of activities connected to social innovation (Cunha & Benneworth, 2020). This underscores the significance of examining and evaluating its efficiency in facilitating beneficial changes for enduring sustainable prospects. Nonetheless, there are currently insufficient established measures and standards for gauging innovation within the social sphere in contrast to those applied in economic innovation (Wobbe, 2012). Consequently, additional efforts are essential to advance concepts, techniques, and criteria necessary for fostering effective diffusion of social innovation.

This doctoral research investigates the connection and necessity of adopting a design approach for social innovation in corporate environments. Italian small and medium-sized enterprises currently face the dual challenge of adjusting to market requirements while embracing socially sustainable practices (Longo et al., 2005). Therefore, the primary goal of this PhD study is to comprehend the role of social innovation within Italian SMEs and how incorporating design principles could facilitate responsible transformation within these organizations. Through integrating participatory design principles, the study seeks to develop customized assessment strategies tailored to SMEs that highlight their potential to drive organizational changes. The overarching objective is to enhance scholarly comprehension and provide practical implications for SMEs as they transition towards a more sustainable future, thereby contributing to fostering socially sustainable SMEs and promoting resilience and competitiveness in an evolving business landscape.

2. Literature Review

Examining current social innovation frameworks and methods has revealed a necessity for a more thorough evaluation approach that considers the overall societal impact of innovation. Additionally, ongoing exploration and analysis of case studies have underscored the potential of utilizing a design-centered approach to evaluate the success and results of social innovation initiatives.

In design, there is a growing understanding of the need to precisely assess the effects of interventions and effectively communicate these findings (European Commission, 2013; Westcott et al., 2013; Drew, 2017; Björklund et al., 2018). Evaluation is crucial in the design process, allowing designers to analyze the impact of their work and make informed decisions for future projects. Design-driven methods have played a key role in driving innovation, particularly in tackling complex business and societal challenges (Buchanan & Margolin, 1995). Nevertheless, there is continued research into the innovation assessment, with a specific focus on social innovation. Utilizing a design approach to evaluate social impact is beneficial because it emphasizes comprehension of human behavior and user experience, as well as an understanding of the needs and goals within the study's context while considering contextual factors that may affect innovation processes (Foglieni & Villari, 2015; Liedtka, 2017; Foglieni et al., 2018). As a direct consequence, it is crucial in the design field for social innovation. Integrating design principles into the assessment of social innovation can improve the process to be more focused on users and responsive to specific contexts (Yu &

Sangiorgi, 2018), leading to a deeper understanding of impact and effectiveness, ultimately guiding the development of more impactful strategies. Incorporating design-centric methods into evaluating the effects of social innovation can improve comprehension of how these endeavors tackle societal issues and advance socially responsible behaviors.

Similarly, effective promotion of social innovation in Italy and coincidental contexts necessitates a thorough understanding of the dynamics, catalysts, and barriers involved. This entails conducting interdisciplinary research incorporating insights from various fields, such as sociology, psychology, economics, and political science (Foglieni & Villari, 2015). Adopting this interdisciplinary approach facilitates a more holistic comprehension of social innovation and its potential impact on society. Moreover, it allows for examining diverse factors that influence the success and expansion of social innovation endeavors. Consequently, researching evaluation and assessment begins with acquiring profound knowledge about tools and methodologies extending beyond those typically associated with design discipline.

Assessment and evaluation practices within the design industry are still fragmented and contentious despite emerging issues that call for project monitoring related to design. The design field often lacks a formal evaluation component, yet empirical evidence demonstrates its potential to enhance outcomes and overall processes (Björklund et al., 2018). Consequently, there is an increasing need in the design discipline to develop more robust methods for demonstrating its value both before and after implementation. Presently, evaluating the impact of design applications primarily takes a formative approach to reflecting on and enhancing outcomes and the designing process (Drew, 2017). However, incorporating evaluation into the design field largely revolves around rationalizing it as a strategic approach to success and innovation (Foglieni et al., 2018). Despite its growing importance, measuring the effects and impact of design outcomes continues to be an area with implications that have not been thoroughly explored in theory or practice (Foglieni & Villari, 2015).

As design becomes increasingly integrated into strategic organizational processes, new challenges exist in demonstrating its business value. This involves developing and applying suitable metrics, thorough evaluations, and early integration of evaluation practices into the design process.

A robust approach to evaluation in the design field is still lacking. While some efforts have been made to address measurement within the discipline, they have not yet produced well-established and widely recognized results. Moreover, there appears to be a predominant focus on proving that something works (summative evaluation) rather than learning what works and improving what doesn't (formative evaluation), which should take precedence (Drew, 2017). The current shift from using quantitative measures to more qualitative ones for assessing outcomes is worth noting, especially in service design (Foglieni et al., 2018). This undefined nature provides an important opportunity for further exploration of the subject matter, contributing towards establishing and reinforcing an evaluative culture within the design community. This is crucial for pushing the boundaries of the discipline and affirming its role as a driver of innovation.

3. Methodology

To meet the research goals, research through design and a qualitative method incorporating participatory design principles will be utilized. The investigation will involve detailed interviews with important figures in Italian SMEs to gain insight into their views on social innovation and the feasibility of integrating its assessment into organizational operations. Criteria for selection will consider industry sector, location, and company scale to capture a broad spectrum of viewpoints.

The research will employ a case study approach to investigate particular Italian SMEs that have adopted social innovation initiatives. Data collection will include on-site visits, observation of organizational procedures, and interviews with staff members at various hierarchical levels within the companies. The

insights obtained from these interviews and case studies will be thematically analyzed and coded to uncover significant themes and recurring patterns associated with social innovation in Italian SMEs. These outcomes will form the groundwork for creating evaluation techniques and prototypes, building on a design-driven assessment framework as the outcome to foster social innovation and facilitate conscientious evolution.

The current research examines and analyzes established social innovation assessment frameworks, methods, and models to pinpoint areas for a design-driven assessment approach. The aim is to establish a solid theoretical groundwork and backing for the conclusions and suggestions. The literature review covers research on social innovation in small and medium-sized enterprises, the impact of design on organizational change, sustainable practices within SMEs, and existing tools for gauging social innovation effectiveness derived from academic studies, industry reports, and best practices.

Introducing social innovation in small and medium-sized enterprises and implementing participatory design principles as a method to develop a comprehensive assessment framework may result in a more thorough assessment approach. The qualitative approach will enhance the comprehension of social innovation dynamics and its impact on the sustainability of SMEs. Additionally, by analyzing its particular context, this research aims to offer valuable insights into the obstacles and opportunities encountered when developing social innovation projects while proposing recommendations for promoting social innovation understanding within this setting. The anticipated outcomes of the study aim to provide practical implications that could aid in advancing socially sustainable business environments in Italy, promoting resilience and competitiveness amid evolving business conditions while addressing the lack of understanding regarding how design can be systematically incorporated into social innovation assessment processes within businesses.

4. Discussion

The anticipated outcomes and planned progression of the PhD research are segmented into three stages: initial exploration, in-depth analysis, and practical application. The first stage entails addressing the initial research sub-question (What are the key components and the current comprehensive frameworks that can capture the nature and understanding of social innovation within companies?) through an extensive review of literature and examination of existing social innovation models to acquire a comprehensive grasp of the

research subject. This phase also involves investigating essential elements and current frameworks for social innovation assessment within organizational contexts. Ultimately, this stage is designed to formulate a matrix for social innovation that delineates crucial components within corporate settings, offering a systematic method for understanding and articulating strategies applicable to business environments.

The in-depth analysis phase explores the second research sub-question (How can the insights, current applications, and best practices from existing frameworks in other domains be leveraged to enhance the design and effectiveness of a design-driven social innovation assessment within corporate contexts?) regarding the perspectives, current implementations, and effective strategies from established models in different disciplines that can enrich a design-driven social innovation evaluation framework within business environments. This phase would entail semi-structured interviews with small and medium-sized enterprises in Italy to delve into their experiences, obstacles, and accomplishments in adopting social innovation practices. It will also involve a comprehensive review of existing assessment frameworks to emphasize their main characteristics, methodologies, and constraints for initial indicators when applying design-oriented approaches to evaluating social innovation.

The last stage, application, will involve prototyping the design-driven assessment framework for social innovation in Italy's SMEs. Building on previous phases, this stage aims to answer the last sub-research question: how design perspectives, tools, methods, and strategies can aid companies in assessing social innovation initiatives within corporate settings. The goal is to evaluate the practicality, effectiveness, and

feasibility of implementing the framework in real-world scenarios while offering practical guidance and resources for companies navigating the complexities of evaluating social innovation. Additionally, this process aims to enhance understanding of the role of design within this context.

From a design viewpoint, these stages will facilitate examining different perspectives on evaluating social innovation in corporate settings and craft a new perspective on the topic, particularly within an Italian context. The sub-inquiries focus on creating a matrix for social innovation, incorporating ideas from current frameworks, and evaluating a design-oriented approach to social innovation assessment. These aspects contribute to the broader research objective of addressing how the assessment of design-driven social innovation can encourage transformations in small and medium enterprises and guide companies toward adopting proactive and responsible changes in their practices.

The outcomes of this study will contribute to a more holistic comprehension of social innovation dynamics in Italian small and medium-sized enterprises, as well as its influence on sustainability. Although the research is still underway, it is crucial to note that initial observations have provided key insights into the significance of social innovation within business environments. The ongoing assessment and scrutiny of established social innovation frameworks, methods, and instances have unveiled significant prospects for an evaluation approach guided by design principles.

Companies have often relied on key performance indicators to evaluate the efficiency and innovativeness of their initiatives (Cisero et al., 2017). However, a crucial consideration is the ongoing shift towards appraising performance and innovation from a design standpoint by moving beyond traditional strategic KPIs. This involves quantifying and assessing the "softer" aspects and results of project processes using concrete metrics and qualitative measures (Drew, 2017). As the PhD progresses, research into evaluation and assessment will support this paradigm. Instead of suggesting a one-time assessment at the end of each project, as seen in other approaches (Foglieni et al., 2018), it will be viewed as an iterative process integrated into continuous improvement. This iterative approach to evaluation and assessment will ensure that social innovation strategies are consistently evolving and adjusting to changing conditions.

5. Conclusion

This research explores the interconnectedness of design, social innovation, and Italian SMEs. It highlights the necessity for SMEs to adopt social innovation to stay competitive in changing market environments. By incorporating design principles into assessment strategies, customized approaches can be formulated to facilitate organizational change effectively. Despite facing challenges in establishing thorough evaluation methods, the study highlights the pertinence of a design evaluation approach to promote socially sustainable business development at a local level. As an outcome, this investigation seeks to contribute to a holistic comprehension of social innovation dynamics within Italian SMEs by underscoring the transformative role of design in driving sustainable organizational practices and enhancing resilience in the business ecosystem.

About the Authors:

Beatriz Bonilla Berrocal is a PhD candidate in Design member of Polimi DESIS Lab. Teaching assistant at the School of Design of Politecnico di Milano and the Faculty of Economics of Università Cattolica del Sacro Cuore. Her research interests focus on Design for Social Innovation and its application both in business and communities.

Annalinda De Rosa is a Design researcher at Politecnico di Milano, focusing on design-driven models for incubating processes to enhance social cohesion through participatory design in urban and rural areas. Member of Polimi DESIS Lab, project manager of "Human Cities/SMOTIES. Creative works with small and remote places," Creative Europe project.

Valentina Auricchio is an Associate professor at Politecnico di Milano, Member of Polimi DESIS Lab. Her research focuses on Design Methods and managing strategic design projects with small and medium industries, including Design Thinking processes. Her main interest is in design processes, methods, and tools and their application within different sectors for strategic innovation.

KEYWORDS | DIGITAL INSTALLATION, MUSEUM INFORMAL LEARNING, HUMAN-COMPUTER INTERACTION, INTERFACE METAPHOR, INTERACTION LEVEL

ABSTRACT | The striking difference between digital interpretative tools compared to earlier analog modes is their dynamism, which takes visitor interaction to a more complex level – from passive recipient to active interpretive participant. Digital installations in cultural heritage sites are a kaleidoscopic phenomenon: they can be structured along several largely independent dimensions and used for several functions, not to mention the richness of technological combinations in its implementation.

This research focuses exclusively on digital installations mounted in the physical space of the exhibition as 'standalone' kiosks. As additional classification criteria, levels of interaction and interface metaphors are both particularly important for this research. The focus will be on teenagers and young adults, as the deployment of museum technology is driven by the demand to engage them as future visitors. There is little empirical research on digital installations of cultural heritage, and the results so far tend to focus on usage or visitors' attitudes toward technology, but only in the general overview of informal learning.

Therefore, we wish to measure the learning outcomes of digital installations and their impact on the attention paid to artefacts and other modalities presented in the exhibition environment. We aim to investigate the use of digital installations through 3 case studies in cultural heritage institutions in Budapest (Petőfi Literary Museum, House of Music, Skanzen).

This short paper introduces a pilot study that was carried out last autumn at the Petőfi Literary Museum; we draw methodological lessons and some observations concerning our research questions.

1. Introduction

1.1 Characteristics of Digital Installations

The digital installations in cultural heritage sites are a kaleidoscopic phenomenon: they can be structured along several largely independent dimensions and used for several functions, not to mention the richness of technological combinations in its implementation. In exhibitions – here explicitly in museums and exhibition centers – primary usage conditions of digital installations are positioning in location and duration of visit, number of users, intellectual/physical challenge, visitor content production, and creative contribution by visitors (Ruttkay & Bényei, 2018).

While intended function may be one (or several) of the following:

- arousing interest to motivate visitors,
- multimodality to integrate visual and other (audio, tactile, motor) channels in the transfer of knowledge,
- playful learning and participation to address visitors in active involvement,
- personalisation of visit,
- outreaching beyond the museum walls in time and space (Ruttkay, 2020).
- Narrative positioning,
- contextual representation of space and time of the exhibition's theme,
- express an emotional charge (Studio Louter, 2024).

In the discipline of Human-Computer Interaction, digital installations in museums are categorized in two ways. Firstly, according to realisation in space: as standalone (kiosk), mobile (portable), and assemblies (comprehensively installed). Secondly, based on the degree of augmentation, contextually embedded and embodied (related to space in an objectified form), extended reality content (AR/VR/XR) and multisensorial (affecting different modalities) can be distinguished (Hornecker & Ciolfi, 2019).

As additional classification criteria, **levels of interaction** and **interface metaphors** are both particularly important for this research.

1.2 Complexity of Interactions and Interface Metaphors

The striking difference of digital interpretive tools compared to earlier analog modes is their dynamism, which takes visitor interaction to a more complex level – from passive recipient to active interpretive participant.

In our definition, **complex-level interaction** of digital installation combines three, but at least two, of the cognitive, affective, and psychomotor learning domains of Bloom's taxonomy (Bloom, 1956). Whereas, at a **low-level interaction**, the handling condition of the installation relies predominantly on one type of these learning domains to convey its messages.

For example, watching a video projection has neither psychomotor (imitation, manipulation, etc.) nor cognitive (analysis, synthesis, application, etc.) requirements for use, relying solely on affective domain of reception. In the 'Letterpress' installation, psychomotor manipulation (sorting letters) and affective value selection (giving headlines) are combined (Figure 1).

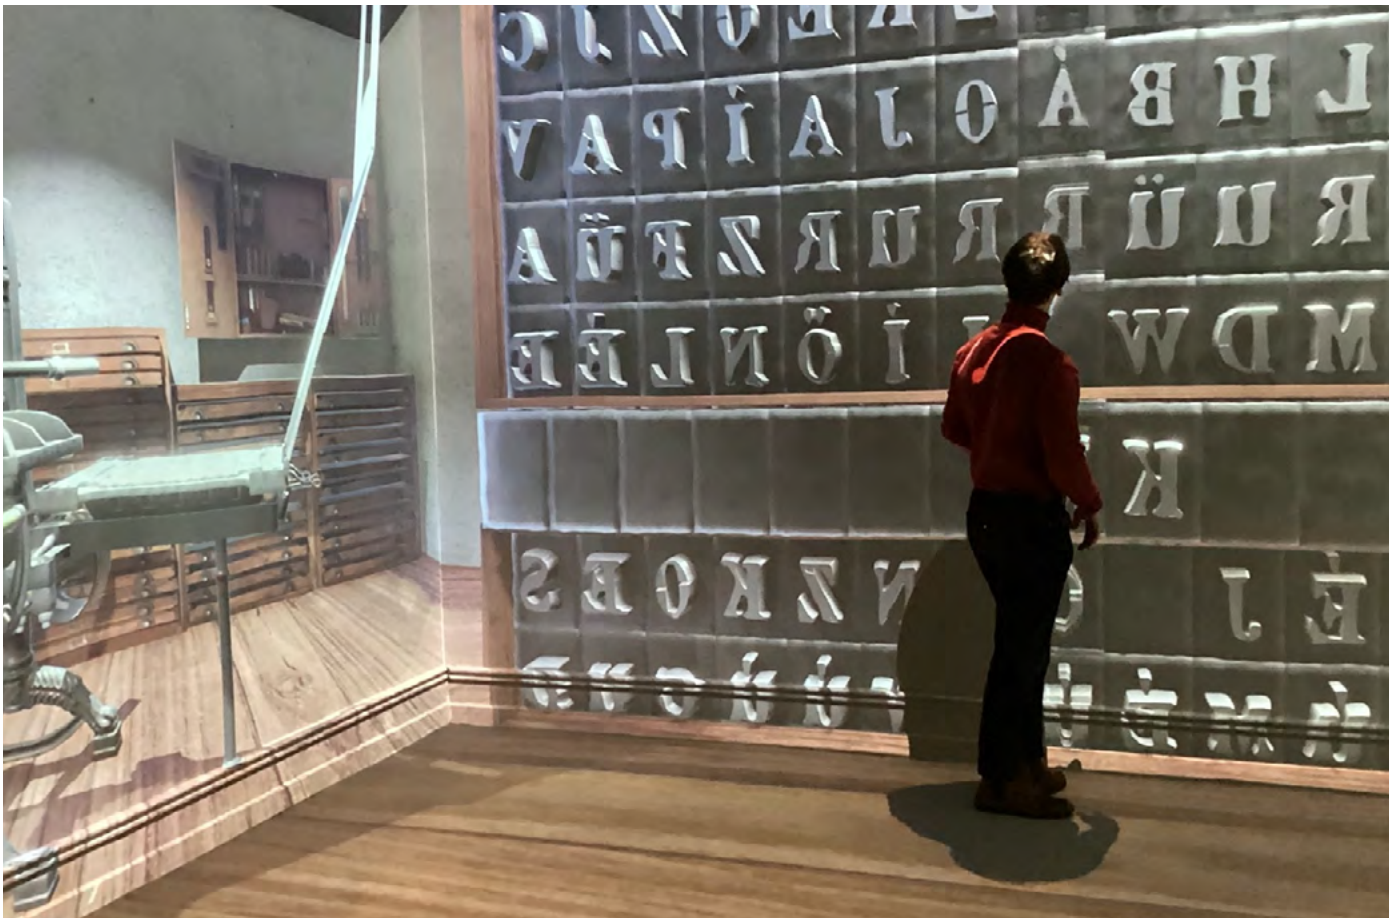

Figure 1 Example of complex-level interaction from the pilot study: "Printing press" implements a media metaphor to challenge participants by sorting the letters to create newspaper headlines.

Interface metaphors are technologies embedded in everyday objects to accelerate the initial familiarity in visitors (Carrol et al., 1988) – just as frames, lenses, vehicles, media, or maps in museums. This proposed list (Table 1) does not aim to be exhaustive, but it provides an overview of the main characteristics. Yet, without playfulness or implemented as a low-level interaction (e.g., launching videos), interface metaphors could be reduced to mere scenery if visitors are left as passive recipients.

Table 1. Interface metaphors of digital installations in exhibitions.

Metaphor	Connotation	Object Extenstion
Frames	border, in and out, casing, framework	window, gate, painting, mirror
Lenses	scaling, reduce, expand speed up, slow down	glasses, telescope, microscope, scanner, door viewer
Vehicles	motion, shifting, navigation, progress	carriage, boat, bicycle, car, aeroplane, spaceship
Media	communication, information knowledge, verification	printing press, book, journal telegraph, radio, television
Maps	coordinates of place and time, background, context	diorama, interactive map, datavisualization

1.3 Earlier Empirical Research on Usage and Effect

The diversity of media technologies and heterogeneous content create unique challenges for evaluation (Diamond et al., 2016). There is little empirical research on digital installations of cultural heritage, and the results so far tend to focus on usage (Hinrichs & Carpendale, 2011) or visitor attitudes toward technology (Hanko et al., 2014) but only in general overview on learning outcomes (Pallud, 2016) or evaluation of it (Kontiza et al., 2020).

Comparisons between graphical and manipulative (tangible) interfaces showed that the latter are more frequently tried, especially by children. In both cases, involving multiple participants leads to significantly longer interaction (Horn et al., 2009). The absolute and relative location of visitor paths influences the attention paid to digital installations proved by installation usage's time spent compared to visitor paths in Chopin Museum (Knast, 2017).
While in vitro design research rooted in HCI (Höök et al., 2003) has turned to in situ evaluation (Galani & Kidd, 2019) to adapt its criteria to the museum's informal learning environment (Bekele & Champion, 2019).

In the Mesch project, researchers evaluated how visitors use digital and non-digital exhibition elements (museum objects, digital replicas, labels, multimedia) by integrating personal meaning maps to measure visitors' informal learning (Damala et al., 2016). Pre- and post-visit mapping helps to assess visitors' knowledge of a broad range of exhibition topics (Falk et al., 2010).
Engagement and learning were examined in two natural history museums, where interactive *tree of life* with 70,000 species was presented on a touch table. A bigger proportion of visitors who used the digital installation understood evolution concepts compared to those who watched overlapping video content in the same time frame (Horn et al., 2016).

2. Own Research Agenda

Our research focuses exclusively on digital installations mounted in the physical space of the exhibition as 'standalone' kiosks. The scope will be on teenagers and young adults (10–19- and 20–25-year-olds) as the deployment of museum technology is driven by the demand to engage them as future visitors. We wish to measure learning outcomes of digital installations and their impact on the attention paid to artefacts and other modalities presented in the exhibition environment. We aim to investigate the use of digital installations through 3 case studies in cultural heritage institutions in Budapest (Petőfi Literary Museum, House of Music, Skanzen).

2.1 Research Questions

1. How does digital installation usage effects visitors' attention distribution in the same exhibition space compared to non-users?

    a) Do digital installation users pay less attention to the collection's objects?
    b) Do digital installation users pay less attention to other presentation modalities?

2. Do users grasp the message conveyed by the digital installations?

    a) How is the recall of digital installations' content right after the visit related to the extensiveness of the usage of the installation?
    b) How is the recall of digital installations' content 4-6 weeks later after the visit related to the extensiveness of the usage of the installation?

3. Comparing complex to low-level interaction usage, which induces a higher proportion of

    a) the involvement of fellow visitors in interaction?
    b) more positive emotional state?
    c) telling about their experience with digital installation to others in 4-6 weeks after the visit?

2.2 Hypotheses

1. Digital installations' users are not paying less attention to the objects or the presentation modes in proximity compared to non-users.

2. Long-term knowledge transfer is only can be conveyed through exhaustive usage.

3. Usage of complex-level interaction-based digital installations compared to low-level based, induce

    a) larger proportion failed to try
    b) more exhaustive exploration of content
    c) higher proportion of fellow visitor involvement
    d) emotional intensity (less neutral state).

4. Experience with complex-level interaction-based digital installations are more often told to others in 4-6 weeks after the visit.

3. Empirical Research Methodology

3.1 Entry Questionnaire – Visitor Profile, Knowledge Brought

To evaluate digital installations' learning outcomes, we apply combined quality and quantity research (Malik et al., 2023). In order to profile the visitors, we use a demographic questionnaire before the exhibition. It is also surveys visiting habits and pre-knowledge of digital installations and exhibition themes, adapting the aforementioned personal meaning mapping method (Falk et al., 2010). Participants are asked to pin up a badge (Figure 2), which links the measurement phases with an anonymous code (Y02=yellow badge+second measurement).

3.2 'In the Wild' Observation – Mode and Circumstances of Use

The guided and covert observations could be 'shadowing' or 'point tracking' depending on the floorplan. To ensure consistency of logging, intercoder agreement should established on the relative values observed, and each observer is expected to record trials before substantive sampling.

The following aspects of usage are observed and coded.

- interaction's duration
- whether it is used alone or with a partner
- degree of usage (try but give up/ask for help/use successfully, etc.)
- extent of usage (amount of discovered content offered)
- attention paid to artifacts or presentation modes(object-descriptions/wall-signs/ QR-codes)
- displayed emotions
- general attitude (experience-seeker/in-hurry/wandering).

Figure 2. Research supplies: badges, artifact photos, and personal meaning maps.

3.3 Exit Interview – Paid Attention to Installations, Artworks, and Texts

At the exit interview, laminated photographs could be handed out (Figure 2) to help identify artworks and evaluate digital installations based on user experiences and the distribution of attention. We ask them to formulate the main message of the digital installations they have engaged. We also ask them to identify which object they recognize and whether they can name the person associated with it from its description.

3.4 Online Questionnaire – Long-Term Knowledge

The follow-up online questionnaire is designed to shed light on the long-term knowledge gain therefore, we ask respondents about their recollection of the installations 4-6 weeks after the visit with questions like: Have they talked about digital installations since? Do they remember digital installations' specific content? How well can they recall displayed objects in the proximity of a digital installation?

4. A Pilot Study

In Petőfi Literary Museum *Petőfi 200 To be or not to be a poet?* permanent exhibition, a pilot study was carried out in the fall of 2023. In design and purpose, [three] significantly different digital installations were chosen, the remaining 13 were not the subject of the research due to their repetitive format or lack of learning function.

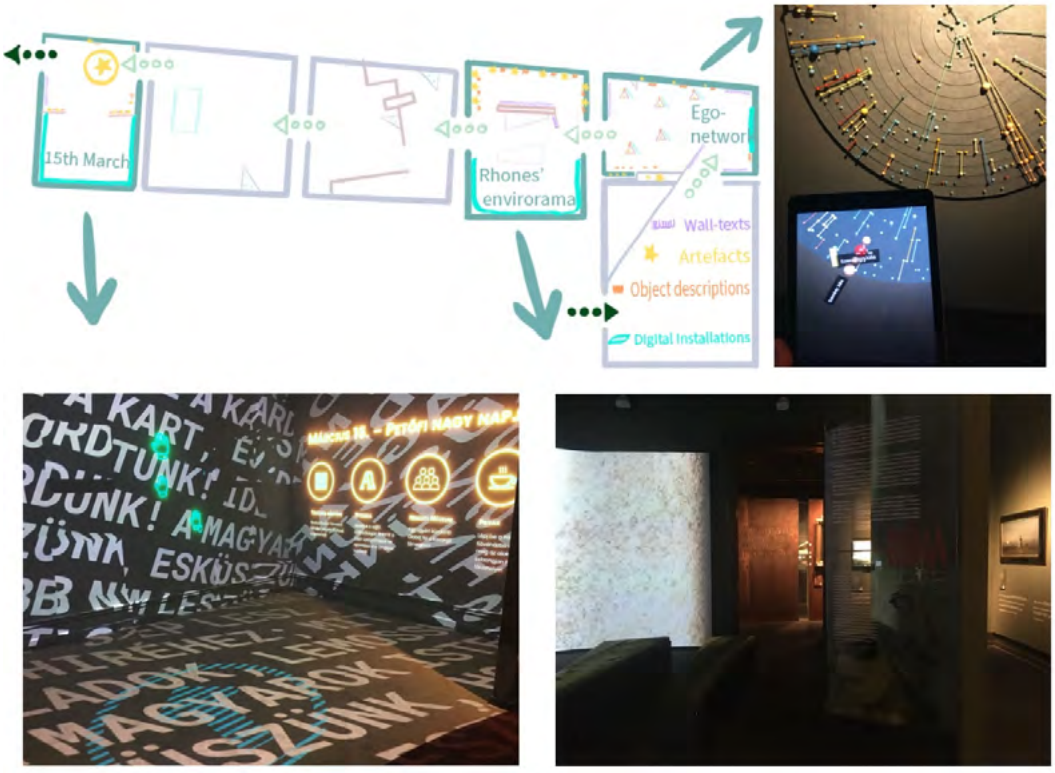

Figure 3. Digital installations on floorplan (top left), Ego-network (top right), Rhone's Envirorama (bottom right), and 15th March (bottom left).

Ego-network (Figure 3) was the kick-off installation, which promotes exploratory learning in layered content - combining data visualization and augmented reality tools (Figure 3). It is aim to reveal who was important to the poet.

Rhone's Envirorama (Figure 3) is an immersive, large-scale projection from the center for relaxation and contemplation. By definition, envirorama is a new generation of the diorama, except it shapes the environment to include visitors as part of it: "Being 'in' a walk-through reconstruction quite directly makes a visitor feel 'part of' the display" (Roppola, 2018, p.151).

15th March (Figure 3) is the final digital installation in the exhibition. Projections of the embayment do not provide narrative factual knowledge; rather, it helps to situate the participant in the milieu of the period. To address schoolchildren at the end of the content-rich exhibition requires full bodily gestures via motion sensors.

The pilot aimed to fine-tune the methodology. Therefore, we applied convenience sampling (n=52), where the gender ratio was 35-65% in favor of females. The vast majority already have used a digital installation in museums (81%), came with family or friends (68%), and were from Budapest (65%).

4.1 Improvements, Limitations, Results

Lessons learned concerning methodology

The major difference between 'shadow-' and 'point-tracking' is that the latter allows more relevant data to be collected in a shorter time; however, the risk of data loss is higher due to the number of observers. Personal meaning maps should be selected that do not appear in any other representation in the exhibition to ensure that the digital installations alone could provide access to learning about the concept.
The small sample size and limitation of the target population did not allow us to get significant answers to the research questions. Moreover, to compare the types of installations, it will be necessary to observe more applications – yet results can be considered indicative for future research.

Some observations about the research questions

1. There is no evidence that those who used the digital installation tended to pay less attention to the artworks or the descriptions.
2. The shorter the time users spent watching Rhone's Envirorama, the more time they spent looking at the artwork. While different relationship was identified for the other complex-level interaction-based installations, more attentive usage was associated with more careful observation of the artworks.
3. More than 75% of respondents mentioned digital installations; complex installations emerged as the most prominent.
4. More positive emotions were monitored during complex-level interaction.

This research makes useful steps in strengthening the evaluation practice of the Hungarian museum scene and also helps digital curators and design practitioners to fine-tune the iteration process in cultural heritage institutions since design practice and -research is built on knowledge advancement and exchange between them.

KEYWORDS | CO-DESIGN, SERVICE DESIGN, SOCIAL INNOVATION, SOCIAL INCLUSION, DEI PRINCIPLES

ABSTRACT | Exploring the potential of co-design methodology to enhance diversity, equity, and inclusion (DEI) in public sector services, this doctoral research emphasizes the need to integrate vulnerable communities into service development processes. The main objective is to understand whether and how co-design and participatory design methods can address DEI challenges, enhance public service delivery, and effectively involve vulnerable communities and public administration in the definition of public services. The research process started with a literature review, defining the concepts of social diversity, equity, and inclusivity. At the same time, the state of the art in the context of co-design and participatory design methodologies was analyzed concerning the public sector. A selection of case studies of socially relevant practices was conducted to assess the implications and effectiveness of participatory and co-design practices together with a variety of vulnerable categories. The analysis of the case studies highlighted the numerous gaps in the services provided by public administration for many communities, which led to the development of bottom-up services that would fill in the gaps and cater to the needs of disadvantaged citizens. Moreover, it emphasized the social relevance of participatory design and co-design approaches in developing solutions for their specific needs. This research serves as a starting point for a future investigation into how the use of such co-design practices with citizens from vulnerable groups can be relevant at the level of public administration and how the public administration itself can adopt such methodologies to provide citizens with the services they need and ultimately what is the role of the designer in this process.

1. Introduction

Social diversity, equity, and inclusivity are crucial in public administration, yet struggles with their implementation are evident due to indecision and delays in the application of just policies.
Public sector managers often lack a deep understanding of organizational diversity, highlighting the need for incorporating social equity principles. (Dooley, 2020) Achieving equity in the public sector involves more than just ensuring equal access to resources and opportunities: it calls for diverse, equal, and inclusive representation in government and decision-making jobs. This may involve reevaluating existing policies and practices through a gender mainstream (Booth & Bennett, 2002; Pollack & Hafner-Burton, 2000) and an inclusive approach to identify and eliminate any biases or discriminatory factors. It also requires addressing systemic barriers that perpetuate inequality faced by marginalized communities, such as people of color, individuals with disabilities, and those from low-income backgrounds, as well as categories of users that are not considered marginalized but still face systemic issues such as women, pregnant people, or members of LGBTQIA+ community. By recognizing these barriers, it will be possible to work towards creating more inclusive policies and services that effectively address the diverse needs of the community.

As this contribution delves deeper into the social implications of diversity, equality, and inclusivity, it sets the starting point of a research on how service design can effectively overcome barriers, promote unbiased approaches, and implement participative strategies to achieve a more just environment for all individuals.

2. Principles of Diversity, Equity, and Inclusion

Diversity, Equity, and Inclusion are essential principles that uphold the values of fairness, justice, and equal opportunities in society. This group of principles, often abbreviated in DEI, are "organizational frameworks which seek to promote the fair treatment and full participation of all people, particularly groups who have historically been underrepresented or subject to discrimination based on identity or disability." ("Diversity, Equity, and Inclusion," 2024)

Diversity refers to the variety within a group regarding identity (i.e., gender, culture, ethnicity, religion, disability, class, etc.), characteristics, or opinion. Its declinations are numerous, such as gender diversity, the composition of men, women, and nonbinary people; age diversity: differences in age groups and generations; ethnic diversity, sharing of common national or cultural traditions or representation of different backgrounds; physical ability and neurodiversity: perspectives of people with disabilities, whether apparent or not. (McKinsey & Company, 2022) Considering this issue in the setting of public administration, it is evident that each of the above-mentioned characteristics and values must be considered in the definition of public services, as each of them might face barriers in different touchpoints of their experiences.

Equity is intended to ensure that everyone has access to the same resources, benefits, and opportunities regardless of their background or circumstances. In the context of public sector services, it is concerned with the measurement and achievement of fairness in the provision of governmental policies and services and emphasizes the impact of the distribution of opportunities, services, and goods on individual well-being. (Cepiku & Mastrodascio, 2021) In this sense, the term can assume two distinct meanings. With "Horizontal equity (equality), everyone receives the same public benefit following the concept of social equity." (Yuan et al., 2017, p. 2) This approach can be controversial, as offering the same tools to individuals with different means and possibilities will lead to uneven results. "Vertical equity," on the other hand, is "based on the different ability and demand of various social groups, whereby the specific socially vulnerable groups receive disproportionately more benefits." (Yuan et al., 2017, p. 2) This side can also bring to light some issues since it can be argued that providing more attention to one specific category could leave out others. Moreover, providing a service for only one category can lead to a ghettoization of it.

Finally, the term inclusion refers to actively creating an environment that embraces diversity and values the contributions of all individuals, making sure that no one is excluded or marginalized. In recent years, there has been a growing emphasis on evaluating the social value of public services: as societies become increasingly diverse, it is crucial for public sector organizations to ensure that their services are accessible and available to all individuals, regardless of their background or circumstances, and to shift away from "managing diversity" in favor of a more proactive approach that involves "managing for diversity" (Chavez & Weisinger, 2008).

One of the goals of this doctoral research is to inquire into the impact of service design methodologies in the public sector, aiming to assimilate and incorporate the principles just outlined into the definition of proper solutions.

3. Service Design in the Public Sector

Co-design and participatory practices in service design are pivotal in the public sector to foster inclusivity and equity, as they actively involve individuals from various organizations or backgrounds to collaborate, sharing and combining ideas and knowledge (Steen, 2013), and ensuring that services will cater for their needs and desires. This inclusive approach is particularly beneficial when designing services for vulnerable consumers. It empowers them to contribute actively, making policies and service delivery more effective and responsive (Dietrich et al., 2017; Fisk et al., 2018; Jakobsen & Andersen, 2013). In the setting of the public sector, the participating actors would represent not only end-users such as citizens (non-citizens as well) but also public employees, administrations, and institutions. The inclusion of the latter presents certainly a challenge and a limitation, and this study proposes future inquiries into methods and approaches to do so.

A distinction between co-design and participatory design is necessary, as they focus on two distinct aspects of collaboration between designers and actors. Participatory design "entails acquiring feedback as the product is being built" (Peacock, 2022). In this way, the creation process is leaner for designers who hold the role of decision-makers: actors engage in advanced stages of the creative process, and their opinions are picked and selected when needed. This approach presents the risk of ability bias as a "tendency to design based on our abilities, and thus, we might bias the feedback we are given"(Peacock, 2022) and of tokenism showing only symbolic effort to be inclusive to members of minority groups rather than allowing them to truly influence the research direction. Co-design, on the other hand, involves the actors from the initial stages until the end of the creative process. In this case, it is necessary to establish an equalitarian relationship between actors and designers, allowing citizens to become designers (Manzini & Rizzo, 2011) and designers to become mediators and facilitators (Melles et al., 2011) rather than leaders.

Many co-design techniques and tools require skills, expertise, and processes that rely on certain levels of communication, cognitive, and creative skills on the part of the participants. (Rodgers, 2018, p. 192) This could lead to the necessity to use specific tools to cooperate with certain vulnerable categories, such as people with mental or physical impairments.

Using both participatory and co-designing techniques allows the designer to access valuable data and knowledge that is ingrained in people's everyday experiences, being citizens, workers, or service providers, granting rich evidence of "real rather than assumed behaviours" (O'Rafferty et al., 2017, p. 16). As described by Blomkamp (2018), "methods such as diaries, collages, card sorts, model building, and various forms of mapping and roleplaying can help to reveal knowledge that is non-verbal, holistic, non-linear, emotional, or intuitive, and which may not be uncovered by other methods." (Blomkamp, 2018, p. 733) Moreover, co-design sessions, such as living labs, provide an open platform for exploring everyday experiences and social phenomena "combined with controlled activities, technical set up, support and data collection." (Kanstrup et al., 2010)

4. Diverse, Equitable, and Inclusive Services: Case Studies

By examining case studies of successful diverse, equal, and inclusive initiatives at the local level, we can gain a deeper understanding of the challenges and opportunities in implementing inclusive services and practices within public sector organizations.

4.1 CAPE – Civic Agency in Public E-services Innovation (2020, Denmark, Finland, Sweden)

The CAPE project tackles marginalized users who lack digital skills. It grants public libraries a more active role as Civic Innovation Centers (CICs), where citizens can be engaged in the improvement of current e-services, as well as in the development of new services. Through a group of volunteers, CAPE aids citizens, the majority of whom are elderly and struggling with digital services. Although this bottom-up effort began as a research project, it has developed into a communication bridge between the general population and the public administration they interact with.

4.2 PYCIPEDIA (2019, Sweden)

Pycipedia is a participative web-based platform for social workers who are certified in providing parenting skills training and support for parents with intellectual disabilities or learning difficulties. This service allows social workers to share, edit, and discuss instructional materials for neo-parents. The adoption of a co-design method to develop an inclusive service for people with disabilities is particularly relevant for research. It serves as a perfect example of how participative design practices may target the individual working on the service itself rather than the vulnerable category.

4.3 GULLIVER (2013, Germany)

Started as a project with the students at Köln International School of Design, in 2001, Gulliver opened as a social facility. It offers a meeting point for homeless men and women to maintain a mailbox and have a dormitory to sleep in during the day and a dressing room for personal hygiene, affordable snacks, and hot drinks. In this case, the co-design approach granted a vulnerable category, such as homeless people, a service that caters to their basic needs but, most importantly, offers crucial support in participating in society with the dignity they deserve. This service closes a gap in the net of Cologne's social facilities.

4.4 HER BARKING (2019, United Kingdom)

Acknowledging the difficulties of vulnerable categories in dangerous areas of the city, a women-led movement was funded, experimenting to collaboratively design and test low-cost interventions to make streets and spaces feel safe. The initiative engaged residents to identify spaces where people do not feel safe and collaboratively design and evaluate several installations. This bottom-up initiative was born from the need of women, older people, and disabled people to safely walk across dangerous streets in the city. Engaging citizens as both data gatherers and solution-providers, this project empowered the community and filled a gap in the urban context.

4.5 CICLOUFFICINA SOCIALE – Social Bicycle Workshop (2013, Italy)

The initiative combines rehabilitation work in supporting people in disadvantaged conditions with manual and cycle-mechanics practice. In the maintenance laboratory, bicycles are repaired and manufactured, emphasizing the recovery of abandoned bicycles. This project's relevance for the community is double since it offers support to vulnerable categories in acquiring manual skills and, therefore, being able to join the workforce. At the same time, it promotes accessibility to cheap means of transport for people in economic difficulties.

5. Conclusions

This doctoral research stems from investigating the public sector under the lens of DEI and its social implications. A study has been conducted on the meaning of these three terms, delving into their declination in the public sector. Subsequently, after a study on the theme of co-design and participatory design, a selection of case studies was conducted analyzing the contribution and the categories to which it is addressed, as well as relevance for research.

The study aims to define how service design approaches DEI issues and how - and if - co-design and participatory design techniques can be a solution for redefining or creating different, equal, inclusive services. There are clear areas for improvement in the inclusion of certain categories in public sector services today. Many of the services analyzed as case studies start as bottom-up projects from academic research or non-profit organizations. In addition, all these projects are either a buffer service (filling the gaps in the public administration) or a bridge service (mediator) between citizens and public administration, highlighting the need for direct government intervention to fill these gaps. On the other hand, it emerged that progress in this direction is possible by including participatory design practices and co-design.

In light of these considerations, how can service design develop empowering strategies in the public sector to support and uplift vulnerable communities without imposing tension on the public administration?
The outcomes of this research pave the way for a deep investigation into the role of service designers and participative methodologies in the public sector to define tools and methods to co-design diverse, equal, and inclusive public services together with the citizens and the public administration.
Finally, future steps will aim to understand the critical role of designers in this collaborative process, questioning how their expertise and approach can facilitate the adoption by the public administration of such methods to improve service delivery and ensure that it is just and fair to all segments of society.

KEYWORDS | DESIGN THEORY, DESIGN RESEARCH, DESIGN PHILOSOPHY, TOTAL DESIGN, METADESIGN

ABSTRACT | This paper aims to advance Design research methods by introducing the four propositions of the 'Dialectic of Design' and understanding the oscillatory tension between Total Design and Metadesign based on the 'Functioning of Design' . It argues for a more holistic perspective on Design to genuinely research its discipline. The developed theory is supported by Flusser's (2012) Design philosophy and guided by Design's inherently anthropocentrism (Archer, 1979), which emerged in prehistory (Margolin, 2017). It advocates for a paradigm shift inside Design research methods, from a 'designer-centric' perspective to a 'human-centric' one. This paper proposes a 'Design Ecosystem' as a theoretical framework converging Design within itself and with Science and Humanities. It is divided according to the theory's three main structures, concluding with the 'Ecosystem' formulation. A previous MA dissertation (Baldaia, 2021) and the ongoing PhD thesis, Total Design and Metadesign: Implications of a Conceptual and Technological Expansion, support the entirety of this research.

1. Introduction

Design needs a unifying theory. There are increasingly more specialised Design fields, boxing designers into narrower specialisations and struggling to integrate our time's necessary permeability and flexibility. Today's fragmented and often 'designer-centric' perspective on Design (formulated since the discipline began) is problematic. We need a paradigm shift in understanding Design, decentralising it, and taking a more holistic view of Design. This paper proposes a 'Design Ecosystem' as a unifying and more stable theoretical framework, contributing to the advancement of Design research methods. The theory is structured as follows: 'Functioning of Design,' 'Dialectic of Design,' Bodies of Knowledge, and 'Design Ecosystem.'

The 'Functioning' supports the 'Dialectic,' establishing a more comprehensive perspective. The 'Dialectic' configures the 'Design Ecosystem' as a framework for converging Design within and with other bodies of knowledge. Bruce Archer (1979) argued that Design may be a third body of knowledge besides the Sciences and the Humanities, occupied with the material culture and the executive skills that make them. Moreover, he provides an anthropocentric approach towards Design instead of a 'designer-centric' one. Through this multi-level theory, we can holistically frame Design, advancing its research methods and allowing for further investigation of the discipline.

2. Methodology

The theory has a corpus of texts identified by searching for 'total design,' 'metadesign,' 'design ecosystem,' and 'design discipline' (in English and Portuguese) in Design journals such as *Design Issues* and *DRS Digital Library* and also Google Scholar and thesis repositories. It was also considered the broader academic literature, and any reference after 2000 was selected whenever possible. The corpus was analysed following Bürdek's (2015) hermeneutics, focusing on the history and conceptualisations of Total Design and Metadesign. On the triangular frameworks of Design, Costa's (2007) paper helped to compile the most relevant references to cross-reference. Flusser's (2012) insights on Design philosophy also strongly support the theory.

3. Background Research

3.1 Total Design and Metadesign

Total Design traces back to the Arts and Crafts (Margolin, 2017). Nuances exist in recent perspectives. Cruz (2006) links it to blurring natural/artificial boundaries, while Wigley (1998) describes it as 'implosive' and 'explosive,' stating that "all design is total design." Meredith (2008) critiques Wigley, citing the Bouroullec brothers' installations as rejecting totalisation. Holder (2019) expands on Wigley's ideas, suggesting that "all design is interior design," meaning a homogenisation of collective imagination. Ortega (2017) introduces the notion of a 'total designer' as a meta-systematiser, converging Design and technology.

Metadesign's founding interpretations include predating object production (Van Onck, 1965), dematerialisation (Baudrillard, 1981), transcending the anthropogenic (Virilio, 1996), and as an evolutionary process akin to autopoiesis (Maturana, 1997). Wood (2008, 2013, 2022) and Vassão (2008, 2017, 2021) see Metadesign as creating paradigm shifts. The concept lacks a coherent theory, facing issues of vagueness and ambiguity (Giaccardi, 2003; Bentz & Franzato, 2017). Nold (2022) argues for its relevance as a self-reflexive attempt to rethink Design, reacting to contemporary crises (Giaccardi & Fischer, 2008; Backwell & Wood, 2011). Metadesign is used to problematise ecosystems, technology, transition, and decolonisation in Design (Irwin, 2015; Escobar, 2018; Sacchetti, 2022; Colombo et al., 2022).

There is an overall conceptual proximity between Total Design and Metadesign, which is relevant for analysing the expanding discipline and the contemporary role of designers. Chapter 5 explores the dialogical relation between both concepts, contributing to formulating a 'Design Ecosystem.'

3.2 Triangular Frameworks

Many authors have framed Design's discipline through triangular approaches. Vitruvius' (1st Century) *Firmitas – Utilitas – Venustas*[3] concepts and Aristotle's three types of activity diagram (after Keitsch modified it in 2006) may be the oldest triangular conceptions at our disposal. Costa's (2007) book chapter helps to compile the most relevant references of triangular frameworks based on Vitruvius/Alberti: Mijksenaar (2001), Kazmierczak (2003), Leiro (2006), and Providência (2003, 2012)[4]. In this regard, Leerberg's (2009) diagram was also considered. In order to develop a more holistic perspective on Design, the frameworks were cross-referenced on top of Archer's (1979) diagram. The result is explored in Chapter 6.

4. The 'Functioning of Design'

Design is modeling (Archer, 1979) and projecting simultaneously; one cannot exist without the other. It is a ballistic human activity of throwing artifices into the world (Flusser, 2012). Since prehistory, humans have become highly skilled in throwing things, becoming the best throwers of any species to ever walk on Earth. Researching Design is analysing the way and the attitude in which we transpose any idea to the world, e.g., how we think of a chair until we make/do it. Throwing the idea out of the human mind/spirit is the ballistic essence of Design (modelling/projecting), ending up having to have its own defined body of knowledge (Archer, 1979).

Design functions through three levels (Figure 1): 'Irradiation', 'Extension', and 'Amplitude' (Baldaia, 2023). 'Irradiation' is modeling/projecting itself, making 'things' and 'non-things'[5] appear in the world (pp. 84, 85). 'Extension' is Design's phenomenological and praxiological presence, the territory occupied by every 'Irradiation' (pp. 85, 86). Design is more 'Extensive' the more humanity designs; the more humanity designs, the more it designs over time. Ultimately, this exponential relation also means an exponential rise in cultural complexity. 'Amplitude' is the modeling/projecting strength of designing, as each model/project opens new possibilities. It is where we glimpse, design, and meta-design the future (pp. 86, 87). Design is more 'Ample' the more 'Extensive' it is.

[3] This triangular framework is, in fact, more Albertian (1452) than Vitruvian.
[4] His triangular framework was later analysed by Branco (2014) and by both authors in 2018.
[5] Everything human-made that is not physical or "impossible to get hold of […] only open to decoding" (Flusser, 2012, p. 86).

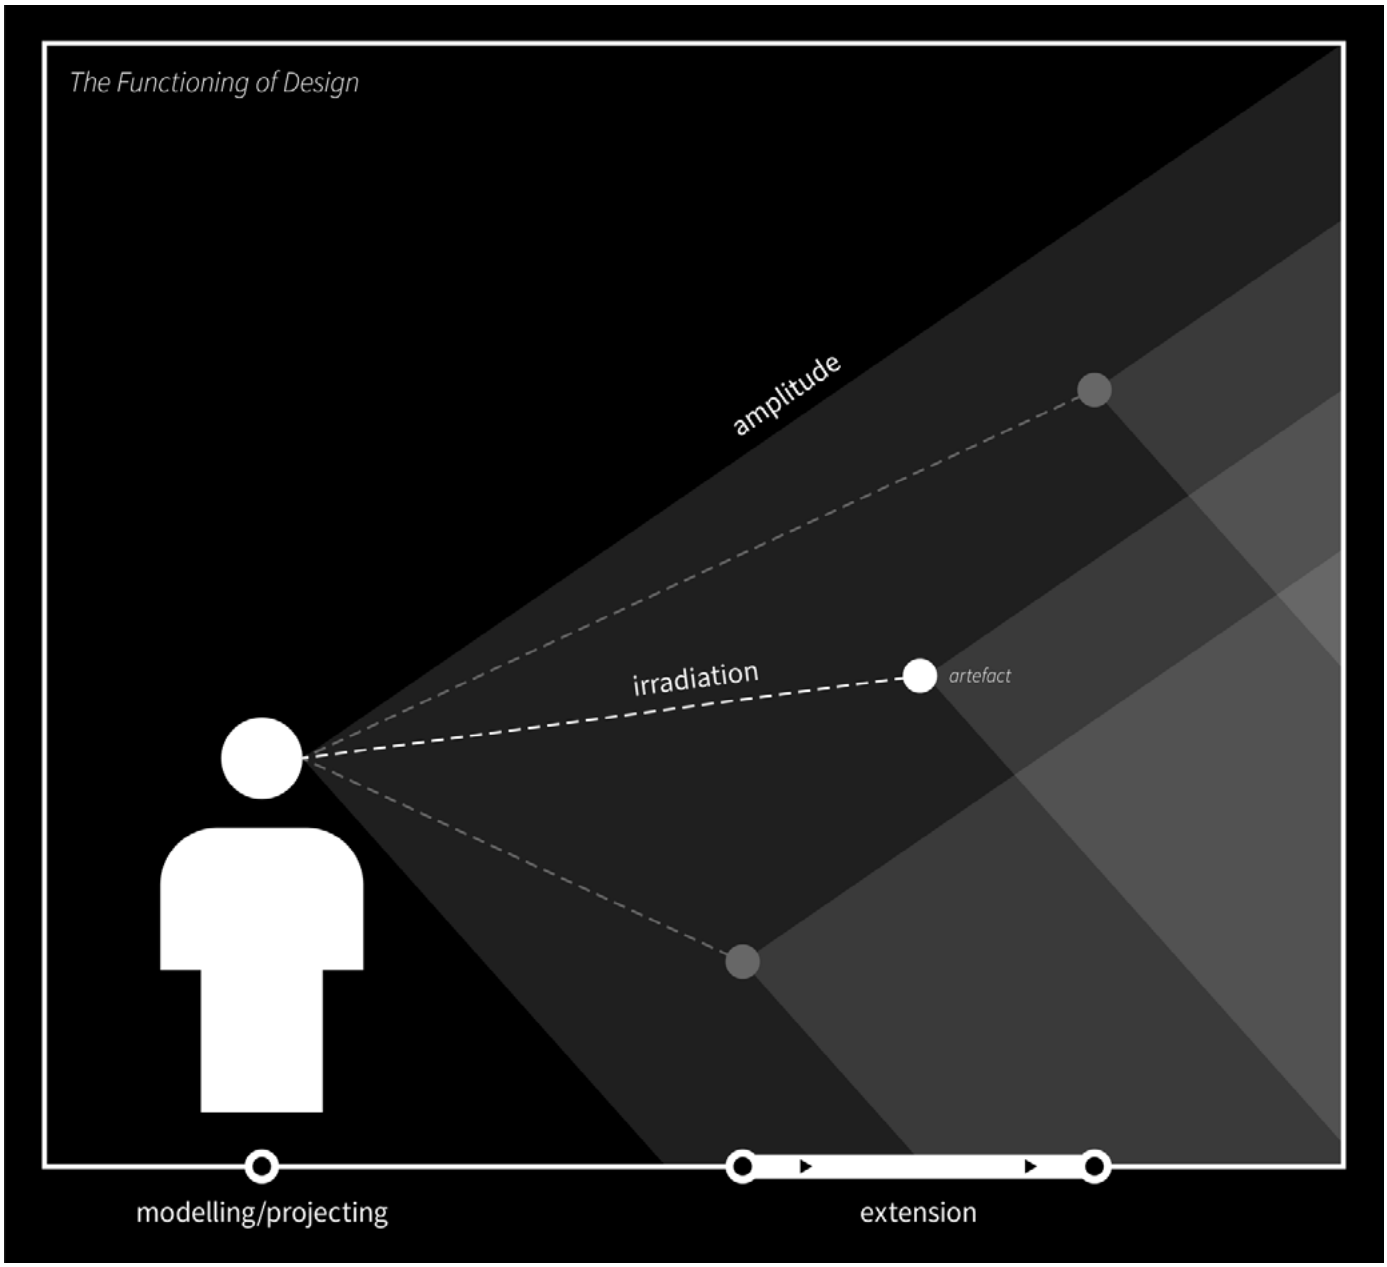

Figure 1. The 'Functioning of Design' through 'Irradiation,' 'Extension,' and 'Amplitude,' beginning with modeling/projecting.

5. The 'Dialectic of Design'

The ballistic 'Functioning of Design' defines the basis of the two fundamental attitudes of Design (Baldaia, 2023; Baldaia & Velez, 2023): Total Design and Metadesign (Figure 2). Total Design exists through the exponential colonising capacity of Design in the world and humanity. Metadesign is mainly present in designing forward while looking both backward and forwards. It is a more dynamic and oscillatory attitude than Total Design, which is usually more linear, conquering new territory without ever losing previous ground.

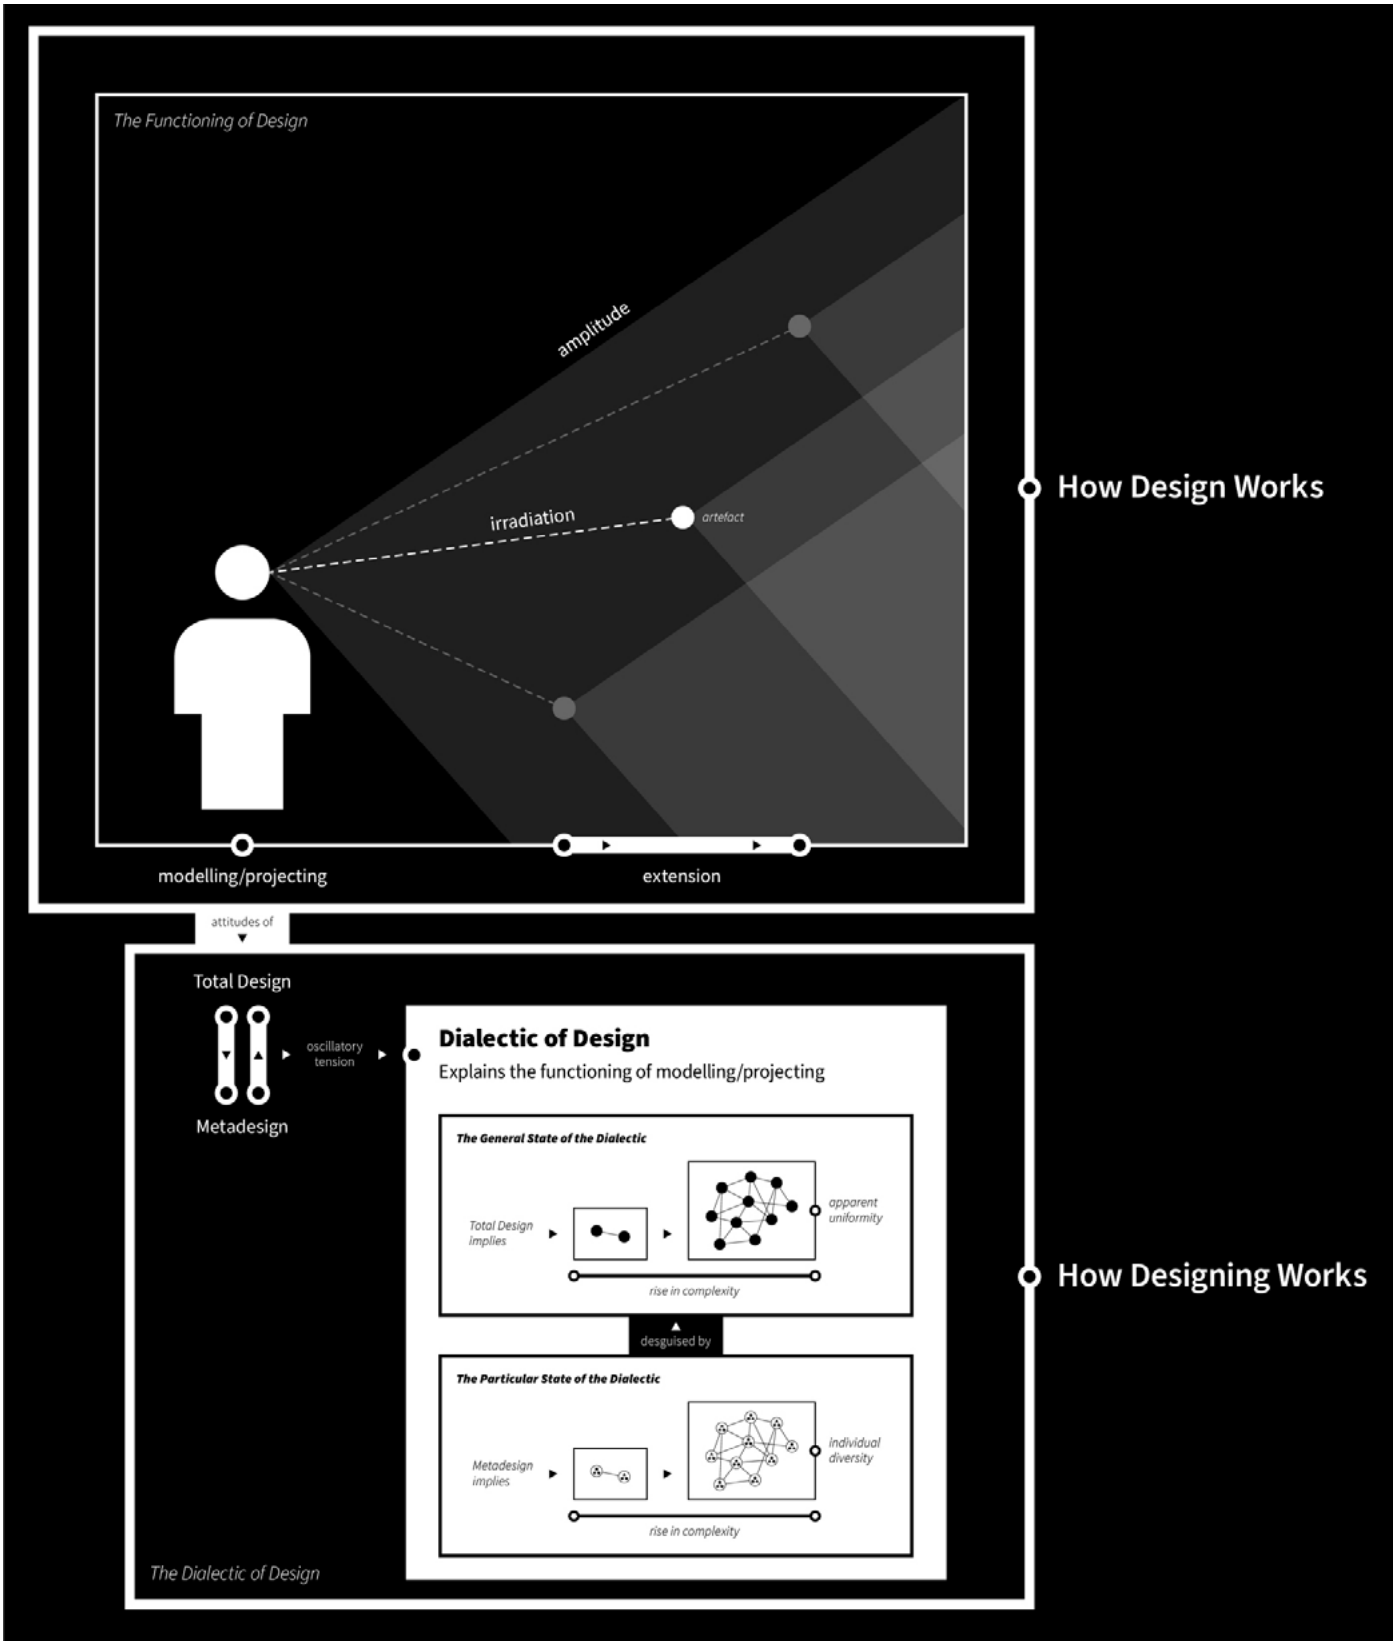

Figure 2. The 'Functioning' and the 'Dialectic' of Design are interconnected.

While modeling/projecting, these two fundamental attitudes relate to themselves through an oscillatory tension (or feedback loop) (Baldaia & Velez, 2023). The result is the 'Dialectic of Design' (Figure 3), which is ever-present while designing. It explains how designing works, another aspect of what Design is, and how it works, integrating the 'Functioning of Design' as a whole. Ultimately, the 'Dialectic' reconciles Total Design and Metadesign towards a synthesis between uniformity and diversity, a more stable homogenisation, and a dynamic heterogenisation.

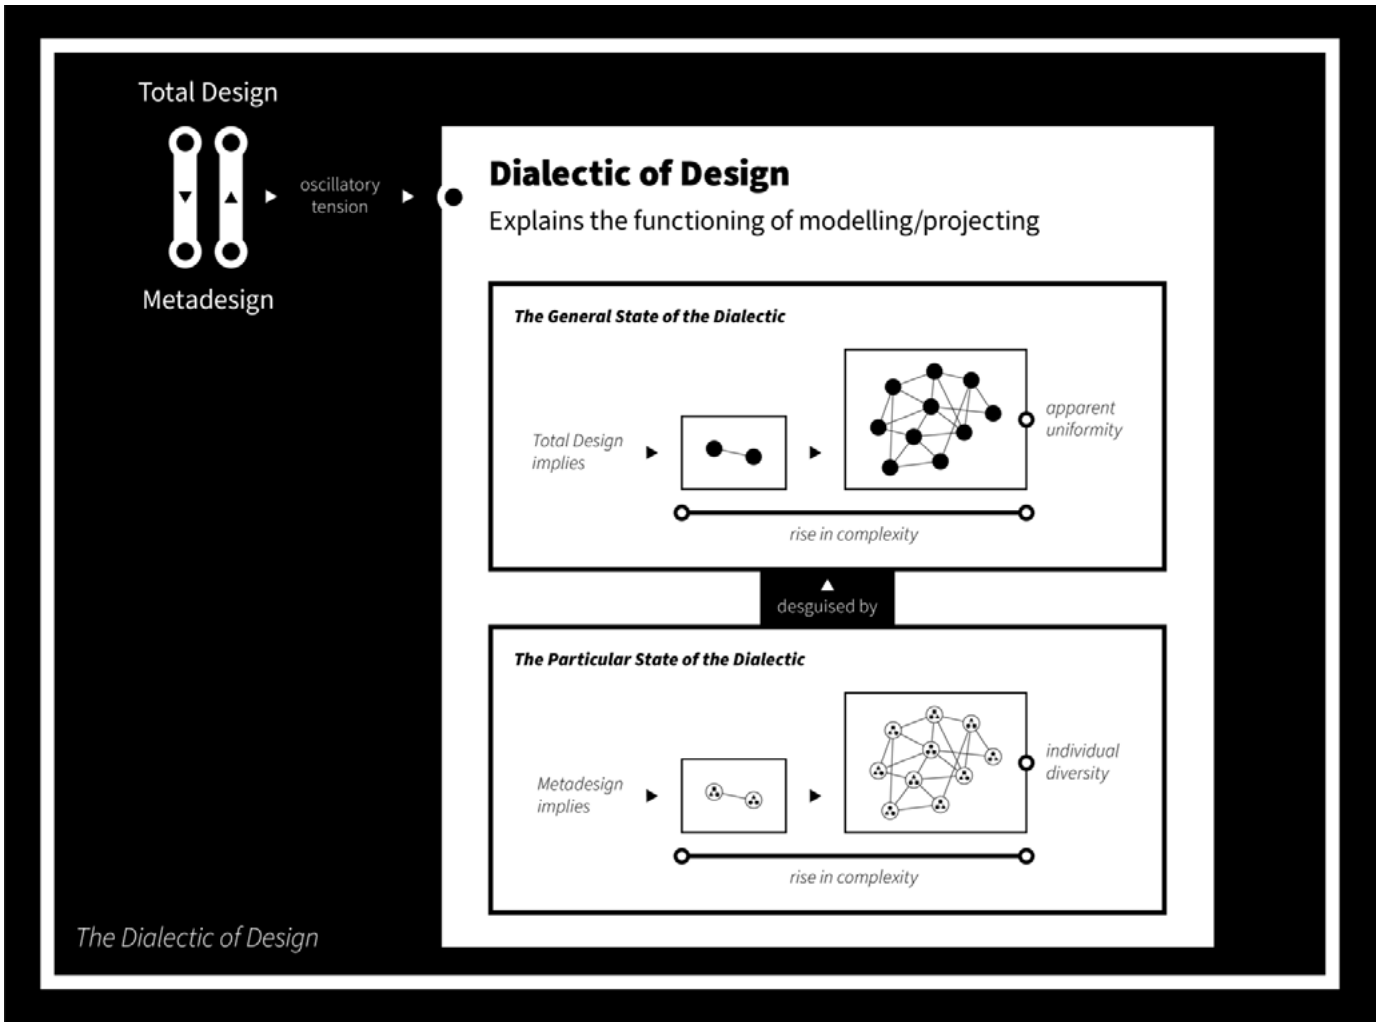

Figure 3. The fundamental states of the 'Dialectic of Design' (second and third propositions).

On the one hand, "all Design is Total Design" (Wigley, 1998), modeling/projecting as a totalizing attitude towards the artificial and cultural world we create, ever-expanding and reaching new possibilities, colonising everything "from the teaspoon to the town" (Rogers, 1952)[6], "from jeans to genes" (Hal Foster, 2011). On the other hand, Metadesign involves collaboration and participation between multiple parts. It functions as an attitude of self-reflection towards remaking and rethinking traditional Design. The etymology of '-meta'[7] may indicate that Metadesign has a dynamic attitude while designing. It allows plurality/diversity, dealing with complexity, and expanding Design in a participatory/collaborative way, ultimately supporting a self-reflective perspective towards Design.

Total Design and Metadesign's oscillatory tension support the 'Dialectic' configured by the following propositions:

1. The 'Dialectic of Design' is defined by Total Design and Metadesign's oscillatory tension.
2. **The General State of the 'Dialectic':** Total Design implies a rise in complexity and apparent uniformity.
3. **The Particular State of the 'Dialectic':** Metadesign implies a rise in complexity and individual diversity disguised by apparent uniformity.
4. The oscillatory tension between the 'General' and 'Particular' states of the 'Dialectic' supports the emergence of creative synergies.

[6] In its original Italian, "Dal cucchiaio alla citta". It was a slogan created in the Charta of Athens, explaining the typical approach of a Milanese architect.
[7] It simultaneously means above, behind, or beyond, configuring the dynamic attribute of Metadesign.

The 'Dialectic' inherits entropy's logic: the tendency of energy (Design) to spread out and reach an equilibrium. The 'General State' explains the apparent uniformity in all human-made objects through Total Design. We can witness this in any brand's/designer's ecosystem, proving inner coherence and even an influence on other designs. It is essential because the 'Particular State' discloses what is underlying it. Metadesign allows us to inspect the inner diversity of a model/project's system. Any Design is made of different parts (methods, graphics, materials, or people), and the appearance of uniformity and coherency disguises them all. This oscillatory tension supports the continuous 'Functioning of Design' over time through the emergence of creative synergies.

6. The Bodies of Knowledge

The 'Ecosystem' also depends on what surrounds Design and its inner 'Dialectic,' i.e., the other bodies of knowledge (Science and Humanities) that permeably relate to Design and vice versa. On top of Archer's (1979) triangular diagram, 'Three Bodies of Knowledge,' we can cross-reference various triangular frameworks attempting to structure Design's discipline or to converge Design with other bodies of knowledge, allowing us to develop a more holistic perspective on Design.

Since it is reasonable to overlap *Utilitas* on Archer's Design and *Firmitas* on Science, let us focus on the *Venustas* edge. Being more related to aesthetics and beauty, *Venustas* would not correctly overlap the Humanities. Instead, we may rename it '*Significatio*' (meaning expression, manifestation, and signification), which better represents the Humanities and what that body of knowledge proposes to do and research. Overlapping Aristotle's three types of activity (Keitsch, 2006) allows us to find a middle ground between *Utilitas*/'*Significatio*' (*Práxis*), *Utilitas*/*Firmitas* (*Poíesis*), and '*Significatio*'/*Firmitas* (*Theoría*) (Figure 4).

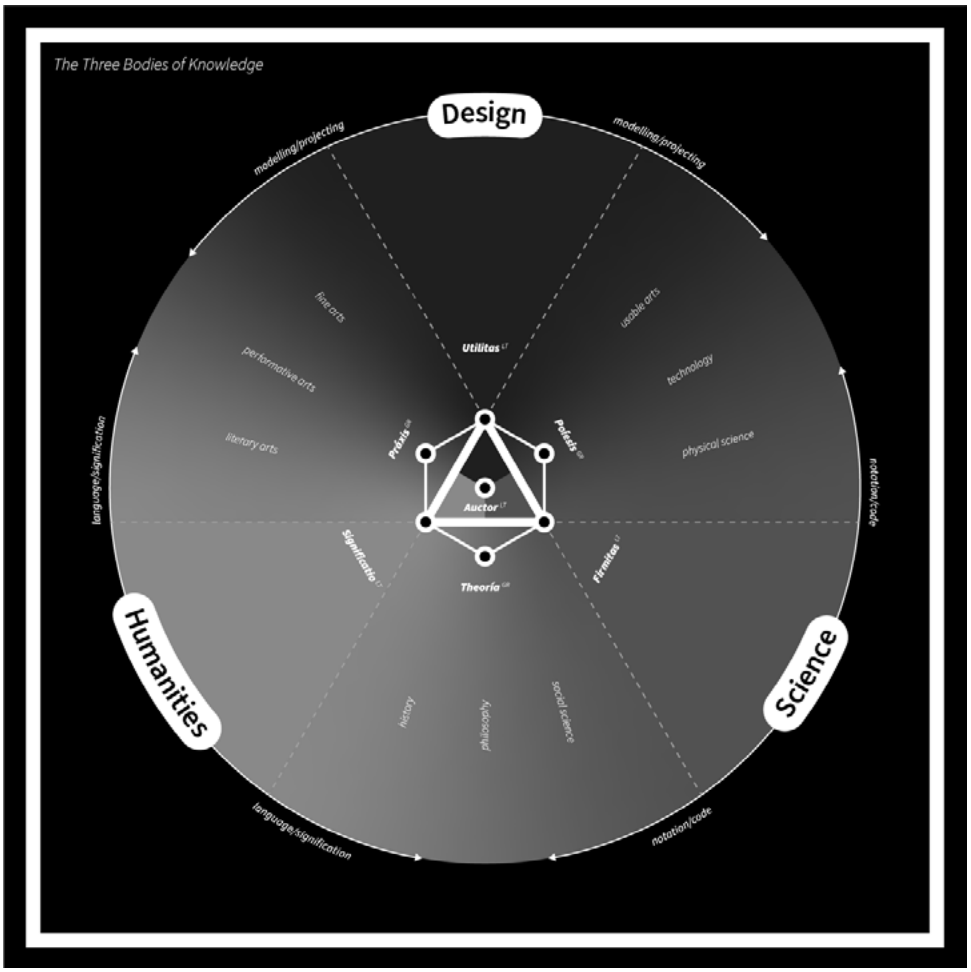

Figure 4. The bodies of knowledge are in an open, interconnected, and expansive system of permeable relations.

Because an author is the one who creates or, as the Latines interpreted it, the one who conquers new territory, it must be at the centre of the diagram representing whoever acts in and through any body of knowledge. Therefore, we have established alongside Archer (1979) how Design is located concerning Science and the Humanities and that the plane of theory (*Theoría*) is what Design continually pursues (Figure 5). Theory may be seen as the archetype of any designer's utopic Design, i.e., the grand model/project in which any other Design could fit without gaps as a perfect Total Design:

> "Strong Design presupposes strong theory. Design is […] the appearance of theory. […] After all, theory is itself an artwork, something designed. Theorists such as Vitruvius and Alberti insist that the ordering and structure of their respective treatises match that which they prescribe for buildings." (Wigley, 1998)

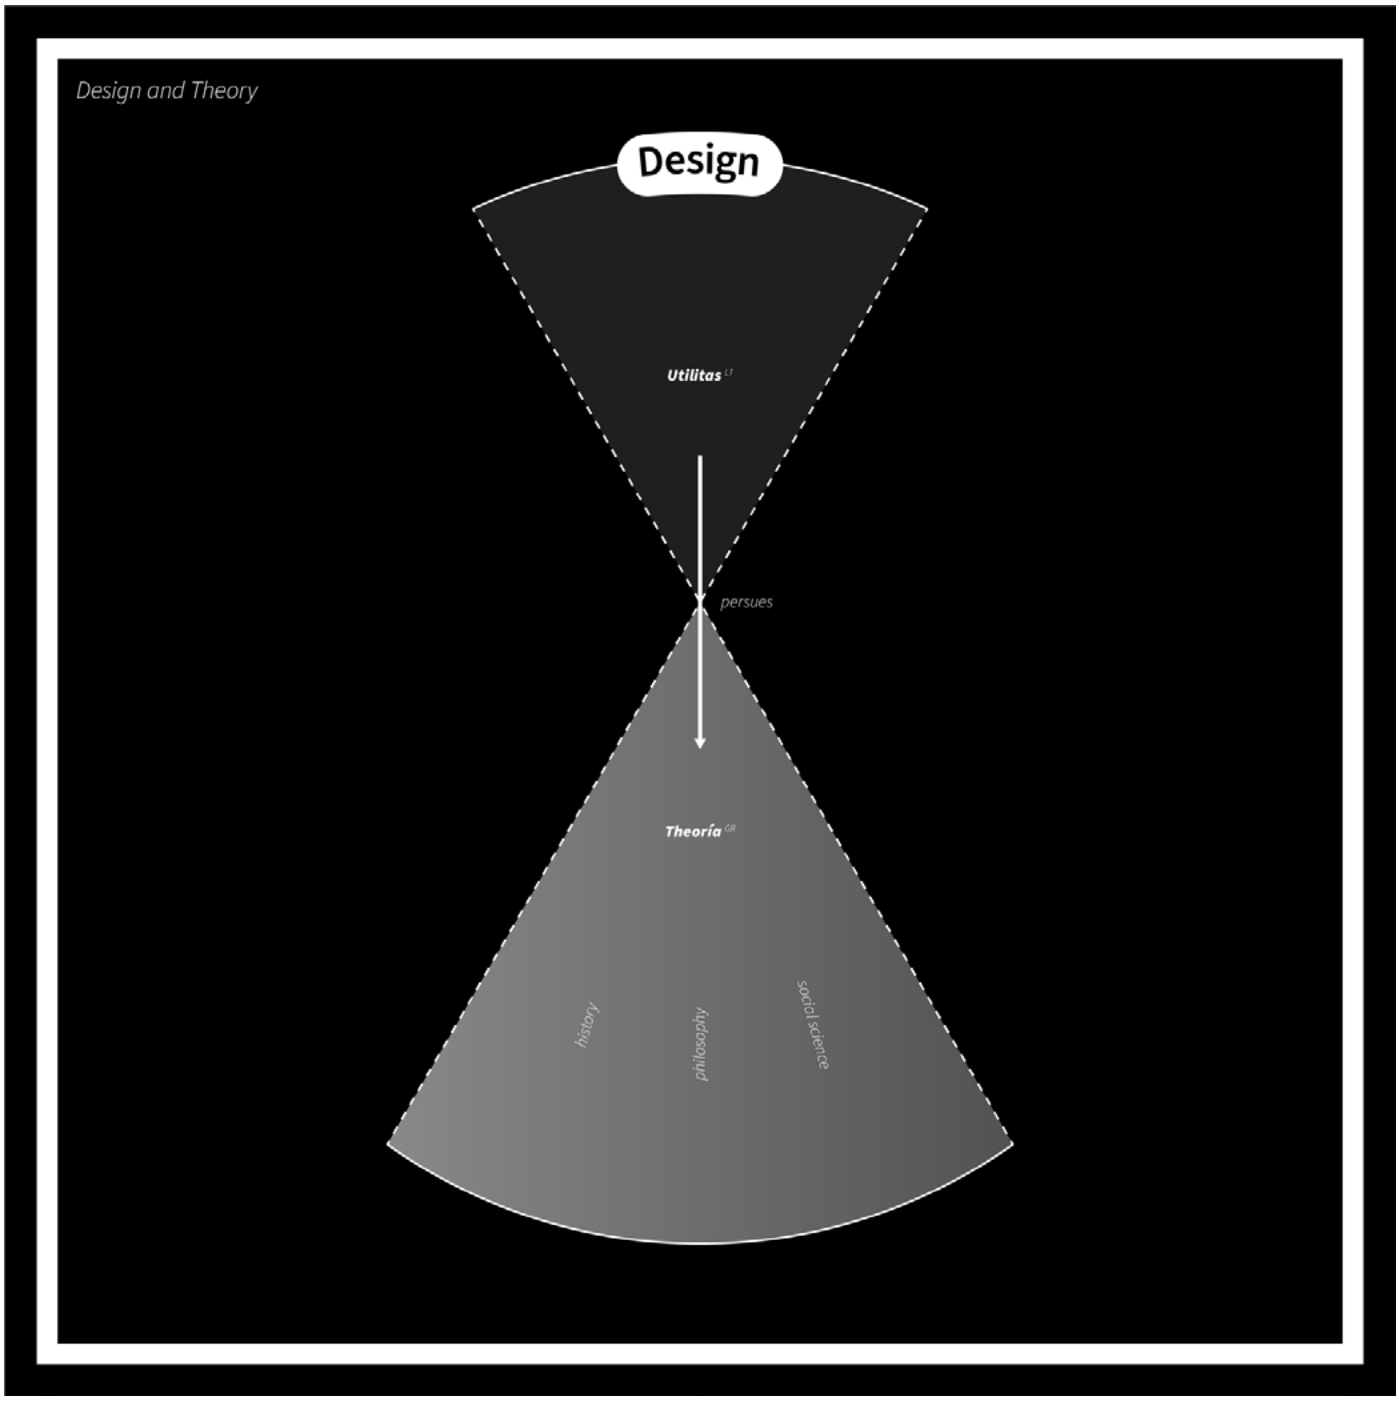

Figure 5. The plane of Design (*Utilitas*) pursues what is mainly theoretical (*Theoría*).

7. Conclusion: A ‘Design Ecosystem’

One can finally and fully framework a ‘Design Ecosystem’ (Figure 6), allowing for further research, e.g., on how design research works within the ‘Ecosystem’ and where/how one could map the discipline and its functioning. The ‘Ecosystem’ embraces all the inner aspects of Design and its relationship with what surrounds it.

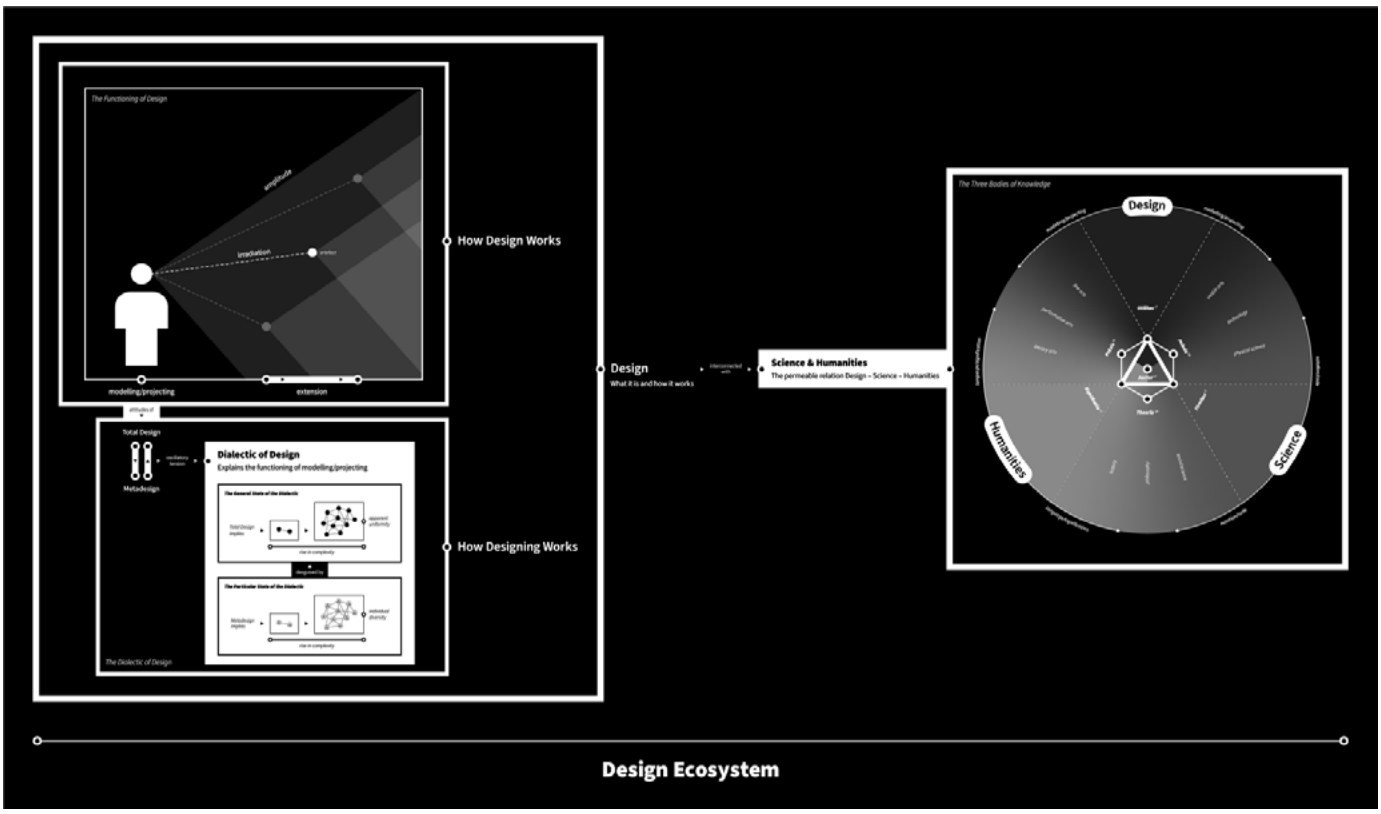

Figure 6. The ‘Design Ecosystem’.

Similarly to biology, the ‘Design Ecosystem’ is an ‘imaginary geography’ (Moura, 2011) where living and non-living parts work together. Its functioning is deeply interconnected to the fact that every individual system is permeable with every other, being intrinsically holistic. While Design is a complex system with its inner functions and oscillatory relations underlying every designing act, it is also inherently interconnected with Science and the Humanities. Designing is not being inside a box labeled ‘Design’ but navigating the other bodies of knowledge, cooperating and contributing while also letting others inside. Even though a broad discipline dedicated to organising and structuring Design’s body of knowledge exists, the ‘Ecosystem’ decentralises it from the ‘expert’ designer (Manzini, 2015) because any human being designs. For a gradual convergence inside Design, every specialised discipline needs a shared core theoretical framework for a more robust and flexible discipline.

Further research is needed to establish a more unified Design theory and true interconnectedness between the bodies of knowledge. We may even involve academics and professionals from other disciplines in this process. Moreover, this theory invokes and supports research on framing the actual Design discipline, its body of knowledge, its methodologies, its practices, and the implications of a conceptual and technological expansion.

KEYWORDS | CHINESE INTERNATIONAL STUDENTS, INTERCULTURAL ADAPTATION, PSYCHOLOGICAL AND PHYSICAL CHALLENGES, SERVICE DESIGN

ABSTRACT | Chinese postgraduate taught (PGT) students experience various psychological and physical challenges during their intercultural adaptation process in the UK. Existing studies have proposed some theoretical or conceptual intervention guidelines to support international students' intercultural adaptation. However, very little research has been considered to help service providers, i.e., Higher Education Institutions (HEIs), to effectively apply the theoretical guidance in their practical service design regarding Chinese PGT students' intercultural adaptation experience in the UK. Service design research also rarely explores the design context of intercultural adaptation. This study aims to explore the comprehensive adaptation experiences of Chinese PGT students, identify their difficulties and needs, and then propose practical service design implications for HEIs. Semi-structured interviews with 24 Chinese PGT students were used to explore in detail their adaptation experiences and service needs from psychological, socio-cultural, and academic perspectives. The results show that Chinese PGT students experienced psychological challenges throughout their adaptation process, particularly in the first few weeks in the UK. These were related to unfamiliarity with the new environment, poor communication experiences, and confusion with academic values or systems (especially in the first academic term). Some implications for service design within HEIs were then developed, such as pre-departure education, more support services in the first few weeks, extension language support services, and more explanation and guidance on the academic values of the host country. This study provides insights for HEIs in supporting Chinese PGT students' adaptation experience and reducing their psychological stress. As the service design approach is at the core of this research, the main knowledge contribution will be in the field of service design.

1. Introduction

Research Background

Intercultural adaptation can be defined as individuals changing their original cultural behaviors to facilitate effective communication in cross-cultural interactions (Cai & Rodriguez, 1997). International students often face challenges when they adapt to an unfamiliar cultural environment due to cultural differences (Dodd, 1998). They may experience prejudice and discrimination, as well as homesickness, disappointment, confusion, and loneliness (Hechanova-Alampay et al., 2002; Brislin & Yoshida, 1994). This psychological stress causes people to have difficulties learning a new culture, solving problems, and making decisions (Xia, 2009), which may affect international students' social integration and academic performance and increase mental health problems.

Some research has seen higher education institutions (HEIs) as the service providers responsible for supporting students' problems and needs (e.g., Gill, 2007; Gu & Maley, 2008; Wang et al., 2012). As HEIs rely on international student enrolments to increase their income (Marshall, 2005), and international students come to the UK motivated by the pursuit of an academic degree; this study agrees that HEIs should be seen as service providers who should support international students' adaptation experience, ensure their wellbeing and help them achieve their academic goals.

Among all international students in the UK, Chinese students are the largest group, not only diversifying campuses but also contributing to academic research in HEIs (UKCOSA 2004). Compared with other international students, Chinese students often have poorer intercultural adaptation experiences, such as bad mental health in general (Leong, 2015). Chinese postgraduate taught (PGT) students face more significant challenges due to their limited study (adaptation) time of one year. Therefore, Chinese international PGT students are the focus of this study.

Intercultural Adaptation

Current studies on Chinese international students' intercultural adaptation in the UK largely focus on students' adaptation processes and influencing factors and then suggest intervention guidelines. For example, Lu (1990) found that Chinese international students often felt homesick as they adapted to the UK academic environment. Gill (2007) argued that the adaptation process of Chinese students in the UK is a learning process and suggested that HEIs should provide them with a facilitative, supportive, inclusive, and culturally interactive environment. Gu and Maley (2008) and Ye and Edwards (2015) suggested that teachers' abilities, such as empathy and sympathy, can be helpful to Chinese students' intercultural adaptation. Zhou and Todman (2008) suggest that 'matching pedagogical expectations' plays a crucial role in Chinese students' intercultural adaptation. An example of pedagogical expectation is that HEIs strongly encourage their students to be independent and become critical thinkers, whereas Chinese universities usually require their students to accept authority (Zhou et al., 2011).

The proposed intervention guidelines, however, are mainly theoretical or conceptual, and few consider the service provider's perspectives to propose practical suggestions based on everyday practices regarding Chinese international students. Furthermore, the guidelines also tend to emphasise the achievement of students' academic adaptation and pay less attention to students' psychological and socio-cultural adaptation, which is important for student's mental health and personal development in the long term.

Service Design

Service design is a practical approach to creating and improving what organisations offer, following the core design activities of research, ideation, prototyping, and implementation to develop experiences that meet the needs of the organisation, the customer, and other stakeholders (Stickdorn, 2018). This means that the interests of both HEIs and Chinese PGT students could be taken into consideration. The principle of

service design also implies the need to focus on students' complete needs rather than superficial symptoms (Stickdorn, 2018).

However, many service designs are complicated because service providers and service recipients may have different views of service concepts (Goldstein et al., 2002), for example, international students may view the concept of services they expect as the whole experience of being supported during their adaptation journey, rather than some specific services (e.g., language or wellbeing support). Although the principles of service design show potential benefits in intercultural adaptation, current service design research is, to my knowledge, rarely explored in this context. Service design is also a relatively new concept to the HEIs (Baranova et al., 2011).

Research Objective

This study aims to provide insights for HEIs to design better services to support the adaptation experience of Chinese PGT students. As the first phase of a larger project, this study focuses on exploring the adaptation experience of Chinese PGT students, identifying their psychological and physical difficulties and needs, and then proposing initial service design implications for HEIs.

2. Research Methodology

The study used semi-structured interviews because it allowed the researcher to gain a deeper understanding of the interviewees' perspectives on their lives, experiences, or situations (Taylor & Bogdan, 1984) during their adaptation journey. In the data analysis stage, thematic analysis was used as it can highlight the common themes in the data set (Braun & Clarke, 2006), which could help to better understand the common adaptation experience of Chinese PGT students in the UK. The data was collected between November 2022 and February 2023.

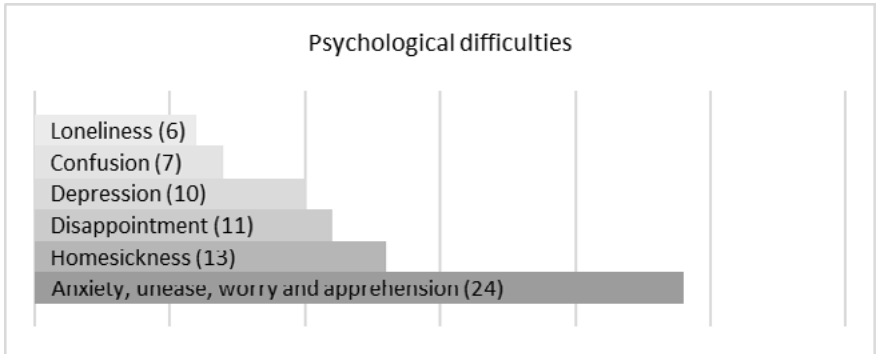
The final sample consisted of twenty-four Chinese PGT students in the UK: fifteen females and nine males. All participants were Chinese PGT students who came from mainland China, used Chinese as their primary language, and experienced the host culture environment in the UK. Ten participants stayed in the UK for 1-3 months, four participants stayed for 4-6 months and then stayed for over six months. Over half of the participants studied in England (n=18), a quarter in Scotland (n=5), and the rest in Wales (n=1).

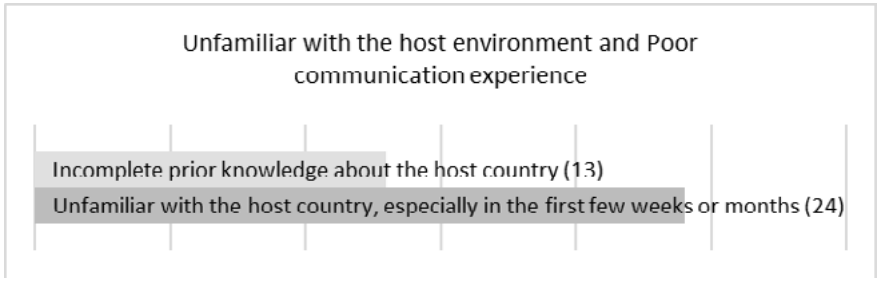
The interview questions were created using the J-curve model and three types of sojourner adaptation (psychological, sociocultural, and academic adaptation). The J-curve model, which was suggested by Collins (2021), describes the adaptation process as three stages: the 'cultural challenges' stage, the 'adjustment' stage, and the 'mastery' stage. The J-curve model is based on short-term adaptation studies and focuses primarily on the international students' adaptation process, which is the most applicable to this study. Two fundamental types of sojourner adaptation are identified by Ward and colleagues: psychological adjustment and sociocultural adaptation (Searle & Ward, 1990; Ward & Kennedy, 1992; Ward, 1996). In addition, some researchers who focus on the student's academic adaptation found that psychological mood could change with the academic calendar during students' adaptation process (Golden, 1973; Selby &Woods,1966). Therefore, three types of sojourner adaptation (psychological, socio-cultural, and academic) were used to investigate students' comprehensive adaptation experiences from multiple perspectives.

3. Summary and Discussion of Findings

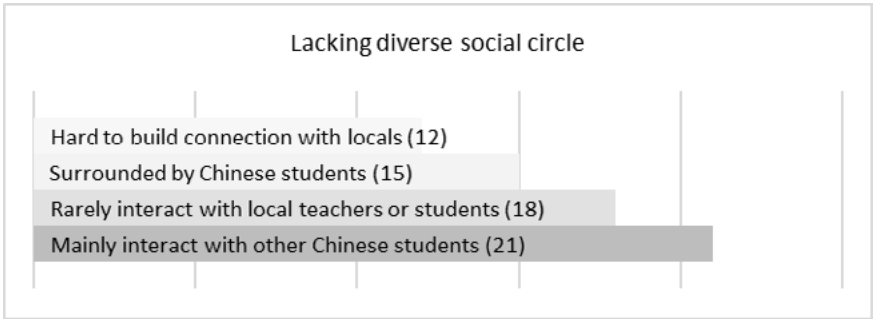
The results of the Chinese PGT students' adaptation experiences are presented in the following categories: psychological challenges throughout the adaptation process, new cultural environment and communication difficulties, and unfamiliarity with the host country's academic values. Based on the results, four main implications in service design for intercultural adaptation are suggested (see Table 1).

3.1 Chinese PGT Students' Adaptation Experience in the UK



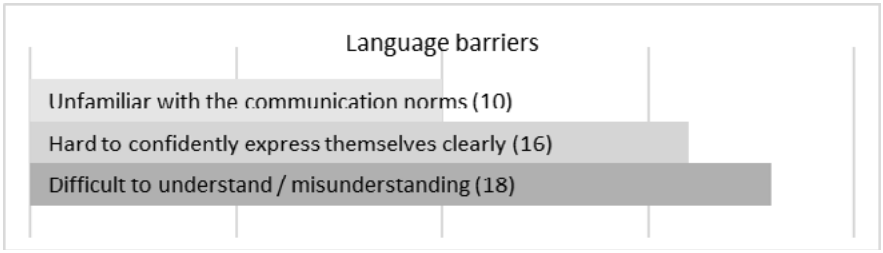


Psychological challenges throughout the adaptation process



Participants reported experiencing a mixture of positive and negative emotions before arriving in the host country. After arriving in the host country, participants' positive emotions (e.g., excitement and curiosity) were concentrated in the first few weeks in the host country, mainly related to a new cultural environment. However, some negative emotions (e.g., anxiety, worry, disappointment, and depression) also seemed to be mentioned more often in the first few months and, especially, in the first one to three weeks. This was because they were in an unfamiliar cultural environment with academic pressures and a lack of social support. When participants approached graduation, they began to feel anxiety and stress about finding future career or study opportunities because of concerns about available visas, unfamiliar environments, or lack of a helpful social network.

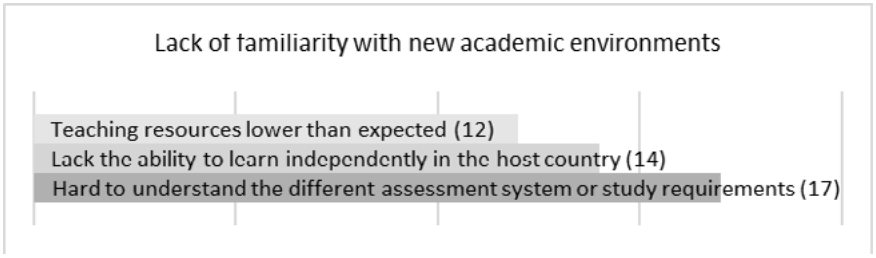
New cultural environment and communication difficulties



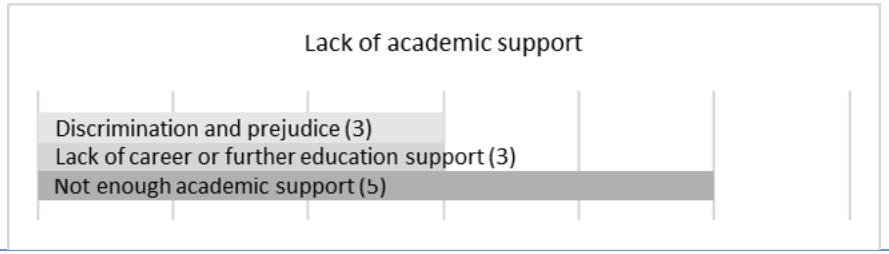
Most participants did not have a comprehensive understanding of the host country before arriving and even had certain prejudices and stereotypes. After arriving in the host country, they found that they were not familiar with the environment, especially the local service system (e.g., banks and General Practitioners (GPs)), which caused a lot of inconveniences and increased their psychological stress. Lack of communication skills and opportunities appeared to be a significant challenge. Most participants preferred to interact within their own culture and rarely communicated with people from other cultures. They felt uncertain about communicating in English, had difficulty expressing themselves clearly, and were confused when interacting with their teachers or other locals. Some participants also mentioned that they were surrounded by Chinese students and rarely had the opportunity to interact with people from other ethnic backgrounds.

Table 1. The results of Chinese PGT students' adaptation experiences and the implications for service design.

Three types of adaptation	Chinese PGT students' adaptation experience in the UK (number of participants)	Implications in service design
Psychological challenges throughout the adaptation process, especially in the first few weeks (psychological adaptation)		More support for socio-cultural and academic adaptation experience (psychological difficulties were highly relevant to their socio-cultural and academic adaptation experiences)
New cultural environment and communication difficulties (socio-cultural adaptation)		Pre-departure education More support services in the first few weeks



(A hidden potential crisis has also been identified – an over-representation of Chinese students in certain subjects in some schools)



Expand language support services

Unfamiliarity with the host academic values (academic adaptation)

More explanations and guidance on the host academic values

Unfamiliarity with the host academic values

Participants usually felt unfamiliar with and confused by the new academic environment. The academic requirements and assessments were the most mentioned. Some participants said that they did not understand teachers' expectations or how to achieve higher scores. Combined with their communication difficulties, it is usually difficult for them to know how to adapt to the new academic environment and adjust their study methods until they receive formal written feedback after the first academic term. Some participants also mentioned that independent learning was a challenge because their home country's education system was more teacher-centered. Therefore, many participants were dissatisfied that teachers did not actively impart more knowledge, did not provide enough guidance and support, and required them to search for information and organise their own study time.

3.2 Implications in Service Design for Intercultural Adaptation

Pre-departure education

Improving knowledge about the host country in the pre-departure stage may be a viable solution to reduce Chinese students' negative emotions and difficulties caused by unfamiliarity with the host culture, as it can reduce Chinese PGT students' prejudices, stereotypes, and culture shock. This could help Chinese students establish realistic service expectations, which is a key factor influencing their satisfaction with service quality (Zeithaml et al., 1990).

More support services in the first few weeks

It might be useful to provide more services to help Chinese PGT students understand the local service system in their early adaptation period, such as more guidance on registering with a GP and applying for a bank card. Although the school provided relevant guidance services, Chinese students continued to find it difficult to access these local service systems.

Participants experienced high negative emotions in the first three months, according to the J-curve model (Collins et al., 2021). However, this study identified that participants felt particularly high negative emotions in the first few weeks, which provides a more specific time for when Chinese PGT students need the most support.

Expand language support services

Chinese students' low confidence in expressing themselves in English and uncertainty about the local etiquette required the most attention, especially in academic situations. For example, in the UK educational environment, the power distance between teachers and students was not as pronounced as in Chinese culture, and positive encouragement and recognition from teachers helped Chinese students to express their ideas and interact confidently with teachers, but some of the indirect 'polite' terms used in the local culture can be confusing for Chinese students. As one participant said: "Teachers were so polite. I thought that putting it in the Chinese context means that I don't need to pay much attention to the exam… I didn't expect that I would fail the final exam". Therefore, language support could also be extended to teach cultural language norms.

A hidden potential crisis has also been identified. Chinese students have been the largest international student group in the UK since 2003 (Gu, 2011), leading to an over-representation of Chinese students in certain subjects in some schools. This 'un-diverse' environment meant that students lacked opportunities for English language communication and multicultural interaction, which could lead to their dissatisfaction and poor adaptation experiences. This issue was rarely mentioned in the current research, but it deserves attention as the feedback from these Chinese students may affect the reputation of the HEIs.

More explanations and guidance on the host academic values

Most of the Chinese students had never experienced alternative teaching and learning styles before, which led them to have misunderstandings and extra pressure (Gu & Maley, 2008), especially in their first academic term. At the same time, the host academic system was more inclined to allow students to learn and explore independently, which leads to students' lack of guidance and support in this regard and exacerbates their difficulty in adapting to the local academic life. Without guidance, it was also difficult for Chinese students to understand the benefits of the host academic values, resulting in some Chinese PGT students interpreting 'self-directed learning' as 'low-quality teaching' and 'lack of academic support.' Therefore, providing Chinese PGT students with more guidance on host academic values in the first term may help them to adapt more effectively to local academic life and better achieve their academic goals.

4. Conclusion

Current research lacks practical service design suggestions for HEIs, and little research explores service design in the context of intercultural adaptation. The findings of this study provide insights for HEIs to better design their services to support and facilitate the intercultural adaptation process and reduce psychological stress, especially for Chinese PGT students. This study, as part of a larger project, explored the research step of service design in the context of intercultural adaptation. The next step will be further research into service provider perspectives, idea and prototype development, and testing, which could lead to more detailed contributions to the field of service design for intercultural adaptation.

About the Authors:

Yi Zhong is a PhD candidate in the Faculty of Arts, Design & Humanities at De Montfort University in Leicester, UK. Her research interests are in intercultural communication, service design, sustainable design, cultural design, behavioural change, health and wellbeing. Her current PhD research topic is focused on improving the international student services in UK higher education institutes in order to improve international students' intercultural adaptation experience.

Dr Kyungeun Sung is a Senior Lecturer in the School of Art, Design and Architecture at De Montfort University in Leicester, UK. Her research is broadly concerned with design and sustainability, focusing on upcycling, circular economy and net zero. She has research interests and expertise in sustainable design, craft, production, business, supply chains, behaviour, consumption and lifestyles.

Dr Lis Ku is a Senior Lecturer in Psychology at De Montfort University. Her research interests focus on how values and motivations influence behaviour and impact individual and societal well-being.

KEYWORDS | DIGITAL TWIN APPLICATIONS, DIGITAL TRANSFORMATION, PUBLIC SERVICES, PUBLIC ADMINISTRATION, HUMAN-CENTERED DESIGN

ABSTRACT | Digital Twins are increasingly being discussed in the literature of industrial, smart cities, and smart healthcare fields, but what if this technology was also applied to the Public Sector? This research aims to identify possible uses of the Digital Twin approach in public services and understand what role the Service Designer can play in the process of integrating this solution. The Digital Twin is already actively used in the industrial context, healthcare, or smart cities thanks to its capabilities for real-time prediction, optimization, monitoring, controlling, and improved decision-making. At the same time, digital transformation has become one of the needs in the Public Sector, and even if many countries are taking significant steps to implement it, many opportunities remain unrealized. The Digital Twin solution can be considered one of the technologies that improve public services, but so far, research on this topic is limited. From a few studies on this topic, one can highlight the Digital Twin Bureaucracy, which is a digital replica of the bureaucracy in the physical world. Simultaneously, there is currently no Service Design literature on this topic, although it can be useful in integrating such technologies due to the design's ability to deal with complexity and the Human-centered approach.

To explore technology applications and design capacity in this topic, this study uses a Literature review and Case studies analysis based on articles and cases that touch on concepts of Digital transformation, Human-centered design, Public services, and Public administration. The study presents a list of possible applications of the Digital Twin in the Public Sector and the role of the designer in this process. Possible uses of this technology in the public services identified in the research are accelerated prototyping and redesigning systems, optimization of organizational resources, forecasting problems, systems planning, and Public Engagement. The Service Designer's role in Digital Twin integration may be characterized as an expert who thinks through the experience of stakeholders based on their needs and improves the interactions between them and technologies.

Future studies will address the following questions: What other uses can a Digital Twin have in the Public Sector? How can Service Design adapt this approach to meet stakeholder needs in public services? How can design make information from this technology accessible and personalized to stakeholders in this context? To answer these questions, the PhD research aims to identify trends and cases of using Digital Twin in the Public Sector, understand the dynamics of one Italian public service that can be improved by applying this technology, develop a prototype of its interfaces, and create guidelines for Service Designers.

1. Introduction

Digital Twin solutions help to effectively plan and optimize processes in various areas of industry, smart cities, and smart healthcare. Could it also be useful for improving the quality of public services from the point of view of the citizens and state employees? This PhD research explores how the Digital Twin can be integrated into public services to improve the efficiency and stakeholders' satisfaction with these services and what is the role of Service Design in this process.

2. Digital Twin: Definition, History, and Benefits

The Digital Twin, according to Rasheed et al. (2020), is defined as a virtual representation of a physical asset that can be used for better decision-making, real-time prediction, optimization, monitoring, and controlling via data and simulators. The idea of a Digital Twin appeared before it gained popularity, namely in 2002 by Grieves, who came up with the “Mirrored Spaces Model” associated with Product Lifecycle Management and consisting of real space, virtual space, and a mechanism for connecting the data flow between them. A decade before this, there was a similar idea called “Mirror Worlds” by David Gelernter, in which software models simulate reality based on information from the physical world. The name Digital Twin itself originated from NASA in 2010 and was designed for flying vehicles (Singh et al., 2021). Singh et al. (2021) also pointed out the benefits of using Digital Twin in different areas.

1. Acceleration of prototyping and product redesign as the Digital Twin allows exploration of a range of scenarios.
2. Economic benefit, since mostly virtual resources are used to create a Digital Twin.
3. Forecasting problems and planning the system in future states of the physical twin.
4. Optimization of solutions through several scenario options proposed by virtual twins.
5. Accessibility is due to the ability to manage and monitor a physical device remotely.
6. Consolidating documentation and communication around the Digital Twin in one place, such as data scattered across different software applications, databases, etc.

3. Digital Twin in the Public Sector and Other Fields

These benefits have already been proven in fields where the Digital Twin is actively used, namely, industry, smart cities, and smart healthcare. On these topics in recent years, numerous articles can be found in the literature. In the industrial sphere, Digital Twins are most popular in the field of Prognostics and Health Management, in smart cities in agriculture, urban transport, urban health management, and security, while in healthcare in personal health management and precision medicine (Yang et al., 2021).

At the same time, digital transformation is a necessity for public organisations, and although some government functions have made significant progress, the full potential of digital transformation remains untapped (Alvarenga et al., 2020). This is why the use of a Digital Twin approach in the Public Sector can be considered, and there are even concepts of using it to deal with bureaucracy, public policy, and optimization of financial data. Eom (2022) speaks about a Digital Twin bureaucracy, which is defined as a digital replica of a bureaucracy in the physical world that will control the physical bureaucracy through autonomous decision-making on matters of government affairs. Another article explores the integration of Digital Twin technologies into public policy-making, looking at a scenario for a public bike-sharing system. Its result highlights the benefits of the implication of Digital Twin simulation modeling to make intelligent public policy decisions (Hwang and Choi, 2023). It is important to emphasize that these two studies above were done for Sejong City in South Korea. Lynch, Issa, and Anumba 2023 discuss how a Financial Digital Twin (Figure 1) can be applied to Public Sector Capital Projects, integrating fund allocation, project execution, and rules-based knowledge management in real-time. This automation ensures compliance and optimizes the use of financial data throughout the asset lifecycle.

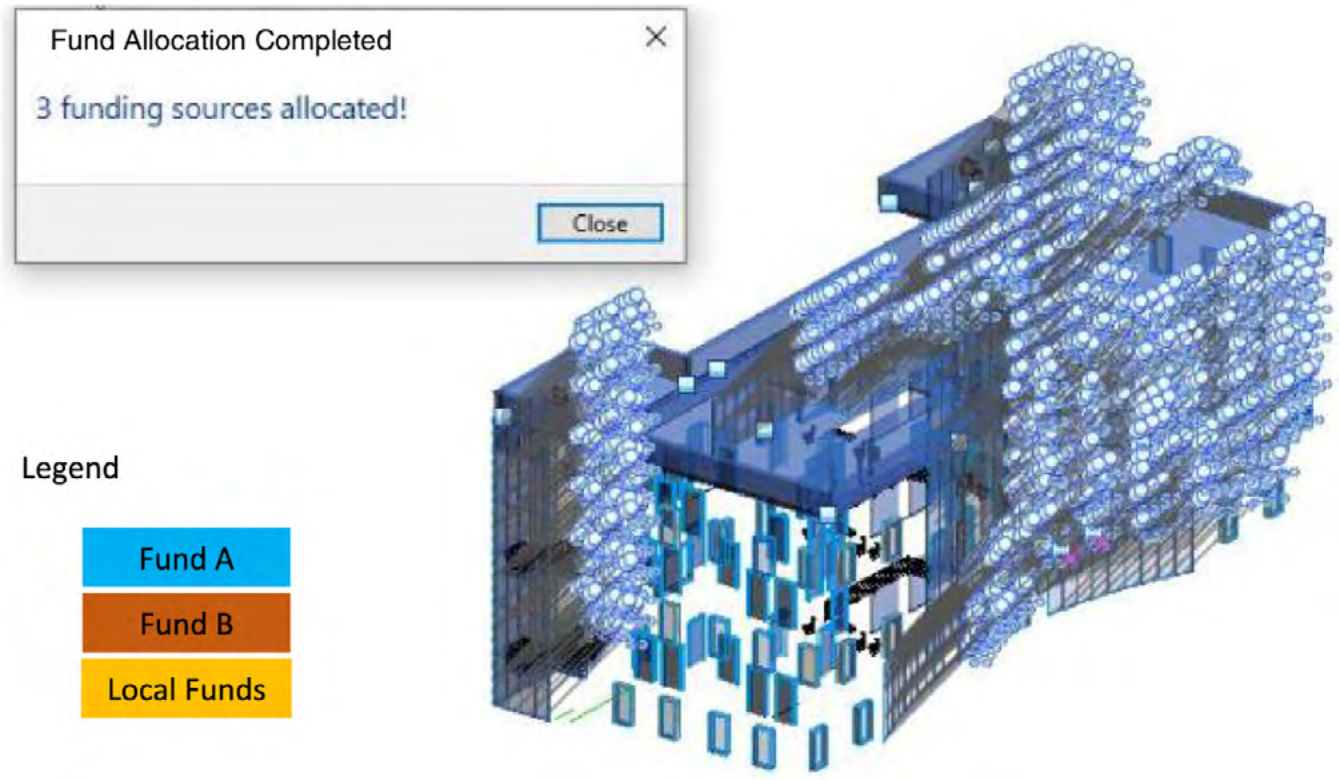

Figure 1. Sample output of prototype plug-in that is used to support funding distribution on an integrated BIM model.

Since there is still little practice on the use of Digital Twin in the Public Sector, we can identify numerous case studies from other fields that may be adapted for the Public Sector.

Kroger Co. and NVIDIA envision using the Store Digital Twin (figure 2) to optimize store efficiency and processes, such as simulating changes and their impacts, for example, removing cashiers and adding self-service lines (NVIDIA Newsroom, 2024).

Figure 2. Simulation of self-checkout and cashier-assisted checkout lines in Store Digital Twin.

Azure Digital Twins (Figure 3) offers the ability to optimize supply chain efficiency by providing real-time tracking, actionable insights, and flexible modeling (Eightify, 2023).

Figure 3. Global map of suppliers, manufacturers, transportation, warehouses, and retailers in Azure Digital Twin.

Twinzo launched a Digital Twin of smart offices (Figure 4) in buildings in London, Bratislava, and Budapest, which allows the client to monitor the movements of employees and visualize the occupancy of desks and rooms and data from the environment. In addition, security workers, in dangerous situations, such as during a fire alarm, can understand where workers are in the office for their evacuation (Twinzo, 2023).

Figure 4. A view of a floor of the smart offices Digital Twin demonstrating the reservation of a workspace in a specific room.

The Docklands area in Dublin, Ireland, has a Digital Twin smart city for citizen feedback, the 3D model of which can be published online for citizens, where they can provide feedback on planned changes in the city and can also interact with components to mark problems in their area. Such a Digital Twin will facilitate the dissemination of information and provide transparency to the public before decisions are put into practice (White et al., 2021).

As shown in Figure 5, features from each of these four case studies may be easily transferred into solutions of Digital Twin for the Public Sector.

Industry and smart city application		Possible features of a Digital Twin in the Public Sector	
Store Digital Twin (NVIDIA Newsroom 2024)	• Optimization of store efficiency and processes • Simulating changes and their impacts	**Calculation of employees in a public office**	• Simulation of an office and citizen traffic with different numbers of employees
Digital Twin of industry supply chain (Eightify 2023)	• Providing real-time tracking and valuable insights • Flexible modeling • Optimize supply chain	**Document tracking**	• Providing real-time tracking of documents
Digital Twin of smart office (Twinzo 2023)	• Monitoring the movement of employees • Visualization of table and rooms occupancy • Data from the environment • Help during emergency situation	**Public Office Digital Twin**	• Monitoring the movement of employees • Visualization of table and rooms occupancy • Data from the environment • Help during emergency situation
Digital Twin for citizen feedback (White et al. 2021)	• Providing citizens feedback • Mark problems in the urban area	**Citizen feedback on policy changes**	• Gathering feedback on policy changes

Figure 5. Possible features of the Digital Twin in the Public Sector by analogy with other areas.

As has been seen in several case studies, there are many opportunities that the Digital Twin can provide to the Public Sector, some of them are:

- accelerated prototyping and redesigning systems using the Digital Twin to explore several scenarios, for example, to create a new service in the Public Sector;
- optimization of Public Sector efficiency and processes in terms of all organizational resources: staffing (for example, monitoring the movement of employees); fiscal resources (for instance, controlling the movement and use of financial resources); facilities, equipment, and technology (such as the visualization of table and rooms occupancy or data from the environment, or even the help during an emergency); informational resources and materials (for example, consolidating documentation and communication in one place, providing real-time tracking of documents or even using of the Digital Twin bureaucracy concept);
- forecasting problems and system planning in future phases of the physical twin;
- Public Engagement, namely, gathering feedback on planned changes in the Public Sector, for example, to the policy.

4. The Role of Service Design for the Implementation of the Digital Twin in the Public Sector

The studies above confirm the possibility of using the Digital Twin in the Public Sector, but what is the role of the Service Designer in this process?

To answer this question, it is important to understand the context that the PhD research will focus on, namely the Italian Public Sector. Various studies highlight the inefficiency and dissatisfaction of citizens with public services. For example, one European study shows citizens' satisfaction with services such as electricity and postal services. The results show that satisfaction levels are lowest in Italy and highest in Denmark and Ireland (Ferrari and Manzi, 2014).
Another research demonstrates how many days were lost to bureaucracy in the G7 countries, and Italy has the highest average (Datta, Walker, and Amarilli, 2020). This study also shows that the complexity of the Italian population lies in the diversity of political views and traditions that exist in a democratic society. The authors emphasize that to make digital transformation effective, the Italian population must accept digital transformation.

In this context, Service Design, with its ability to face complexity and find a Human-centered approach, can be useful for creating flexible solutions. As Manzini affirms, a designer's role within social innovation initiatives might function as an expert, triggering and facilitating various design conversations (Manzini, 2015). Several governmental organizations are already interested in using Service Design methodologies for the Public Sector, such as Design Thinking and Co-design. For instance, the Design Thinking methodology has helped some public managers explore new policy development methods (Mortati, Schmidt, and Mullagh, 2022). The introduction of Design Thinking and Service Design methodologies into Italian public administration through digital services was done in the Italia Login project. The collaborative and open-source models present an opportunity to reconsider public service communication in a context that encourages sharing between public managers and designers for public benefit (Sinni, 2017).

Despite these few practices of using Service Design in the Public Sector, there is no Service Design literature yet on the integration of the Digital Twin in this area. Therefore, it is important to plan future research on this topic.

5. PhD Research

The PhD research (Figure 6) is devoted to the integration of the Digital Twin into the Italian Public Sector. In order to comprehend and face these challenges, the study will address the following questions.

1. What uses can a Digital Twin have in the Public Sector?
2. How can Service Design adapt Digital Twin technology to meet stakeholder (state employees and citizens) needs in the Public Sector?
3. How can Service Design make information from a Digital Twin accessible and personalized to stakeholders in this context?

Based on the identified applications and design opportunities, the research project aims to understand how to effectively integrate the Digital Twin into the Public Sector while taking into account the needs of stakeholders. The specific objectives of the research are to:

1. identify trends and cases of using Digital Twin in the Public sector;
2. understand the dynamics of one Italian public service that can be improved by applying Digital Twin; namely, determine the characteristics and problems of this service, taking into consideration different types of citizens and state employees involved in this service; develop a

prototype of interfaces for selected public service with the Digital Twin and create guidelines for Service Designers on applying Digital Twin in this context.

The research plan consists of three main phases, which will employ various tools and methods typical to Service Design.

1. Preliminary research through Literature review, Case studies, and Field research resulted in the mapping of case studies from Italy and from abroad.
2. Ethnographic research through the creation and application of an ethnographic toolkit, followed by a report of summarized findings with different Service design tools (Personas, Journey Map, etc).
3. The experiment phase with prototyping and testing Digital Twin interfaces leads to the creation of guidelines for Service Designers on applying Digital Twin in the Public Sector.

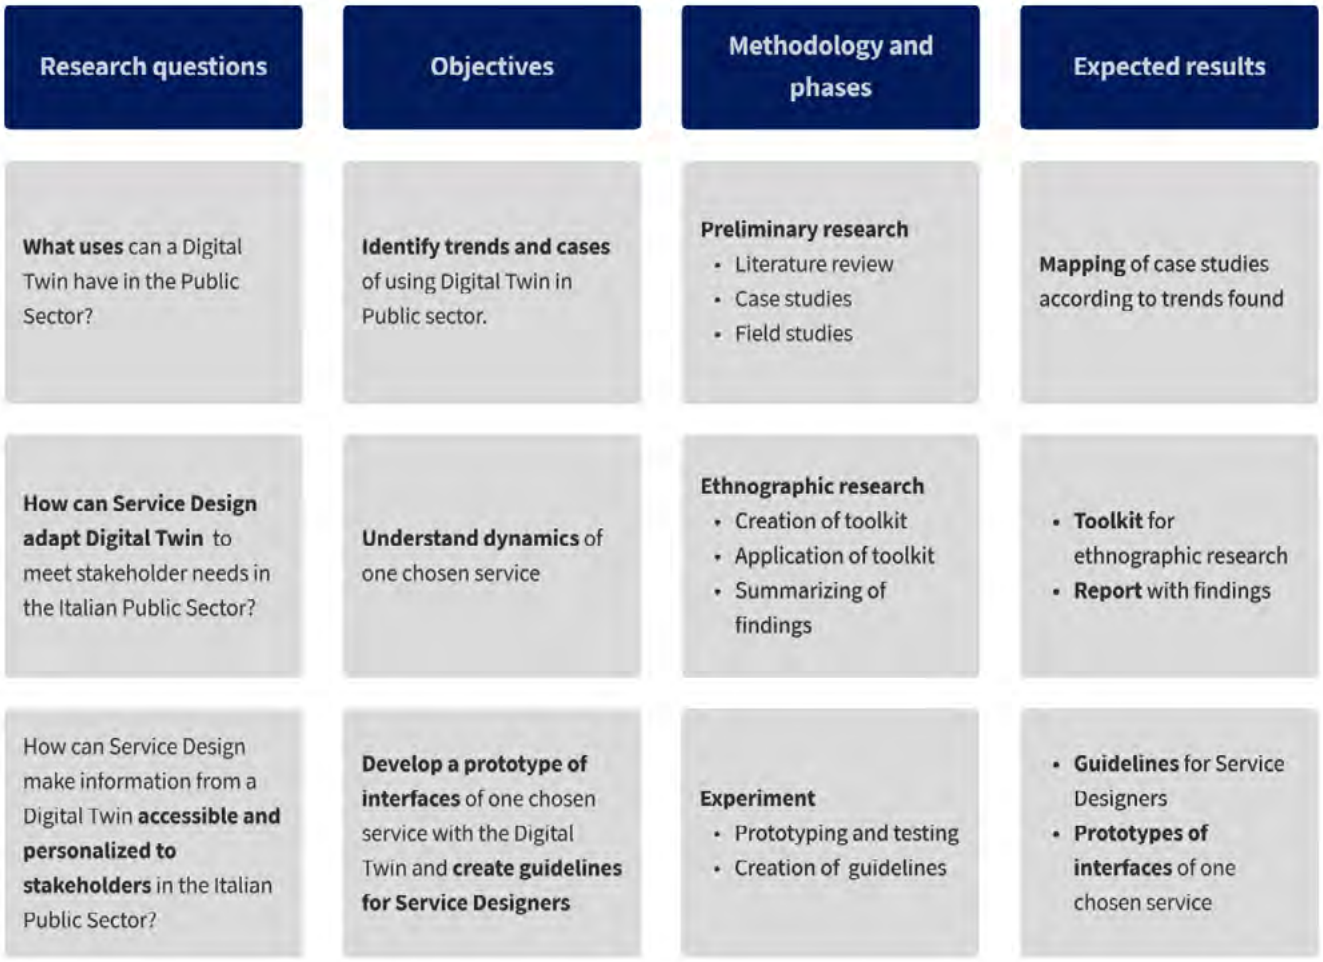

Figure 6. PhD research.

6. Conclusion

This article, through an initial Literature review and Case studies, identified possible applications of the Digital Twin in the Public Sector. The role of the Service Designer in this process can be defined as an expert who thinks through the experience of stakeholders based on their needs and improves the interactions between them and technologies. The research has already shown that the Digital Twin approach in the Public Sector can bring economic benefits due to the use of mostly virtual resources, time benefits through faster prototyping or redesign, transparency, and quality thanks to Public Engagement.

The future research and the PhD research proposal can cover the following questions. How can the Digital Twin be integrated in the context of the Italian Public Sector? What challenges could there be in integrating the Digital Twin into the Public Sector, including ethical, legal, social, and technological challenges?

KEYWORDS | OUTPUT-INPUT SYNERGY, WASTE ENHANCEMENT PROCESSES, INTERSECTION OF SUPPLY CHAINS, SYSTEMIC AND REGENERATIVE DESIGN, INDUSTRIAL SYMBIOSIS

ABSTRACT | Investigating the food system towards goals of stability and sustainability, the research aims to explore – through the specificities of the systemic design approach, able to jointly consider multiple and different information, actors, and strategies – the possibilities and development potential of agro-food waste regeneration processes in a logic of co-evolution (Fassio & Tecco, 2022) oriented towards the development of industrial constructive and restorative solutions, able to influence the environmental, economic and social dimension (Antonelli & Tannir, 2019) of the supply chain on which it works.

Intending to increase the enhancement of the agri-food chain and reduce environmental impacts, the research proposes a qualitative investigation in the field of the transformation of industrial cereal waste into competitive industrial products within which the different design approaches – related to experiments with the matter, Material Design; to technologies and methods for the design of products, Product Design; and to the optimisation and transformation of production processes, Process Design – can synergistically and strategically collaborate through the use of the systemic design approach.

Through systematising the literature and analysing case studies, the research investigates the characteristics of agro-food waste, the reuse processes, and the companies/start-ups that process them. A series of representative and interpretative diagrams will clarify tools, methods, and practices, enriching the research contribution. The emerging solicitations will induce a phase of direct and indirect experimentation with specific research centers and production contexts whose socio-environmental impact on the territory will be assessed.

The final goal of the research is to enhance agro-food waste into a competitive industrial product realised through hybrid innovation practices. Among these, industrial symbiosis processes between companies in the same agrifood chain are critical.

The theorization and prefiguration of industrial symbiosis between different production supply chains represent a further departure from originality.

The possible merger between the identified cereal supply chain and other Italian production chains with a high environmental impact is proposed both as one of the challenging goals of the research and as a prospect of originality.

1. Foreword: Food System and Ecological Transition

Taking as the premise of the research the complexity of the food system – evident in issues such as the fragmentation of relations between supply chains, partially interconnected with each other, the extension of the scope of action able to act on a local and/or global scale (Pauli, 2017) – embedded in a condition made critical by the effects of climate change and the uncontrolled exploitation of environmental resources (Peppoloni & Di Capua, 2022), the research investigated the socio-cultural context and design practices to contribute to the enhancement of the agri-food supply chain through the reuse of its waste.

Food, indeed, as a mediator of human relations able to involve the individual, the community, and governance, takes on in this context the features of strategic, transdisciplinary, and multifocal projecting areas (Descola, 2005), explorable at many levels, from the socio-political to the economic to the environmental.
In each of these, waste plays a role as a characterising part of the production, transformation, and consumption processes.

Various International Institutions have discussed the peculiarities, potential, and extension of projects related to food and, more generally, the agro-food supply chain.
European Commission (EU) with the Farm to Fork strategy (European Commission, 2020; European Commission, 2021) contained within the broader Green Deal; United Nations (UN) with the 17 Sustainable Development Goals SDGs (Agenda 2030, 2021; European Commission, 2017) of the 2030 Agenda; and Food and Agriculture Organisation (FAO) with the Urban Food Agenda (Marino et al, 2020 p.10; FAO, 2019) have promoted projects and programmes that have also highlighted the potential generated by the reuse of agro-food waste (European Commission, 2017).

The Italian Department for Cohesion Policies, with suggestions, guidelines, and regulations on the Bioeconomy, has also converged along these lines.
Some of the proposed strategies suggested strengthening the sustainable production of waste and its conversion into industrial products through integration between sectors, systems, actors, and institutions (Agenzia per la Coesione Territoriale, 2016) by promoting industrial symbiosis interventions (European Commission, 2022), therefore promoting the merging of two or more industrial sectors.
Industrial symbiosis has been a resource-use optimization strategy involving industries to generate competitive benefits for companies through different approaches, including transferring resources, such as matter, energy, space, technology, skills, etc. (Renner, 1947; Chertow, 2007).

From the point of view of design, the approach that most relates to industrial symbiosis is systemic design. In this context, the area investigated is that of micro-small companies (MPI), which, in addition to being a constitutive element of the Italian production system, are also characterised by flexibility and adaptation to changes and innovations (Barbero, 2016).

The systemic approach, condensed in Table 1 (below), makes it possible to interpret the relationship between territory and community by enabling the development of design actions that favour the triggering of sustainable enhancement processes of local resources (Gaiardo et al., 2022) or to act as a mediator by stimulating the meeting between different knowledge and expertise to promote contamination, participation, and collaboration between them; or to use data as raw material to create new forms of value that push design to understand the context and take on the role of activator of experiences (RIBA and ARUP, 2013).

Table 1. Interpretative diagram of design action through the systemic approach.

DESIGN ROLE	ACTION	GOALS
Interpreter	Projects between Territory and Community	It **Triggers** Processes of Enhancing Local Resource
Mediator	Encounter between Knowledge	It **Promotes** Contamination, Participation and Collaboration
Enabler	Data as Raw Material	It **Understands** the Framework and Proposes Experience

Design actions within the agrifood supply chain interpret and adapt the specificities of the systemic approach to the context, the company, and the reference actors.
In this context, systemic action promotes interventions able to take into account the causal relationships between the actors and the feedback flows between the elements of the supply chain, operating syntheses of the interactions emerged from the mapping of systems (Acaroglu, 2017), which offer possibilities for design actions (Figure 1).

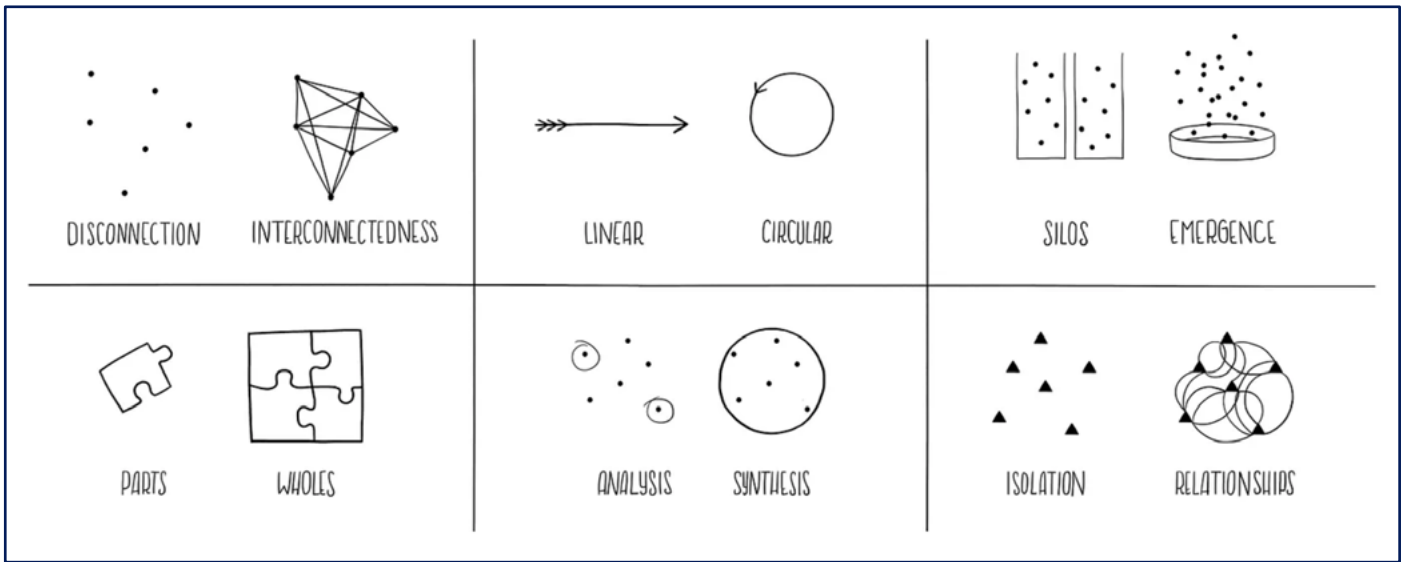

Figure 1. Interpretative diagram of design action through the systems approach. Credits: Segal, E. (Illustrator). (2017, 7 September). Tools of a system thinker [digital image]. Extract from https://medium.com/disruptive-design/tools-for-systems-thinkers-the-6-fundamental-concepts-of-systems-thinking-379cdac3dc6a .

Within the industrial sphere, a field investigated explicitly by the research, these characteristics can be declined on the analysis of industrial processes aimed at their optimisation (Jones, 2014), on the verification of input-output processes to limit waste and reduce environmental impacts (Bistagnino, 2012; Meadows, 2008), or on the reuse of production waste to operate in open and collaborative systems (Capra and Luisi, 2014).

The research proposes scenarios for the enhancement of the agrifood supply chain identified through the study of the transformation of the industrial waste it produces, the analysis of the potential and development limits of waste enhancement processes, the testing of stakeholders and their synergies, and

the identification of supply chains to be enhanced in a logic of environmental and economic co-evolution. Research also includes the reuse of waste within Life Cycle Assessments (LCA) to reduce the environmental impact of the supply chain (Vinci, 2022) and, in parallel, promote open supply chain strategies (Bertalanffy, 1968).

2. Field and Goals: Waste as a Resource

The triggering of transformative waste processes creates the conditions for configuring competitive and bio-based industrial products to enhance the agro-food chain.
In pursuing this goal, the research uses a systemic analysis of agro-food waste, critically ordered through parameters, categories, and qualitative and quantitative characteristics, to identify the supply chain to work on.
The analysis of the present condition makes it possible to identify the cereal chain as the one on which to work at an experimental level thanks to the physical characteristics of the waste due to the reduced environmental impact of the transformation processes and the possibilities of maximizing enhancement actions, overcoming what usually happens.
To date, cereal waste, the result of industrial processes, if disposed of, increases environmental pollution and generates only a minimal contribution to the supply chain if transformed into animal feed.

By implementing processes for the regeneration of industrial cereal waste into industrial products through adopting traditional and local transformation processes, the experimental phase proposes the prefiguration of scenarios to enhance the supply chain.
Operating at a local level, with low environmental impact transformation strategies and waste regeneration projects, it acts within open supply chains to generate a high economic impact and increase the value of the companies involved, the supply chain, and the territory.

3. Methodology: The Systemic Approach to Waste Enhancement

Taking as its basis the necessity to adopt a trans-disciplinary and interdisciplinary approach to the contemporary context, the research moves by examining socioeconomic, governance, and environmental conditions, investigating scientific studies and territorial inclusive policies, and exploring, through the methodology of systemic design, areas of action and design practices.

In the first phase of the explorative research, in which the activities of literature review and selection of case studies, sometimes consequential and sometimes parallel, allow us to understand the state of the art and define the field of investigation, a second interpretative phase is inserted through which we proceed to the critical reading of the case studies and to the individuation of the supply chain on which to carry out the subsequent experimental phase, still partially being defined.

3.1 Explorative and Interpretative Phase: From Literature Review to Database Construction

The literature review was based on investigating four research fields: social sciences, international politics, industrial symbiosis processes, and systemic design. The literature review made it possible to identify concepts, trends, and strategies for each and relate them as part of a system (Figure 2).

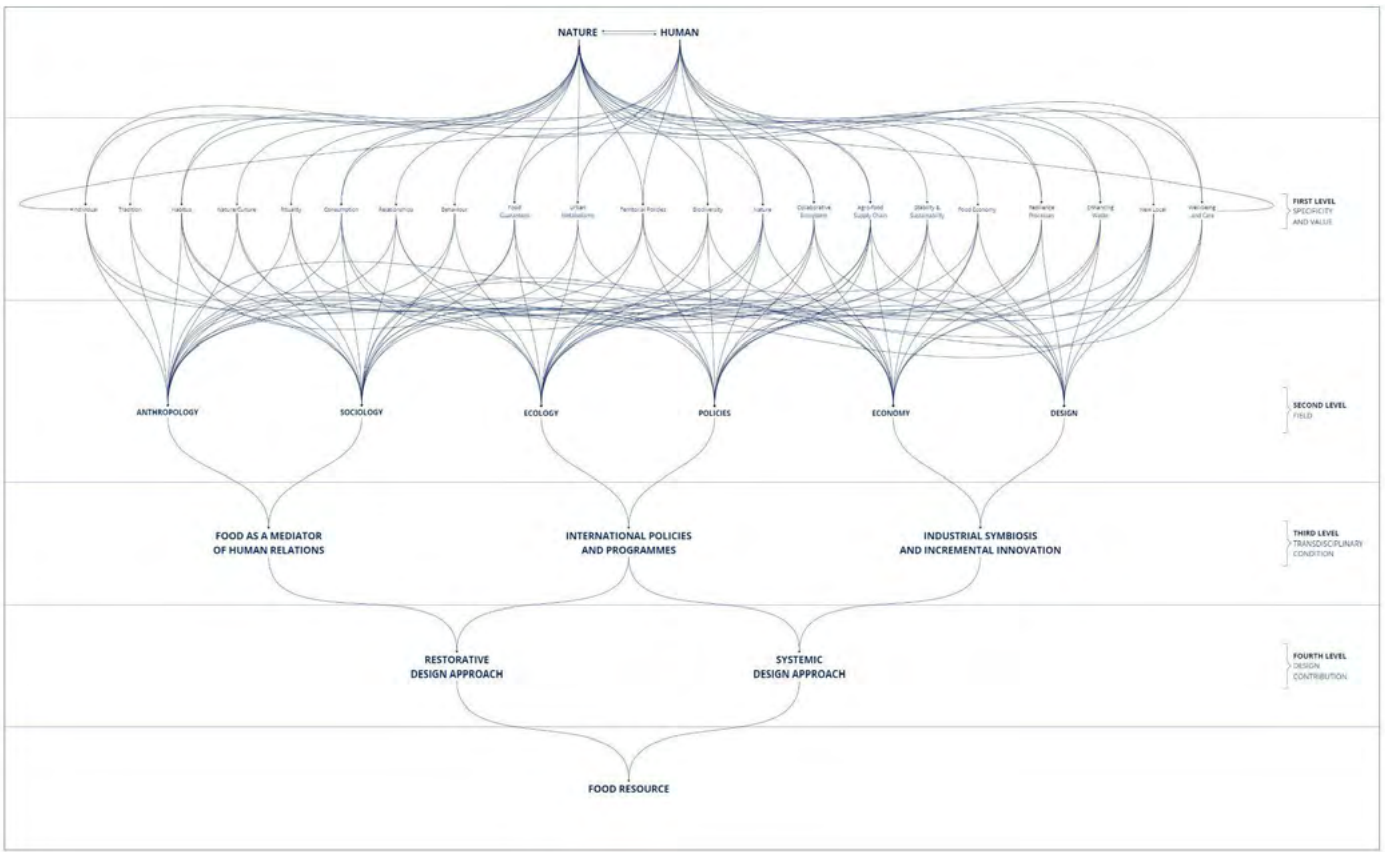

Figure 2. Interpretative diagram showing the existing correlations within the reference literature. Credits: Francesca Ambrogio.

The setting up of a qualitative database defined and systematised the research framework within the real context.
An early survey collected 128 case studies found through desk research that could be clustered into surplus recovery processes, participative guarantee forms, and waste reuse processes.
The focus on waste reuse processes reduced the selection to 43. The cases were then cross-referenced with the reference literature and with what emerged during the previous analyses.
For each case, the qualitative characteristics of waste, its processability, the possible transformation processes, and the interlocutors were then noted.

The selection of the case studies was finalized by organising a database (LINK[1]) composed of four parts, defined according to specific parameters that emerged from the literature review and case study research.

Given the goal of the research, aimed at the enhancement of the agro-food supply chain, the creation of the database served to draw up a mapping of the waste transformation processes on the Italian territory to understand the approaches that generated the origin of these processes and how they work; and to identify the actors of possible technology transfer that can be activated within the agro-food supply chain or between different supply chains.

A critical interpretation of the database made it possible to identify the sustainability level of waste transformation processes and final products to understand what forms of relations and what network formalizations exist among supply chains and actors, to understand how waste transformation methods are influenced by their qualitative characteristics; to map out the general motivations that push towards the definition of agro-food waste reuse processes, the specific motivations that concern the reuse of waste within the supply chain that generated the waste as well as those that concern transformation processes aimed at other supply chains.

3.2 Experimental Phase: Towards Reuse Scenarios

Once the supply chain to carry out the experimentation has been identified, the research includes an interview, verification, and field test phase. Interviews will be conducted in selected companies to verify their production processes and the consequent waste generation.
These will be succeeded by interviews in research laboratories aimed at understanding the properties of the waste and the reusable processes that can be adopted.

Subsequently, a dialogue will be established with product designers to identify design possibilities and solutions based on the chemical, physical, and aesthetic characteristics of the material.

Further in-company discussion and verification with experts in the specific field will support and promote the effective prefiguration of reuse design scenarios. The verification phase of the results will bring to the definition of the industrial process for the reuse of waste, the environmental and economic impact of which can be measured, and the open supply chain LCA verified.

4. Conclusion

The approach promoted by systemic design applied to the verification of industrial input-output processes of the agro-food chain to contain waste and reduce environmental impacts encourages the development of an overall supply chain enhancement strategy.

The enhancement of waste derived from agro-food industrial production transformed into input for another production process can also be compared with other production supply chains by promoting new relations between actors towards developing products with a low environmental impact.

4.1. Deliverables and Impact of the Research

The research gives the scientific and professional community the reconstruction of the theoretical framework related to the identified topic, integrated through the construction of representative and interpretative diagrams.

In the explorative and interpretative phases, the research produces a database focused on agro-food waste, which can be interrogated and implemented as a source and tool for further research and projects.

The database supports the work of design researchers, who can find aggregated qualitative information on materials, production processes, and products. It broadens the choice of materials usually used by designers, who, by interrogating the database, can identify bio-based alternatives to materials of extractive origin.

In the experimental phase, it prefigures scenarios of socio-economic enhancement of the food supply chain in a process shared between researchers and companies.
Through the study and in-depth study of waste processing and transformation processes, the company virtuously uses waste for the industrial production of products with a low environmental impact.

Notes

1. The database, being a tool and a source for research, is currently only in visualisation and in Italian. The use of the Italian language was oriented by the wish to also use this database to interact with local actors and local situations with whom it would not have been possible to use an English language tool.

DESIGN STRATEGIES FOR THE COMMUNICATION OF MEDICINE AND HEALTH PROMOTION IN SCIENCE MUSEUMS.

Giovanna Nichilò*[a]

a Università degli Studi di Napoli Federico II, Italy
* giovanna.nichilo@unina.it

DOI: 10.63442/OZQC8464

KEYWORDS | SCIENCE EXHIBIT, HUMAN BODY, MEDICINE, HEALTH DATAFICATION, SCIENCE MUSEUM

ABSTRACT | The doctoral research presented in this paper explores the relationship between design and scientific communication in medicine and health museums. In particular, the thesis aims to define methods, principles, and scenarios useful for the design of scientific exhibits that display visitor information by redefining the human body metaphors. The challenges of contemporary society include the need to facilitate access to the latest results of medical research for an ever-wider public to contrast the growing phenomenon of disinformation about these topics. Medical sciences are exhibited in science museums concerning medicine, health, and hygiene and science centres using different exhibition strategies. Generally, designers and curators work simultaneously to design exhibitions and exhibits, but in this context, there emerges a lack of involvement of designer profiles in the visitor experience design and also a loss of appropriation of these issues by the discipline. It was necessary to complement the design literature review – that is particularly limited – with the analysis of the wider literature in the sectors of museography, museology, scientific communication, and public health. The review was supported by visits to European museums that revealed a panorama where visitor involvement by exploring their data increases engagement. In this way, users feel more involved even but sometimes this is at the expense of awareness. A mapping of usable data was returned. It brings out problematic design aspects and new design scenarios for health datafication. To reconsider these themes considering scientific and technological development is both necessary and urgent because design has an increasingly important function to interpreting and transferring scientific knowledge to society by creating engaging, inclusive, and exciting experiences. In this regard, the doctoral thesis intends to provide the groundwork for reflecting on science exhibits and exhibitions that incorporate visitor data inside the design discipline to stimulate reconsideration of the relationship between designers and science and technology museums reciprocally and innovatively. This is considered necessary to get the design back on body and interaction issues in these contexts.

1. Scientific Background and Purpose

The doctoral thesis presented in this contribution investigates the relationship between design, scientific communication, and the museum to understand the contribution of design in health science museums. Specifically, it examines the exhibition of the human body and medical sciences in science and technology museums (UNESCO/STC/Q/853, 1984) based on an analysis of the contemporary exhibition scenario. The need to promote knowledge of these themes to an ever-widening public in a manner appropriate to the contemporary techno-scientific scene is recognised as a founding mission of these institutions that responds to an emerging need in contemporary society. In fact, in a 2021 report on the economic and social impacts of health systems, the World Health Organisation reported that a population consciously educated on health-related issues has access to considerable social and economic benefits (WHO, 2021). Recently, however, the COVID-19 pandemic has highlighted a problem of public misinformation about medical prevention because people are frequently unable to distinguish between credible sources and fake news (Sala & Scaglioni 2020). Therefore, the function played by museums that illustrates scientific methods and progress by narrating and exploring knowledge and offering a dynamic perspective to the dissemination and production of knowledge is becoming increasingly important. However, the surveys on the number of visitors to Italian museums (ISTAT, 2020; 2022) show how museum institutions still address only a small part of society even though they act as an engine for the construction of cultural identity. Science museums must, therefore, reach out to the public distant from scientific culture by translating and making medical-scientific phenomena and principles more accessible. This change involves several disciplines associated with museological and museographic management and design. These include the designer as a strategic actor in designing the cultural experience inside and outside the museum using exhibitions, visitor paths, installations, and interactive exhibits. Currently, medical sciences and the human body are displayed in their everyday functions using virtual and augmented reality, 3D animations, and interactive and hands-on models by linking medical-scientific knowledge to social and cultural sources of care and support, with focus on the stories of people and the ethical-behavioural sphere of individuals.

In the last few decades, the development of advanced medical imaging techniques and processes, nanotechnologies, biosensors, and telematic and digital communication technologies have made possible a very advanced level of acquisition, transmission, and representation of the human body. Body digitalisation also profoundly changes the relationship of individuals with their bodies because it transforms the way we perceive, manage, and communicate health through new models, technologies, and metaphors. In the history of medical museology, technoscientific innovations in medicine have often driven the development of new ways of displaying the body (Canadelli, 2011).

In connection with the foregoing and the multiple intentions of science museums, the importance of interpreting medical sciences to inform audiences about health promotion is evident (Batterham et al. 2016; Christensen et al. 2014). However, even today, many people are critical about learning in modern science centres and science museums and often classify them as exclusively playful contexts. Concerning the correct design of interactive exhibits, several contributions have informed the discussion in science museology since the 1980s (Merzagora & Rodari, 2007). These papers cannot be found in the research in design but in the other disciplines involved in museums. This suggests that museums while using design science in different ways, do not directly and consciously involve the figure of the designer. Moreover, the inappropriate and sometimes missing status of these disciplines in the statutes and regulations of museums and museum associations show that they are not institutionally recognised (Celi et al., 2013). The relationship between design and museums should be even more evident in science museums, which, by their specific identity, are responsible for connecting scientific-technological advances with society in which design plays a strategic role. Design and science are related in many ways. They are two mutually intersecting and co-evolving units, and design is often used to interpret and communicate concepts effectively to science (Langella, 2019). There is, therefore, an urgent need to investigate the contemporary museum context to understand which practices we are moving towards. The research topic, therefore, is located at the intersection between fields of investigation that in recent decades have been attracting increasing interest from various international scientific communities, such as health promotion, digital

technologies for modelling and representing the body, digital health, exhibit design, interaction design and design for the communication of science. The doctoral research was developed starting from a series of theoretical-methodological and applicative questions: in contemporary society, what are the most effective semantic, metaphorical, and linguistic codes for representing the human body? How does the use of electronic and digital technologies influence the exhibition of the human body and medicine? How can design contribute to the dissemination of medical science and health promotion in science museums? What are the relationships between design and other disciplines in science museums, and what role does it play? What is the role of design in designing experiences involving scientific phenomena and principles related to health and medicine? How can scientific phenomena and principles relating to health and medicine be translated and made more understandable and accessible?

2. Design Strategies for Health Promotion and Medical Sciences: Showing Visitor's Data

The doctoral research explores, therefore, the present scenario of museums covering the topics of the body, public health, and medical progress using a multitude of practices and representations of the human body. The aim is to reduce the distances between scientific and design areas by converging them in the design of interactive exhibits. To achieve this, it is necessary to start with the establishment of scientific literature that is currently severely lacking in the design area. The lack of contributions in design made it necessary to define broader selection criteria than the design domain by including articles from other areas such as public health, health education, museology and scientific museology, history of medicine and history of science, communication of science and science education, information and communication technologies, medicine, social sciences, psychology of perception and learning, media studies and design. The literature review shows that in museums aimed at the general audience, such as health exhibitions, technologies are currently used to make visitors aware to engage and discover themselves. There is a trend towards the use of devices that gather data from the visitor's body to induce them to think about their body and its functions in everyday life contexts to influence correct lifestyles and good behaviour (Garneau & Hostetler, 2010; Canadelli, 2011; Saab et al., 2013; Rivera-Gutierrez et al. 2014; Sandholdt & Achiam, 2018; Bønnelycke, Sandholdt & Jespersen, 2018; Lykke, Skov & Jantzen, 2021). Evaluation studies show its opportunities and limitations, especially about learning in informal settings and health promotion. Contextualising the visitor's data and information in a personal everyday or pathological life scenario promotes learning and reflection. The design essays highlight the interdisciplinary nature of these issues and the close relationship between design and science. Their limited number, combined with their geographical concentration, shows that design has not yet appropriated adequately, in theoretical terms, the design of scientific exhibitions and exhibits on the body, medicine, and health. This does not allow for an appropriate assessment of the involvement of designers in practice.

For this reason, the analysis of the state of the art is complemented by the investigation of exhibitions and museums on site. Therefore, a mapping of the exhibition strategies and technologies used, the approaches used to exhibit, and the relationships museum institutions establish with the scientific community is proposed. This study was carried out by identifying the main European science centres and science museums. From these, eight museum facilities were selected in Europe in the geographical areas that have historically played a primary role in medicine and medical museology – Italy, the United Kingdom, the Netherlands, and Germany. In this way, more traditional institutions dealing with the body and medicine were intercepted in the same areas.

The analysis focused on exhibition practices that display personal data and information related to the visitor's body, identity, and health that are captured in real-time with digital or analogue techniques. Visitors, therefore, can observe, monitor, measure, and listen to themselves through the exhibits to acquire new knowledge and reflect on sensitive issues such as health. From being more or less passive users of communication, depending on the context, bodies become subjects of representation themselves. Sometimes, the information is collected for scientific purposes, contributing to the progress of research and experimenting with novel practices of health datafication (Ruckenstein & Dow Schu, 2017).

In this regard, case study analysis and confrontation provided the starting point for the doctoral research and set the stage for a critical reading of the transition as to how the exhibited body is the visitor's body and opens up reflection on not only technological but also cultural and ethical issues. The systematisation of these aspects supported the definition of strategic directions for the design of exhibits displaying the body of visitors for the dissemination of medical science and health promotion in museums in three categories: methods and tools, design principles, and possible scenarios. The result is a detailed mapping of the exhibition possibilities in terms of data and detectable information, opening up reflection on ethical issues regarding the management and use of data within the museum. It revealed a few critical aspects concerning scientificity, the relationship to the visitor's path, and the way of interaction. It highlighted a strong standardisation of exhibits, which has been intercepted in the literature as a tradition in these contexts. New exhibition opportunities have also emerged from exhibits and exhibitions designed in collaboration with companies and research centres that open the way to new project scenarios in which the exhibit is conceived as a tool for research, diagnosis, meeting with society and the scientific community, and creating new experiences. In the panorama of scientific museology, the actors involved converge in affirming that for the construction of the Museum of the Third Millennium, it is necessary to reach new audiences and be more inclusive not only in terms of physical and social accessibility but also to create an open and collaborative multidisciplinary community. Bron, Leroy, and Merzagora (2018) describe a vision in which science museums can and should take on the role of knowledge production devices, as well as communication or public engagement devices, through initiatives useful for specific aspects of academic, industrial, or citizen-driven research. In this sense, the possible scenarios identified involve exhibits that go "outside the museum" to involve people; exhibits that collect data from visitors contributing to research - providing a large and heterogeneous sample; exhibits that involve visitors in a citizen science perspective; exhibits that incorporate medical diagnostic tools - as user interfaces to explore notions and concepts or as actual diagnostic tools; exhibits that promote prevention and health promotion actions in collaboration with medical departments; exhibits that collect data to create new content in a generative way; exhibits that use personal or museum wearable devices to simplify data creation and management. According to the proposed scenarios, it is considered essential to consider exhibition design strategically to make the place of the visiting and learning experience, in its configurational aspects and interactive components, a tool not only for communication but also for investigation.

In this view, design has an interpretative role and is responsible for translating scientific information and curatorial vision to audiences, providing technical and communication skills to engage visitors in the exhibit and exhibition experience. The relationships between design, medical sciences, and scientific museology also reveal new scenarios and opportunities in terms of new occupations in which it can be difficult to distinguish the boundaries of intervention and expertise to which we have been used. To make design consciously and widely appropriate to this area and to increase professional possibilities in both qualitative and quantitative terms, design schools need to approach this challenge proactively by offering students appropriate and ad hoc training courses that enable them to effectively integrate scientific understanding and interpretation into their projects.

KEYWORDS | DESIGN FOR SOCIAL INNOVATION, ANARCHAFEMINISM, TEMPORALITY, GAME DESIGN

ABSTRACT | In discussions of social change, the temporal dimension often remains a silent observer, flattened by a singular focus on future outcomes that bypasses a richer canvas for designing and enacting impactful innovations.

With this short theoretical reflection, I want to underscore the pivotal role of time (and its disruption) in Design for Social Innovation (DSI), critiquing its prevalent forward-gazing narrative deeply entrenched in a linear model of progress aligned with neoliberal and colonial imaginaries. And yet, at the same time, radical critiques, while effective in challenging dominant discourses and deconstructing current social hegemonies, keep the analysis anchored in the past, creating a space-and-time stalemate of inaction.

Amidst this seemly irreconcilable temporal tension between the futurist-futuring projection of DSI and the over-backward gaze of critique, I found anarchafeminist perspectives as crucial and long overdue alter-narratives of change. On the one hand, the anarchist component, by advocating for the immediate enactment of future ideals (prefiguration) and repurposing of past elements for contemporary use (constitutionalising), seeks to collapse traditional temporal boundaries in the here-and-now. On the other hand, the contemporary feminist and queer calls to engage with the 'queer time' of performativity and 'stay with the trouble' invites us to reimagine social innovations within novel fluid temporal dimensions and, still, grounded into actionable presents.

Central to this anarchafeminist exploration of DSI theory, which harmonizes the lessons of the past, the urgencies of the present, and the possibilities of the future, is, therefore, the quest for coherent methodological orientations. In this sense, I conclude by advancing the application of games and play as time warp machines, enabling explorations and performances of social change not as a distant ideal or a static critique but as a lived reality co-created in the spirit of anarchafeminist play.

1. Premise: from Research to (Design) Practice to Theory Again

This theoretical reflection is part of a broader exploration of grassroots social innovations through a playful design approach, which evolved almost ‘organically’ during my ongoing PhD research into London’s housing precarity.

The critical quest for a term overcoming the ideologically constructed notion of "housing crisis" (White & Nandedkar, 2021; Klein, 2007) led me to 'precarity,' highlighting the political nature of injustice (Waite, 2009) and gender’s overlooked aspect. This political, feminist, and queer perspective guided my inquiry, with Butler's work on precariousness and vulnerability (2004, 2010; Butler et al., 2016) providing a theoretical anchor on the potential of shared conditions of vulnerable uncertainty to unite radical and care-based struggles.

I realized that design for social innovation (DSI), particularly in reclaiming its original subversive and grassroots discourse (Godin, 2012; Srinivas, 2023), could have benefited from inhabiting the uncertain condition of precarity-vulnerability (Zechner &Cobo-Guevara, 2017) to disrupt its 'business-as-usual' and reorient actions and strategies for social change—not just to design a social change that reacts to disruption but rather one that acts through disruption.

This exploration first led me to reflect on my role as a researcher critically. I realized that the traditional academic path to participatory research is too often driven by philanthropic 'good' intentions (Volpi et al., 2024), which unintentionally perpetuated saviour dynamics and corporate-like efficiencies at the expense of genuine horizontal collaboration. As a result, I adopted the explicit feminist, situated, and autoethnographic 'I' (Young, 1997), stepping back from the expert's podium with my design co-participants (and therefore refusing on these pages the impersonal ‘objective’ voice too), to embrace the vulnerable role of the 'unsure,' —one that I had always tried to conceal in my migrant/gendered academic position where I thought I needed to hide any fragility that could call my rational 'authority' into question.

The deliberate shift towards embracing 'disruption' as a research compass revealed many unquestioned academic practices of embedded epistemic injustice, not only in language but also in methods and timelines that I, as a researcher, was perpetuating. How could I promote new forms of discontinuity instead of reproducing them? I started undoing the 'participatory' design plans I unilaterally made to reconceive a collective methodology with more uncertain, voluntary, and relational dynamics. Surprisingly, this 'ineffective' ongoing turn became a strength rather than a limitation—a change in perspective resonating with the ludic principle of "meaningful inefficiencies": players are given goals and face unnecessary obstacles, and it is precisely those unnecessary obstacles that make their game’s efforts meaningful (Gordon & Walter, 2019).

This approach necessitated reconsidering temporal dynamics, too, for a more fluid, co-created process. "As academics, we knew that our lives were structured by time as a vector of power, from minutiae, such as class schedules, through annual reviews and milestones, such as merit steps and promotions, through the larger temporal systems that govern invisibly, which Michel Foucault ([1975] 1995) understood as the heart of discipline and which one of us calls ‘chrononormativity’ (Freeman 2010)" (Samuels & Freeman 2021, p. 245). Navigating temporal tensions was not just about rethinking how time could be managed in a caring manner, shielding my co-researchers from academic pressure to unambiguously ‘manage and finalise’ the project, but about reimagining ambiguous time altogether.

Ludic principles permeated our collaboration and evolved into playful projects and then methodologically oriented tools. This enabled us to use time as a canvas for creative exploration of alternative forms of social change and temporal experience. Through this approach, we created spaces to envision future societies, reflect on and revise the past, and deeply engage with the complexities of the present in a participatory manner. This new form of social innovation, rooted in the manipulation of time, allows for a radical and inherent transformation in participatory processes underpinned by anarchafeminist principles.

But an anarchafeminist praxis means not just bringing theory into practice but 'dragging' the personal and practical into the theoretical again. "The personal is theoretical. Theory itself is often assumed to be abstract: something is more theoretical, the more abstract it is, the more it is abstracted from everyday life. To abstract is to drag away, detach, pull away, or divert. We might then have to drag theory back, to bring theory back to life" (Ahmed, 2017, p. 9-10).

This short contribution aims, therefore, to open up a discussion in DSI theory and engage with time more deeply.

2. Time and Change: All About the Future

Time is increasingly recognized as a fundamental concept in social sciences, and disability and queer studies (Samuels & Freeman, 2021; Freeman, 2010; Muñoz, 2009) are particularly emphasizing its crucial role in transcending normative and colonial biases to liberate the collective imagination.

> "Just as the foundational works of queer theory revealed that gender, sexuality, and race/ethnicity are not natural or inevitable but social and conventional—and hence ethical and political—these time-(dis)oriented works of queer theory demonstrate that even seemingly commonsensical categories such as past, present, and future are no less culturally constructed and no less intimately bound up with the (il)logics of desire and power" (Moore et al., 2018, p.3).

And yet, temporal dimensions in DSI theory are frequently overlooked despite their crucial role in shaping our understanding of social change and its binding relationship with power discourses.
Despite DSI's commendable intentions to address societal challenges while fostering equitable and sustainable community-centered initiatives, current mainstream theoretical directions and applications are increasingly coming under scrutiny. On the one hand, the design thinking approach to social change aims to move beyond current wicked problems towards future transformative solutions urgently, and in this 'rush' risks overlooking communities' immediate realities -and informal responses; on the other hand, DSI in the last decade demonstrated a certain susceptibility to neoliberal co-optation and elite capture (Táíwò, 2022), and I argue, here, that this co-optation strongly reflects an insufficient engagement with temporal discussion.

SI's unquestioned tendency towards a linear and progress-oriented view of change is embedded within colonial and northern-Western epistemologies (Tunstall, 2013; 2023) and notions of progress that, by emphasising market-driven solutions, are sidelining more radical, grassroots efforts that operate outside the conventional market logic. More poignantly, despite the approach's focus on the future, it can be argued that SI fictional expectations (Beckert, 2016) are not different from the present, and while "design fictions articulate desires for new futures of the everyday life, (…) their fictional status bring forth desires that bear no accountability in the present" (Gonzatto et al., 2013, p. 36).
In other words, the futures of neoliberal innovators are colonising other forms of creative agency (Ziegler, 2019, p.165) and potential social arrangements proceeding through trials, errors, and vulnerable coalitions, pointing to significant gaps in DSI frameworks: a lack of critical underpinnings that could challenge current power structures and a lack of imagination towards alternative futures beyond the status quo.

In response to these critiques, design futuring emerges as an attempt to infuse DSI with a needed dose of speculative thinking and criticality.
The concept of the future is gaining great academic traction (Andersson, 2018; Beckert, 2016; Beckert & Bronk, 2018; Bryant & Knight, 2019; Urry, 2016; Oomen et al., 2022), rooted in the rich theoretical soil of utopian studies with their focus on ideal societies and transformative visions. Design futuring tries to catch up with philosophical discussions and extend *social innovations* beyond practical solutions to engage with the realm of the possible by drawing on utopian *anticipation* (Wagner-Lawlor, 2017) and leveraging its visionary scope to inspire radical innovations that are both speculative and actionable; yet, this future-only orientation also encapsulates the crux of the challenge. Both DSI and a certain brand of speculative-

utopian blueprints that leaves no room for the messy, iterative processes of real-world change tend to privilege ideal novelty over proven informal methods, thus still prioritise future outcomes at the expense of present imperfect realities, and still “need greater plurality” (Howell et al., 2021).

In sum, while the future-directed trajectories of DSI, design futuring, and utopian studies offer powerful frameworks for imagining and striving towards better societies, they also underscore the need for a balanced engagement with time, recognizing that meaningful social innovation must weave together and problematise the threads of past experiences to create a tapestry of change that is both visionary and critically grounded.

3. Stuck in the Past

In examining social change, dissecting it through the complex layers of history that have shaped our current societal conditions, and putting the ideological construction of alternatives in power and discursive contexts, critical methodologies such as genealogy offer incredibly deep insights.

Genealogy, as developed by Foucault (1977), serves, in fact, as an invaluable tool for excavating the origins and transformations of social practices and power dynamics. By tracing the historical lineage of present-day realities, genealogy uncovers the contingent and often arbitrary nature of what we take for granted as 'natural' or immutable, but it would be wrong to think about genealogies as mere historical analysis; rather their “intent is to problematize the present by revealing the power relations upon which it depends and the contingent processes that have brought it into being” (Garland, 2014, p.372) and contextualize social changes within a broader evolution of the ideological framework.

Yet, while genealogy and other critical discourse analyses excel in deconstructing historical and narrative social change, they may lack a *constructive* dimension and thus lead to a state of paralysis where design hesitates to commit to concrete, actionable social innovations.

To foster meaningful innovation, I believe it is key to move beyond a retrospective limbo of perpetual critique as much as a futurist forward-gazing discourse and rather leverage novel approaches that not only dissect the past and inspire the future but crucially engage with the uncertain present.

4. Here-and-Now: Anarchism and Feminism Collapsing Time

To move beyond future-focused visions or past-static critiques, I often question why design overlooks anarchism (Graeber, 2004) and why DSI, in particular, ignores anarchafeminist valuable insights. The synthesis of anarchism's commitment to dismantling interlocking hierarchies and feminism's focus on gender and social justice that “practices what anarchism preaches” (Tanenbaum, 2016, p.13; Bottici, 2022) offers a unique perspective to approach and understand social change in a new temporal and profoundly agentic dimension.

Anarchism’s relation with the past, through processes of anarchist *constitutionalising* (Kinna et al. 2019a; 2019b), revisits and repurposes historical elements to better fit contemporary contexts and activists’ networks. But it is not just the past to pass through the lens of temporal disruption: it is the future, too. The concept of *prefiguration* (Boggs, 1977; Maeckelbergh, 2011) posits that the future we strive for cannot be a distant horizon but must be enacted in the present, embodying the changes we wish to see. This means rejecting the notion that power can be granted by "enlightened experts” (Long & Villareal, 1993, p.160) while maintaining the same asymmetrical power dynamics (Boje & Rosile, 2001; Gruber & Trickett, 1987) and instead directly committing to being the change. Prefiguration, in other words, does not await a perfect future, designed and implemented by experts and representatives; rather, it creates spaces for present-day horizontal decision-making processes and living experiments of alternative social orders where failure and trial are also embraced as part of the process (Antebi et al. 2007).

Prefiguration thus becomes a method of '"collapsing the future into the present" (Swain 2019, p. 55), offering a direct challenge to the status quo by integrating critiques from the past and future ideals into the fabric of current action.

The idea that the future is real “to the extent that it is performed” in the present (Butler, 1988, p. 527) has a significant impact on contemporary feminist thought as well. *Performativity* (Butler, 1990), which emphasizes the importance of social actors’ performances “of the future which have an effect on others’ actions in the present” (Tutton, 2017, p. 483) can be seen as another form of praxis that corrects historical biases (e.g. Edelman, 1985) by the enactment (Burke, 1969; Ezrahi, 2012) of a queer time that disrupts and reconfigures the future (Halberstam, 2005; Arruzza, 2015). This aligns with anarchism, which asserts that we can challenge normative temporalities and social orders through conscious acts of defiance and prefiguration. At the same time, enacting alternative social relations and structures in the here and now, demonstrating a direct engagement with the complexities and urgencies of the present moment, and avoiding the pitfalls of deferring change to a distant future resonates in Haraway's notion of *staying with the trouble* (2016).

An increasing number of critical texts argue that design has an ideological impact and shapes society (Dunne & Raby, 2013). Anarchafeminist's contribution to DSI lies in this debate, rejecting solutionist thinking, positivist universal ontologies, and Northern-Western epistemologies, and rather opting for “trouble, situated knowledges and intimate futures [which] (…) cannot and should not be captured” (Sondergaard, 2018). In some ways, anarchafeminist temporal disruptions already reflect Erlhoff and Rezai’s idea that design must “never yield to stability, but rather to indulge in the intersections of incongruities, uncertainties, and complexities” (2021).

The questions that I am trying to answer are, therefore, how (design) research can thrive in the uncertain, and which interactive design medium can serve as a sandbox for experimenting with the principles of anarchafeminist DSI?

5. Conclusion: Playful Time Warp Machines for DSI?

My research is currently exploring games as novel, playful arenas where the anarchafeminist collapsing of time is not only possible but inherent.
Design literature already recognizes the potential of games to envision democratic scenarios, renegotiate power dynamics, and foster collaboration (Brandt & Messeter, 2004; Eriksen et al., 2014; Khaled & Vasalou, 2014; Brandt. 2006), and games are also increasingly being explored as catalyzers of social innovations (Bayrak. 2019; Gomes et al., 2021; Swain. 2007). However, I believe that games’ main strength lies in their ability to offer a unique medium for critiquing, exploring, and reimagining social realities within fluid temporal dimensions.

Time is a tool that can be manipulated by game designers (Tychsen & Hitchens, 2009), and yet, designers are not the only agents involved in temporality. Indeed, game temporalities, as mechanisms of organizing time within games, are intricately formed through the ongoing performance of routinized behaviours, mutual expectations, and norms shaped by players' actions and agency (Rapp, 2019; Nguyen, 2020).

This dynamic interplay highlights how games can offer diverse ways to experience and manipulate time, emphasizing the role of both designers and players in continuously shaping and disrupting temporal planes, thus offering a practical application of anarchafeminist principles in DSI that challenge the linear progression of time and encourages a more holistic and democratic understanding of social change.

I am presently collaborating with East London housing activists to design together a political board game about the London Olympic Legacy that not only serves as a cultural, entertaining, and socialising medium but as a time warp machine. The participatory game design phase allows us to reflect and rewrite the betrayal of Olympic Legacy promises (Wainwright, 2022) to disrupt the past; its cooperative play phase

provides an opportunity to practice alternative solutions to the current dehumanizing and alienating housing and social cleansing issues. Lastly, the iterative playtesting phase continuously (re)shapes future-oriented practices of rule-bending, broadens the participatory spectrum, and disrupts dominant fictional expectations through grassroots actionable knowledge production (Boje et al., 2004, p. 1).

The dynamic nature of play and games is thus a poly-vocal *ante-narrative*: a "fragmented, non-linear, incoherent, collective, unplotted, and improper storytelling" (Boje, 2011, p. 1) that bridges the "static dominant narrative of the past with the dynamic 'lived story' of the present to enable reflective (past-oriented) and prospective (future-oriented) sense-making" (Boje, 2008, pp. 6-13; Jones et al., 2016).

As I have explored the intersection of temporality, social innovation, and radical critique through an anarchafeminist lens, advocating for a deeper engagement with time in the design and implementation of social innovations, I hope to continue to further investigate how games and play can operationalize anarchafeminist principles, and I look forward to witnessing these principles being applied by other researchers in a variety of design contexts, such as evaluating their 'impact' on community involvement, self-empowerment, and the creation of just and sustainable social realities.
As we continue to navigate the complexities of social change, the playful exploration of time offers a promising path toward more inclusive and transformative social innovations. And, after all, to paraphrase a famous Italian pun[1], the problems are wicked but not serious.

KEYWORDS | MATERIAL SELECTION, SAMPLE, CLASSIFICATION, DESIGN ARTIFACT, NON-EXPERT USER

ABSTRACT | This article introduces design-led doctoral research focusing on material's classification in the context of a new Parisian-based material library. Selection methods such as the Ashby diagram are useful for materials experts and can be used to select materials early in the design process. But are these selection methods suitable for non-expert users? Given the diversity of training courses in fashion, applied arts, and design in the Parisian area, we want to highlight an educational continuity in materials selection between these disciplines. In addition, the use of material samples enables a dialogue between the different actors involved in a design project by providing both information and a physical representation of a material. We therefore suggest that the material sample is necessary to understand the material specification from the point of view of non-expert users such as craftsmen, designers, or architects, and we consider the role of the material sample in the design process.

1. Introduction

The article sets the stage for an exploration of the role of one particular design artifact, the material sample, in the design process. Artifacts such as material samples, models, and prototypes serve as markers of a project's progress (Camburn et al., 2017), aiding in the dialogue and evaluation of technical, functional, and sensory aspects (Bassereau et al., 2015; Jeantet, 1998). While they do not constitute the final product, they play a crucial role in guiding design decisions.

Documentation associated with material samples is emphasized as vital for representing material attributes and guiding selection. This documentation provides a common language rooted in design methodologies and material knowledge, facilitating comparison between different materials. This documentation is linked to the role of material samples during the project phase through multi-criteria approaches and dedicated design methodologies based on metrics (Ashby et Johnson, 2014). Are these methods, such as the Ashby diagram, made for expert users such as engineers, would be useful in the design practices of non-expert users?

The focus is on the nature of material samples as mediators in the design process (Gentès, 2022), with specific experiential knowledge for specific users (Romani et al., 2023), namely reflective practitioners (Schön, 1992). Drawing parallels with scientific research and industrial production, material samples represent a snapshot of information that must be accessible, understood, and adaptable as projects evolve. To define the role of material samples, the methodology is constructed on two aspects, first, as practice-based research (Koskinen et al., 2012) conducting the program of a material library, the article will present an overview of the future users of the material library. It considers the importance of structuring information for various users, from students in fashion, applied art, and design sectors.

Simultaneously crossed with materials education teaching experience at the École des Arts Décoratifs in the bachelor program, the article will provide a case study: a specific project of a supervised workshop focused on made-to-measure bio-based materials. In this study, the role of the material sample is at the forefront of the design project as a design aid in practice and as a facilitator of the translation of knowledge into design practices and project outcomes.

The purpose of crossing quantitative and qualitative data (Gray et Mallins, 2014) is to redefine the place and the role of material samples during the design process because of their strong influence on the material library system. Linking know-how, sensory qualities, and technical properties could allow bringing the gap between knowing and making, i.e., material sciences and design practices, and be useful for non-expert users to improve understanding through experiential knowledge.

2. From Boundary Object to Material Classification

2.1 The Material Sample

In delineating between matter and material (De Visscher, 2023), the material sample emerges as the representation of a "single class" material, including properties information (Bréchet, 2015). This information based on scientific experiences and measures serves to simulate and predict material behavior, material sample is therefore used for application and performance. Considering the material sample as a limited representation helps us to see it as an intermediary of embedded information between agency and ontology concepts. The material sample is, therefore, an agent and a boundary object (Koskinen, 2006), i.e., a snapshot in a becoming process (Di Paolo, 2023) and an intermediate across design and media disciplines (Gentès, 2022).

It generally stands as a Semi-finished good (SFG), providing an objective representation of a material's surface aspects and properties. This representation encompasses technical, sensory, environmental, and aesthetic qualities, as well as potential shaping processes and know-how. Material samples, alongside other artifact like models and prototypes, serve as structural representations within a project, facilitating dialogue and decision-making among stakeholders (Bassereau et al., 2015). Particularly, material samples are valuable in the assessment of sensory qualities and surface aspects, crucial for understanding the emotional dimensions of the final product (Karana et al., 2015).

These samples play a pivotal role in enabling the comparison of materials based on a theoretical state, thus assisting both technical and non-technical users in material selection and creation during the design phase. The documentation accompanying material samples serves to codify their properties into a common language, which is essential for all involved in the project. The material sample acts as evidence (Schuppli, 2020), i.e., a model of scientific objectivity drawn by materials science and circumstantiated to expert material users in a constructed objectivity (Friedman et Krauthausen, 2023; Datson et Gallison, 2007) with the aim that users could produce an exercised judgment.

However, questions arise regarding the representativeness of material samples, as they inherently embody a fragment of a whole material. Despite their scientific nature, they provide a fixed state of information that needs to be interpreted and contextualized within the design project, thus functioning as an input for knowledge through making (Mäkelä, 2007). This dual nature of material samples, as both a design tool based on perception theory (Luyat et Regia-Corte, 2009; Gibson, 1986) and a model of data objectivity, underscores their significance in facilitating material-related decisions in the design process.

2.2 The Material Library

Material libraries serve as spaces where samples and their characteristics are made accessible, typically organized according to a classification system. These venues, prevalent in architecture and design agencies, offer expertise and facilitate interactions between users and suppliers (Akın et Pedgley, 2016). Material libraries cater to two main audiences: those with theoretical knowledge who utilize them for simulation and prediction and those without prior knowledge who use them as entry points to understand materials. Through classification methodologies, material libraries aid researchers in navigating and selecting materials based on project requirements and criteria.

The classification system within material libraries fosters a systematic comparative logic, facilitating the exploration of material families and their properties. They serve as practical tools for project development, distinct from laboratories or workshops, by organizing a wealth of materials and knowledge into accessible formats. Various types of material libraries exist, each emphasizing different aspects such as material life cycles, shaping processes, innovation, or specialization in particular trades or heritages (Akın et Pedgley, 2016). While some professions may rely on theoretical knowledge and databases for material selection, the emergence of design methodologies underscores the importance of a transdisciplinary language on materials, bridging practitioner profiles, and material-oriented approaches (Romani et al., 2023).

2.3 The Future Users of the Campus Mode, Métiers d'Art & Design

In envisioning a reference and classification system tailored to the needs of its users within a material library, a connection is established between material users, design methodologies, and data processing, encompassing materials in all their states. The focus shifts to the creation of a material library as a device that proposes a classification corresponding to the singularities of its users.

The future users of the material library of the Manufacture des Gobelins are students undertaking fashion, applied art, and design training across schools in the Paris and Créteil academic regions.

Visual representations of enrollment data from secondary to higher education are used as graphic tools to aid analysis and decision-making (fig.01; Fig. 02) (Gorkovenko et al., 2023; Bihanic, 2015). Distinctions are drawn between fashion, arts and crafts, and design courses, showcasing the distribution and proportion of enrollments and the types of careers they prepare students for. Data analysis makes it apparent that design training constitutes a significant majority, with a focus on generalist design disciplines such as graphic design, objects, and space. The visualizations also highlight the continuity in training between those professions, underlining the common language built around shared practices.

The sample, as an object for design, is governed by selection criteria based on characteristics requiring classification. It caters to the specific needs of material users, who operate within a common language bridging crafts and design. Looking at design and selection methodologies used in engineering provides insights into how theoretical knowledge can be enhanced. Overall, this approach emphasizes the importance of tailoring material libraries and design methodologies to the specific needs and backgrounds of users, particularly within the context of fashion, art, and design education. By leveraging data visualization and understanding the interconnectedness of design disciplines, material libraries can effectively serve as hubs for knowledge exchange and innovation (De Giorgi et al., 2020).

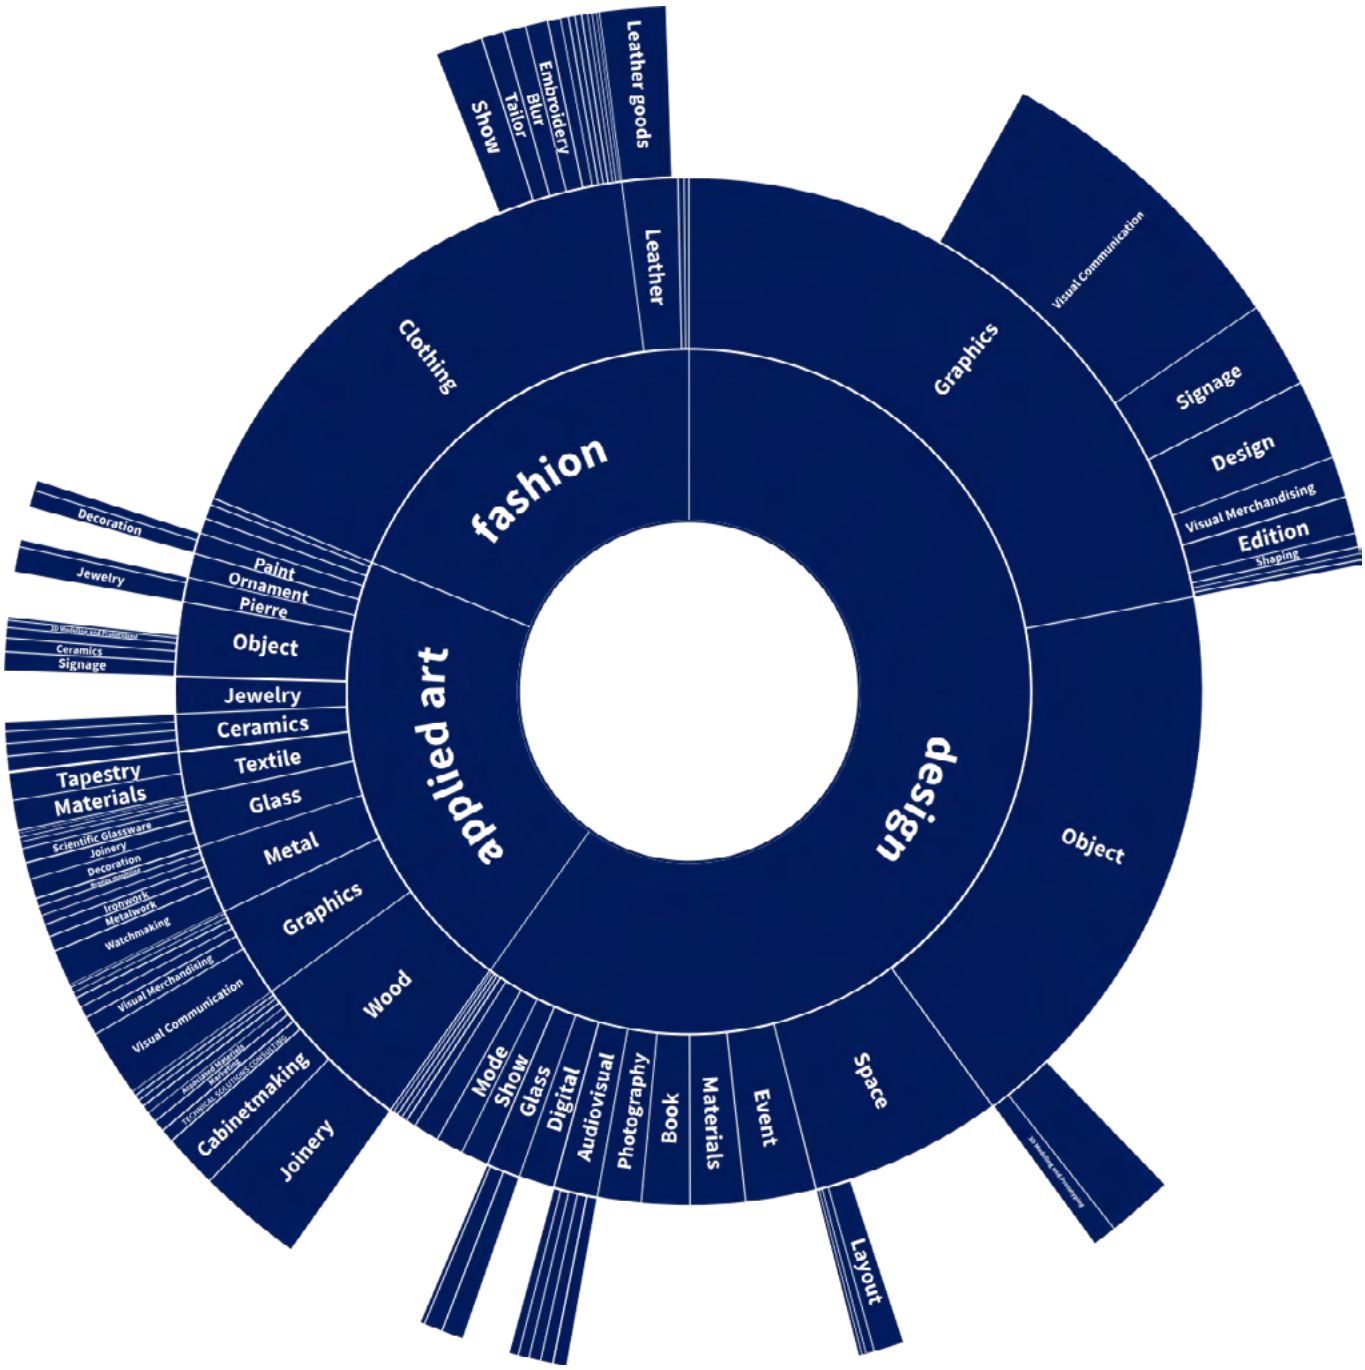

Figure 1. Students from fashion applied art, and design sectors by professional area in the Paris area during the academic year 2022-2023 (future users of the material library) (thesis context). Source: Number of students per training institution and fields of training [dataset]. Ministry of Education, France (2023).

Note: the difference between design and applied arts can be highlighted, you'll find many specifications in the applied arts sectors related to jobs and manufacturing, whereas in the design sector, categorizations depend on general fields.

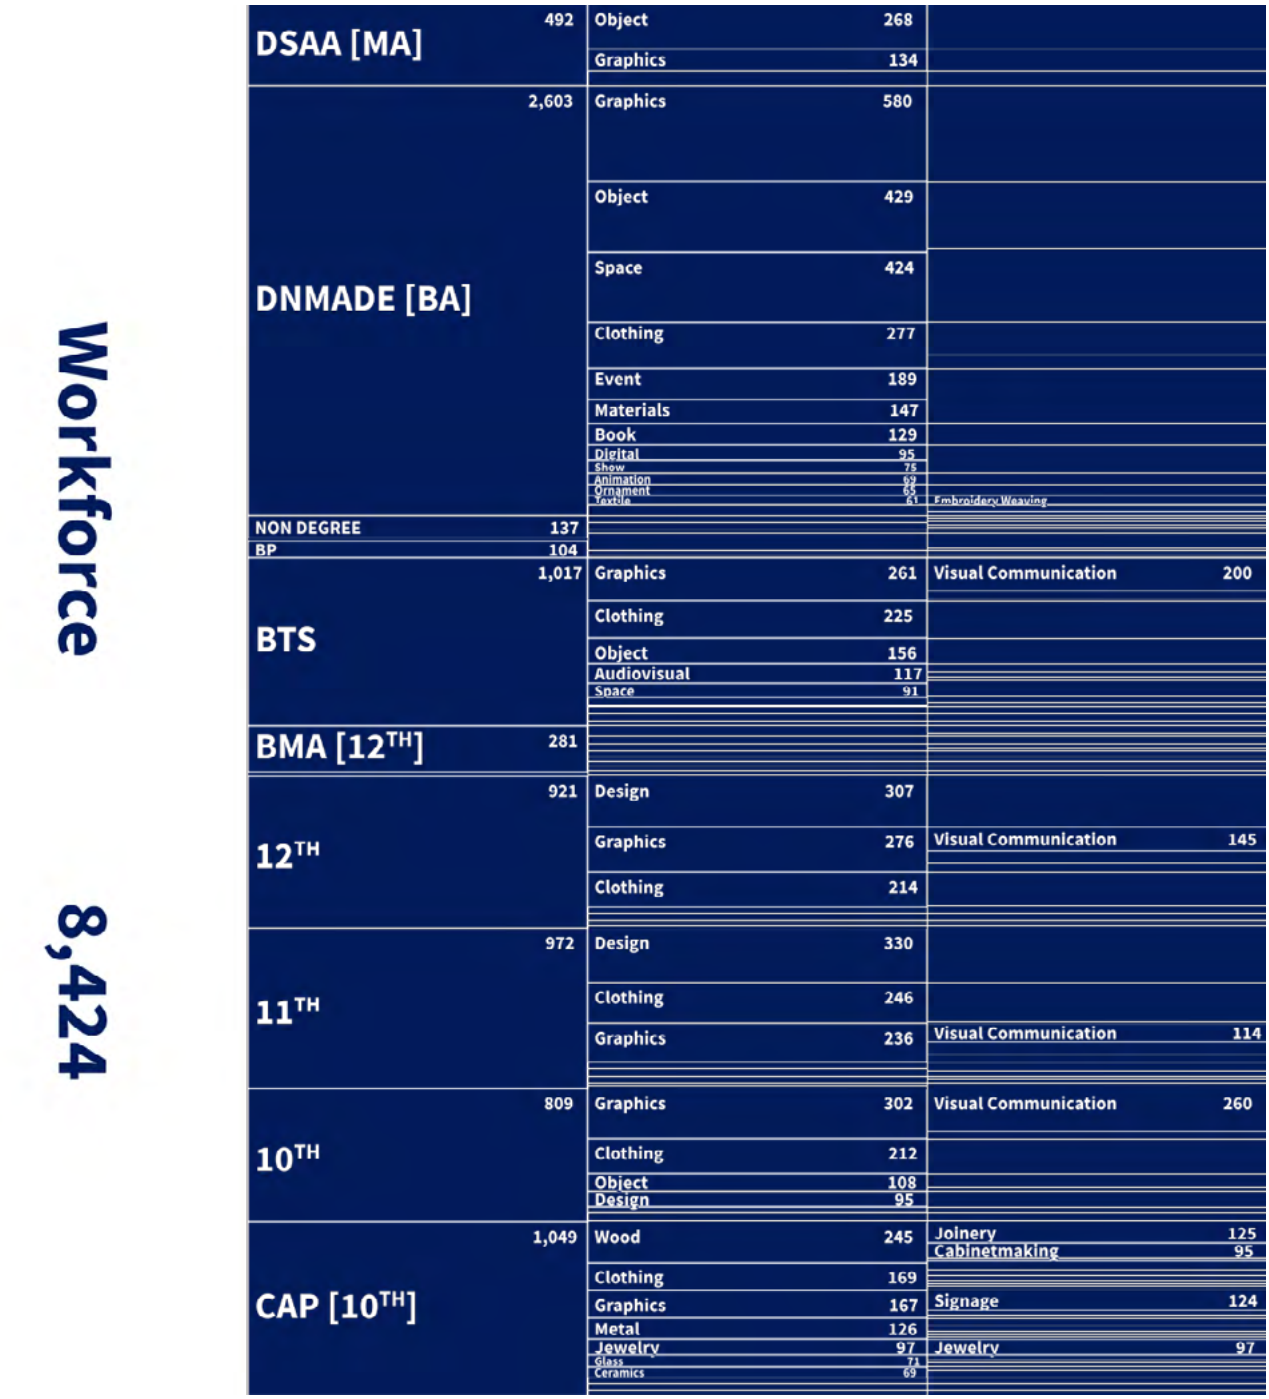

Figure 2. Students from fashion applied art, and design sectors by grade in the Paris area during the academic year 2022-2023 (future users of the material library) (thesis context). Source: Number of students per training institution and fields of training [dataset]. Ministry of Education, France (2023).

3. Material Selection in Design Methodologies

3.1 Selecting Materials

In the process of establishing a classification system for materials, especially when faced with an abundance of options, it becomes essential to differentiate between them based on their properties (Ashby et Johnson, 2014). Drawing from design sciences, material selection methods prioritize properties, ranking their importance relative to each other. The Ashby method, for instance, utilizes metrics to compare material properties, aiding in their differentiation. This method involves graphically representing material families by comparing two technical properties on a common matrix, facilitating the decision-making process for material selection based on technical characteristics. However, it's important to note that the selection method in product design relies on a material's ability to meet performance requirements, which may sometimes be contradictory. This has led to the emergence of tailor-made and structured materials like composites and sandwich materials, which cannot simply be selected from a catalog but require detailed analysis and specification. While the Ashby method provides a controlled knowledge of materials through their properties, it may not be suitable for all design situations, e.g., the emergence of material libraries (Akın et Pedgley, 2016). Mastering selection criteria is crucial for such a method to be effective, allowing for the association of constraints and properties. Moreover, while selection requires knowledge of associated properties, it's not limited to them. Classifying these properties enables a connection between different types of knowledge, facilitating interdisciplinary collaboration.

Multi-criteria design is significant as it considers various constraints, accommodating different perspectives within project specifications. To align multi-criteria selection with a broader range of users, the classification of materials must incorporate a common language, including design methods and materials geometry, to facilitate dialogue across disciplines. Additionally, the integration of multi-scale modeling with multi-criteria design is necessary to establish a shared understanding among different users of materials (Bréchet, 2015). However, it is important to acknowledge that these design methods, while valuable, still stem from a linear industrial production system that warrants further examination (Menu, 2022).

3.2 Design Requirements

While research and industry have historically focused on developing tailor-made materials to address industrial challenges (Friedman et Krauthausen, 2023), there is a growing emphasis on responsible design practices. This includes considerations of material criticality, life cycle, and recyclability. New research methodologies rooted in a resilient approach are emerging, placing materials at the forefront of project management (Mosse et Bassereau, 2019). Material Driven Design (MDD) highlights the central role of materials in creating meaningful, emotional experiences within specific performance contexts (Karana et al., 2015; Chapman, 2009).

Materials are increasingly viewed in conjunction with boundary disciplines like chemistry, biology, and robotics, driving innovation in project management (De Giorgi et al., 2020). This approach underscores the importance of considering materials not in isolation but in their production processes, shaping the expertise of all stakeholders involved in the design process.

By integrating materials science upstream in the design and creation phases, design students from École des Arts Décoratifs have explored innovative approaches to material selection and application. These workshops focused on sustainable design practices, such as recycling industrial waste or maximizing the recyclability of textiles, demonstrating the value of considering materials as boundary artifacts in the design process. These workshops fostered experimentation and applied design practices, encouraging students through experiential knowledge to develop resilient solutions that minimize waste and maximize resource efficiency (Dew et Rosner, 2019).

Figure 3. Adamiak, A. & Menival M. (2022). Sciuratine Project [Photography]. École des Arts Décoratifs.

Note: close-up of final experimentation of the project realized in the Biomaterials and Ornaments workshop directed by the author. The students have tried to master a linoleum recipe based on their know-how and experience, they have also improved their knowledge of material dedicated to their discipline.

3.3 Material Driven — Design Practice

In the workshop titled Biomaterials and Ornaments, codirected with the design studio Hors Studio (Rebecca Fezard et Élodie Michaud), students explored the recycling of materials, waste, and offcuts from the materials bank Precious Kitchen (part of Hors Studio activities). The aim was to create composite, bio-based, and mono-materials by incorporating offcuts into new compositions, adding value to otherwise discarded materials. The Sciuratine project (Alek Adamiak et Marie Menival, 2022) used sawdust, a feedstock, and bovine gelatin as a binder to produce sheets akin to linoleum. Through experimentation, students refined the material's properties to make it suitable for linocutting, resulting in a textured aesthetic for their project.

Throughout the project, the students learn to master the transformation process, which works by repeating and adapting a gesture, a documented craft production in which the material is adjusted to meet technical properties and plastic qualities. This approach is said to be experiential in the sense that the production of material is mastered empirically, and it is only at the end of the experiments that the process is stabilized and mastered, not in an explanatory way but by empirical imitation. The material itself becomes an object of reflection based on how samples function as a medium for design and research. The role of the samples in this process is to enable their comparison based on plastic qualities to the made-to-measure materials that the students are used to working with. This method is different from the use of a database, where the information is only shown to people who know how to interrogate through technical properties.

4. Discussion

Does the material experimented with upstream of the design stage play a mediating role in the sampling process specific to the design? It's a question of a single material that can take on multi-material forms. In the workshop, the material being worked on represents a body of practical knowledge, as well as perceptible sensory qualities as a support for a practical process. When it comes to designing a made-to-measure material, all the information is needed. We propose that, in the case of engineering, it is a question comparing properties, whereas in the field of design and craft, knowledge comes through the practice of a gesture (Ingold, 2001), and that this empirical method also allows materials to be compared with each other, related to experiential knowledge. This experiential knowledge, and if it was not mastered, gives rise to experiments aimed at learning about the material through its reactions and effects. The place of materials upstream in the project and the technical data are mastered and guessed at through experimentation without recourse to theoretical knowledge. This is an inductive approach in which experiential knowledge is refined so that the parameters can be controlled by the practitioner.

The role of material samples in the design process highlights their function as medium artifact and their implications for design methodologies. The workshop focused on designing with waste, presenting different approaches to material experimentation and application. As composites, these experienced mono-materials are characterized by their limited recyclability (Karell, 2021). The material samples serve as a medium for reflection and experimentation, allowing designers to explore properties, sensory qualities, and practical know-how. This approach emphasizes the practical aspect of material exploration, where knowledge is gained through hands-on experience rather than theoretical understanding alone. These experiments emphasize the need for sensitive design methods that bridge technical properties with creative approaches, ultimately leading to new forms of materials and research.

In conclusion, the material sample plays a crucial role in the design process, serving as a mediator between theory and practice. Its role in facilitating knowledge transfer and guiding design decisions underscores the importance of considering its link with users and the properties of materials within a coherent, structured system.

KEYWORDS | PERMACULTURE, FARMERS, AGRICULTURAL RESILIENCE, PARTICIPATORY DESIGN

ABSTRACT | Permaculture farming is a pivotal solution to the pressing global challenges of climate change, resource depletion, and food security. In India, where over 80% of the farming community comprises marginal farmers, transitioning to sustainable practices is crucial yet challenging. The primary barrier to this transformation is the significant knowledge gap these farmers face in integrating permaculture principles into their agricultural practices. A year-long study engaging directly with farming families, explores the intricacies and obstacles encountered by marginal Indian farmers transitioning to sustainable permaculture farming. The research identifies a critical knowledge gap as a major impediment to adopting permaculture, leading to the development of a participatory-based permaculture toolkit. This toolkit aims to revolutionize sustainable agricultural practices among marginal Indian farmers who confront the dual challenges of ecological degradation and economic vulnerability. Employing a participatory design methodology (Sanders, 2012), the study involved farmers co-creating a toolkit that amalgamates permaculture principles with localized agricultural practices. The research provided deep insights into the farmers' needs, preferences, and specific challenges through workshops, interviews, and hands-on sessions. The findings highlight the toolkit's success in enhancing the farmers' understanding and implementation of sustainable practices, evidenced by their understanding of permaculture farm design collaboratively. Also, the initiative fostered stronger community ties, promoting knowledge exchange and mutual support among participants. This research not only underscores the tangible benefits of a participatory approach to permaculture in enhancing the livelihoods of marginal farmers but also contributes to the discourse on sustainable agriculture globally by offering a model that is both scalable and adaptable. The successful field study underlines the potential of participatory-based tools in empowering farmers towards ecological resilience and a sustainable agricultural future, facilitating sustainable farm designs, community building, and localizing food and resources. This initiative represents a significant step towards addressing current challenges and encouraging the widespread adoption of sustainable agriculture practices.

1. Introduction

The primary aim of this research was to comprehensively investigate the challenges and opportunities associated with the adoption of sustainable permaculture farming practices among marginal Indian farmers. This research delves into the complexities and hurdles faced by marginal Indian farmers during their journey towards sustainable permaculture farming. Through a year-long research conducted in collaboration with farming families, we aim to identify the major challenges faced by these farmers during the transition period. Our primary focus is on the knowledge gap and its impact on permaculture adoption. In response, this research has led to the development of participatory-based research. This innovative initiative empowers marginal Indian farmers to design sustainable farms, build resilient communities, and support the localization of food and resources, which is essential for long-term sustainability. By addressing the knowledge gap, this approach not only offers hope for overcoming immediate challenges but also contributes to the broader adoption of sustainable agriculture, strengthening the path towards global sustainability.

Sustainable agriculture has emerged as a critical solution to some of the most pressing global challenges of the 21st century (CEEW 2021). These challenges include climate change, resource depletion, and ensuring food security for a growing global population (Rockström et al., 2017). At the core of this transition lie the fundamental principles of sustainable farming, focusing on optimising land utilisation, reducing environmental harm, and ensuring a consistent food source. Sustainable agriculture is not merely a goal. It is imperative for the welfare of our planet and the well-being of generations to come. A significant and integral part of the global agricultural community, particularly in the Indian subcontinent, comprises marginal farmers. India has over 90 million farmers, and 80% are small and marginal and have less than 2 hectares of farmland (Ministry of Agriculture & Farmers Welfare, 2020). These farmers, who own or cultivate small parcels of land, often struggle to make ends meet, facing many challenges, including limited access to resources, uncertain weather patterns, and economic constraints (Shiva, 1991). In sustainable agriculture, the role of Indian marginal farmers is important. They contribute significantly to the nation's food production and hold the key to addressing broader sustainability concerns.

The challenges faced by these marginal farmers are multifaceted. Their small landholdings often result in lower economies of scale, making technological investments less feasible (World Bank, 2019). Lack of access to credit and modern farming techniques, coupled with dependency on erratic monsoons due to inadequate irrigation facilities, further exacerbates their vulnerabilities (Ranganathan, 2011). Price volatility in agricultural produce and a lack of bargaining power in the market further diminish their earning potential (Chand, R., & Srivastava, S. K., 2014). Additionally, they often grapple with land degradation due to continuous farming with chemicals, fertilizers and pesticides without adequate knowledge or resources for soil health replenishment (FAO, 2018). However, adopting sustainable permaculture farming practices among marginal Indian farmers is far from straightforward. Transitioning from conventional farming to permaculture is complex and challenging (Sharma, 2023). One of the primary impediments to this transition is a substantial knowledge gap. The knowledge gap arises from a lack of awareness and understanding of permaculture principles and sustainable farming techniques (Altieri, 2002). Although rooted in historical and regional contexts, traditional farming methods often fail to address modern environmental and economic challenges (CEEW 2021). The transition to sustainable agriculture, specifically permaculture (Mollison, 1988), offers a promising solution. The inherent complexity of permaculture and its scientific underpinnings present a formidable learning curve for these farmers. Bridging this gap is difficult for marginal farmers, who often rely on conventional practices and chemical-based farming. As a result, the adoption of permaculture principles, which promise more resilient and sustainable farming systems, is hampered. To effectively promote sustainable agriculture among marginal Indian farmers, addressing this knowledge gap and providing them with the tools and resources needed for a successful transition is imperative. To achieve this overarching goal, the research has been structured around the following specific objectives. Firstly, a comprehensive examination of their current knowledge levels, awareness, and perceptions regarding permaculture principles and sustainable farming techniques. Secondly, the research seeks to investigate the multifaceted challenges these farmers face during their transition to sustainable

permaculture farming. This involves conducting detailed interviews, surveys, and on-site observations, as well as participatory workshops to pinpoint the specific barriers, including limited access to resources, economic constraints, and social factors, that hinder the adoption of sustainable practices. Building on these insights, the third objective involves the development of a participatory toolkit to bridge the identified knowledge gap and address the challenges faced by marginal Indian farmers.

2. Literature Review

2.1 Sustainable Agriculture and Permaculture

Sustainable agriculture, as defined by (Pretty, 2008), is a holistic approach prioritizing environmentally sound, economically viable, and socially responsible farming practices to ensure current and future generations can meet their food needs, highlighting the significance of soil health, water conservation, pollution reduction, and biodiversity enhancement. The Food and Agriculture Organization (FAO, 2018) underscores the global imperative for sustainable agriculture, emphasising its role in achieving the Sustainable Development Goals (SDGs) related to hunger, food security, nutrition, and sustainable agricultural practices. Permaculture, introduced by (Mollison and Holmgren, 1978), embodies a design philosophy for sustainable habitats, emphasising care for the earth and people and the redistribution of surplus through the development of agriculturally productive ecosystems mimicking natural systems' diversity and resilience. Yet, (Altieri, 2002) and (Shiva, 1991) notes the challenges in adopting such sustainable practices in developing countries like India, where a significant knowledge gap, reliance on chemical inputs, inadequate market access, and climate change impacts pose barriers to small and marginal farmers, who form over 80% of the farming community (Sharma, 2023). This confluence of sustainable agricultural principles and the unique challenges faced in implementing permaculture in developing nations underscores the urgent need for tailored solutions that address specific local challenges to foster environmental sustainability, food security, and economic viability.

2.2 Marginal Farmers in India

Marginal farmers, who own less than one hectare of land, form an essential part of Indian agriculture, accounting for over 80% of all farmers (Ministry of Agriculture & Farmers Welfare, 2020). These farmers are pivotal in sustaining agricultural biodiversity and contributing significantly to the rural economy despite facing multifaceted challenges. Economically, they struggle with limited access to credit (Verma, 2021), market volatility, and inadequate irrigation, which enhances their vulnerability to monsoon variability (Sharma, B. R., Rao, K. V., Vittal, K. P. R., & Amarasinghe, U., 2010). Environmentally, challenges like land degradation due to the overuse of chemicals and climate-induced extreme weather events threaten their agricultural productivity and food security (Bhattacharyya et al., 2020). Socially, the scenario is compounded by limited access to education on sustainable farming and gender inequality in community building, which restricts their capacity to adopt sustainable agricultural practices (Rajbhandari, 2015). This intricate array of economic, environmental, and social challenges highlights the urgent need for comprehensive support and interventions to bolster the sustainability and resilience of marginal farmers within the Indian agricultural framework.

3. Methodology

The methodology of this study utilised a participatory design approach, chosen for its effectiveness in actively engaging stakeholders, in this case, farming families, in the research process. This approach aligns with the objectives by ensuring that the development of the permaculture toolkit is grounded in the real-world experiences and needs of the target population, thereby enhancing the relevance and applicability of the research outcomes. Sampling involved a carefully structured selection process to represent a diverse cross-section of the farming community, focusing on marginal farmers most impacted by the challenges

the study aims to address. Data collection methods were multi-faceted: Structured interviews were designed around key themes, such as current farming practices, knowledge of permaculture, and barriers to sustainable agriculture, to delve deep into the participants' experiences and perspectives. Workshops and hands-on sessions were conducted to facilitate active learning and engagement, focusing on permaculture design principles and sustainable farming techniques and creating a community of practice among participants, expecting to foster a collaborative learning environment and tangible skill development. To quantify the prevalence of certain practices and perspectives within the sample, surveys complemented these methods by covering a broad range of areas, including demographic information, farming practices, and attitudes toward sustainability. Analysis of the collected data employed qualitative techniques to interpret the rich, narrative data from interviews and workshops, alongside quantitative analysis of survey responses to identify patterns and trends that could inform the toolkit's development and the broader research findings. We conducted several participatory workshops to co-create and test the toolkit (Sanders, 2012). This toolkit was very useful for the farmers to design and plan their permaculture farms collaboratively. Toolkit also helped farmers to articulate their tacit needs and translate them into design decisions. This comprehensive methodological framework was designed to provide a holistic understanding of the challenges and opportunities associated with adopting sustainable permaculture practices among marginal farmers, facilitating the creation of a targeted, effective intervention.

4. Findings

The research findings have led to the development of a transformative participatory-based permaculture toolkit aimed at enhancing sustainable agricultural practices among marginal farmers in India. Through an extensive year-long study, we meticulously mapped out the various activities involved in permaculture farming (see Figure 1), identified farmers' understanding of permaculture principles, and uncovered their tacit knowledge of sustainable farming practices. A significant revelation from the study was that while farmers may not initially be familiar with permaculture principles, they demonstrate a remarkable ability to grasp the concepts when provided with explanations and guidance. Workshops, interviews, and hands-on sessions were instrumental in deepening farmers' knowledge of sustainable farming techniques and permaculture design principles, empowering them to make well-informed decisions about farm management. We conducted several workshops to co-create the toolkit with farmers to understand its nuances. The participatory-based toolkit facilitated farmers in articulating their needs and sharing their knowledge with the community to collaboratively design the farm and devise strategic plans. Also, the critical role of the social aspect of sustainability in agriculture often overlooked. Through the toolkit, farmers not only learned to design and maintain their farms but also cultivated a sense of community, promoting the localization of the food system. Farmer’s participation in workshops fostered a heightened sense of community and empowerment among farmers, facilitating knowledge exchange, mutual support, and a shared sense of purpose. This collaborative ethos not only strengthened social bonds but also bolstered the sustainability of farming practices adopted by promoting localized food system and community development. Our findings underscore the effectiveness of a participatory-based approach in addressing knowledge gaps and overcoming barriers to sustainable agriculture among marginal farmers. By equipping farmers with the necessary knowledge and tools for sustainable farming, the toolkit has the potential to catalyze broader adoption of permaculture principles and contribute to the resilience and sustainability of agricultural systems, both in India and beyond.

Figure 3. Participatory-based permaculture toolkit for farmers to design farms using permaculture principles and ethics.

Figure 4. Learning from Permaculture design course at Aranya Permaculture farm.

Figure 5. Participatory workshop with the farmers to design permaculture farm using the toolkit developed.

5. Conclusion

The study successfully bridged the significant knowledge gap among marginal farmers in India regarding permaculture and sustainable agricultural practices, underscoring the efficacy of a participatory design approach in fostering an understanding and implementation of these practices. This research not only identified the initial knowledge levels and perceptions around permaculture but also meticulously documented the multifaceted challenges faced by farmers during their transition to sustainable farming. The development and utilisation of a participatory-based toolkit, co-created with the farmers, directly addressed these challenges and knowledge gaps, demonstrating a practical application of theory to real-world circumstances. The findings from this research highlight the critical role of community engagement and participatory methodologies in enhancing the knowledge base, thereby facilitating the adoption of sustainable practices among marginal farming communities. Also, the study contributes significantly to the global discourse on sustainable agriculture by illustrating a scalable and adaptable model of community-based learning and adaptation. Recommendations for future research include exploring the long-term impacts of toolkit implementation on farming sustainability and productivity, assessing the toolkit's applicability in different agricultural contexts, and expanding the participatory approach to include a wider range of stakeholders. The potential areas for the toolkit's application are vast, encompassing diverse agricultural settings and varied socio-economic contexts, thereby offering a valuable resource for promoting sustainable agriculture practices worldwide. This study lays the groundwork for future initiatives to empower farmers with the knowledge and tools necessary for sustainable farming, paving the way for a more resilient and food-secure future.

* stefano.salzillo@unicampania.it

DOI: 10.63442/CJVN8708

KEYWORDS | DESIGN FOR TERRITORIES, SYSTEMIC APPROACH, CO-PARTICIPATED SUPPLY CHAIN, SYMBIOTIC SUSTAINABLE DEVELOPMENT, MADE IN ITALY

ABSTRACT | The intervention priorities of the Recovery and Resilience Plan (PNRR), introduced by the European Union following the pandemic, represent an opportunity for economic recovery for Made in Italy and the country's production chains. Key sectors such as agri-food, automotive, furniture, and clothing constitute the manufacturing sectors primarily interested in implementing sustainable, economic, and social development initiatives. In this context, the Green & Digital Transitions guide and shape the future of societies, highlighting the need to overturn the linear economic paradigm in favor of restructuring value chains that integrate the principles of sustainable development, innovation in business models, sector-specific skills, and production processes, with their re-centralization in the territories. The Italian manufacturing system, characterized by micro-small enterprises, sometimes organized in districts and production chains, aligned to the concept of the soft economy, constitutes fertile ground for initiating design-oriented systemic strategies capable of combining local resources and productions while maintaining the integrity of natural ecosystems.

In this scenario, the research project aims to develop a strategic model of co-participated production chains, aiming to establish productive symbiosis relationships and integrate tangible and intangible resources of the territories in a systemic and circular perspective across different manufacturing sectors of Made in Italy concerning agri-food chains and the cosmetic sector. The research intends to explore various implementation scales of the co-participated model, involving local manufacturing through business audit activities, incorporating already ongoing sustainable production processes, and utilizing Industry 4.0 technologies through collaboration between enterprises, research centers, and Innovation hubs present in the territory. Through field research, the bottom-up detection methodology identifies initiatives, needs, and emerging issues from territorial production contexts, evaluating possible collaborative match-making strategies. The project's results are directed towards enhancing the excellence of Made in Italy, engaging and strengthening links between productive communities (micro-small enterprises), and experimenting with innovative products that synergize local know-how and design-oriented strategies. The co-participated model's experimentation aims to test collaborative production between companies in the agri-food and cosmetic sectors present in the Campania region. The outcomes of the experimentation will determine the verification of the co-participated chain model, the identification of replicability requirements, and the development of a disciplinary tool for creating new synergies between different production sectors. The paper describes the theoretical background, project objectives, methodology, and initial outcomes of the doctoral research conducted during the 1st year of the National Interest Ph.D. in Design for Made in Italy (XXXVIII cycle) at the University of Campania "Luigi Vanvitelli."

1. Background and Objectives of the Research Project

The field of the research project investigates design-oriented strategies for sustainable development in territories, aiming to enhance Made in Italy supply chains through co-participation among various manufacturing sectors. In the Italian production landscape, Industry 4.0 is guiding regional economic systems toward adopting new approaches to promote territories and excellence. To preserve the identity linked to specific geographical contexts, manufacturing, and local know-how, micro and small enterprises are identifying new opportunities for valorization through collaboration with other production entities and community relationships. A collaborative society, promoting dialogue and confrontation, follows an alternative economic model with positive impacts on territories and communities (Bistagnino, 2016). This model, incorporating the concept of a soft economy based on community cohesion, aligns with the programmatic strategies of the 2030 Agenda for sustainable development, directing societies towards integration between the production-economic system and the socio-institutional system.

From this scenario and the analysis of project experiences in symbiotic processes of closed-loop supply chains and based on the priorities identified in the National Recovery Plan (PNRR - investment 5.2: Competitiveness and Resilience of Production Chains), the research project aims to develop a strategic co-participatory supply chain model. This model aims to create productive and collaborative processes in a systemic and circular perspective, focusing on agri-food excellence and cosmetic companies in the Campania region. The model intends to activate synergistic actions between the two sectors, involving the know-how of supply chains in the selection of secondary raw materials and activating symbiotic processes among companies, local producers, research centers, and innovation hubs. The project results target the protection of Made in Italy excellences and the creation and enhancement of multi-sectoral, innovative, and sustainable aggregation processes. The outcomes of the experimentation in the Campania region (Italy) will determine the verification of the co-participatory model and the project requirements for defining replicability in other production sectors. Within the field of the research project, design considers the territory as an intermediate substrate on which to initiate processes of innovation, whether it is understood as an "object" or as a "context" (Parente et al., 2016) of design practices. From this scenario, the doctoral research project conducted during the 1st year of the National Interest Ph.D. in Design for Made in Italy (XXXVIII cycle) at the University University of Campania “Luigi Vanvitelli,” investigates the following macro-areas of research:

- Strategies and research projects in the field of design for territorial development and design-driven innovation through the analysis of systemic design approaches, circular design, and participatory design practices.
- Investment priorities of Mission 1, "Digitalization, Innovation, Competitiveness, Culture, and Tourism," and Mission 4, "Education and Research" of the National Recovery and Resilience Plan (PNRR).
- International and national funding programs for territorial development (LEADER, EUI, LDEI) and integrated supply chain projects (PIF).
- Opportunities, challenges, and emerging needs in Made in Italy production chains through consultation of reports and databases from Unionfiliere, Italian District Federations, Confcommercio, and Confindustria, monitoring the productivity and trends of the country's production sectors.
- Sustainable production processes and business models of Industry 4.0 through projects promoted by platforms such as Circularity, ENEA, Symbiosis, ECEP, and ICESP.

The analysis of existing literature on territorial sustainable development projects has revealed a gap in the systematization of symbiotic processes among productive sectors of different economic activities.

Two main aspects emerge from this analysis: firstly, the absence of a regulatory framework governing the aggregation between different production chains; secondly, the lack of a coherent procedural path aligned with regulatory aspects that facilitates the encounter and collaboration between different sectors. These premises have contributed to defining the research objectives through which the project intends to address the identified scientific problem.

- Construct a replicable co-participatory supply chain model, designing guidelines that instruct and facilitate the integration among companies for the development of co-participated production processes.
- Establish a multisectoral network that synergizes territorial resources, companies, and productive communities through co-design experiences.
- Iterate symbiotic productions and cross-fertilization processes involving productive communities, manufacturing, and local know-how.
- Activate systemic actions among territorial productions to optimize resources used and enhance the value of secondary raw materials.
- Reduce the ecological footprint of production processes by introducing or strengthening closed-loop product systems.
- Enable productive entities for Industry 4.0 technologies, integrating training programs within Innovation hubs and research centers to promote the development of new business models.

2. Research Framework

From the in-depth exploration of the research background, three main areas of investigation have emerged. The first focus involves the research and critical analysis of case studies in the field of systemic design concerning sustainable and socially responsible development of territories. The projects were selected and evaluated according to criteria relevant to the research project's objectives, such as collaboration between companies and the territory, support for the local economy, reduction of environmental impact, innovation in production processes, optimization of resources, valorization of waste, and the production of secondary products. The second focus of the research centers on the examination of experiences of productive symbiosis already experimented in the territory through the analysis of closed-loop production processes, both within the same sector and between sectors of different economic activities. The selected case studies were cataloged in synthesis tables to create a mapping based on the following analysis criteria: geographical area, type of promoting company, number of partner companies, involved productive sectors and economic activities, types of funding, collaboration results, limitations, challenges, and future replicability. The third focus of the research concerns the analysis of integrated supply chain projects, in which productive collaborations have been established among companies belonging to the same sector or different productive sectors. To examine the strategies, methodologies, and results of such collaborations, similarly, to focus 2, reference case studies were identified and subsequently cataloged in synthesis tables according to the following criteria: geographical location, number of partners, type of supply chain, sector of affiliation, involved economic activities, partner supply chains, type of funding, collaboration results, limitations, challenges, and possibilities of future replicability.

2.1 Methodology

The research adopts a bottom-up research-action methodology that, starting from the analysis of the territory, identifies the needs perceived by local communities to transfer them to the co-participated supply chain model. The four phases of the research, named Discover, Detect, Define, and Develop, consist of tasks for acquiring information and data, intending to provide concrete results. Each phase identifies a step towards achieving one or more research project objectives, for which different design methods and approaches will be used. The community-centered approach and co-design practices will be adopted to

identify emerging needs and challenges in the territory, as well as to identify collaborative processes between companies, communities, and stakeholders. Simultaneously, systemic design and circular design will be employed to facilitate the transfer of inputs and outputs between the productive realities of different sectors, adopting a "cradle to cradle" perspective.

- The first phase, called "Discover," conducted during the first semester of the doctoral research, focused on building the theoretical foundations of the project and the state of the art of design practices in the territorial context through literature review activities and the exploration of case studies. Subsequently, national and regional funding programs were examined, along with the current regulatory framework concerning productive chains.
- The second phase, called "Detect," involves field research to identify agri-food and cosmetic companies in the Campania region. These companies will be subsequently analyzed to identify matchmaking opportunities and experiment with the co-participated supply chain model. The selection will take place through the analysis of databases from the entities identified in the research background and will involve companies more inclined towards building a collaborative, productive network. The collection of qualitative and quantitative data from the companies will be conducted through questionnaires and one-to-one interviews to investigate the relationships between the companies, the territory, and the community; the skills involved in the company's production activities; the resources used and production waste; emerging challenges and perceived needs.
- The third phase, called "Define," involves organizing workshops that will engage the companies interviewed in the previous phase to identify collaboration opportunities through discussion and sharing activities. The results of the field data collection and the analysis of the workshop outcomes will form the basis for the project phase of the co-participated model and identify possible achievable matches.
- The fourth phase, called "Develop," concerns the project development and experimental application of the co-participated supply chain model in the Campania region. Sample companies operating in the agri-food and cosmetic sectors will be selected based on the interpretation of the collected data and the matching opportunities that emerged from the workshops. The outcomes of co-design meetings will constitute the requirements for defining a disciplinary tool that facilitates collaborative synergies and the creation of innovative and sustainable supply chain products.

3. Results and Conclusions

The first year of research concluded with the achievement of the objectives outlined in the initial phase, and its outcomes have brought forth considerations related to the investigated theme. Specifically, the results of the conducted activities have impacted various aspects of the project, including the in-depth exploration of research background topics and the identification of primary focus areas; the compilation of the reference bibliography and the creation of the state-of-the-art methodologies and approaches of design for the sustainable development of territories; the research and cataloging of case studies related to productive symbiosis and integrated supply chains, along with their interpretative parameters; the selection of international and national funding programs, followed by an analysis of their respective guidelines. Based on the insights derived from the theoretical background, the construction of the state-of-the-art, and the analysis of case studies, research questions have been formulated that the project aims to address.

RQ 1. What design-oriented strategies can be considered most effective in promoting sustainable development in territories from a collaborative perspective?

RQ 2. What approaches, methods, and design tools can be employed to facilitate multisectoral integration between productive supply chains and territories?

RQ 3. Which design practices can contribute to regulating organizational aspects of multisectoral collaborations within participatory production processes?

The activities planned for the current semester will involve the research and selection of companies operating in the agri-food and cosmetic supply chains in the Campania region. This will be followed by planning the field investigation phase, which will include conducting questionnaires and interviews for

Data collection. The results of these activities will subsequently be presented through the development of interpretative maps for effective visualization of the collected data. The paper aims to share the idea that the diversity of productive sectors present in the Italian territory constitutes a distinctive feature globally. This diversification and excellence specialization, combined with the high manufacturing specialization of the Made in Italy system, can represent a significant resource for the realization of design-oriented sustainable development strategies and new transition models. These strategies aim to combine economic competitiveness with social cohesion, drawing strength from local communities and surrounding territories (Cianciullo & Realacci, 2005).

KEYWORDS | DIGITAL TRANSFORMATION, POLICIES, EDUCATION & TRAINING, LEARNERS, INNOVATION

ABSTRACT | Digital transformation is anticipated to have a major influence on a global scale. The use of digital technology in education and its integration has become a national priority for many countries, with leaders in education and policymakers targeting institutions to become operationally efficient and act promptly to implement changes deemed to enable digital innovation. However, it appears that the digital transformation in education is part of a more complex and intricate system. A lack of clarity, requirements, and well-defined objectives necessitate the active collaboration of all relevant stakeholders and decision-makers across sectors to co-create and lay a strong basis for the development of a systemic approach to address this pressing issue. This calls for solutions capable of proactively navigating this renovation, ensuring that ongoing assessment, flexible thinking systems, and analysis of the long-term implications for the claimed shift align with pedagogical goals, enhance student engagement, and ultimately improve learning outcomes. This short paper must be seen as a conversation starter that aims to clarify the urgency of digital transformation for public education and pinpoint the critical components that hinder effective digital transformational change. By following a holistic approach to targeting systemic change, the scope of future research is to identify the trajectory of technology policy for education within the digital educational landscape and possibly address the present and recent history to set the groundwork for an analysis of feasible and successful digital service design solutions that meet the set objectives.

1. Introduction

Fostering the development of a high-performing digital education ecosystem and enhancing digital skills and competencies has become a key priority around Europe. This short paper is intended to clarify, initially, the urgency and meaning of digital transformation in public education. It will then focus on selected challenges faced by all stakeholders involved in the educational ecosystem and how they are currently addressing those challenges while also highlighting some of the conditions that can make those initiatives feasible. Finally, it will suggest opportunities for the education and training community, such as teachers and students, policymakers, academia, and researchers on a national, EU, and international level, to contribute to an effective digital transformational change.

1.1 Digital Transformation

A rich body of literature contributes to the understanding of the benefits as well as the challenges associated with digital transformation at multiple levels. As Vial (2019) states, digital transformation is

> "A process that aims to improve an entity by triggering significant changes to its properties through combinations of information, computing, communication, and connectivity technologies." (p.118)

Accordingly,

> "Innovation is focused on the moment of invention and the implementation of that invention," but "digital transition is an extended process of change that may have multiple goals." (Gobble, 2018, p.57)

Controversially, it is still unclear whether, in the context of education, this means introducing or replacing outdated technologies, guaranteeing digital infrastructure and security, aiming at green transactions and resource efficiency, and integrating digital approaches into the curriculum to help students thrive in the new economy, or all of the above (Arinushkina et al., 2023).

What is extensively understood is that digital transformation completely revolutionizes the current economic setting (Majchrzak et al., 2016), and there is a common consensus that building a digital transition for education is significant and will soon serve as a driving force (Negreiro et al., 2019; Hashim et al., 2022; European Commission, 2018; United Nations, 2023). However, school leaders and policymakers have to define the term "digital transformation" to establish a foundation upon which to build a shared vision (Haleem et al., 2022). For this short paper, it makes sense to use the term digital transformation to refer to the transformation that takes advantage of the new opportunities created by the new information and communication technologies in education.

1.2 Digital Transformation in Education

Currently, the digitalization of education is significantly transforming the traditional classroom and administrative processes, creating more engaging learning experiences and improving operational efficiency. With the introduction of technology-assisted learning tools like learning platforms, educational apps, interactive digital content, virtual laboratories, mobile devices, tablets, laptops, smartboards, MOOCs, simulations, and dynamic visualizations, the learning process is transforming, becoming more personalized, inclusive, dynamic, and data-driven (Arinushkina et al., 2023; Al-Emran et al., 2020). These digital platforms and media are said to act as catalysts for a learner-centric model, expanding the alternatives for the delivery and accessibility of educational content everywhere and at any time; students can access resources, participate in discussions, and submit assignments online (Grenčíková, 2021). However, this comes with its risks. It is argued that the claimed change goes beyond just integrating digital

tools; rather, it radically redefines the nature and methods of education (OECD, 2021). Teachers must be equipped to deliver innovative approaches and learning designs that hold the possibility of a safe and meaningful digital transformation (Fisher et al., 2023; Hanelt et al., 2021). This calls for leaders capable of proactively navigating this renovation, ensuring that technology integration aligns with explicit pedagogical goals, enhances student engagement, and ultimately improves learning outcomes (Bush et al., 2019). Hence, additional research on the impact of digital technology on innovative teaching and learning implementation is essential.

1.3 Challenges of Educational Digital Transition

Digital transformation is a process that continually adapts to rapidly emerging digital innovations; as such, it demands agility and has no clear ending. According to McCarthy et al. (2023),

> "it needs consideration of industry research reports when envisioning what is required for successful digital transformation, particularly in the areas of strategy and people development, leveraging best practices in the approaches to technical deployment and user experiences."

Furthermore, there is a necessity to reduce the digital divide and provide equitable access to technology (UNESCO, 2018; Rose et al., 2015). This requires investigating how these emerging technologies might interact with the existing social contexts of education and what the experiences of young people and instructors alike are inside and outside the school eco-system.

In this regard, research argues that the significantly outdated European public digital education programs need to be rapidly updated, from preschools to universities (Global Education Monitoring Report, 2020). The public offering must renovate its curricula to satisfy the demands of the evolving labour market and emerging technologies while guaranteeing access for all. Although technology has proven to play an essential role in shaping the future of education, it also has potential pitfalls. The advent of Industry 4.0 has highlighted the lack of skilled students equipped for the digital and green transition and labor markets (European Commission, 2018) and is claiming a broader and cutting-edge education framework. As more and more job positions become knowledge- and skill-intensive, it will become necessary to be able to transfer existing skills from one industry or occupation to another (Cedefop, 2015a, 2018a; McGuinness et al., 2018). In response to the demands of both individuals and industries, education delivery must simultaneously become more digital, adaptable, and customized (OECD, 2023).

1.4 Strengthening Key Enabling Factors

The urge of digital transformation has led the European Commission (2020) to formulate an updated version of the Digital Education Action Plan (2021–2027) that calls for high-quality, inclusive, and accessible digital education in Europe, especially for the achievement of the European Green Deal objectives, the 2030 Digital Compass, and for reaching climate neutrality by 2050. However, member states have not yet succeeded in bringing about a systemic digital transformation in education and training. They continue to face challenges in securing adequate funding for digital education and training infrastructure, equipment, and digital education content, digital training of educators and staff, and monitoring and evaluation of digital education and training policies (European Commission, 2023). Inevitably, this calls for internal organizational and governance reforms, enabling partnerships with civil society and the market sector, and providing substantial investments in connectivity and new educational initiatives for professors and teachers, ensuring that they have the know-how to effectively use digital tools and to value the importance of digital connection in their practice (Johnson et al., 2016).

A major concern is how quickly schools may develop innovative service models to meet the demands of the rapidly changing digital landscape, especially with the prominence of AI and automation tools, while evaluating the effectiveness of the implementation of new digital solutions for the user's value creation process (Facer et al., 2021). Ongoing assessment, flexible thinking systems, and analysis of the long-term

implications for the shift to digital technology and, ultimately, for the growth of students must be provided. Consequently, collaborating with technology experts, educators, and students is becoming vital in making informed decisions about technology integration. Furthermore, cross-sectoral policies, a shift from standardization to customization, the participation and cooperation of numerous stakeholders, and a determined push for the policy uptake of the schools to address inequality are all necessary (Burns et al., 2018; Cedefop, 2022). In this regard, a new creative architectural blueprint design, a network for research and policy creation that promotes sustainable practices, reporting systems, and the implications for leadership could be tested.

2. Discussion

The significance of the research study, which will be part of a PhD in Service Design for Public Sector at the Sapienza University of Rome, is the analysis of the scientific literature and case studies, such as the Digivisio 2030 program, EIT Digital, EURASHE's strategic framework, and the CoSn consortium, that could enable in-depth, multifaceted assessments of digital issues relating to educational settings and pedagogy.

The aim is to identify the trajectory of technology policy for education within the digital educational landscape, with particular attention to the Italian context, and possibly address the present and recent history.

Of Higher Education to lay the groundwork for an analysis of feasible and successful digital service design solutions. For example, the most recent "Piano scuola.4" strategy plan for schools which foresees the implementation of innovative learning environments integrated with digital, physical, and virtual technologies as part of Italy's educational digital transition (Piano Nazionale di ripresa e resilienza missione 4: istruzione e Ricerca, 2023), defines and sets out a range of possibilities for technology-related provision within the curriculum, and schools are required to proactively respond to it. However, according to the OECD 2023 report,

> "due to the somewhat decentralized and highly devolved nature of governance, ensuring the equity of access and use of digital infrastructure and solutions in schools is a challenge," and more concerning is that "just a few of the publicly provided digital solutions and resources in Italy are mandatory, and schools have significant autonomy to choose and acquire additional components of their digital infrastructure." (OECD, 2023)

Future research on the topic may zoom in on specific challenges upon which to intervene.

By the considerations made so far, the Research questions is: how do and can Italian public schools allow for digital innovation to continue to improve and update the educational ecosystem?

By following a holistic approach to targeting systemic change, the research project will be conducted by employing an interdisciplinary mode that incorporates information, data, techniques, tools, views, concepts, and theories from multiple fields to meet the set objectives. Through the exploration of how digital innovation diffuses in targeted Italian schools' organisations at the local, regional, and national scale, the research may define their morphology, including their capacity for change, adaptation, inclusivity, interactivity, and pedagogical facilitation. The collection of data among students and teaching staff, using tools such as EUSurvey, could lead to strategic directions that can form the basis for the detection of challenges and opportunities upon which to intervene and may help educational leaders effectively guide their institutions through the digital transformation, ensuring that the move toward digital education is seamless, effective, and beneficial for all stakeholders involved.

In this scenario, the capability of the service design approach, which involves the students, schools, and all stakeholders orchestrating the backstage and frontstage of the educational service, seems beneficial (Trischler et al., 2022). It presents the idea of bottom-up initiatives to establish both a long-term vision and

short-term achievable goals through the "analysis of other sub-factors, such as infrastructure and spaces, school culture, planning strategies, professional development, and teacher ICT - Information Communication Technology-efficacy and ICT integration competence" (Wu et al., 2019, p.1221).

The resulting findings will serve as the theoretical and methodological foundation for the definition of service design approaches and suggestions on the critical characteristics of upcoming innovative educational ecosystems.

3. Conclusion

Building a digital transition for education is acknowledged to be significant and will soon serve as a driving force. Digital transformation involves changing inclusive processes and procedures. Yet, a broad understanding must be made of a sustainable vision of a digital school (Haleem et al., 2022). Challenges detected but for which solutions remain difficult to scale include advancing digital equity, equipping educators, and adapting traditional organizational models to more flexible designs that advance the future of the workplace. To justify digital transformation, policies need to be complemented with a methodical approach that includes explicit priorities and agreed models for growing and sustaining.
The project aims to tackle these issues by linking three main areas: policies (objectives and priorities), virtual space and technology (online/network-based learning and teaching), and social aspects (local, national, and global community). It seeks to define new public educational design services that are co-created collaboratively by actively involving end-users both locally and worldwide in promoting their experiences and sharing data. The network/space will be a living entity with iterations and interactions between students, teachers, and educational leaders that assist schools in the value creation of digital transformation.

About the Authors:

Sonia Belhaj, Experienced Designer and Design & Technology teacher, I recently embraced a PhD in Service Design for the Public Sector at Sapienza University. I firmly believe in designing effective approaches while promoting kids' holistic growth. My research revolves around discovering high-potential opportunities and developing ground-breaking solutions for public systems such as schools, defining when barriers can be overcome as well as how and what technologies will help public sector to thrive and accelerate uncommon growth. Moreover, identify leverage points to harness knowledge and digital transition for future recovery and prosperity.

KEYWORDS | RELIGIOUS STUDIES, DIGITAL HUMANITIES, DATA VISUALIZATION, DIGITAL ARCHIVES, UX RESEARCH

ABSTRACT | Resilience, as the first European research infrastructure for Religious Sciences, establishes its foundational framework through the collaborative efforts of the ITSERR research team – Italian Strengthening of the ESFRI RI Resilience. The objective of this project is to develop new visualization tools and systems aimed at providing support to the scientific community engaged in Digital Humanities for Religious Studies. Employing an experimental and interdisciplinary design approach within the ITSERR ecosystem, the research explores visual strategies in Information Design and Data Visualization. The aim is to preserve both tangible and intangible religious corpora's heritage. To analyze visualization systems created by Christian and Islamic scholars in theological, historiographical, scientific, and graphic-visual contexts, it is necessary to study several infographic representations and their evolution over time. According to the academic perspective, De Christiana Doctrina by St. Augustine emphasizes the necessity of combining exegetical examination of sacred texts with historiographical and scientific pursuits (Brotton, 2017). An essential tool for providing support and guidance through the phases of research and graphic design is a multidisciplinary glossary that can be established as a collaborative space accommodating various disciplines.

Within the multidisciplinary milieu of ITSERR, the integration of qualitative techniques in the design process is deemed essential for an exhaustive comprehension of individuals' activities and the influence of environmental factors, as articulated by Norman (2019). Methodologies such as structured interviews, focus groups, and VARK questionnaires serve as guiding tools, steering designers toward creating designs that facilitate a more congenial learning experience for users through dynamic and multichannel audio-visual modalities. As a result, the ITSERR project's amalgamation of concepts from history, theology, and science creates a complex network of data and information. The translation of this intricate web requires the use of strategic communication design methodologies.

1. Introduction

1.1 ITSERR: a Transdisciplinary Research Platform

Within the ESFRI, the European Strategic Forum on Research Infrastructures, ITSERR has emerged as a strategic instrument fostering scientific research in Europe and fortifying the diffusion and internationalization of Religious Studies. Within ITSERR, the convergence of memory and science preserves the past through memory reconstruction and new interpretations, particularly within religious corpora, where sacred texts become "places of memory." In the religious corpora, the word becomes "omnipresent": the sacred texts, as timeless "places of memory," are mnestic archives that connect the history of both God and man (Assmann, 1997). A transdisciplinary design approach is a means to develop innovative visual strategies for the preservation of both material and immaterial heritage described within the narrative space of the corpora and their linguistic toponyms.

The ITSERR's research ecosystem is paramount for the Resilience project, involving different disciplines, departments, and Italian universities as project collaborators (the University of Modena and Reggio Emilia, Turin, Naples L'Orientale, the University of Palermo with Departments of Architecture, Culture and Society, Law, Engineering, Mathematics, and Computer Science). The core of this framework is the amalgamation of knowledge and expertise to support comparative studies and advance scientific research. In this context, a specialized team of designers comprised of an associate professor, a researcher, and a Ph.D. student is working in the field of Religious Studies to connect Information Design, Data Visualization, and Digital Humanities.

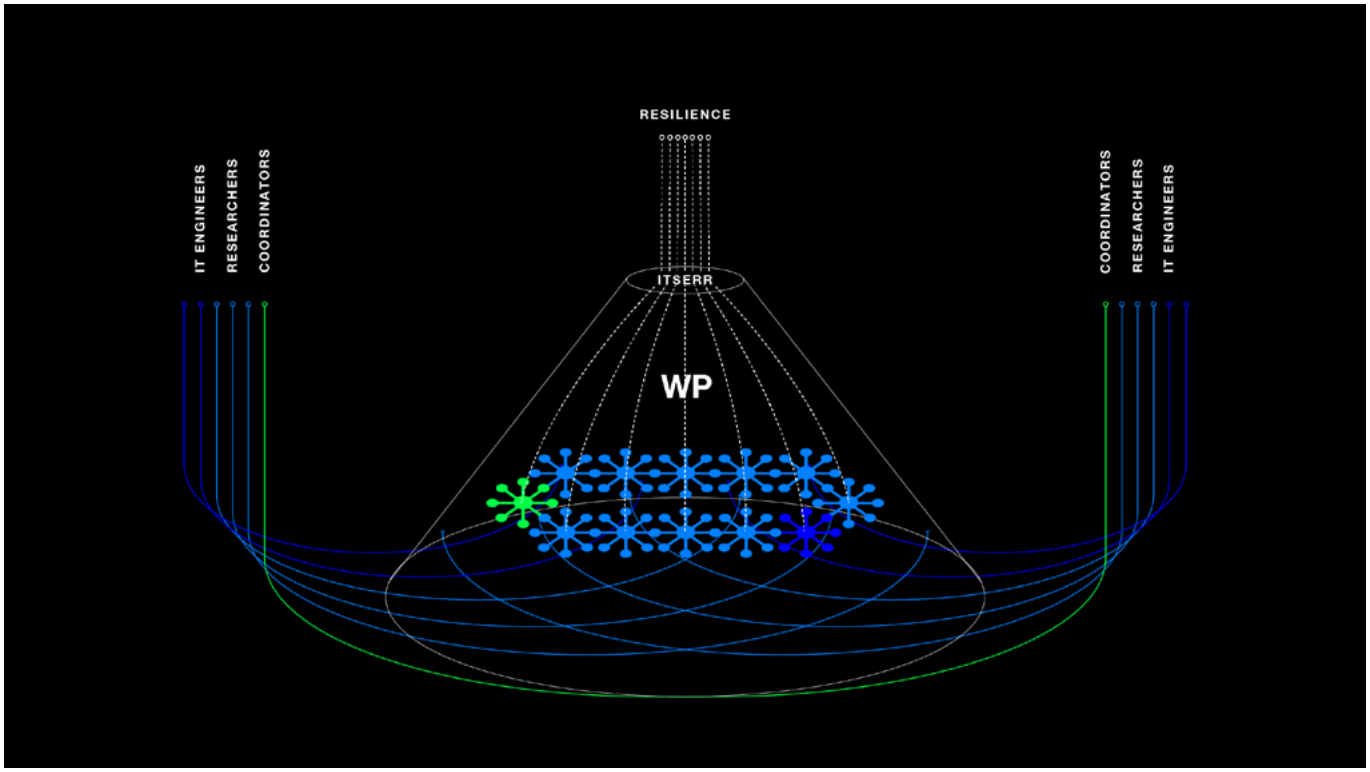

Figure 1. ITSERR ecosystem.

1.2 Research Questions and Objectives

To devise more effective visualization systems and conserve the material and immaterial heritage embedded in religious corpora, the research aims to explore new visual strategies within Data Visualization. The primary focus is enhancing the processes of consultation, archiving, and data utilization

within the humanistic discipline of Digital Humanities. Key questions include selecting, designing, and creating tools to construct a multidisciplinary design language. Integral queries involve identifying, designing, and generating tools to create a comprehensive multidisciplinary design language. In addition, the study explores the intricate dynamics of how design contributes to the realms of communication and content dissemination, allowing for the visualization of new semantic, syntactic, and morphological configurations.

2. Methodology

2.1 Anthropocentric Design

To ensure the seamless integration of scientific knowledge into the design process, it is essential to establish a methodological framework that is meticulously tailored to various research and project phases (Maldonado, 2015). Ubiquity's scope encompasses a defined methodological approach that incorporates techniques from allied disciplines in harmony with the project's transdisciplinary nature. In a collaborative setting, philologists, historians, computer scientists, engineers, and designers work together to develop new methodologies and tools.

The influence of Human Factors (Sinico, 2012) in the design process requires the implementation of interdisciplinary methodologies, pushing research into novel realms and elevating communication design to unprecedented heights. According to Human-Centered Design (Norman, 2019) and Humanity Design-Centered (Norman, 2023), qualitative research methodologies prioritize understanding human needs, capabilities, and behaviors as a guideline for adaptive design strategies. Anthropocentric design is emerging as a means of tracking a design trajectory, with observation as the primary method for collecting data on non-verbal behavior (Corbetta, 2015). Acquiring knowledge requires listening, and the user is both a researcher and a consumer of content. The design process is enhanced by the researcher/user's active involvement throughout the project phases, which ensures that the resulting products are authentic, comprehensible, and user-friendly (Norman, 2019).

2.2 Researcher's Work: An Inquiry into Methods and Tools for Humanities Research

Structured interviews and focus groups are essential in qualitative anthropological-social research, as they help to understand the analyzed environments and contexts and provide insights into the characteristics of representative interviews.
The use of a tool like Google Form, which was intended for structured interviews, is utilized to gather information from ITSERR researchers in humanistic disciplines. The interview format, which is broken down into four thematic groups (Spaces, Tools, Time, and Knowledge) and uses both open-ended and closed-ended questions, allows for capturing the expressed needs, requirements, and desires of the scientific community. Notably, the incorporation of open-ended questions enables the detailed documentation of the intricate aspects of the researchers' activities. After being collected, the results were reworked and standardized in an Excel matrix. This has resulted in the creation of a first representative sample and the attainment of valid qualitative results, which can be utilized to extrapolate new research ideas.
Furthermore, a retrospective review of previous studies demonstrates the distinct cognitive modalities employed by each individual in information assimilation (Claxton & Murrel, 1987). The different ways in which individuals acquire, process, interpret, and elaborate on information are delineated by cognitive-personal, info-processual, socio-interactive, and didactic-preferential models (Curry, 1983).

Analyzing individual learning styles is essential for recognizing diverse cognitive approaches in information acquisition and processing. The VARK system, conceptualized by Fleming (1987) – an acronym for Visual, Aural, Read, and Kinesthetic – facilitates the identification of preferred didactic patterns utilized by individuals. This encompasses four sensory learning modalities: non-verbal visual, auditory, verbal-visual, and kinesthetic. Through these modalities, information is acquired using non-verbal visual aids like

diagrams and graphic visualizations, auditory aids such as recordings, verbal-visual aids encompassing texts, annotations, and writing, and kinesthetic aids involving practical and laboratory activities. The VARK model, introduced by Fleming to enhance the learning experiences of his students, aims to scrutinize the ways and strategies through which data and information are recorded and processed. To achieve this, a questionnaire based on Fleming's framework (1992) was devised to comprehend the learning styles employed most frequently and the channels through which researchers acquire new knowledge.

3. Results

3.1 Learning Styles: Methods and Strategies in the Acquisition and Personal Elaboration of Information

The observations and collected data underscore the necessity of designing more effective and intuitive tools to enhance data and content utilization in scientific research. According to the Vark questionnaires (figure 2-3), humanist researchers are more likely to use visual channels (verbal and non-verbal) for annotation and information acquisition. Notes, annotations, lists, definitions, and customizable signs can be useful tools for the user/researcher to enhance the use and dissemination of textual and paratextual data and information. This prompts new questions about the subject being investigated and demonstrates how analog tools can aid in the better organization of information by utilizing personal visual codes. The obtained data not only uncover novel inquiries relevant to the investigated theme but also affirm the indispensable nature of dialogue and collaboration among researchers and industry professionals as tools for knowledge enrichment.
From this, it emerges how it is essential to design more efficient and intuitive tools that can improve the use of data and content in the scientific research of Digital Humanities.

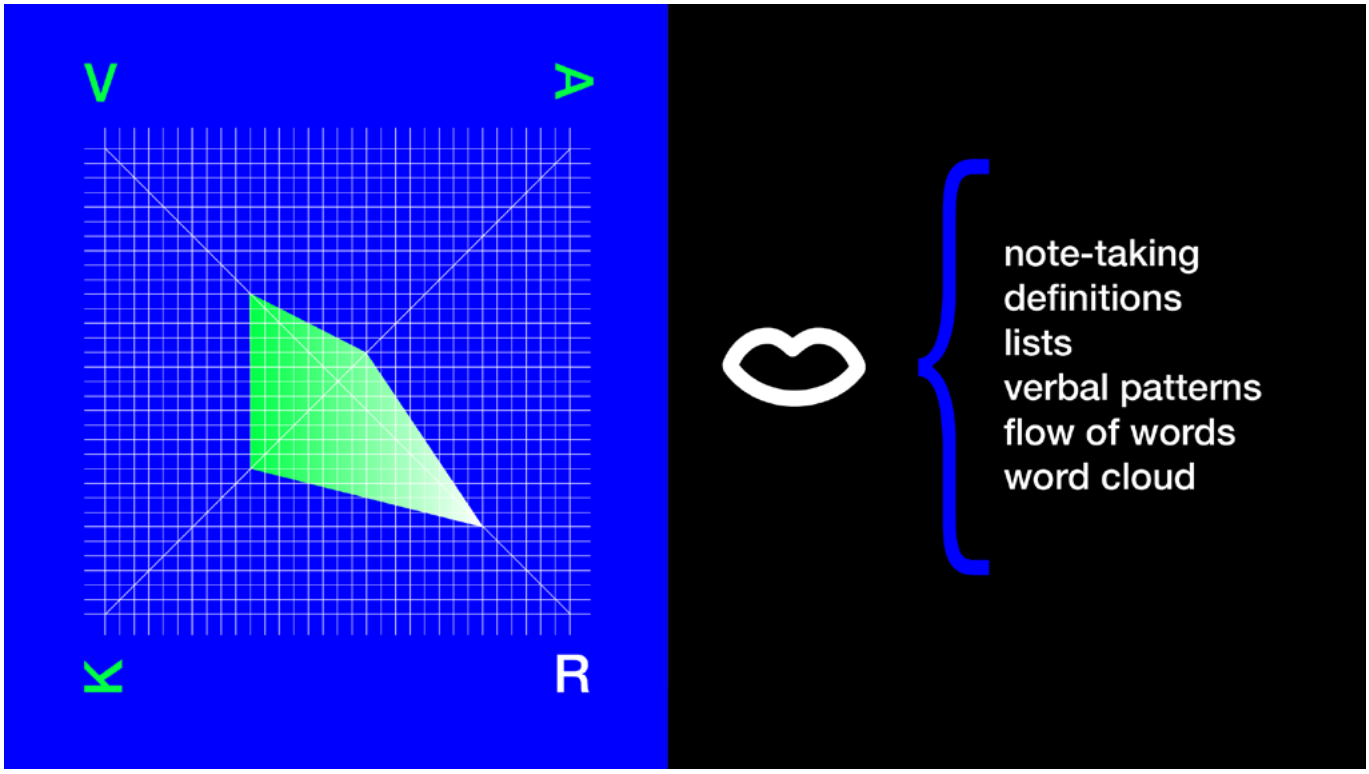

Figure 2. The graph illustrates the learning strategies employed by humanist researchers to acquire data and information: verbal strategies such as creating word lists, using definitions to clarify concepts, word streams, and annotations are preferred by researchers who have identified significant responses in the visual verb channel (R=read and write).

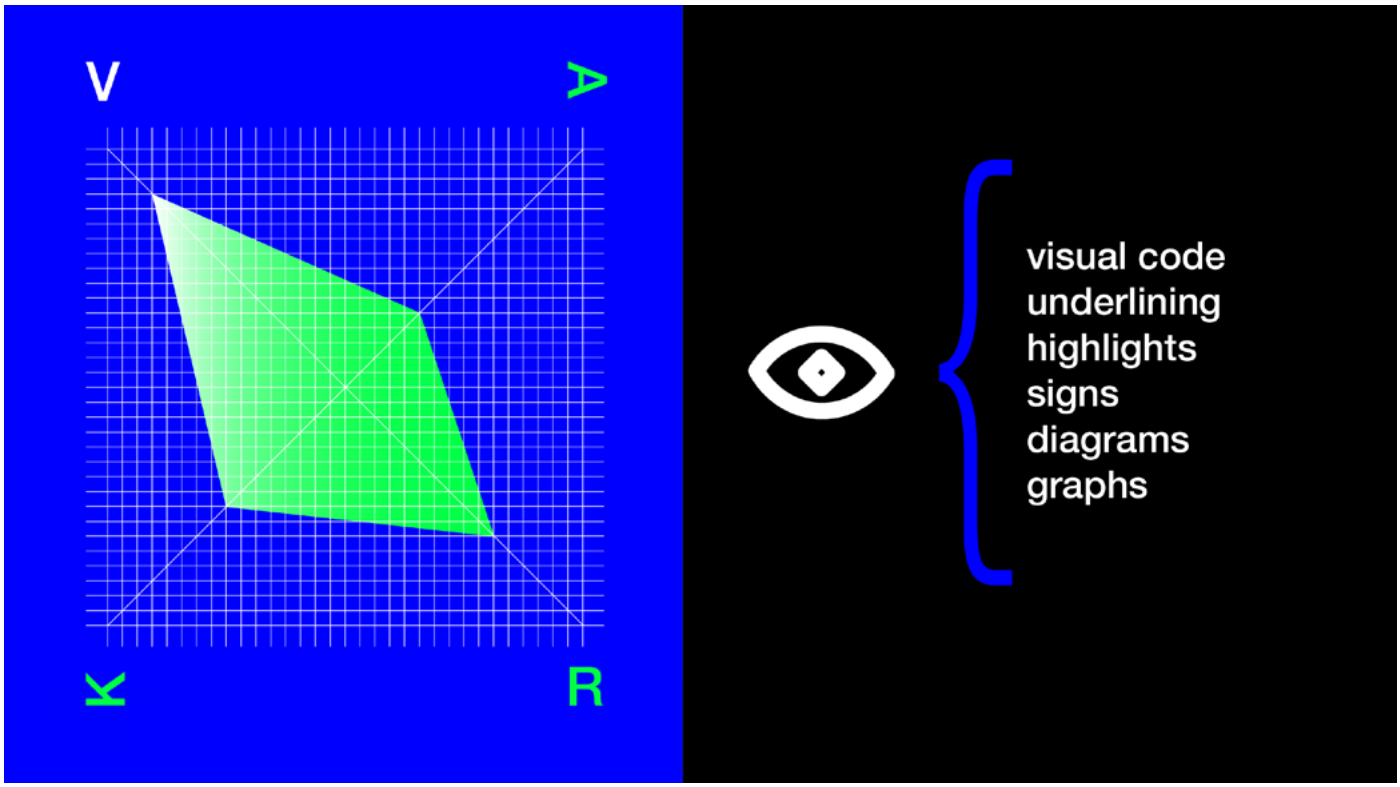

Figure 3. The graph illustrates the learning strategies employed by humanist researchers to acquire data and information: verbal strategies, such as creating visual code using underlining signs and highlights, are preferred by researchers who have identified significant responses in the visual nonverb channel (V=visual).

Analysis of the documented responses reveals a predilection among researchers for recording qualitative and quantitative data using personalized visual-verbal codes and analog annotation methods. Subsequently, these acquired insights undergo processing through digital annotation tools. Digital tools contribute to a hierarchical and structured organization of concepts, thereby accelerating document production and significantly curtailing compilation time. The mechanization of processes, coupled with data and metadata storage, in conjunction with the potential for multi-spatial and instrumental pole connections, ensures the production of complex, precise, and easily disseminable documents.

On the other hand, analog tools retain a pivotal role in transcribing acquired information. The capacity to craft visual-verbal visualizations inherent in writing is limited by the deficiency of mechanically annotating data through digital devices, such as computers. Perondi and Romei (2010) pointed out that computerized writing has reintroduced a linearist bias, making it more difficult to compose non-rigidly sequential texts. The inability to incorporate characters beyond the basic set, coupled with the inability to dynamically organize text in space, results in semantic impoverishment. The reevaluation of data and information through visual-verbal connections, encompassing arrangement, orientation, size, etc., bestows an enhanced value and meaning to the written word, with space emerging as "one of the central dimensions of writing [...] that could allow for the most interesting developments" (Perondi, 2023).

Furthermore, the inherent flexibility of analog writing tools (pen, pencil, etc.) and the swift, fluid gestures inherent to the act of writing position calligraphic writing as a particularly apt means for the transcription of thought. However, in a novel rendition, contemporary devices like the iPad Pro offer an experience closely mirroring analog writing. This experience is characterized by "allowing the spatial organization of writing and a user experience that captures the text as a whole," surpassing the capabilities of digital platforms utilizing AI systems for the spatial organization of content (Perondi & Romei, 2010). The enhanced ability to trace data within text and reprocess extracted information utilizing customizable visualization tools persists as a central and unavoidable concern for accurate design. To transform this into a novel source of knowledge, it is necessary to develop more adaptable writing tools to ensure an improved approach to the written text (Perondi, 2023).

4. Conclusions

4.1 Future Scenarios for Religious Studies

Mapping information involves simplification and abstraction and uses graphic configurations derived from cultural and social conventions, which vary across different cultures. According to Barthes, images have significant expressive value as a sign or element of a communication system (quoted by Polano, 2018, p.10). Using visualization through images, specific concepts can be communicated using iconographic models that are shared within collective memories and knowledge. However, Polano introduces the caveat that "unlike writing or language, the image presents itself globally, making it difficult to determine the context. Thus, what the image gains in expressiveness, it often loses clarity." Images are always accompanied by words, whether they are in the form of captions, comments, or detailed explanations. Sinsemic relationships established between text and image within a specific context, defined as the graphic space of representation, influence the meaning attributed to the elements they reference. Data visualization through images and visual analogies can emerge as an influential tool for generating and communicating new meanings (Perondi, 2023).

At the same time, the design of spatial and temporal visualization systems incorporating multiple graphic representations, such as iconography and typography, culminates in outcomes that, when translated into interactive and hypertextual systems, unveil novel visual configurations.

This exploration goes beyond the realm of knowledge:

- Space: The primary dimension discussed pertains to spatiality, delving into different visualization systems that consider synthetic relationships between text and image as tools for knowledge and semantic enrichment.
- Time: After spatial considerations, the fourth dimension of knowledge, temporality, is examined through timeline construction. This facilitates the visualization of a dense network of relationships that intertwines the history of terrestrial and celestial locations with figures from biblical and Quranic contexts, Church Fathers, and theologians within commentaries and religious texts.
- Knowledge: The dimension of scientific knowledge is meticulously constructed using established tools and methods, some well-established in design and others bespoke to cater to multidisciplinary teams. Creating a shared glossary within the Ubiquity team transforms it into a research tool, facilitating the study and connection of terms across diverse disciplines. The process involves defining diverse domains that can be further broken down into disciplinary subdomains: design, religious studies, and computer science.

Graphically visualizing concepts, content, and words and capturing logical-transversal connections significantly enhances research efficacy. By utilizing customizable graphic configurations and the ability to trace direct and indirect information hierarchically across multiple reading levels, research can be elevated by facilitating text comparisons and expediting meticulous analysis. The exploration of novel visualization strategies within the domain of data visualization and information design for Religious Studies, aligned with the adoption of transdisciplinary methodologies, steers design efforts toward crafting profound multimedia and immersive narrative systems. According to this approach, infographics are invaluable memory aids and powerful tools for exploring and constructing new knowledge (Yates & Gombrich, 2007).
