CONTENTS

3 **IMPRESS**

29 **PRESIDENT MESSAGE FOR CUMULUS BUDAPEST PROCEEDINGS.**
Lorenzo Imbesi

31 **DESIGNING A DESIGN CONFERENCE: INSIGHTS AND RECOMMENDATIONS FROM ORGANISING CUMULUS BUDAPEST 2024.**
Attila Bujdosó

CENTRES AND PERIPHERIES

ACADEMIC PAPERS

59 **DEEP LOCALISATION: A FUTURE OF INTERNATIONAL EUROPEAN FASHION SCHOOLS?**
Kirsten Scott, Mevin Murden

79 **CIRCULAR DESIGN THROUGH TRADITION: A TRANSFORMATIVE APPROACH TO PROMOTE THE MEDITERRANEAN CULTURAL IDENTITY AND SUSTAINABLE ARCHITECTURAL INNOVATION.**
Ana Cardoso, Raquel Salomé

101 **REDEFINING GEOGRAPHICAL BOUNDARIES: MAPS AS COMMUNICATION DESIGN TOOLS FOR PURSUING SOCIOPOLITICAL GOALS.**
Vicenzo Maselli

117 **DOWNTOWN BERLIN AFTER THE REUNIFICATION AS AN EXAMPLE OF GLOBALISED DESIGN.**
Sigrun Prahl

129 **DESIGN RESEARCH INCUBATION: REFLECTIONS ON HOW TO FOSTER DESIGN RESEARCH.**
Judith Dobler, Michael Hohl, Gwendolyn Kulick

143 **AN ENQUIRY INTO SPATIAL ATTRIBUTES OF THE URBAN: RURAL TRANSIENTS IN INDIA.**
Renuka Oka

167 **ENABLING CROSS-CULTURAL DIALOGUES AS A TOOL FOR CO-DESIGN: BUILDING EQUITABLE KNOWLEDGE EXCHANGE THROUGH CREATIVE TEXTILE CONNECTIVITY.**
Anne Marr, Rebecca Hoyes, Stephanie Rolph

187 **IM/POSSIBILITIES FOR PLURIVERSAL DESIGN EDUCATION: A FIELD GUIDE FOR NOTICING INSTITUTIONAL LIFE.**
Andrew Whitcomb

199 **LOCAL TRADITION AND GLOBAL FUTURE: NEW PARADIGMS OF THE MADE IN ITALY CULTURAL DESIGN.**
Vincenzo Paolo Bagnato

211 **THE LIBRARY AS THRESHOLD: LIMINALITY IN THE CONTEXT OF FASHION RESEARCH.**
Carolina Francesca Maria Davalli

227 **EPI-CENTRES OF THE WORLD WIDE WEB: 30 YEARS OF ITALIAN WEB INTERFACE DESIGN HISTORY, A CRITICAL INVESTIGATION.**
Letizia Bollini, Francesco E. Guida

241 **DYNAMIC TRADITIONALISM BETWEEN ARCHAISM AND FUTURISM: OBELISKS AS CONSTANT IN GLOBAL MEMORIAL DESIGNS.**
Christian Langer

259 **“DE OTRO MODO”: SOUTHERN THAN SOUTH.**
Magdalena Cattan, Pamela Gatica-Ramirez, Camila Vicencioba

275 **EVOLUTION OF URBAN RESIDENTIAL SPACE AND FAMILY DAILY LIFE DESIGN IN BEIJING SINCE THE REFORM AND OPENING-UP.**
Ming Cheng

SLIDE DECKS

295 **PERIPHERIA X COR (AGENCY OF AMBER).**
Mantas Lesauskas

303 **CONTEMPORARY ART PRACTICES IN REVIVING FOLK ART / INDONESIAN - HUNGARIAN CASE STUDY.**
Luca Petrányi

CONVERGING BODIES OF KNOWLEDGE

ACADEMIC PAPERS

323 **NATURA ARTIS MAGISTRA: THE ENDOSYMBIOTIC DEVELOPMENT MODEL IN THE FUTURE ART ACADEMY.**
Dr. Marc Boumeester, Bob Verheijden FRSA

335 **THE MUSEUM AND ME: CO-DESIGNING A RESOURCE WITH FAMILIES TO ENHANCE PARENT CHILD INTERACTIONS THAT SUPPORT EARLY YEARS DEVELOPMENT GOALS.**
Adira Andlay

357 **MATERIAL AGENCY IN BOOK DESIGN.**
Elena Bartomeu, Lluc Massaguer

373 **DESIGN AND SIGNATURE PEDAGOGIES: WHICH IMPLICATIONS?**
Giulia Ciliberto

385 **SITUATED KNOWLEDGES: VISUAL REPRESENTATION IN SOCIAL DESIGN EDUCATION.**
Michal Pauzner, Jonathan Ventura, Jennifer Schubert

403 **DESIGN FOR CHILDREN: THE CASE STUDY OF DESIGN-DRIVEN LABORATORY AGAINST EDUCATIONAL POVERTY.**
Luca D'Elia, Lorenzo Imbesi

423 **IMPACTS OF MENTORSHIP ON INTERNSHIP FOR INDUSTRIAL DESIGN STUDENTS: A CASE STUDY OF THREE COMPREHENSIVE UNIVERSITY PROGRAMS.**
Carly Hagins, Betsy Barnhart, Dr. Katherine Tierney

437 **ANCESTRALITY AS A MEANS TO LOOK FORWARD: THE PRESENCE OF INDIGENOUS KNOWLEDGE IN FOUR LATIN-AMERICAN BIODESIGN PROJECTS.**
Andrea Bandoni, Maria Cecília Loschiavo dos Santos

453 **THE DESIGNER'S STANDPOINT: FEMINIST EPISTEMOLOGIES AND AGNOTOLOGY AS A ROAD MAP FOR SUPPORTING WRITING PRACTICE IN DESIGN.**
Paul Laborde

467 **MICROBRIEFS: USING DESIGN SPRINTS IN PRACTICE-BASED EDUCATION.**
Alon Meron, Spyros Bofylatos, Alex Williams, Krity Gera, Bahbak Hashemi-Nezhad, Thomas Lohfert Wagner, Youngmi Christina Choi

483 **A STUDY ON CURRICULUM DEVELOPMENT TO PROPOSE A NEW DESIGN EDUCATION MODEL: FOCUSED ON USING THE CREATIVE THINKING STYLE INDEX(CTSI) TO ENHANCE COLLABORATIVE CREATIVITY.**
Kyungwon Kim, Juyoung Chang

497 **TRANSFORMATIVE STORYTELLING DESIGN: FROM INDISCIPLINARITY TO EMPATHY.**
Eleonora D'Ascenzi, Irene Fiesoli, Giuseppe Lotti

509 **HYBRID ECOLOGICAL NETWORKS: DESIGNING RELATIONAL AND RECEPTIVE LEARNING.**
Pavel Cenkl

525 **PROBLEM-SOLVING APPROACH IN FASHION DESIGN EDUCATION: A CASE STUDY OF STUDENT PROJECT FOSTERING INCLUSIVITY IN FASHION.**
Shipra Kukreja

543 **DESIGNING FUTURES: ASSESSING FUTURES CONSCIOUSNESS AND AI ATTITUDES IN AFRICAN DESIGN EDUCATION.**
Ryna Cilliers, Veronica Barnes

561 **TRAVERSING HISTORY: TRANSFORMATION OF INTERCULTURAL PRACTICE THROUGH THE SPATIAL EXPLORATION IN HARBIN BAROQUE ARCHITECTURAL AREA.**
Fangyu Cheng, Xi Li, Mengyao Guo

583 **INTEGRATING PERSONAL DEVELOPMENT, VALUES, AND SELF-REFLECTION IN DESIGN EDUCATION: A HOLISTIC APPROACH FOR CREATIVE EXCELLENCE.**
Hilde Van Dyck, Elke Mestdagh, Kristof Vaes

599 **INWARD A DEMONSTRATOR: EXPERIMENTAL STUDY TO REACH DESIGNER'S INNER CONVERSATIONS THROUGH INTERNAL FAMILY SYSTEMS.**
Aleksandra Sviridova, Jouke Verlinden

615 **CONTRIBUTION TO THE DEFINITION AND STATEMENT OF PERFORMATIVE DESIGN: RELEVANCE TO DESIGN TEACHING.**
Susana Leonor , Américo Mateus

631 **THE CONCEPT OF 'EQUALITY, DIVERSITY, AND INCLUSION' IN DESIGN EDUCATION: OVERVIEW AND DIRECTIONS.**
Emilio Rossi, Sarah Jane Cipressi, Alessio D'Onofrio, Raffaella Massacesi, Giulia Panadisi, Rossana Gaddi, Antonio Marano

651 **FUTURE ART SCHOOL TRENDS UK (FAST UK).**
Cathy Gale, Max Ryan, Emily Strange, Annie Watson

SLIDE DECKS

665 **TRANSCENDING BOUNDARIES - DESIGN EDUCATION FOR SOCIAL INNOVATION.**
Lakshmi Srinivasan, Ritu Sonalika

677 **THINKING 'TOOLS'; LOOKING AT OURSELVES.**
Dov Ganchrow

685 **CODING IN ART AND DESIGN: FROM DEMOCRATIZATION TO MAINSTREAM.**
Kálmán Tarr

WORKSHOPS

693 **IS THIS PRINT TALKING TO ME? MATERIAL AGENCY IN DESIGN.**
Elena Bartomeu, Lluc Massaguer

699 **STICKS AND LADDERS - PHYSICAL AND THEORETICAL APPROACHES TO THE INTEGRATION OF PARTICIPATORY DESIGN INTO SCHOOL CURRICULA.**
András Cseh, Szilárd Köninger

705 **DESIGNING REFLECTIVE FRAMEWORKS FOR ENHANCING COLLABORATIONS BETWEEN NGOS AND ACADEMIA.**
Ruth-Helene Melioranski, Bori Fehér, Jonathan Ventura, Eva Liisa Kubinyi

REDEFINING DATA BOUNDARIES

ACADEMIC PAPERS

715 **AESMOOD: AN INTELLIGENT SYSTEM FOR GENERATING MOOD BOARDS WITH AESTHETIC COMPUTING.**
Rong Rong, Shuyi Liu, Hanling Zhang

735 **FROM BIG DATA TO LOCAL DATA: AN EXPLORATION OF ALTERNATIVE APPROACHES TO DATA IN DESIGN.**
Paola Pierri

747 **THE AESTHETICS OF LISTENING: MATERIAL-DISCURSIVE EXPLORATION OF VERBATIM TESTIMONY AND AUGMENTED REALITY.**
John Morrison, Fiona Stewart

765 **DATA-DRIVEN DESIGN FOR THE DESIGN HERITAGE.**
Alessandra Bosco, Fiorella Bulegato, Lucilla Calogero

785 **MATERIALISING DATA: GETTING TO GRIPS WITH SLIPPERY CONCEPTS.**
Michael Smyth, Inge Panneels, Caitlin McDonald, Ingi Helgason

799 **BEYOND AUTOMATION: AI'S ROLE IN REDEFINING DESIGN PARADIGMS.**
Margherita Tufarelli, Paolo Franzo, Elisabetta Cianfanelli

811 **POST-CADASTRAL DETERMINISM: UNRAVELLING URBAN CARTOGRAPHIES, VALUATION, BEHAVIOUR AND DECISION-MAKING IN REALTIME.**
Ian Nazareth

BRIDGING DESIGN AND ECONOMICS

ACADEMIC PAPERS

833 **EMBEDDING SUSTAINABLE VALUES IN THE HIGH-END MARKET THROUGH PREMIUM DESIGN.**
Xiaozhu Lin, Matteo Oreste Ingaramo

847 **IMPLEMENTING DESIGN THINKING FOR EXPLORATION AND EXPLOITATION: CREATING CONDITIONS FOR ADOPTION.**
Xue Pei, Gianluca Carella, Michele Melazzini

861 **DESIGN RESEARCH LABS: A NEW PERSPECTIVE FOR PUBLIC SECTOR INNOVATION.**
Lynn Harles, Andrea Augsten

875 **REGENERATIVE DESIGN IN THE CIRCULAR ECONOMY: AN OXYMORON?**
Inge Panneels, Matt Sinclair, Emily Alder

891 **SENSE OF POSSIBLE: A DESIGN PROCESS MODEL BASED ON EFFECTUATION AND SENSEMAKING.**
Ilkka Kettunen

909 **ENVIRONMENTAL SUSTAINABILITY PRACTICES IN PRODUCT DESIGN FIRMS.**
Sofia Soledad Duarte Poblete, Laura Anselmi, Carlo Proserpio, Valentina Rognoli

931 **BRIDGING BY DESIGN: A DESIGNERLY APPROACH FOR CITIES TO SUPPORT INNOVATION PROCESSES IN THE URBAN CONTEXT.**
Nicola Morelli, Graham Colclough, Rike Neuhoff, Luca Simeone, Justyna Starostka, Hadas Zohara

947 **CULTURAL VALUE CHAIN: STRATEGIES FOR ACTIVATING CULTURAL VALUE IN MADE IN ITALY PRODUCTS AND SERVICES.**
Piera Losciale, Annalisa Di Roma, Alessandra Scarcelli, Marina Ricci

965 **CO-DESIGN SESSIONS AT REVIGRÉS: WORKSHOP 2.0 TO NURTURING DESIGN-LED INNOVATION IN THE INDUSTRY.**
Gisela Pinheiro, Teresa Franqueira

983 **KICKSTARTING CULTURAL ENTREPRENEURSHIP VIA CROWDFUNDING. DISRUPTING FROM BOTTOM UP.**
Nora Szeles

SLIDE DECKS

1005 **ENTREPRENEURSHIP THROUGH DESIGN: RECOMBINING THE DESIGN PROCESS WITH METHODS AND TOOLS FROM OTHER DISCIPLINES IN PROJECT-BASED ACTIVITIES.**
Elisa Chiodo

1019 **DESIGN IN THE CONTEXT OF BIOECONOMY: AN EXPERIENCE IN THE AMAZON FOREST.**
Andrea Bandoni, Carla Paoliello

SPECULATIVE PERSPECTIVES

ACADEMIC PAPERS

1035 **SPECULATIVE PERSPECTIVES OF FASHION GAMIFICATION.**
Paolo Franzo, Margherita Tufarelli

1051 **COUNTER-RHETORICAL DESIGN: USING POLITICAL RHETORIC AS A DESIGN FRAMEWORK.**
Dr Austin Houldsworth, Dr Carlos Peralta

1067 **(DE)COLONIZING OUTER SPACE: SPECULATIVE FRONTIERS OF OUTER SPACE EXPLORATION IN VIDEO GAMES.**
Alberto Calleo

1081 **ANTHROPOGENIC NARRATIVES: COMMUNICATING AND EXPERIENCING NON-HUMAN PERSPECTIVES.**
Francesco E. Guida, Martina Esposito

1099 **TOWARDS INTERMEDIATE ZONES: ARTEFACTS OF THE UMWELT DESIGN APPROACH.**
Giliam Antonie Ganzevles, Bert de Roo

1113 **INSECTURE: INTERSPECIES-INTERACTION (IX) DESIGN.**
Christopher Mark Kaltenbach

1131 **DE-ANTHROPOCENTRISING OCEAN OBJECT RELATIONS.**
Ashley Hall, Elise Hodson, Carla Amaral, Paul Anderson, Bjorn Sommer, Christopher Ross

1149 **MULTISPECIES ENGAGEMENT AND SPECULATIVE ECOLOGIES: TOWARDS MULTISPECIES WAYS OF KNOWING FOR ECO-SOCIAL SPECULATIONS.**
Lynn Harles

1167 **TECHNOLOGICAL FUTURES AND RECURRING DREAMS: THINKING ABOUT EMERGING TECHNOLOGIES THROUGH SPECULATIVE DESIGN.**
James Auger, Julian Hanna, Valentin Graillat, Etienne Axelos, Estelle Hary

1185 **REDEFINING DESIGN PRACTICE: POST SPECULATIVE & CRITICAL DESIGN AND CRITICAL JUGAAD IN DETROIT'S ABOLITIONIST WORKSHOP.**
Deepa Butoliya

1201 **FOOD FORWARD: DESIGN FUTURES TO SUPPORT ALTERNATIVE FOOD SYSTEMS IN URBAN AREAS.**
Marta Corubolo, Daniela De Sainz Molestina, Lucia Viganego Ballesteros, Anna Meroni

SLIDE DECKS

1217 **YOU SHALL OWN NOTHING, GO NOWHERE, 'EAT ZE CANCEROUS BUGS' AND BE HAPPY.**
Erik Hansen-Hansen

1225 **‘THE ART OF THE INVISIBLE: PNEUMA’– EXPLORING THE PHENOMENON OF DARK MATTER THROUGH ARTISTIC SPECULATIONS.**
Csenge Vass

1237 **PRACTICING ORDINARY SPECULATIONS: MUNDANE PROTOTYPES FOR MORE-THAN-HUMAN COHABITATION.**
Antonio Bernacchi, Alicia Lazzaroni

1245 **ECOLOGICAL SPECULATIONS – PLANETARY FUTURES FROM GLOBAL SPECIES MOVEMENTS.**
Sophie Falkeis

WORKSHOPS

1251 **DXT—DIGITAL EXPERIENCE THEATRE: EXPLORING POST-HUMANIST DIGITAL PRODUCT DESIGN THROUGH AI AND SPECULATIVE IMAGERY.**
António Gorgel Pinto, Paula Reaes Pinto

1255 **EMOLAB: A SPECULATIVE DESIGN APPROACH TO EMOTIONAL BIOPOLITICS IN A CAPITALIST WORLD WITH PERFORMATIVE TECHNIQUES.**
Katarzyna Anosowicz

1259 **DECENTERING DESIGN PERSPECTIVES THROUGH THE UMWELT.**
Giliam Ganzevles, Bert De Roo, Glenn Deliège

FORMAT X

1265 **THE PROMISE AND PROBLEM OF PROVOCATION.**
Stephanie Tharp, Bruce M. Tharp

THE POWER OF IMMERSION

ACADEMIC PAPERS

1273 **PERFORMING CULTURAL HERITAGE: ADVANCING URBAN EXPLORATION THROUGH AUDIO-VISUAL-IMMERSIVE JOURNEYS ON PUBLIC TRANSPORT AND CINEMATIC VIRTUAL REALITY.**
Ella Raidel, Marlene Rutzendorfer, Benjamin Seide

1287 **IMMERSIVE DESIGN THROUGH SYNCHRONIC PROCESSES BETWEEN BODY AND SPACE.**
Giorgio Dall'Osso, Michele Zannoni, Luca Barbieri

1303 **XR_CODESTO: ANALYSIS OF EXTENDED REALITY COLLABORATIVE DESIGN TOOLS.**
Flora Gaetani, Federica Caruso

1323 **ENHANCING CRAFTSMANSHIP THROUGH VISUAL GUIDANCE USING MIXED REALITY: A STUDY ON LEARNING ORIGAMI.**
Ian Garcia, Anthon Van Dyck, Arno Vereecken, Stien van Vooren, Lucía Rodriguez Diez, Jouke Verlinden

1337 **EXPLORING THE INTERSECTION OF RUNNING AND MUSIC: INSIGHTS INTO USER EXPERIENCE AND INTERFACE DESIGN.**
Açelya Küçükkurt, Bahar Şener

1351 **LONGITUDE AND LATITUDE – EXPLORING THE RELATIONSHIP BETWEEN VIEWERS, ART, AND EXHIBITION SETTING IN IMMERSIVE DISPLAYS.**
Angela Chulei Tang, Yuan Zhang, Zhigang Wang

1365 **APPLICATION OF EMPIRICAL AND ANALYTICAL USABILITY STUDIES TO THE USER-CENTRED DEVELOPMENT OF EXTENDED REALITY (XR) SOFTWARE.**
Bálint Szabó, Rita Ladjánszky, Fruzsina Pataki-Bittó, Sarolta Tóvölgyi, Kata Kapusy

1385 **DESIGN FICTION GRAPHIC NARRATIVES: DESIGNING WITH RATHER THAN FOR EXPERIENCES.**
Terence Fenn, Jason Hobbs

1401 **THE EFFECTS OF THE SOUND NARRATIVE OF AN ARTISTIC INSTALLATION ON CULTURAL HERITAGE LEARNING.**
Jiaxin Chen, Baosheng Wang

1417 **PRINT INTERACTION: HINTS AND NOTES FOR A NEW DESIGN SPACE.**
Marco Neves

SLIDE DECKS

1435 **INSTALLATION "MISUNDERSTANDING OF THE FACADE" — BREAKING AWAY FROM TRADITIONAL VISUAL IMMERSION INSTALLATIONS FOR BODILY IMMERSION.**
Zixuan Zhou, Zhi Wang

1445 **EMBRACING UNCERTAINTY IN EXHIBITION DESIGN: A PARADIGM SHIFT TO CHALLENGE DIGITAL HOMOGENIZATION — THE EXHIBITION DESIGN OF LU HONG'S ART ARCHIVES: 1978-2022.**
Yiqing Yan, Zhenpeng Zhou

1457 **THE MEANING OF VIRTUAL ARCHITECTURE.**
Gabriele Aroni

THE FUTURE OF WELL—BEING

ACADEMIC PAPERS

1471 **UNHURRIED POST-MORTEM.**
Marja Kuronen, Prof. Melanie Sarantou

1485 **E-TEXTILES IN THE FUTURE OF WELL-BEING AND CARE OF ELDERLY.**
Paula Veske-Lepp, Kristi Kuusk, Helen Kool, Merje Beilmann, Ada Traumann

1507 **UTILISING CLOTHING WASTE TO ALLEVIATE PERIOD POVERTY IN SOUTH AFRICA.**
Zanné de Meillon

1523 **HOW CAN SOCIAL DESIGN FOSTER BETTER EXPERIENCES FOR PATIENTS IN THE FORM OF SERVICES, PRODUCTS AND SPACES?: THREE CASE STUDIES FROM HEALTHCARE FOR/WITH CHILDREN IN DENMARK.**
Canan Akoglu, Kathrina Dankl

1541 **COMFORT, SHAME, AND INNOVATION: THE CHALLENGES OF REINVENTING THE GYNECOLOGICAL SPECULUM IN THE 21ST CENTURY: A CONTRIBUTION TO A FEMINIST-INSPIRED REDEFINITION OF MEDTECH.**
Victoria Juretko

1561 **WHEN THE PARK INTERWEAVES THE OLD NEIGHBOURHOOD: FUTURE SCENES PLANNED FOR LIVING UNDER THE URBAN RENEWAL.**
Siyuan Qin, Jianzhong Hu, Mao Lin

1573 **DESIGN IN SEASIDE CONTEXTS: PRACTICES, MODELS AND EXPERIENCES OF WELLBEING, SOCIALITY AND SUSTAINABILITY.**
Ivo Caruso, Vincenzo Cristallo

1589 **EXPLORING INTERACTION AND CREATIVE PRACTICES FOR RECONFIGURING ACTIVE LIVING IN AGEING COMMUNITIES.**
Alessandro Pollini, Tania Sabatini, Arlene Astell, Danielle Saney, Lorena Rossi, Roberta Bevilacqua

1605 **DESIGNING DIGITAL PET ADOPTION SERVICES: BARRIERS AND OPPORTUNITIES FOR ITALIAN OLD ADULTS.**
Angela Giambattista, Carlotta Soddu, Cosimo Miraglia

SLIDE DECKS

1627 **ENHANCING WELLBEING: EMPOWERING INDIVIDUAL AND COMMUNITY NEEDS FOR SHARED IMPACT.**
Line Ulrika Christiansen

1635 **ARI-TEST: SET THE FOCUS ON THE USER EXPERIENCE IN THE DESIGN OF A SELF-SAMPLING DEVICE FOR HPV DETECTION IN WOMEN.**
Macarena Silva, Alberto Gonzalez, Ivan Caro

TAMING ENTROPY — SYSTEMS DESIGN FOR CLIMATE AND CHANGE

ACADEMIC PAPERS

1657 **FUTURE ISLAND: ENHANCING ANTICIPATORY COMPETENCE OF CHILDREN AGED 7 TO 11 IN ESD THROUGH GAME-BASED LEARNING.**
Yanning Zheng, Kaiyu Zheng, Keer Wei, Junjie Jiang, Ting Qiu

1677 **WHAT DO WE MEAN: THE LANGUAGE OF DESIGN FOR SUSTAINABLE PRACTICES.**
Luke Gooding, Sharon Baurley, Emily Boxall, Daniel Knox, Charlotte Nordmoen, Robert Phillips, Alec Shepley, Tracy Simpson, Sarah West, Joanna Wright

1693 **SUSTAINABILITY BY DESIGN: A FIVE-YEAR CROSS-CURRICULAR PROGRAMME FOR DESIGN STUDENTS.**
Emna Kamoun

1709 **TOWARDS CIRCULAR UPHOLSTERY: PRACTICE-BASED RESEARCH FOR THE CIRCULAR TRANSITION OF THE MADE IN ITALY UPHOLSTERED FURNITURE SECTOR.**
Ludovica Rosato

1723 **CO-DESIGNING A DECARBONISATION ROADMAP FOR THE HUNGARIAN CONSTRUCTION SECTOR. A DESIGN-LED MISSION APPROACH TO STAKEHOLDER ENGAGEMENT: A CASE STUDY.**
Daniella Huszár, Eniko Barbarics

1747 **FROM CABINETS OF CURIOSITIES TO DESIGN RESEARCH LABS?: HOW TO REIMAGINE NATURAL HISTORY MUSEUMS THROUGH DESIGN IN TIMES OF ECOLOGICAL CRISIS.**
Lynn Harles

1763 **SERVICE DESIGN FOR FOOD SYSTEMS: AN EDUCATIONAL EXPERIMENT TO EXPLORE ALTERNATIVES FOR THE MILANESE FOOD SYSTEM IN ITALY.**
Lucía Viganego Ballesteros, Daniela De Sainz Molestina, Daniela Selloni

1779 **RETHINKING THE LIFESPAN OF TEXTILES: A FRAMEWORK FOR SUSTAINABLE MATERIAL DESIGN BASED ON ENHANCED MULTIMODAL ATTRIBUTES.**
Delia Dumitrescu, Erin Lewis, Riikka Talman

1795 **DESIGNERS' COMMITMENT TOWARDS SUSTAINABILITY: CLIMATE CARE AS A CHALLENGE FOR DESIGN EDUCATION.**
Alessandro Pollini, Gian Andrea Giacobone

1811 **QUANTIFYING CIRCULARITY: TOOLS AND INSIGHTS FOR FASHION DESIGN FOR RECYCLING.**
Laetitia Forst, Kate Goldsworthy, Tim Cross, Jenny Valarino, Padouk Fielding

SLIDE DECKS

1823 **SUSTAINABLE ARCTIC PRODUCT DESIGN: OPPORTUNITIES FOR SNOW GLASS DEVELOPMENT WITH STUDENTS.**
Milla Johansson

1831 **8 STRATEGIES FOR A NEW MILLENNIUM.**
Tim Power

1843 **ADAPTIVE CITIES: TEMPORARY INTERVENTIONS & FLEXIBLE STREET FURNITURE DESIGN.**
Péter István Varga

WORKSHOPS

1853 **PUTTING THE "VOCATION" IN VOCATIONAL DESIGN EDUCATION.**
Astrid Lubsen, Irene Kamp

1857 **MATERIALS DIALOGUES: MATERIALS DESIGN FOR SUSTAINABLE SYSTEMS, NAVIGATING CONTEMPORARY MATERIALS DESIGN CULTURE.**
Sofia Soledad Duarte Poblete

1861 **DESIGNING THE WILDERNESS FOR YOUR P(A)LATE: A JOURNEY INTO SUSTAINABLE LIVING THROUGH FORAGING.**
Zsófia Márta Németh

FORMAT X

1865 **WET WET WET FLUID: A COLLABORATIVE JOURNEY THROUGH ECOSYSTEMIC RIVER NARRATIVES.**
Katarzyna Anosowicz

WAYS OF LIVING TOGETHER

ACADEMIC PAPERS

1877 **BEYOND CO-PRODUCTION: DESIGN AS A MEANS OF EVOKING AUTONOMY THROUGH ECOLOGICAL CITIZENSHIP.**
Robert Phillips, Jon Alexander, Emily Boxall, Luke Gooding, Daniel Knox, Charlotte Nordmoen, Alec Shepley, Tracy Simpson

1895 **GENERATING DESIGN BRIEFS BASED ON THE ANALYSIS OF WORKPLACE ARTIFACTS INVENTED BY INDUSTRIAL WORKERS: TOWARDS ADDRESSING GAPS OF CONTEXT AND SCOPE IN THE STUDY OF SPONTANEOUS DESIGN.**
Ana Correia de Barros, Inês Magalhães, Catarina Correia, Rúben Moutinho

1907 **LISTENING TO THE SHIPYARDS: DESIGN FOR SOCIAL INNOVATION IN POST-INDUSTRIAL REDEVELOPMENT AMIDST CONTESTED HISTORIES.**
Frédérique Krupa, Clémence Montagne

1925 **DESIGNING FOR EQUITY AND JUSTICE: LESSONS FROM PUBLIC LIBRARIES SPACES.**
Cássio Carvalho, Alexandra Alegre, Teresa Heitor

1941 **SPELLING 'GENDER-NEUTRAL': A COMPREHENSIVE OVERVIEW OF NON-GENDER-SPECIFIC PRODUCTS.**
Martina Labarta, Matteo O. Ingaramo, Francesca Mattioli

1963 **BREAK DOWN THE STIGMA THROUGH COMMUNICATION DESIGN: A PARTICIPATORY DESIGN PROJECT FOR A CAMPAIGN ON MEDICAL ABORTION.**
Giulia Panadisi

1975 **INTEGRATING DESIGN THINKING WITH VALUE SENSITIVE DESIGN THROUGH A SYSTEMS THINKING APPROACH.**
Rafail Andrianos Pappas, Katerina Malisova, Modestos Stavrakis, Spyros Bofylatos

1993 **PROJECTIVE PROVOTYPE DESIGN: A COLLABORATIVE DESIGN RESEARCH METHOD FOR CO-ANTICIPATING NEIGHBOURHOOD COMMUNITIES' PREFERRED FUTURE URBAN PLACES.**
Terence Fenn

2015 **EMPOWERING EXPERIENTIAL EDUCATION IN DESIGN: INTEGRATIVE MODEL AND PILOT APPLICATION IN AN UNDERGRADUATE EXPERIENCE DESIGN COURSE.**
Najla Mouchrek

2031 **SAFE SCHOOL ZONES: URBAN RESEARCH FOR THE DEVELOPMENT OF CHILDREN'S VISIBILITY USING CO-DESIGN AND PLACEMAKING METHODS.**
Erzsébet Hosszu, Rita Szerencsés, Borbála Marosán

2047 **ECONOMIES OF ENTREPRENEURIALISM AND POLITICAL AGENCY: URBAN INFORMALITY AS A DESIGN PARADIGM FOR RESILIENT FUTURE CITIES.**
Krity Gera, Peter Hasdell, Gerhard Bruyns, Diego Sepulveda-Carmona

2061 **ACROSS TIME AND STONE: EVOLUTION OF TYPOGRAPHY IN DELHI'S HISTORIC ARCHITECTURAL MONUMENTS.**
Rana Shinde, Saurabh Tewari

2077 **RADICAL INCLUSIVE ATTITUDES: THE CHALLENGE OF DOING, UNDOING, AND REDOING THE WORLD-IN-THE-MAKING.**
Daniele Busciantella-Ricci, Luis Soares, Lakshmi Srinivasan, Mike de Kreek, Anne H. Berry

2095 **HOW SCENARIO BUILDING AND SERVICE DESIGN CAN CONTRIBUTE TO PLACEMAKING: THE CASE OF THE TOURIST HARBOUR CARLO RIVA IN ITALY.**
Daniela Selloni, Marta Corubolo

2109 **CULTIRIDER - THE CASE STUDY OF A MOVING COMMUNITY SPACE CREATING INTERCULTURAL CONNECTIONS BETWEEN LOCAL AND MIGRANT YOUTH IN HUNGARY.**
Ágnes Jekli, Erzsébet Hosszu

SLIDE DECKS

2127 **SEED PODS OF DEMOCRACY: DESIGN FOR HUMAN RIGHTS.**
Moon Jung Jang, Kyungwon Kim, Yumi Kang

2139 **HUMANIZING HIGH SECURITY SPACES: REFORMATORIES FOR MINOR OFFENDERS - THE TEACHING AND PRACTICE OF DESIGN FOR SOCIAL INNOVATION TOWARDS VULNERABLE COMMUNITIES.**
Eugenia Pérez de Mezquia, Álvaro Albajez, Vanesa Gil, Maria Anonia Valverde

2149 **PAINTED PLAYLAND: DESIGNING 'WITH' THE COMMUNITY, 'FOR' THE COMMUNITY.**
Jaii Shrivardhankar, Sanjushrree Subash

WORKSHOPS

2165 **THE CONVERSATIONS OF DESIGN.**
Timothy Jachna

FORMAT X

2169 **GUT FEELINGS: AN EDIBLE EXPLORATION OF PARTICIPATORY DESIGN LANGUAGE.**
Josymar Rodríguez Alfonzo, Liesbeth Huybrechts

CUMULUS PHD NETWORK

2181 **ARTEFACTS FOR CHANGE: INTEGRATING ECO-SOCIAL JUSTICE INTO DESIGN EDUCATION.**
Lezhi Zhang

2191 **DESIGNING AUDITORY EXPERIENCES: EXPLORING THE MIGRATION OF BEIJING SWIFTS THROUGH SOUNDSCAPES.**
Fangxia Wei, Zhigang Wang

2197 **CONTEXTUAL REVIEW OF THE PEDAGOGIC DESIGN STUDIO.**
Cróna O'Donoghue

2209 **UNRAVELING IDENTITY'S INFLUENCE ON DESIGN: A HOLISTIC EXAMINATION OF CHINESE INDEPENDENT PRODUCT DESIGNERS' NARRATIVE IN DESIGN PRACTICE, MANUFACTURING, AND EXHIBITION.**
Dan Mu

2219 **DESIGN TOOLS FOR A SUSTAINABLE HEALTHCARE: EMPOWERING MEDICAL PROFESSIONALS WITH MULTIFUNCTIONAL CONSUMABLES APP.**
Gabriele Maria Cito

2229 **CUSTOMER, USER, OR CITIZEN? A COMPARATIVE ANALYSIS OF HUMAN-CENTERED DESIGN PARADIGMS.**
Luca Baldini

2239 **EATING TOGETHER: TOWARDS A GUT-CENTRED APPROACH IN PARTICIPATORY DESIGN.**
Josymar Rodríguez Alfonzo

2247 PARTICIPATORY ART IN CONTEMPORARY NEW PUPPETRY.
Hanny Wijaya

2255 DESIGN AND PROJECT LEARNING: A SYSTEMATIC LITERATURE REVIEW AND DISCUSSION ABOUT THE FUTURE OF THE FIELD.
Maura Flores, Gabriela Pizzato

2265 FOOD WASTE NINJAS AND SLEEPING SHEEP: UNDERSTANDING THE ROLE OF VERNACULAR DATA VISUALISATION DESIGN IN CIVIC ENGAGEMENT AND INFLUENCING FOOD-WASTING HABITUAL BEHAVIOURS.
Regine Abos

2279 UNLOCKING THE POTENTIAL OF POST-CONSUMER TEXTILE WASTE: EXPERIMENTING WITH NEW RECYCLING PRACTICES.
Carmen Digiorgio Giannitto

2287 CRAFT-DRIVEN INNOVATION – THE "KNOW-HOW" AT THE BASE OF INDUSTRIAL INNOVATION.
Bianca Chiti

2297 DESIGN AND RESEARCH FOR A FASHIONABLE PROTOTYPE FOR PATIENTS WITH FECAL INCONTINENCE.
Inês Camaño Garcia, Ana Margarida Ferreira, Banu Hatice Gürcüm

2305 IMPLEMENTING EDUCATION FOR SUSTAINABLE DEVELOPMENT AS A GUIDING PRINCIPLE IN FASHION DESIGN HIGHER EDUCATION.
Hanieh Choopani, Martina Glomb, Anne-Marie Grundmeier

2315 MAPPING THE NEW NORDIC REGION'S START-UP ENTERPRISES FROM THE PERSPECTIVE OF LEADERSHIP CHARACTERISTICS, MINDSET, AND SKILLS: THE RELEVANCE OF SOFT SKILLS IN SHAPING ENTREPRENEURIAL ECOSYSTEMS.
Lili Ermezei

2325 PARTICIPATORY DESIGN PRACTICES FOR INCLUSIVE LEARNING ENVIRONMENTS. A CROSS-FERTILIZATION EXPERIENCE FOR A PILOT PROJECT ON ACCESSIBLE SIGNAGE AT THE INSTITUTO SUPERIOR TÉCNICO – LISBON.
Giulia Beltramino, Claudia De Giorgi, Daniela Bosia, Silvia di Salvatore

2335 DESIGN WITH LIVING ORGANISMS. ALTERNATIVE PERSPECTIVES FOR REGENERATIVE ECOLOGIES.
Calogero Mattia Priola

2345 MAPPING INTERACTION BETWEEN DESIGN AND THE THIRD SECTOR IN ITALY. PERSPECTIVES TO PROMOTE SOCIAL INNOVATION.
Maria Manfroni

2357 PARTICIPATORY DESIGN FOR THE ENHANCEMENT OF CULTURAL HERITAGE AND URBAN PUBLIC SPACES.
Federica Maria Lorusso

2367 BRIDGING DESIGN AND EDUCATION: INNOVATING LIFELONG LEARNING IN THE PUBLIC SECTOR.
Aureliano Capri

2375 TOWARDS SEAMLESS HEATED GLOVES PRODUCED BY KNITTING.
Adéla Fürstová, Stanislav Hosnedl, Radek Soukup

2385 PARTICIPATION THROUGH DESIGN – COLLABORATIVE METHODS SUPPORTING THE SOCIAL INCLUSION OF YOUNG REFUGEES.
Ágnes Jekli

2395 DESIGN-LED STRATEGIES IN SOCIAL INNOVATION ASSESSMENT: A PATH FOR SOCIALLY RESPONSIBLE TRANSFORMATION.
Beatriz Bonilla Berrocal, Annalinda De Rosa, Valentina Auricchio

2403 INTERACTION LEVELS OF DIGITAL INTERFACE METAPHORS IN MUSEUMS – LEARNING OUTCOME AND DISTRIBUTION OF ATTENTION.
Anett Kőhalmi

2415 **AN INQUIRY ON PARTICIPATORY DESIGN FOR A DIVERSE, EQUITABLE, AND INCLUSIVE PUBLIC SECTOR.**
Miriam Saviano

2423 **DESIGN ECOSYSTEM: FUNCTIONING, DIALECTIC, AND BODIES OF KNOWLEDGE.**
Daniel Baldaia

2435 **SERVICE DESIGN FOR THE INTERCULTURAL ADAPTATION EXPERIENCE OF CHINESE POSTGRADUATE TAUGHT (PGT) STUDENTS IN THE UK.**
Yi Zhong, Kyungeun Sung, Lis Ku

2447 **DIGITAL TWINS IN THE PUBLIC SECTOR AND THE ROLE OF THE SERVICE DESIGNER.**
Mariia Ershova

2457 **DESIGN FOR THE ENHANCEMENT OF THE AGRIFOOD SUPPLY CHAIN. TOWARDS THE TRANSFORMATION OF CEREAL WASTE INTO A COMPETITIVE INDUSTRIAL PRODUCT.**
Francesca Ambrogio

2467 **DESIGN STRATEGIES FOR THE COMMUNICATION OF MEDICINE AND HEALTH PROMOTION IN SCIENCE MUSEUMS.**
Giovanna Nichilò

2473 **CHRONO-DISRUPTION: ANARCHAFEMINIST (GAME) DESIGN FOR SOCIAL INNOVATION.**
Valentina Volpi

2485 **THE MATERIAL SAMPLE AS A DESIGN AID FOR MATERIAL SELECTION IN THE PRACTICE-BASED RESEARCH.**
Antoine Tour

2499 **CULTIVATING RESILIENCE: A PARTICIPATORY APPROACH TO PERMACULTURE FOR MARGINAL FARMERS IN INDIA.**
Agnivesh Sharma, Nishant Sharmaa, Vivek Kant

2509 THE DESIGN APPROACH FOR INTEGRATING CROSS-SECTOR PROCESSES. APPLICATION OF TANGIBLE/ INTANGIBLE RESOURCES FROM THE TERRITORY TO A CO-PARTICIPATED SUPPLY CHAIN MODEL.
Stefano Salzillo

PRESIDENT MESSAGE FOR CUMULUS BUDAPEST PROCEEDINGS.

Lorenzo Imbesi*[a]

a Sapienza University of Rome, Cumulus Association, Italy
* lorenzo.imbesi@uniroma1.it

DOI: 10.63442/VTCC2962

Nestled in the vibrant cultural milieu of Budapest, the Cumulus Budapest 2024 Conference took place at the esteemed Moholy-Nagy University of Art and Design, an institution that proudly boasts a 143-year legacy of artistic and academic excellence. This setting seamlessly aligned with the conference's overarching theme, "P/references of Design," which encapsulates the multifaceted nature of contemporary design discourse: the shifting paradigms that influence our understanding and preferences in a world increasingly characterised by environmental degradation, social upheaval, economic instability, and the pervasive influence of data systems.

As traditional value structures erode, the design field is compelled to adapt and redefine its role. Conversely, the conference provided a fertile ground for scholarly exploration around a range of urgent topics, including: “Converging Bodies of Knowledge” as a means to enhance theoretical and practical support; global tensions between “Centres and Peripheries”; “Redefining Data Boundaries” due to the ever-shifting dynamics between data, humans, and non-humans; “Redefining Data Boundaries”; “Bridging Design and Economics” to shape and influence spaces of governance, business, and innovation; “The Power of Immersion” and its subtle impact on our daily lives; “Speculative Perspectives” to transcend established boundaries; “Taming Entropy: Systems Design for Climate and Change”; and identifying “Ways of Living Together.”

These discussions resulted in a variety of paper presentations, panel discussions, keynote speeches, and networking opportunities, where participants engaged in a profound examination of the tensions and parallels that guide contemporary practices, harnessing both human and machine creativity while navigating the social, physical, and virtual realms of design.

The space for inquiry and reflection offered by Cumulus Budapest 2024 calls for a rethinking of established norms and the embrace of new perspectives. Human-centered design has long been the cornerstone of design practice, prioritizing human needs and experiences. However, the pressing challenges of climate change, geopolitical instability, and the complexities of a post-truth society necessitate a paradigm shift. Designers must recognize that the spatial-temporal dimensions of design extend beyond anthropocentric considerations, requiring an acknowledgment of the interdependencies between human and non-human entities. In this liminal age, designers are urged to embrace a more holistic perspective that redefine the foundational principles of design, including its starting points and objectives. They must engage in an ongoing revaluation of the values that underpin their work, navigating alternative ontologies, particularly in the

context of pressing issues such as climate change, geopolitical tensions, the post-truth world, and the rise of generative content creation. Addressing this complexity requires the inclusion of various non-human agents that influence our world while transcending the established references inherited from modernism, ultimately adapting to the evolving needs and preferences of society. This requires a commitment to sustainability, inclusivity, and ethical considerations in the design process.

The Cumulus Budapest 2024 Conference catalysed a critical and speculative design culture aimed at addressing systemic global and local social issues while proposing new ways of convergence where communities can coexist. The insights gathered from this event underscore the imperative for designers to transcend traditional roles and exploit strategic design, systems thinking, co-creation, and more-than-human design approaches. The attendance from around the globe demonstrated collective resilience and commitment to fostering a design practice that engages with the complexities of our contemporary context, venturing into the realms of the speculative, the unconventional, and the transformative.

The proceedings collected in this volume stand as pillars of wisdom for the global design community, inviting reflection on the past while charting a course toward innovative and transformative futures. The enriching dialogue initiated at the Cumulus Budapest 2024 Conference establishes a trajectory toward conscientious, groundbreaking, and paradigm-shifting prospects within a global context where the threads of a sustainable, equitable, and responsive design intertwine with the fabric of our world, and the flow of information and collaboration continues to prevail.

About the Author:
Lorenzo Imbesi is Full Professor of Design at Sapienza University of Rome, where he is the Director of the Sapienza Design Research Interdepartmental Centre and the Coordinator of the PhD in Service Design for Public Sector. Currently, he is the President of the Global Association Cumulus, a member of the Board of the Italian Scientific Society of Design SID, and member of the Executive Committee of the EAD European Academy of Design.

KEYWORDS | CONFERENCE ORGANISATION, EVENT EXPERIENCE, CONFERENCE THEME, STRATEGIC ALIGNMENT

ABSTRACT | Reflecting on the organisation of the Cumulus Budapest 2024 conference provides a valuable opportunity to summarise efforts, distil key takeaways, and share insights gained from the process. Coordinating such a large-scale, international event required meticulous planning, adaptability, and collaboration across various organisational units of the host university, Moholy-Nagy University of Art and Design Budapest. It also required close collaboration with the Cumulus Association and the leadership of a large team across institutions. Sharing details of the submission, review, and organisation process; examining participant feedback; summarising what worked well; identifying areas for improvement; and listing practical recommendations for future conference organisers aim to document and share learnings within the Cumulus network and beyond.

1. Introduction

Moholy-Nagy University of Art and Design Budapest (MOME) is a design university in the capital of Hungary, and one of the most prominent institutions in the Central-Eastern Europe region. While building on its 143-year legacy, the university has completely renewed its physical environment in the last decade. The new campus, which opened in 2019, provides the community and visitors with some of the most modern institutional infrastructure in the region. The university also aims to be the first carbon-neutral university in Hungary.

Cumulus Budapest 2024: P/References of Design was the semi-annual conference of the Cumulus Association, hosted by MOME from May 15–17, 2024. The event, which welcomed over 600 participants, was the largest international gathering ever hosted by the university and represented an unprecedented organisational effort.

Describing details of the organisation, submission and peer review processes, documenting challenges encountered through the process, sharing participant feedback and offering practical recommendations can benefit future conference organisers within the Cumulus network and beyond.

2. Organisation Process

The organisation of Cumulus Budapest 2024 started with alignment on strategic goals, refining the conference theme and defining tracks, logistical and spatial planning, setting up a dedicated team, and focusing on creating a rich conference experience.

Initial efforts centred on establishing strategic objectives with university leadership, guiding the event's overarching purpose, and ensuring support across MOME departments and functions. Addressing logistical and spatial constraints was essential, particularly given the academic semester timing and the venue limitations of the MOME Campus. For instance, working with the largest auditorium, which has a maximum capacity of 200, and managing catering for over 450 participants without disrupting the event schedule presented challenges that needed to be addressed upfront.

Pre-mortem sessions identified potential challenges early on, while feedback from previous organisers offered valuable insights to refine the planning process.

Figure 1–2. Master building and main entrance at Moholy-Nagy University of Art and Design Budapest, during the Cumulus Budapest 2024 conference. Photos: Máté Lakos.

2.1 Aligning Strategic Goals

The most important first step in organising the conference was to align strategic goals with the university leadership. This provided a baseline for our planning activities and decision-making throughout the organisation process. This was especially important because the undertaking required all MOME departments — Academia, Innovation Center, Doctoral School, Tech Park — and all functions — Brand Office, Campus, HR, Procurement, and Finance teams — to work orchestrated.

Strategic goals that were agreed upon by the university leadership and the core organising team:

- Provide a good conference experience
- Adhere to Cumulus Association requirements
- Adhere to academic conference principles
- Add local flavour
- Bring in local/peripheral perspectives
- Highlight MOME transition (2014–)
- Celebrate the new MOME campus, renewed in 2019
- Promote English master programs
- Introduce the ongoing transformation of the university
- Present the current and future rectors
- Raise the international visibility of MOME and Budapest
- Elevate MOME and local speakers
- Generate visibility of Cumulus Budapest 2024 beyond the in-person participants.

2.2 Logistics and Spatial Constraints

Regarding the timing of the event, the only viable option for a conference of this scale to be held on the MOME campus was to hold it during preparation week — the week directly after all semester classes end and before students present their work and the exams and diploma presentations begin. This scheduling allowed rooms, both auditoriums and seminar rooms, otherwise occupied, to be utilised for the conference. The obvious downside of this timing was that students, busy finalising their semester projects, were not available to join the conference as participants or volunteers.

Critical bottlenecks were identified in terms of available space, specifically the size of the main auditorium, the available rooms to host parallel sessions, and the space that could host catering for nearly 500 onsite participants.

The main auditorium in the Master Building, the largest on campus, has a maximum seating capacity of 200 people. Anticipating a larger number of onsite participants, the organising team decided to stream the plenary sessions to additional rooms, allowing those unable to fit in the auditorium to watch the talks in real-time. While it was not ideal for some in-person attendees to watch the sessions via live stream rather than experiencing them directly, this solution ensured that everyone could view the busiest plenary sessions —including interested MOME faculty members and students both in the additional rooms and online. It also enabled the event to remain on campus, which was an important strategic objective aimed at showcasing the venue.

An important question was on setting time and space constraints for parallel sessions. As seen later, nine thematic tracks were proposed, but it was understood that they do not need to run all parallel. Next to the main auditorium, six rooms were booked for parallel sessions, and six seminar rooms were booked for workshops, Cumulus Working Group meetings, and format X sessions. Additional rooms were reserved for impromptu meetings, interviewing, and video shooting. The available rooms and a preliminary programme schedule allowed the core organising team to define how many parallel sessions, and how many paper and slide deck presentations could physically fit into the timeframe of the 3-day event.

2.3 Pre-mortem

Three pre-mortem sessions were held: one with the university leadership, the second with track chairs, and the third with the organising team. In this session, potential risks and challenges that could occur were identified. For instance, it was highlighted that construction work and noisy garden work (e.g., lawnmowing) could easily destroy the participant experience. Some of these issues might seem banal, but discovering and managing such risks early on allowed the organising team to build the necessary support across the university.

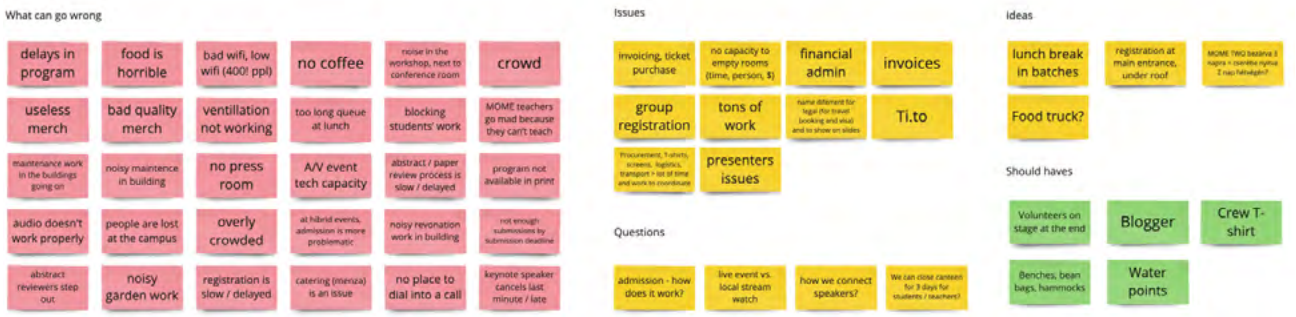

Figure 3. Combined outcomes of the three pre-mortem workshops.

2.4 Collecting Feedback from Previous Organisers

Requirements for the conference were provided by the Cumulus Association and regular meetings were organised between the organising team and Cumulus Association secretariat.

Some members of the organising team attended the Cumulus Antwerp 2023 and the Cumulus Beijing 2023 events, which provided valuable insight into the scale and organisational nuances of such an event.

Additionally, discussions with previous conference organisers, including Kristof Vaes (University of Antwerp), Maria Luisa Rossi (College for Creative Studies, Detroit), and Lorenzo Imbesi and Viktor Malakuczi (Sapienza University of Rome), proved to be immensely helpful.

2.5 Team Setup

After successfully earning the opportunity to host the event, organisational work commenced in July 2023 with the appointment of Attila Bujdosó as conference chair and Andrea Kovács as project manager and curator. Their initial tasks included drafting an organisational chart for the event, as shown in Figure 4.

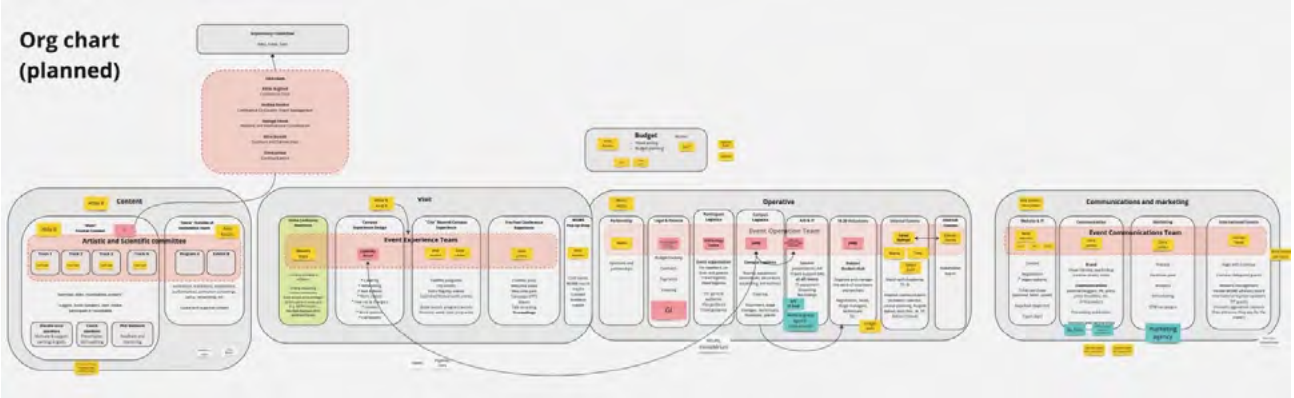

Figure 4. The initial team organisational chart.

In a parallel workstream led by the conference chair, the refinement of the conference theme, the establishment of the Scientific Committee, the definition of thematic tracks, and the preparation of the call for participation were started. The track chairs included Ágnes Karolina Bakk, Miklós Erhardt, Tamás Fogarasy, Boglárka Jakabfi-Kovács, Mary Karyda, Anna Keszeg, Ákos Schneider, Bori Fehér, Márton Szentpéteri, and Bálint Veres, who all contributed their expertise to the development of the call. An additional track was opened for doctoral students by the Cumulus PhD Network, led by Lorenzo Imbesi, Cumulus President. This work culminated in designing and developing the website and publishing the call for participation in September 2023.

The core organising team for the event began their work nine months prior, in September 2023, led by Attila Bujdosó as conference chair. The initial team included Andrea Kovács, responsible for curating the student exhibition and overseeing cultural and social programmes, as well as project management; Györgyi Falvai, managing network, and international coordination; Dóra Juhász, leading communications; and Nóra Comas-Demők, handling sponsors and partnerships.

Four months before the event, Dr. Judit Kollár joined to take on event management, and Vivien Andavölgyi expanded the team's capacity in communications and project management. Two months before the event, Júlia Horváth and Zsófia Zubay joined the team, with the former supporting workshops and working groups and the latter focusing on the virtual conference. By the time of the conference, the team had grown and evolved into a setup visible in Figure 5.

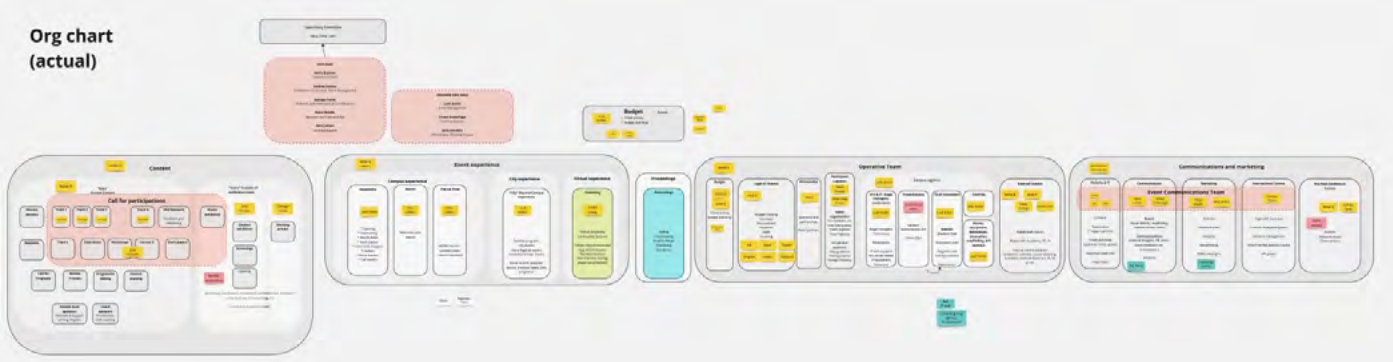

Figure 5. How the team organisational chart evolved.

It is important to highlight that, in addition to the core organising team, a large number of university staff were involved in the organisation process — from communications to invoicing, from procurement and contracting to accounting, and from campus logistics to website development. As shown in Figure 6, as the preparation work progressed, more and more contributors were required across multiple organisational units of the university. Specifically, during the week of the conference, an additional 54 staff joined, including hosts, moderators, stage managers, A/V technicians, and catering and cleaning staff.

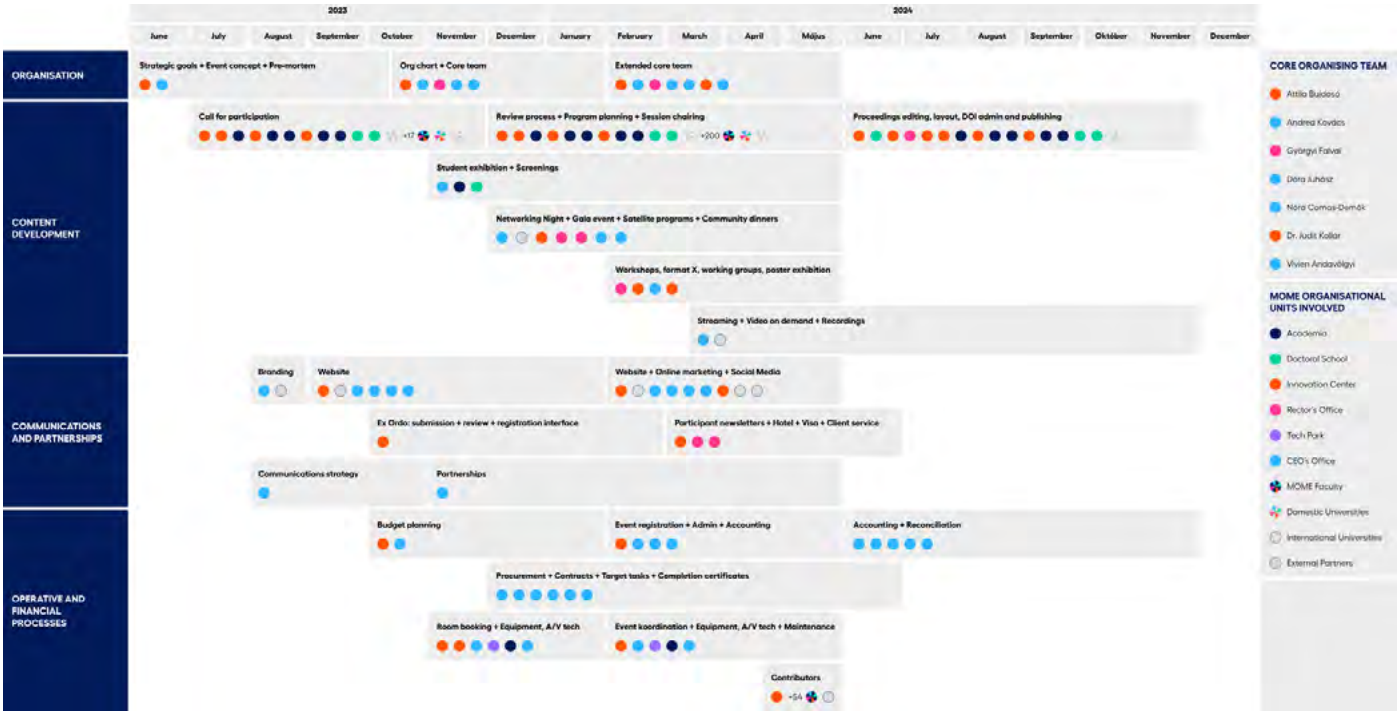

Figure 6. Breakdown of workstreams and contributors from different organisational units.

3. Conference Theme, Tracks, Keynotes, and Plenary Talks

The conference theme, "P/References of Design," was initially established prior to the submission of the application to the Cumulus Association's call for conference hosts in 2022. It was further refined and officially published alongside the call for contributions in September 2023, (P/References of Design: Cumulus Budapest 2024, 2023) as follows:

"Our references for understanding and relating to the world, as well as our preferences when we make our choices as humans are confronted by major ecological, socio-economic, and geopolitical challenges. The horizons of art and design are changing. Anchor points, both old and new, must be reconsidered. As modern value structures break down and new ones emerge, we find ourselves in an age of liminality.

A hundred years ago, during another time of global turbulence, Laszlo Moholy-Nagy, an emblematic figure of the Bauhaus movement, stated that "tradition must be dynamic."[1] As we see our own century unfolding, with collapsing ecosystems, struggling global and local communities, and failing economic paradigms, we must admit that Moholy-Nagy was right. Human references and preferences do shift, and must be shifted.

The Cumulus conference in Budapest aims to explore contemporary design culture[2] by examining its current tensions and parallels. Participants are encouraged to share their perspectives on the ongoing "revaluation of values"[3] which concern established references and competing preferences in design.

When the long-standing paradigm of human-centred design falls short in addressing the complexities and the variety of multiple non-human agents in our world, how should we approach design? Should the position and possibilities of the living, sentient, knowing and purposeful human being as the ultimate reference of any cultural activity be reconsidered in the face of the prevailing ideologies of 'humanness' inherited from modernism? Is design, as a tool for optimizing user experience and "streamlining the sales curve",[4] still preferable when facing the "limits to growth"[5]? Is the user still the legitimate source and focus of the design process? How should the starting points and objectives of design be set today?

What is the role of design and the designer in society anyway? Where will the expertise of designers be most crucial in the upcoming years? How should the design profession adapt to effectively address future needs and preferences? How are traditional references being challenged by alternative ontologies in the shadow of climate change, intensifying geopolitical tensions, the emerging post-truth world, and the rise of generative content creation?

During the conference, we will delve into various perspectives of strategic design, systems thinking, co-creation and more-than-human design. The event will also examine tensions and parallels that guide us towards contemporary practices which harness both human and machine creativity, and navigate the social, physical and virtual realms of design. The widening liminal space between value structures will also provide us with a chance to contemplate the dynamics between the centres and peripheries of the global design landscape, along with the history and institutional power structures of modern design.

As a transitional zone situated between the West and the East, the Balkans and the Baltics, Hungary has always encountered diverse and contesting values, resulting in a wide array of references and preferences. With its 143-year history and a recent major institutional renewal, Moholy-Nagy University of Art and Design Budapest invites academics, educators and art and design professionals from all over the world to discuss and consider the revaluation of established frameworks and explore future perspectives of design culture."

3.1 Tracks

To support the strategic objectives outlined in section 2.1, multiple potential track structures were examined. Ultimately, the decision was made to adopt a holistic, all-encompassing approach that welcomes contributions across a wide range of focus areas rather than opting for a more focused yet narrow approach. The following nice tracks were established:

- Centres and Peripheries
- Converging Bodies of Knowledge
- Redefining Data Boundaries
- Bridging Design and Economics
- Speculative Perspectives
- The Power of Immersion
- The Future of Well-being
- Taming Entropy: Systems Design for Climate and Change
- Ways of Living Together

The potential tracks were formulated in a way that MOME faculty and lecturers from all relevant departmental units — Academia, Doctoral School, and Innovation Center — could serve as track chairs, fostering collaboration and bridging organisational silos within the university. Selecting track chairs from MOME allowed for a closer working relationship between the conference chair and track chairs while involving co-chairs from other — including international — universities introduced more diverse expertise.

When appointing co-chairs, and later reviewers and session chairs, emphasis was placed on including not only international contributors but also representatives from fellow domestic universities. This approach enabled academics from other Hungarian institutions, such as the Hungarian University of Fine Arts, Budapest University of Technology and Economics, Eötvös Loránd University, and Central European University, to engage with the network offered by the Cumulus Association.

Additionally, a special track was organised by the Cumulus PhD Network for doctoral students to present their research and get general feedback.

3.2 Formats

In addition to common conference formats like paper presentations, workshops, and posters, the organising team experimented with two formats.

“Slide deck” was proposed to encourage academic, industry, and art professionals to present their creative and professional works, whether it is research, design, or artistic.

“Format X” submissions were welcomed to propose new, experimental formats that actively involve 15+ participants and let them come together and discuss, debate, play, paint, scratch, bend, tear apart, or X a specific topic. Such formats were expected to be engaging, social, inclusive, cooperative, and highly interactive.

3.3 Keynotes

Eric Zimmerman, a renowned game designer, and NYU professor, delivered the first keynote exploring the intersection of play and systems design. His talk, *Gaming the System*, delved into how game design principles can challenge societal norms, inspire creative thinking beyond the digital realm, and be used to design social systems of scale. His talk highlighted themes from his latest book, *The Rules We Break*, advocating for play as a powerful tool for learning and engagement.

Vladan Joler, a professor at the New Media Department of the University of Novi Sad and an interdisciplinary researcher, examined the hidden mechanisms of contemporary technology in his keynote, *New Extractivism*. Focusing on the exploitation embedded in digital infrastructures and algorithmic systems, he unveiled the intricate connections between data extraction, labour, and ecological impact. His talk underscored the necessity of transparency and accountability in technological design and policy.

Figure 8. Vladan Joler delivered his keynote talk on Day 2, May 16, 2024. Photo: Máté Lakos.

Dr. Robin Schuldenfrei, a historian specializing in modern architecture and design, brought a nuanced perspective on materiality in her keynote. She explored the cultural and political dimensions of objects in modernism, drawing from her recent publication, *Objects in Exile*. By examining the migration of design and architectural ideas across borders during the mid-20th century, she illuminated the intersections of luxury, modernism, and identity. Schuldenfrei's insights bridged historical analysis with contemporary relevance, enriching the discourse on the enduring impact of modernist material culture.

3.4 Plenary Talks

In the plenary sessions, speakers brought in local perspectives by reflecting on the keynote talks and shedding light on various topics. Dr. Petra Aczél, a full professor at MOME, discussed educational design in the age of artificial intelligence (AI). Adam Somlai-Fischer, co-founder of Prezi.com, designer, media artist, and aspiring musician, talked about his passion for shaping futures and taming technology to make it more humane and less boring. Hedvig Harmati, textile artist, university professor, and head of the MOME Doctoral School, introduced the "Future Traditions" design research and curriculum development process. Dr. Dániel Barcza, strategic vice-rector of MOME, introduced the ongoing Future University project, a comprehensive redesign of the university's educational model. Finally, Lāsma Ivaska, director of the Innovation Center at Moholy-Nagy University of Art & Design, presented research projects aiming to design for life in an era of climate crisis.

4. Submission and Review Process

4.1 Initial Submissions

The call for participation received approximately 540 academic paper abstract submissions, significantly exceeding the organisers' prior estimate of around 400. The submission deadline was 15 December 2023. After removing duplicates and miscategorised submissions, 537 academic paper abstracts were reviewed.

The deadline for other formats — workshops, posters, Format X, and slide decks — was 25 January 2024. A total of 80 submissions were received across these formats, slightly fewer than expected (100), as detailed below:

- Slide decks: 37
- Workshops: 27
- Posters: 16
- Format X: 8

4.2 Review Process in the Abstract Phase

From 537 submissions, a total of 185 abstracts were accepted and invited for full-paper submissions. This represented a 34% acceptance rate across all tracks, ranging from 29% to 51% for individual tracks.

67 promising submissions (12%) were rejected but recommended for resubmission as Slide Decks (15), Posters (12), or Short Papers (40) in the Cumulus PhD Network track. For Slide Deck and Poster submissions, authors were offered additional time to submit their materials (between 2 February and 15 February), as the original submission deadline (25 January) was no longer realistic for them.

85% of accept/reject decisions were published on time (on 24 January 2024), and 98% of decisions within a two-day delay. The remainder of the authors were informed within 10 days. These were mostly submissions that were proposed to be moved to other tracks, which required alignment between track chairs.

4.3 Review Process in Full Paper Phase

Altogether, over 700 submissions were received. After the full submission of academic papers, all contributions underwent a double-blind peer review process. Finally, a total of 106 academic papers were accepted to the conference, representing a 19.7% acceptance rate. Additionally, 42 Short Papers, 23 Slide Deck presentations, 18 Posters, 11 Workshops, and 4 Format X submissions were accepted, as detailed in Table 1.

There was a slight delay in the review process, but 94% of authors were notified within three days of the planned decision announcement date. A few submissions were withdrawn by their authors after acceptance, and one was withdrawn following the conference.

Table 1. Contribution formats at the conference.

Format	Selection Process	Presentation Length/Format	Q&A Length	Presentation Mode	Submissions Received	Contributions Accepted
Keynote Talk	Invitation	35’	10’	In-person	N/A	3
Plenary Talk	Invitation	15’	5’	In-person	N/A	5
Academic Paper	Peer Review	15’	5’	In-person*	537	106
Short Paper	Peer Review	10’	5’	Hybrid	87	42
Slide Deck	Peer Review	15’	5’	In-person*	37	23
Workshop	Peer Review	45–180’	N/A	In-person	27	11
Format X	Peer Review	45–90’	N/A	In-person	8	4
Poster	Peer Review	70 x 140 cm print poster	two meet-the-authors sessions	Hybrid	16	12+5
Working Group	Coordinated by Cumulus Association	90’	N/A	Hybrid	N/A	23

5. Conference Experience Planning

5.1 Experience Planning

A multi-layered experience planning (see Table 2) aimed to deliver an engaging and memorable event for attendees.

Table 2. Layers of experience at Cumulus Budapest 2024.

Virtual Experience	Conference app | On-demand documentaries | Dance performance streaming
City Experience	Gala Dinner | City walks | Recommended programmes
Social Experience	Networking Night on day 0 | Reception on day 1 | Community Dinners
Campus Experience	Tech Park tour | Activities in campus garden | Morning yoga | Pop-up shop
Exhibition Experience	Student exhibition | Poster exhibition | Screenings
Interactive Experience	Workshops | Working groups | Format X
Presentation Experience	Keynotes | Plenary talks | Academic papers | Short papers | Slide decks | Q&As

5.2 Outdoor Activities

To harness the value of the MOME campus, several outdoor activities were planned. For instance, a game design workshop entitled “Rock, Paper, or Scissors” was led by keynote speaker Eric Zimmerman on the second day in the campus garden. Some workshops were held outside, and conference participants were invited to join MOME’s regular morning yoga sessions on the roof terrace of the MOME ONE building. Additionally, tours organised to the Tech Park were very popular among participants.

Figure 9–10. “Rock, Paper, or Scissors” workshop by Eric Zimmerman and “Sticks and Ladders - Physical and Theoretical Approaches to the Integration of Participatory Design into School Curricula” by Dr. András Cseh and Szilárd Köninger. Photos: Máté Lakos.

5.3 Pop-up Shop

As an experiment, the front area of the MOME library was turned into a pop-up shop for the three days of the conference. Over 40 design objects and books were showcased, highlighting the local talent and creativity of MOME students and faculty, and were made available for purchase at the location.

5.4 Voucher in the Gift Bag

MOME, as the host university, aimed to treat the large international audience with warm hospitality, which included offering complimentary conference gifts to in-person attendees. At the same time, the organising team sought to balance this generosity with sustainability considerations. Therefore, the gifts offered to participants were intentionally kept limited—to a tote bag, a notebook, and a pen. In addition to this, participants received a voucher. Participants could exchange their vouchers for a university-branded merchandise item, a reusable water bottle, or a booklet, or they could use the voucher to purchase any items on sale in the pop-up shop. This approach allowed useless merchandising objects to be kept to a minimum while allowing participants to select gifts according to their preferences or purchase and take-home local books, art, or design objects of their choice.

6. Key Challenges

6.1 Review Process

Completing the peer review process on time can be a major challenge for conference organisers. The organising team, together with track chairs and co-chairs, recruited over 200 reviewers. As described in sections 4.2 and 4.3, some delays occurred, but the review process was running mostly on time. In the process, some challenges occurred, as explained in the following.

6.2 Submission Process

There were a couple of cases (~5) where authors reached out to the organising team because they had not received feedback on their final paper acceptance. After careful investigation, it was found that some authors who were invited to submit their full papers started to upload their full papers but did not submit them. The Ex Ordo conference management system labelled such contributions as "pending." As it turned out, this label was somewhat misleading because it could be interpreted as "pending review," besides its intended meaning as "pending submission." Upon successful submission of full papers, contributions were labelled as "completed," and authors received an email notification confirming that — but this was not clear to all authors. Papers that were not completely submitted (along with 30% of abstracts that were invited but were not submitted as full papers) were not peer-reviewed and were excluded from the rest of the process.

In some cases, when this situation was discovered early (6–8 weeks before the conference), the conference chair decided to reinsert such submissions into the peer review process. When this was discovered later (in one case, just two weeks before the conference), time was insufficient to enrol the papers into the peer review process, and those papers had to be rejected.

The conference chair raised this issue with the Ex Ordo support team and suggested renaming the label of unsubmitted submissions to "draft." The product team at Ex Ordo committed to considering this feedback.

6.3 Anonymity of Submissions

Some submissions did not fulfil the requirement of anonymity and had to be rejected during the abstract phase or final submission phase.

One short paper submission was submitted non-anonymised. During correspondence with the author, it was found that the call for participation in the conference had not explicitly required short paper authors to submit their initial submissions anonymised. From the textual context, this requirement could have been assumed — since all other submission types required anonymity — but it was not a formal requirement. When this was discovered, the conference chair asked the author to resubmit their short paper in anonymised form, and it was assigned to new reviewers.

6.4 Written Feedback on Academic Paper Abstracts

After announcing accept/reject decisions on submitted paper abstracts, 44 authors reached out to conference organisers via email because they had not received written feedback on their abstract submissions. Some authors expressed doubts about whether there had indeed been a review process and reviewers. Some simply asked whether it was possible to review the decisions, while others genuinely asked for feedback so that they could improve their work. Additionally, ten accepted authors requested feedback to help them write their full papers.

The default setting in the Ex Ordo system required reviewers to share feedback with track chairs, and they were able to choose whether to make their feedback visible to authors or not. Many reviewers followed the default setting — hence, some reviews were visible only to track chairs and not to authors. Reviewers were also required to provide numerical ratings, but these were not visible to the authors either.

While it was not previously announced what kind of feedback would be given to authors during the abstract selection phase, this was a very unfortunate situation for multiple reasons. First,

- Invisible feedback could not help authors improve their work (regardless of whether they were accepted or not).
- The situation caused some authors to question whether there had been a review process at all.
- The organisers received many email queries after announcing the decisions, leading to an overwhelming two weeks of communicating with the authors.

The organisers and track chairs made efforts to reply to every author who reached out to them and shared feedback manually, either via email or within the Ex Ordo system. In four cases, the original decisions were revisited.

6.5 Hybrid vs. Onsite Experience: Remote Participation, Remote Presenting

Providing the option to present at the conference remotely or attend the event virtually was a major discussion item between the organising team and representatives from the Cumulus Association.

The following perspectives were taken into account:

1. Allowing authors to present remotely offers greater inclusivity to those unable to travel due to budget, health, or time constraints.
2. Having remote presenters can detract from the onsite attendee experience, as people are increasingly fatigued by online speeches and encounters.
3. Having remote presenters introduces additional technical risks to the preparation of sessions.
4. Remote presenting reduces the serendipity of encounters and decreases the networking value of the conference.
5. Charging the same registration fee for in-person and remote presenters may feel inappropriate, but the reality is that the bulk of conference organisational costs remain unchanged regardless of presentation format.
6. Charging a significantly lower registration fee for remote presenters introduces unpredictability to revenue planning, potentially jeopardising the budget.
7. Streaming presentations increase the visibility of the content presented at the event.
8. Streamed content, if done properly, can be shared later as recordings.
9. The cost of streaming (technology and team) can be significant if done professionally.

Considering all of the above aspects, the organising team decided to limit remote participation to streaming from one room — the Auditorium — and participation in Cumulus Working Groups. The Auditorium hosted all plenary sessions and a subset of track sessions, which were streamed throughout the three days. This decision also helped address the capacity issues of the Main Auditorium, as described in section 2.2.

Cumulus Working Groups announced their topics beforehand, and each session was provided with a separate Zoom link to allow for remote joining. Separate Zoom accounts were purchased just for the conference, but here, a small yet serious mistake was made: parallel sessions had been created from the same Zoom account. This was discovered late during the technical checks and fixing the invite links and properly communicating them to working group members and participants caused delays — resulting in one working group being inaccessible online and some other working groups starting late and under frustrating conditions.

Regarding remote presenting, the organisers announced the call for participation with the requirement that at least one presenter per paper be onsite and present in person. However, at the specific request of the Cumulus President and the chair of the Cumulus PhD Network track, an exception was made for

doctoral students. Additionally, already approved speakers who were not able to travel to the venue due to visa issues or last-minute health concerns were allowed to present remotely.

To reduce the risk of technical or connection issues and ensure a smooth transition between speakers, the organising team requested remote presenters to show a pre-recorded video. The videos, which included both the slides and the presenter's face, felt almost as if they were presented in real time. After the talk, presenters were invited to join live for the Q&A online via Microsoft Teams. This solution seemed to be a good compromise between accessibility, quality of experience, and enabling academic discourse. However, in some cases, due to a lack of appropriate communication between organisers and stage managers, dialling in for the Q&A was hectic and last minute. Additionally, some remote presenters expressed discontent as they were not able to follow the track their presentation was part of—since streaming was limited to one room only.

Due to local tax laws, taxation of registration fees differed for onsite and remote participants. This made the invoicing process more tedious, and participants switching from one form of participation to another created extra administrative work, as explained in section 6.8.

6.6 Food and Catering

The university canteen, which is already busy on normal university days, has limited capacity. Therefore, it was decided to close it for the event so that the space could be utilised by an external catering company. This required proactive communication with stakeholders, university leadership, and the student union. To ensure lunch was served smoothly and on time and to avoid jeopardising the packed conference schedule, food boxes were handed out to participants. This allowed for much quicker service and enabled participants to use multiple areas of the campus, including the garden, to eat their lunches — both of which proved to be highly effective. However, it also generated significant amounts of (recyclable) waste and offered less flexibility for participants to choose their meals compared to what would have been possible with a buffet-style catering solution.

6.7 Campus Wayfinding

MOME Campus has seven buildings, and the floor numbering can be difficult to understand. As a result, a consistent room naming convention, dedicated host personnel, wayfinding communication, and a detailed campus map (Figure 11) were implemented. Still, onsite participants often found it challenging to navigate and locate the 24 locations spread across six buildings.

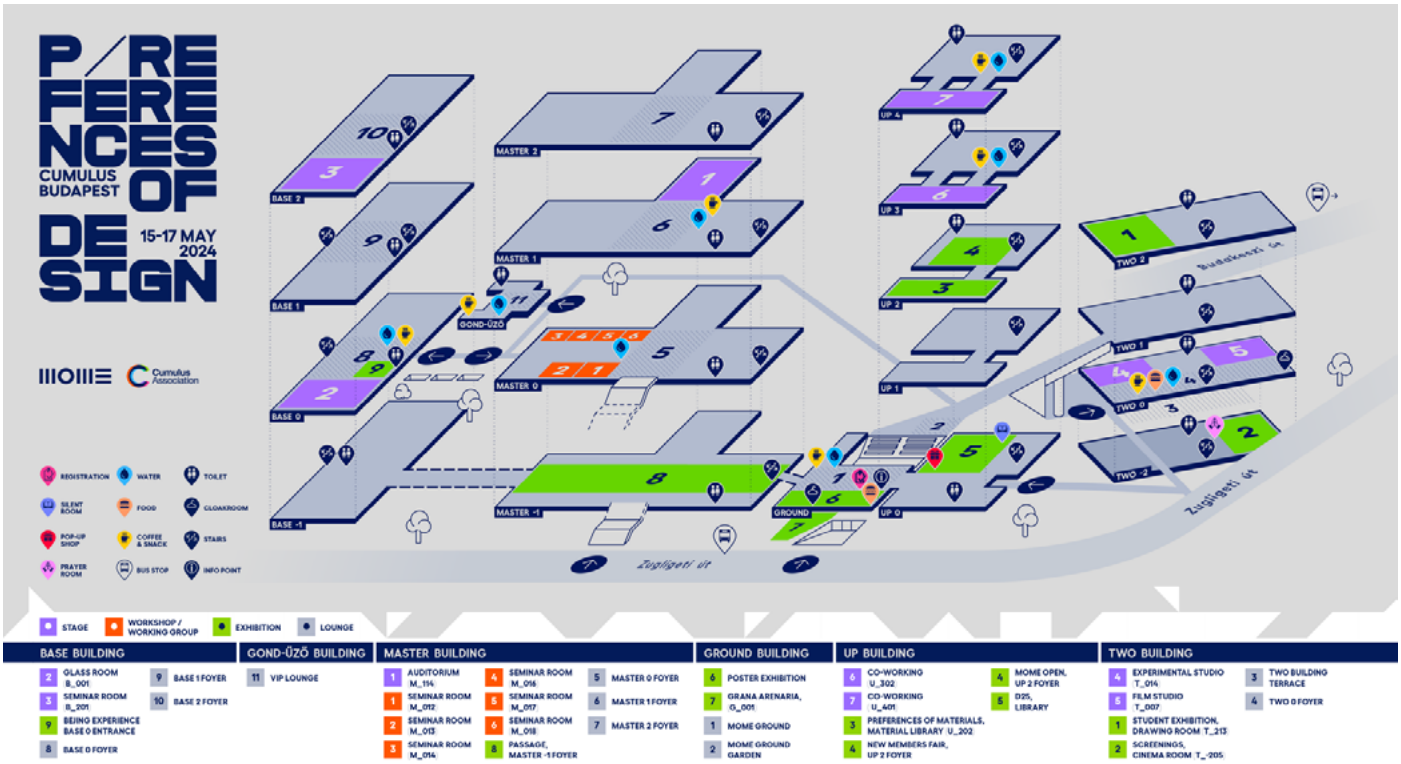

Figure 11. Conference and campus map.

6.8 Invoicing

Invoicing, though less visible, is a crucial aspect of the event organisation, and proved to be a significant challenge for the organising team. One of the reasons for choosing the Ex Ordo conference management system was that it covers most aspects of conference organisation: submission and review management, communication with authors, programme management and publishing, registration, and payments.

One shortfall discovered during the process was that the invoicing solution of Ex Ordo was not compliant with local tax authority requirements. For instance, the interface did not collect tax IDs, which are required for issuing invoices in Hungary for organisations. The hybrid participation model also posed challenges under local tax laws: the VAT rate for the registration fee differs for remote and onsite participants. A complex taxation scheme had to be followed based on the following criteria: whether the participant is onsite or remote, whether the buyer is an individual or an organisation, and whether the buyer is from Hungary, the EU, or a third country.

Taking all these complexities into account, and following a failed attempt to automate the process, the organising team and the finance team at MOME had to make the difficult decision to issue all invoices manually and accept it as an administrative overhead.

6.9 Communication with Authors

The organising team created a shared email inbox to manage all communications with attendees. While this worked well technically, the effort required to communicate with individual participants — whether regarding their submissions or the review process, practical details such as finding accommodation and issuing invitation letters, or last-minute changes requested by authors that affected the programme schedule — was vastly underestimated.

7. The Conference in Numbers

The conference showcased impressive submission and participation efforts. Over 700 submissions were received for the call for participation. Attendees hailed from 58 different countries, with more than 600 attendees in total, including 450 paying onsite registrants. The remainder of the participants were onsite contributors from MOME and other institutions, including track chairs and session chairs, representatives of the Cumulus Association, and online participants.

Communication with participants was overwhelming and required constant dedication: the central email address saw 300+ email threads; additionally, over 1,000 direct messages were exchanged through the Ex Ordo conference management platform, and over 5,000 system messages were sent out by the platform.

Administrative works had to follow: over 450 invoices were issued manually, 60 visa invitation letters were issued, and more than 100 certificates of participation were provided. Over 85 contracts were signed, and 100 incoming invoices were paid. Over 80 briefs were given to the graphic designer, reflecting the extensive work needed to prepare the venue and the event. The conference experience was totalled with exhibitions showcasing projects by 41 students and 12 screenings. Over 40 design items and books were featured in the Pop-up Shop.

The event reached 99,000 people with over 275,000 social media appearances and more than 20 press articles.

8. Participant Feedback

A feedback survey was sent out to participants approximately one month after the event. Due to the late send-out date, the number of respondents was relatively low: 43 people filled it out from 607 recipients (3 emails bounced back from the original 610 target recipients).

Table 3. Participant feedback was collected through a survey.

Number of responses within a question group (r), number of ratings (n), score on scale 1–5 average (a), % of positive responses (p).

Feedback gathered from open-ended questions can be summarised as follows:

Top positive sentiments:

- Networking Opportunities: Many participants highlighted networking as one of the best experiences, with comments like “meeting the participants,” “networking with other universities,” and “interaction with colleagues from all over the world.”
- Quality of Event and Presentations: Attendees appreciated the quality of the conference, mentioning “high-quality speakers,” “impactful presentations,” and “quality of conversation and papers.”
- Venue and Atmosphere: The venue and atmosphere were praised, with statements such as “fantastic campus,” “friendly and welcoming environment,” and “organised thoughtfully and in detail.”
- Organisation: The organisation of the event was described as having a “designerly quality,” being “very well organised, with passion and care,” and “organised very thoughtfully and in detail.”

Top negative sentiments:

- Hybrid/Remote Participation Issues: Remote presenters faced challenges like limited access to tracks, lack of proper communication and preparation, and technical issues with pre-recorded videos not being played on time.
- Program and Organisational Challenges: Participants expressed frustration over overwhelming schedules, too many programmes running parallel, complicated conference app, the late announcement of the final programme, and difficult campus navigation.
- Inclusion and Accessibility Concerns: There were mentions of limited tickets for the gala dinner and the lack of diverse voices in keynote presentations.

The feedback survey was sent out to all 610 attendees of the event. As such, it does not include feedback from academics who chose not to submit an abstract for any reason, whose contributions were not accepted, or those who withdrew their contribution from the conference.

9. Conclusions

As seen from the participant feedback collected, Cumulus Budapest 2024 was overall considered a successful event. The quality of the content, the breadth of topics discussed at the conference, and the networking opportunities provided a deep professional experience, while the venue setup, attention to detail, the variety of on-campus programme items, and the accompanying social and cultural programmes offered a rich visitor experience.

Identifying potential risks early in the organisation process helped mitigate key challenges. Most organisational or technical issues, except one — remote participants being unable to join one of the Working Group meetings as described in section 6.5 — were resolved promptly behind the scenes.

In terms of programming, three areas are recommended for reconsideration by future organisers.

Accepting over 170 contributions with presentations meant that presentation sessions were running in 7 parallel rooms while working group meetings and workshops were held in 6 additional rooms. Having 13 sessions running in parallel created audience fragmentation and evoked a sense of FOMO (fear of missing out) among participants.

Cumulus working groups enable members of the Cumulus network to engage in discussions about various topics regularly. Onsite meetings during the Cumulus conferences provide an opportunity for working group members to meet in person. However, some of the Working Group meetings were in fact mini symposiums embedded in the conference programme with local speakers invited. The value of such meetings should be revisited, as they may not always align with the intended goals of the working groups and create unnecessary competition for other sessions at the conference.

Enabling online presentation and participation, while inclusive, brings many logistical and budgetary challenges. Proper streaming is costly, and managing online audiences and presenters requires dedicated resources and attention.

9.1 Practical Recommendations for Future Organisers

- Run pre-mortem sessions to identify potential risks early and mitigate challenges.
- Thoughtfully and respectfully reject last-minute requests.
- Assign a dedicated person to manage the shared email inbox and correspondence with authors and attendees.
- Hire a dedicated event manager to oversee logistics, scheduling, and communication with conference staff.
- Dedicate personnel for specific tasks: event management, working groups, workshops, onsite host coordination, info desk, and exhibitions. These roles are critical to handling the scale and complexity of the event.
- Limit the number of working group meetings and parallel sessions to maintain a cohesive programme.
- Improve hybrid participation through robust technical checks, clearly defined roles and responsibilities, and detailed communications with track chairs, session chairs, stage managers, and A/V technicians.
- Enhance wayfinding and onsite support to assist with navigation.

- When planning the submission and review process timeline, account for submission deadline extensions, inevitable delays in the peer review process, and the time required to manage submissions, communicate decisions, and respond to inquiries.
- Provide templates for contributing authors to streamline the layout editing process.
- Define file naming conventions upfront to avoid working with files named like “Camera-ready.docx.”
- Remind authors with draft submissions to complete the submission process.
- Ask authors to always reference their submission ID in correspondence.
- Brief reviewers to provide actionable feedback to their reviewers.
- Configure the submission management system in ways that make written feedback mandatory and visible to authors.
- Develop strict timelines for presentation file collection and management, moderator and stage manager briefing, and technical checks.
- Integrate legal disclaimers (e.g., copyright statements) into the submission and registration workflows.
- Automate processes wherever possible, including issuing visa invitation letters or certificates of attendance or contribution.
- Avoid leaving technical checks or installation works for Day 0; complete them by Day -1.
- Avoid manual invoicing; outsource it to a company if at all possible. Choose a payment provider with whom you have prior experience.

Cumulus Budapest 2024 was a highly successful conference in terms of networking, quality content, and experience delivery despite the organisational challenges. The lessons learned and shared above provide a roadmap to streamline processes and improve future conferences of similar scale and complexity hosted by the Moholy-Nagy University of Art and Design Budapest and other universities within the Cumulus network.

About the Author:

Attila Bujdosó works as strategic design lead at MOME Innovation Center and is the conference chair for the Cumulus Budapest 2024 conference. In 2019, he published Social Design Cookbook: Recipes for Social Cooperation. His research interest lies in designing social systems. Previously, he worked as lead UX designer at BlackRock, co-founded collaboration software startup Opp.io, led design research projects at Kitchen Budapest new media lab, worked as an architect for ONL, and was curator at Hungarian Contemporary Architecture Centre. His works have been exhibited at the Venice Architecture Biennale, Transmediale, Science Gallery, DOX, and Pixelache.

Acknowledgements: The conference chair would like to express his gratitude to the members of the organising team—including Andrea Kovács, Györgyi Falvai, Dóra Juhász, Nóra Comas-Demők, Dr. Judit Kollár, Vivien Andavölgyi, and Zsófia Zubay—for their dedicated work in making the event a success. Special thanks go to Ákos Karácsonyi for tirelessly managing invoices.

He would also like to thank the members of the scientific committee—including Ágnes Karolina Bakk, Miklós Erhardt, Tamás Fogarasy, Boglárka Jakabfi-Kovács, Mary Karyda, Anna Keszeg, Ákos Schneider, Bori Fehér, Márton Szentpéteri, and Bálint Veres—as well as all track co-chairs and session chairs for facilitating meaningful discussions and driving the conversation.

Gratitude is extended to MOME faculty and staff, sponsors, and partners for their invaluable support and contributions to the conference. He would also like to thank the invited speakers for accepting the invitation to participate.

Sincere thanks go to all who entrusted the organising team by submitting their proposals and contributing to the conference. Appreciation is also extended to all reviewers who volunteered their time to peer review submissions, thereby enriching the academic discourse.

The track was devoted to tantalising tensions between mainstream contemporary design cultures and those of (semi)peripheral capitalisms and emerging third world and global south countries. In this respect the issue of the total aestheticization of the world proved to be of high eminence considering the way how spectacularly did unsustainable late capitalism apply design and the hegemony of consumption as a means of the (an) aesthetization of consumers and the corresponding total virtualisation and alienation of citizens living in a "sublimated slavery" (Herbert Marcuse) in which basic human rights and dignified living conditions are no longer tenable. The neoliberal McDonaldisation, a particular type of colonisation that swept through the post-socialist region during and after the political regime changes is a unique phenomenon that is yet to be fully understood in the broader perspectives of the apparent failure of liberal democracies in the region. Neoliberal colonization went hand in hand with destabilizing processes of postmodernist relativism and criticism of classical liberalism which brought with it different anti-humanist and anti-Enlightenment subversion on behalf of mostly leftist cultural studies and critical theories that in turn gradually became hobbyhorses of new authoritarian and illiberal cultural and political streams as it is now rather clear from Fareed Zakaria's, the late Ulrich Beck's and Francis Fukuyama's recent works. Furthermore, the postcolonial situation of the global south was also in our focus, because thought- and meaningful comparisons help us better understand our pretty diverse anamneses and find mutual diagnoses and promising prognoses together on a global scale.

We invited scholars and design educators to discuss options for critical and speculative design and practice-oriented design culture studies interventions that can help better understand the recent past and in turn, create new perspectives for a better and more humane future with dignity. The power of criticism either written or built in art and design projects was of high interest in this respect as in the case of fashion and design education for example.

The global power structures within contemporary design cultures are converging in a specific field of design pedagogy, fashion and textile education. Fashion is often regarded as the “black sheep” of design, seen as excessively dominated by capitalist market forces and a no-go zone. However, it has recently become more receptive to speculative perspectives that offer systemic critiques of the industry. Concepts such as deep localization, design research as an ethical stance, and textile connectivity, alongside criticism of the overly optimistic promises of pluriversality, were central themes addressed by researchers in the sessions. While capitalism has traditionally anchored fashion to the market, education appears to be creating an alternative pathway -- one that challenges the system by cultivating a differently educated workforce. A fundamental question arised during the conference: “Could this be the foundation for systemic change? Could this guarantee a fundamental switch to a new paradigm?”

KEYWORDS | LOCALISATION, CULTURAL RESILIENCE, INTERNATIONAL FASHION EDUCATION, TEXTILE KNOWLEDGE SYSTEMS

ABSTRACT | Western design cultures continue to propagate specific concepts of modernity, globally, at the expense of local, non-western and sustainable traditions which have been described as sacrifice zones in the expansion of the global fashion industry. In addition to the large number of international students that enrol in design schools in the UK and Europe each year, one of the enablers of this form of neocolonialism has been the international expansion of many Western design schools. Is there, now, a responsibility for these schools to help preserve and promote the cultural crafts and clothing systems that the global fashion industry has all but erased? Are there, in fact, some particular advantages that these schools might bring to supporting endangered traditions? This research offers a case study of ways that deeply-localised, design-led, project-based learning equips Indian students studying at an international fashion school in India with deeply-contextualised skills and knowledge. At the request of the artisan community of Kotpad, Odisha, mediated by project partner Creative Bee, Hyderabad, and guided by ongoing dialogue, the project aims to assist artisans in negotiating change by preserving knowledge of and promoting an at-risk textile tradition through a series of staged interventions, in the hope that this may defend their craft against macro and micro local and global challenges, including continuing forms of colonisation.

1. Introduction

1.1 Fashion and Capitalism

Fashion has been described as the favourite child of capitalism (Sombart, 1902): dependent on the rapid obsolescence of goods that must be replaced by the *new* in a cycle of perpetual growth, and therefore is dependant on a system of escalating resource extraction (Hickel, 2021, Marx, 1990). An insatiable quest for modernity in wealthy countries has resulted in enormous volumes of low-quality, discarded or unsold garments being exported to less affluent countries in the Global South, much of which ends up in vast dumps, and where eighty percent of the negative environmental impacts of fashion are felt (Greenpeace, 2022).

Western fashion exemplifies a particular paradigm of modernity that has been imposed on non-Western clothing cultures, undermining local expressions and systems of fashion and thus leading to what has been termed as 'fashion sacrifice zones' (Niessen, 2020: 864, Escobar, 2018, Cheang et al, 2021, Torretta and Reistma, 2019). It is beyond time to realise that,

> "…we are living with the legacies of ways of thinking that took their modern shape in the nineteenth century, and it is high time to subject them to the best thinking of the twenty first." (Appiah, 2018: XIII)

1.2 Western Fashion and Its Sacrifice Zones

Fashion sacrifice zones are cultures whose identity – as expressed through clothing and/or specific materials and techniques - has become obscured or even erased (directly or indirectly) by Western fashion (Niessen, 2020: 864). Multinational brands have arisen from the West that contribute to the erosion of local clothing traditions in a number of ways: they continue to colonise more sustainable systems of clothing creation by asserting how fashion should be designed, produced, sold, and consumed at the expense of local, pluriversal clothing cultures that might otherwise articulate their own paradigms of modernity (Niessen 2020, Jansen, 2020, Escobar, 2018, de Sousa Santos, 2014). Fashion sacrifice zones are compounded by the depletion of local resources; changes in local labour opportunities (for example, towards industrial garment production); the transition of a community to become consumers for industrialised fashion; and the swamping of local markets with second-hand clothing from Western countries; and ultimately the loss of knowledge systems on which a local clothing culture is dependent (Niessen, 2020: 865, Jansen, 2020). The extractive practices of capitalism include the ways that traditional cultures are mined and appropriated as inspiration by the fashion industry in clothing collections that rarely acknowledge the source of this cultural intellectual property, or else objectify artisan communities in their reductive marketing communications (Bota Moisin, 2017).

2. Western Fashion Education Today

Much like its fashion system, a Western model of fashion education has been exported to many other parts of the world. Rooted in Eurocentric design histories, ideals of beauty, and the values of unregulated capitalism, the Western model of fashion education trains students to join a fashion industry that is tied to extractive, colonial practices and in thrall to the orthodoxy of growth (Fletcher and Tham, 2019, Torretta and Reistma, 2019, Vettorello, 2023). Until relatively recently, Western education has been unquestioning of its role as a propagator of specific concepts of modernity, globally, that no longer serves us (Machado de Oliveira, 2021, Orr, 1994:5, Dawson, 2019, Vettorello, 2023). We reap what we have sown:

> "Without significant precautions, education can equip people merely to be more effective vandals of the earth." (Orr, 1994:5)

2.1 International Students Studying Design in the UK

UK art and design schools enjoy an international reputation for creative excellence - indeed the two best design universities in world rankings are first the Royal College of Art (for the ninth consecutive year) and then University of the Arts London (QS Top Universities, 2023). A seductive article by the British Fashion Council in India invites potential students to,

> "Step into a world of limitless possibilities in the United Kingdom, where academic excellence meets innovation." (British Council India, 2023)

International students studying in the UK currently contribute approximately £2.25 billion to the UK economy (London Economics, 2023). The largest group of these are from Asian countries (HESA 2023), in particular from China and India. Enrolments from these countries increased significantly between 2017/2018 and 2021/2022, to 151,690 enrolments and 126,535 enrolments respectively, as shown in Figure 1 (HESA, 2023).

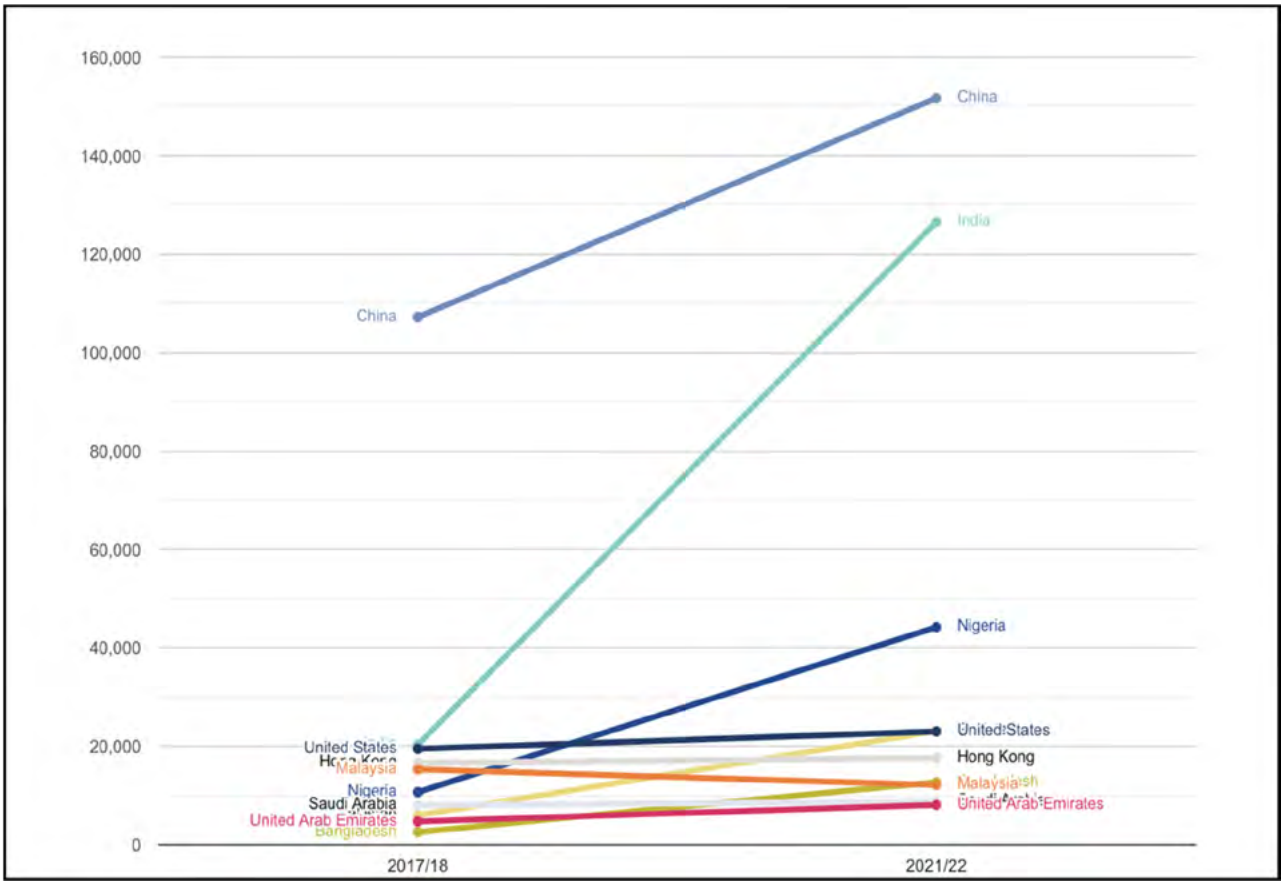

Figure 1. Patterns of growth in Non-EU enrolments in UK HEIs 2017/2019 – 2021/2022, showing a sharp rise in enrolment of Chinese and Indian students (HESA, 2023).

Specialist design universities in the UK have seen a dramatic rise in overseas enrolments in general, and have become reliant on these to fill financial gaps left by government reduction in funding for Higher Education in the public sector or to boost profits (Figure 2). At the Royal College of Art and the University of the Arts, overseas student enrolments have risen from approximately 35% in 2016 to 53% in 2021. Therefore, overseas students represent a significant proportion of the UK student body (Aguilar García et Al, 2023).

Similar patterns of international enrolment appear for EU universities, with 25% of students studying in European countries coming from Asia in 2021, although specific data on enrolments for art and design by nationality was unavailable (Eurostat, 2023).

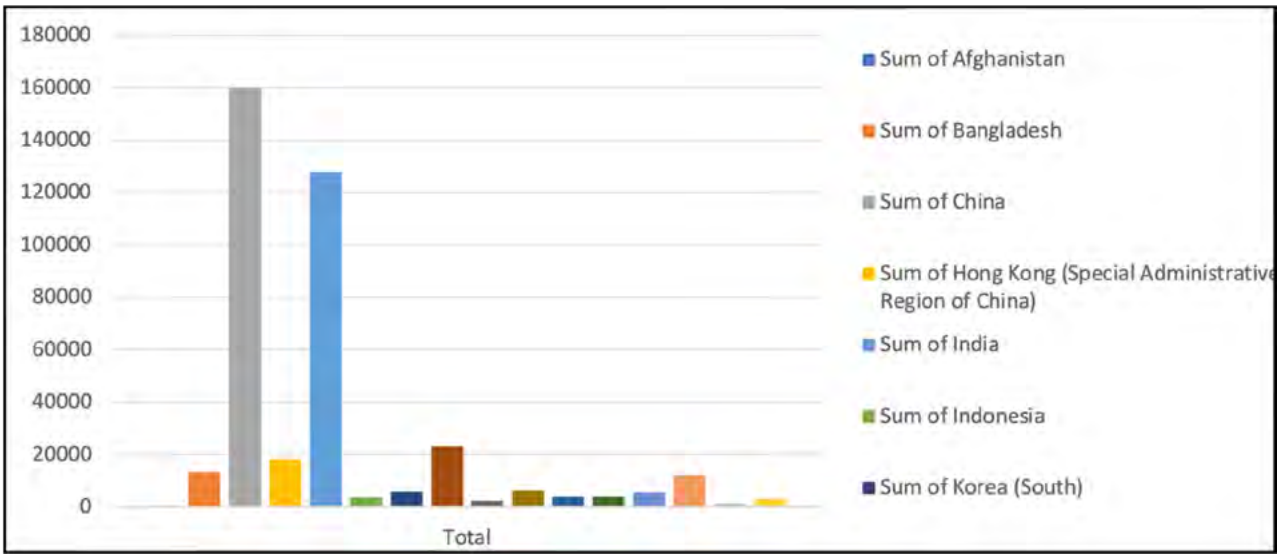

Figure 2. Enrolment data for Asian students in specialist design schools in UK 21/22 (HESA, 2023).

2.2 UK and EU Design Schools Overseas

In addition to the large number of international students that enrol in design schools in the UK and Europe each year (HESA 21/22, Eurostat 2023), one of the enablers of colonialism may be the international expansion of many Western fashion schools. International expansion is here defined as partnerships with overseas institutions (for example, in curriculum development), as project partners or as validating bodies, or through the establishment of an entire school or campus overseas.

Fashion education increasingly is searching for ways to evolve more ethical approaches, while continuing to train young people to join the industry as it is now. While this uneasy compromise fails to drive the urgent systemic change needed for us to live within planetary boundaries and prevent further climate change, students must find employment when they graduate in an industry that has yet to fully comprehend the seismic transformation required of it. It is crucial to critically self-reflect, as Western fashion educators, on our positionality and the values that are implicit in what and how we teach - and to whom (Torretta and Reistma, 2019, Vettorello, 2023). As Haraway reminds us,

> "It matters what stories we tell to tell stories with…it matters what thoughts think thoughts." (Haraway, 2017: 12)

Is there, now, a responsibility for Western fashion schools to actively regenerate the cultural crafts and clothing knowledges – the sacrifice zones - that the global fashion industry and its education system have all but erased? It is of urgent importance to learn from traditional knowledge systems that have existed for centuries, if not millennia, that embody ways to produce clothing in emotionally, environmentally and culturally sustainable ways, which today have all but been erased by Western fashion (Harper, 2018, Chapman, 2015, Niessen, 2020), but how might we do this in a non-extractive way? How, now, might we right the wrongs of a particular form of colonial oppression that has been imposed on non-Western design cultures (Niessen, 2020, Vettorello, 2023)? Are there, in fact, any specific advantages that Western design schools might bring to supporting endangered traditions, if they will work humbly in non-Western settings (Torretta and Reitsma, 2019)?

2.3 Western Fashion Education in India

As indicated previously, Indian students represent a significant proportion of overseas students studying in design the UK and EU today. In recent years, a number of Western universities and design schools have become closely linked with Indian design schools and some have established their own schools.

Istituto Marangoni Mumbai (IMM) was opened in 2017 to bring the values of Italian design to fashion education in India (Istituto Marangoni, no date). The School Director is Indian, the Director of Education of Indian heritage, and approximately 70% of the tutors Indian, with some 30% from other countries. Students may study for two years in Mumbai before completing an undergraduate qualification at one of the European IM schools, or complete a shorter programme after two years.
The teaching philosophy of IMM is one of locally-contextualised learning that is evolving a distinctive identity across all courses. This includes collaborative projects with local designers that promote local heritage, skills and knowledge systems; visits to and collaborations with local artisan communities and textile producers; recruiting inspiring Indian designer-mentors for students; and the promotion of local cultural crafts, which are characterised as true luxury in a counter-narrative to the conventional concepts of luxury in Western fashion.

Fashion students at IMM come from all over the incredibly diverse Indian sub-continent. They are encouraged to research in depth, to look inwards, experiment, and to find new inspiration in their own local crafts. This approach provides students with an opportunity to discover and refine a unique design identity, that is simultaneously rooted in tradition and authenticity, and to construct a culturally sustainable value system that will guide them in their future careers. Multiple workshops and studio visits enable students to work closely with artisans, in their own language, to develop and co-design together. This process equips the artisans with new ideas that may support their livelihoods and enables the students to develop vital skills in innovating with local crafts for local and global markets. Social and environmental responsibility is reinforced by encouragement to use only local, natural, and sustainable materials, through which students build a network of local artisans, suppliers and manufacturers that are invaluable for their future careers. Final-year collections are distinctive in their use of local materials and the application of embellishment techniques created in partnership with local artisans. Graduating students eventually will work with local designers, who require a good knowledge of local and global. Furthermore, affluent urban consumers in India now actively seek out and appreciate the value and beauty of local textile crafts and enjoy wearing modern interpretations of these. Recent praise of and publicity for international designers that use extraordinary Indian expertise and materials in their collections, including the Dior Fall 2023 show that took place in Mumbai, has stimulated a further sense of pride in Indian craftsmanship.

A common challenge encountered by the school is that some artisans struggle to independently innovate for new markets and many cannot afford to experiment with new ideas because of the financial risks attached. Experimentation may require new materials, dyes, equipment and time, and may not result in success and sales. The school is now deepening its localisation approach by attempting to support a hard-to-reach artisan community that faces particular challenges, including through the experimentation and sampling processes required to innovate for new markets.

2.4 Nothing Comes Without Its Worlds

The negative impacts of colonialism, Western modernity and globalisation on India's cultural textile sector have been well-documented (Jena, 2019, Bannerjee and Mazzarella, 2022, Roy, 2020). Europeans have a problematic history in the region, and the British in particular. Until Indian independence in 1947, the British systematically undermined local textile traditions, reducing India to a source of raw materials for industrialised British mills whose fabrics were then exported back to India (Bannerjee and Mazzarella, 2022, Roy, 2020).

India is an example of a country where cultural craft has fought back, where some traditions have been maintained and even successfully recovered. However, in spite of many initiatives designed to support or revive traditional textile knowledge systems by Indian governments over the years, many remain in decline and are at risk of being lost (Tarai, 2022, Jena, 2019). The reasons for this are complex, manifold and to some extent locally specific, however some recurring factors may be identified: the competition to local handwoven textiles from cheaper, synthetic, industrially produced fabric (including sarees, kurta and dhoti); the influence of globalised clothing styles that undermine local identity and influence tastes, particularly in urban areas; the subsequent reduction in market for traditional crafts; the inability of artisans to adapt their designs to contemporary markets that might afford labour-intensive craft; the reluctance of youth to learn time-consuming and highly-skilled crafts, when the market for these is too small to provide a sustainable income; the crafts being associated with the past, rather than representing modernity; a lack of entrepreneurial and IT skills; and other social or environmental factors that may affect the value chain (Tarai, 2022, Jena, 2019, Roy, 2020).

3. The Kotpad Project

At the request of the artisan community of Kotpad, Odisha, mediated by Bina Rao, project partner and founder of Creative Bee, Hyderabad, and guided by ongoing dialogue, a holistic research and design project has been created with IMM and IML to deliver a series of staged interventions that may assist the Kotpad artisan community in negotiating change and in helping to preserve, promote and ultimately regenerate an at-risk Indian textile tradition. The team members from IML, IMM, and Creative Bee hold positions of privilege and power relative to the Kotpad artisans. As much as possible, our activities have been guided by the artisans: by their wishes, their ambitions, their ideas, their skills, and by the limits and possibilities they decide. However, we acknowledge the precarious nature of this intervention, that has at times lapsed into the prescriptive, and have attempted to hold space for the listening that reinstates balance and facilitates cultural sensitivity (Torretta and Reistma, 2019). Bina Rao has a long-standing relationship with the community and has therefore been an invaluable in assisting understanding of local culture, gender and other social politics, religion and environment.

3.1 Plan

This research offers a case study of stage one of a collaborative project between IMM, IML, Creative Bee, and the artisan community of Kotpad. The project offers a lens through which to examine the ways that situated, negotiated and humble research and design activities might articulate a new, deeply localised role for Western fashion education today. It draws on field work that took place in January and November 2023, which included interviews with the dyers and weavers, local youth, and with designers that have worked with the artisans for many years. A review of existing literature revealed that previous initiatives from local government, designers, educational institutions and organisations have not resulted in sufficient long-term benefits (Jena, 2019, Dutta and Maulik, 2021, Tarai, 2022). Analysis of the project activities and findings (to date) identifies the interactions and impacts of diverse ecologies of knowledge (de Sousa Santos, 2014), the potential benefits and difficulties of the collaboration, the challenges that have been encountered along the way, and are foreseen in future.

3.2 Plan/Design

Figure 3 presents the project plan, adapted from Yin (2018), which outlines the processes used for this research. We consider this to be a flexible framework rather than a cage, however, and are responsive to the dynamic and generative nature of collaborative research may be marked by serendipity. Therefore, the sub-headings in the sections below indicate where more than one part of the process has taken place simultaneously.

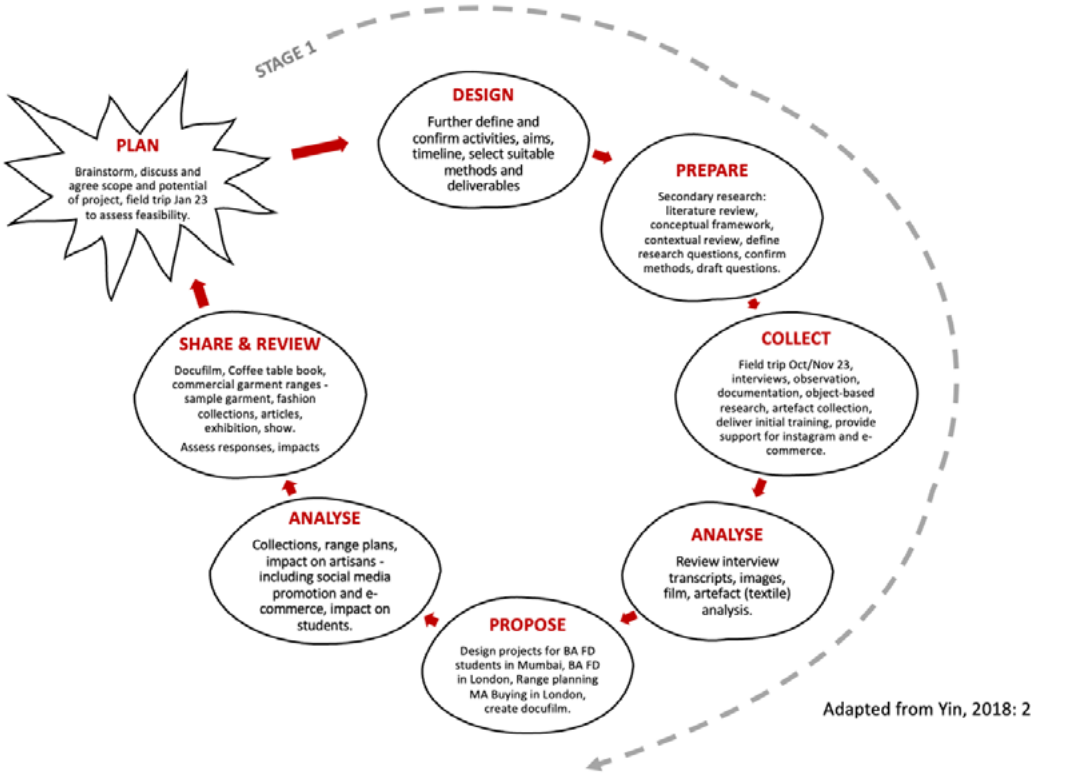

Figure 3. The Kotpad case study process plan.

3.3 Design

The Kotpad artisans wanted to learn how to promote their textiles online in order to reach new markets. They were open to developing new textile designs (within the strict parameters they set on fibre, colour range and weaving technique). For this project, they would like enough work to keep their looms busy for three to six months or longer and to raise awareness of the contemporary potential of their cultural craft more widely in the region and even internationally. They want customers to appreciate the time and skill required by the complex, ancient processes that achieve the deep red of the aal dye and the distinctiveness of their woven textiles, and who would be willing to pay what their work is really worth. Ultimately, they are hoping for an improved market that will enable their craft to continue for generations to come. Creative Bee asked IMM and IML to carefully document all the techniques, processes and products created by the Kotpad artisans so that there is a detailed record of these.

The schools will offer a holistic package that includes documentation of the craft and its skilled artisan community, support with product development for contemporary markets, branding, online promotion and e-commerce. In addition, they will showcase the outcomes in exhibitions and shows that improve regional and international awareness of the potential of Kotpad textiles in fashion that is simultaneously rooted in place and authenticity.

The initial scoping visit to Kotpad by representatives from IMM, IML, and Creative Bee took place in January 2023, after which a plan was developed in consultation with Creative Bee and the Kotpad artisans.

3.4 Prepare/Collect/Analyse

A second visit to Kotpad took place in November 2023, to conduct interviews, document histories, materials, techniques and value chains, to identify the challenges and opportunities that confront this artisan community today. A researcher from IML conducted a series of semi-structured interviews with

weavers, dyers, and youth in the community, as well as with Bina and Kesav Rao, while observing and documenting all processes, investigating local and personal histories, material culture, customs, gender-politics, environmental issues, and their concerns, in order to develop a deeper understanding of the specific local context and the wishes of the community. The interviews with individual aal-dyers and weavers used a similar questionnaire as a starting point, enabling interview data to be triangulated. The group was accompanied by an Indian film and photography crew from IMM to capture local context, people, tools, materials, techniques and processes (Figures 4, 5, 6). Saloni Lakhia, a representative from the United Nations Institute of Training and Research (UNITAR), joined us to conduct a needs assessment for more holistic training that might benefit the Kotpad community, particularly to support women and the local youth. Initial training was delivered in packaging, promotion on social media and an introduction to e-commerce. Bina and Kesav Rao acted as invaluable intermediaries and interpreters with the artisans – some of who spoke their tribal language rather than the more common Hindi.

3.5 Collect/Analyse

Kotpad tribal textiles represent many centuries of situated knowledge of how to produce materials for clothing that are emotionally and environmentally sustainable (Chapman, 2015). However, these precious textiles are no longer economically sustainable. The Kotpad artisan community face the mounting suffocation of their tribal identity, culture, craft and knowledge by intersecting external factors that are outside of their control and by internal cultural factors that are constricting opportunity (Figure 6). Today this community comprises approximately 10-12 female aal dyers and a similar number of male weavers from families that have passed down their knowledge for at least six generations of the Panika tribal group. They trace their craft back to the sixth century, when they claim it was introduced by Kabir, considered a patron saint of weavers.

The techniques used to create Kotpad textiles comprise many labour-intensive, repeated processes and stages (Figures 4, 5, 6). The characteristic deep red, cotton yarn in their weaving takes approximately three weeks to perfect. Women learn aal-dyeing from their mothers or mothers-in-law using the ground root bark of the aal tree (morinda citrifolia) and the dye confers natural, anti-bacterial properties on the yarn. The aal traditionally is harvested and sold by the Alkudu tribal people that gather this sustainably without damage to the tree. They source their cotton yarn from bigger centres in Odisha or in Andhra Pradesh, and tussar silk yarn from Jagdalpur. Other essential ingredients to their complex dyeing process are castor oil, ash water, and cow dung. In addition, they make a deep, warm black dye by mixing jaggery and iron, and have begun to use indigo for dark blue, which was introduced to them by Creative Bee.

Young men and boys learn weaving on pit-looms from their fathers when they are considered old enough – normally at fifteen or sixteen – and the oldest male child is still expected to continue the craft (Figure 5). The traditional motifs in the textiles are created by using a floating weft technique in a contrasting colour (normally red), where additional yarn is woven separately into the warp in an intricate process that requires lifting individual warp threads by hand. There are commonly used motifs, such as fish, but each weaver will create these in their own design (Figure 5). Today there is some government-supported training for girls too, taking place at a small pit-loom centre in Kotpad, and a daily allowance is paid to those undergoing training. Interviews with local people suggest that some attend training for the allowance, rather than a desire to learn the craft and find a future in it. Some men in the community were not happy that women might become weavers, and one woman who mentioned she could weave was quickly silenced by her brother. Regardless of who weaves, there is reduced demand for their culturally-significant textiles, including large shawls that customarily were worn for local weddings (Figure 8), sold in their Sunday markets and further afield in Odisha, Chhattisgarh, and beyond. The market has shifted to a preference for cheaper, synthetic textiles, although the aal-dyers themselves all wore cotton sarees which they find much more comfortable to wear in the heat. Climate change is an additional factor affecting local preferences too, as temperatures have risen in the last few decades; therefore, a lighter, industrially-produced fabric is preferred over slightly thicker, firmer Kotpad textiles. From a thriving craft with more than fifty artisans in Kotpad village alone, the number of practising aal dyers and weavers has declined as a consequence of the factors outlined earlier.

Figure 4. Purnima Samrat, a sixth generation aal-dyer, coating cotton yarn with aal and ash water solution in the dyeing process in Kotpad, 2023. (Vora, T., November 2023).

Interviews with youth in the community suggested that there was great interest in continuing the craft amongst them but they could see no future for it, in current market conditions, so were turning to other forms of employment. The ancient dyeing and weaving processes require great skill, patience and are extremely time-consuming – their local customers can no longer afford these textiles and purchase cheap synthetics instead.

Figure 5. The floating weft technique, used to create motifs and pattern in Kotpad textiles, is extremely time-consuming and requires great skill, Kotpad 2023. (Vora, T., November 2023).

In addition, local development and pollution affect the availability of natural resources. For example, the aal harvesters used to collect the root bark near or even within Kotpad village, but due to deforestation the trees are now around 200 miles away in a forested region controlled by Naxalite rebels. From fluid, local and accessible transactions, sourcing aal root bark now relies on traders coming to Kotpad and thus higher costs. Local government has planted an aal tree nursery a few miles from Kotpad and this should, in time, become a reliable source of dye if the tradition survives that long. The lake near the village where the aal-dyers historically washed the yarn between phases of the dye process is now too polluted with rubbish to use, so they must travel further afield to a river, incurring additional travel costs (Figure 6).

Figure 6. IMM film crew recording the rinsing process that is part of aal-dyeing and repeated at various stages, at a river 15 minutes' drive from Kotpad, 2023. (Scott, K., November 2023).

3.6 Analyse

The Figure 7 diagram summarises the most significant factors that are impacting Kotpad artisans in continuing their craft, providing a sense of the suffocation they experience. Analysis of these factors suggests that there are measures that can be taken in the short term that will improve the resilience of the craft and the livelihoods of the artisans, and which may help to preserve knowledge of the craft before it is lost. The need to preserve this knowledge before it is too late was identified as paramount, followed by support in raising awareness of the craft and finding new markets.

In the short to medium term there are opportunities to promote Kotpad textiles through social media, using visual storytelling with compelling imagery, as well as through design projects that showcase the potential of their work in contemporary luxury clothing. The patterns used in the textiles can be adapted in multiple ways, without changing the technique used. Exhibiting the outcomes online and physically may support the artisans in finding new markets that are able to afford their highly specialised, time-consuming, natural, wholly sustainable textiles.

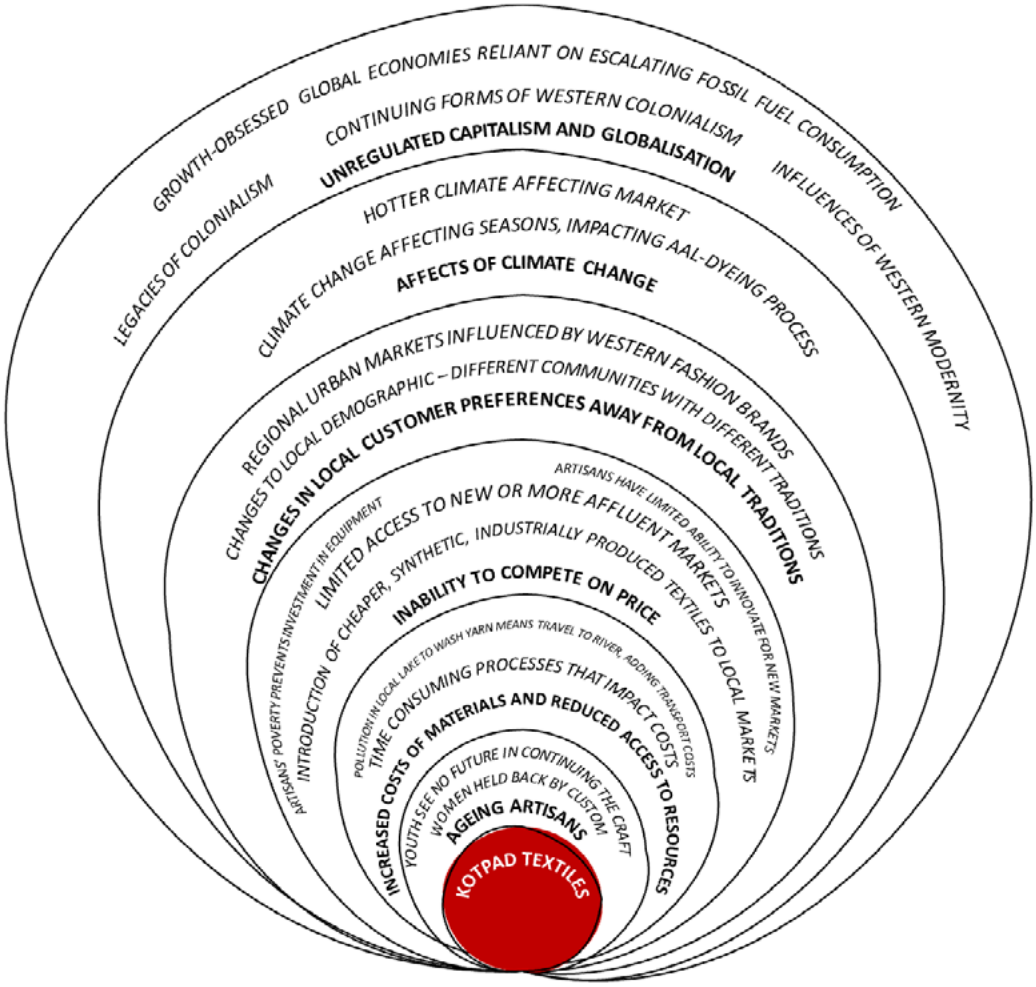

Figure 7. A summary of factors impacting the Kotpad textile artisans, showing the complex macro and micro obstacles that they face.

3.7 Propose

In the short term, a docufilm has been created to capture the lives, environment, histories, culture, skills, materials, techniques, processes and textiles of the Kotpad artisans by a team of film makers from IMM (Figures 4, 5, 6, 8). This film provides an important record of unique people and their situated craft practices for posterity. In addition, an illustrated book will be published that includes more detailed information.

Mevin Murden, Director of Education at IMM, gave some initial training to the younger artisans on how to photograph their stock in the most attractive way, including the important practicalities, such as ironing the products first, how to curate a photoshoot, best lighting, background etc. Mevin's background in luxury branding enabled him to support the artisans with ideas for non-verbal communication (such as packaging, initial logo ideas) that may help to elevate the status of this textile and reach a more affluent customer. IMM fashion business students have since created a brand logo (Figure 9) and an Instagram page for master weaver Purushottam Samrat, who represents his fellow artisans at #purushottam_kotpad. The page is administered by his oldest son Baskar, and will showcase Kotpad textiles to sell directly to consumers rather than to businesses, gaining a better financial return and reaching a wider market locally and internationally. Crucial to this strategy is the powerful visual storytelling that connects community to brand, and repositions Kotpad textiles as a premium product that is socially, aesthetically, emotionally and environmentally sustainable (Harper, 2018, Chapman, 2015).

Figure 8. A traditional style of Kotpad wedding shawl showing some motifs and patterns commonly incorporated in these, Kotpad, 2023 (Scott, K. 2023).

Figure 9. Branding created for the Kotpad artisans by Istituto Marangoni Mumbai Fashion Business students.

Further training will be provided to the artisans on marketing, branding and e-commerce, so that their work can reach other customers in the region. Reciprocity is considered key to the success of this project, where mutual learning is made possible in ways that may help to right the wrongs of Western fashion. This approach reflects aspects of humble design in the co-creation of products and services that is led by local actors (Torretta and Reistma, 2019).

In the medium term (stage 2), IMM and IML students and faculty will offer textile development ideas (within parameters set by the artisans) and fashion designs, commercial range planning, and product development for the luxury sector. Selected small collections and products will be produced as sample garments that demonstrate the enormous potential of Kotpad textiles as contemporary, sustainable fabrics. Some initial orders for existing fabrics have now been placed, while IMM students develop new motifs to be trialled.

It is important to be clear about what is and what is not within our scope to change, as fashion schools and as fashion practitioners. The inequalities and sacrifice zones engendered by capitalism and colonisation are formidable challenges that we are all compelled to address. The complex, structural disadvantages experienced by the Kotpad artisan community require a more systemic intervention than IMM, IML and Creative Bee are able to engineer alone. What we can do – first and foremost – is to listen, then to exchange and develop ideas in collaboration with the Kotpad artisans, and to offer support in specific, design and business-related areas within our expertise that may improve the market and encourage the youth to find a future in an ancient craft. Within our curricula, we can continue to emphasise the value of traditional crafts in ways that may inspire young designers and business students with an appreciation of their own cultural heritage, and of slow and local, place-based systems that challenge Western fashion colonialism. We are able to use our skills, our resources, and our networks (our privilege) to amplify these materials, techniques and processes that embody sustainable collaboration with nature, in ways which may attract others to work with endangered textile knowledge systems. In addition, Kesav (from Creative Bee) has already delivered natural dye training using locally available plants, to increase the range of colours that Kotpad fabrics can sustainably be made in, as well as finding alternative natural mordants. The UNITAR representative that accompanied the team in November 2023 will raise funding for a holistic training in IT, entrepreneurial skills, literacy and numeracy, and empowerment for women and girls that builds the community's resilience in a changing world. In these ways, we may affect longer-term change.

4. In summary

This research reveals how deeply-localised, design-led learning and teaching activities might advance a now crucial role for international fashion schools in preserving, promoting and regenerating traditions that Western design cultures have previously de-futured. It identifies specific challenges that negatively affect the Kotpad artisans, including the impacts of western modernity; it outlines potential benefits that a bespoke designed intervention of this type might offer to all parties; and finally, it suggests that (if they get it right) this role may even be framed as international fashion schools' responsibility today.

IMM and IML were invited into this project by Creative Bee and the Kotpad artisans. Although the project has been designed together, we acknowledge the problematics of a Western fashion school descending on an artisan community in India to offer solutions to the complex challenges they face. While our proposed solutions have been co-created, they may ultimately turn out to be temporary or even ineffective. We ask ourselves whether we are merely re-enacting practices that reflect unequal privilege and power: to some extent we are. However, we believe that we may now have something specific to contribute to a transition away from extraction and over-production in fashion, which advocates for traditions that hold vital clues to how we might live in collaboration with - rather than in opposition to - nature. The benefits of the collaboration to the Kotpad artisans include training and support that may improve their resilience and equip them to reach new markets that can afford the higher costs that slow textiles demand, in the face of competition from low cost, low quality, industrially-produced fabrics. Istituto Marangoni's Italian design roots reflect a historic appreciation for high quality local textiles and the values of craft, legacy and innovation. The school works closely with the luxury sector and is therefore particularly well-placed to

support artisans in developing new ideas and innovation for those contemporary markets that can pay the premium that slow, handcrafted materials require; to provide guidance with branding, packaging and promotion that amplify the luxury of their craft; in developing e-commerce capabilities; in the documentation of their craft for posterity, through a docufilm and a significant publication; and with shorter-term financial support in the forms of orders for project sampling and experimentation.

The students and tutors at IMM and IML benefit enormously by learning how to work pragmatically and creatively within boundaries dictated by the artisans themselves; being able to see the textiles developed in collaboration with the artisans realised and showcased in small fashion collections; by learning to define implementable range plans and create sample garments suitable for small-scale production that amplify the local; and by increasing their knowledge of and appreciation for the value of craft traditions today. The design process is naturally constrained by the seasonal availability and sustainable supply of the raw materials required for Kotpad textiles, and by lead times that must accommodate fluctuating weather conditions that impact dye processes. Such restrictions are rare in an industry built on exponential growth, and resource use. Today it is crucial to re-learn how to work within natural limits in the face of enormous environmental and climate challenges. This deeply-localised approach reveals how we might reconnect with limits and begin to hospice and transition away from the mainstream, while regenerating traditions that have sustainably been performed for centuries, to re-materialise a pluriversal fashion system that is characterised by less and better. On completion of stage two of this project, completed collections will be analysed to measure the ways that students have responded, comparing outcomes in Mumbai and in London, interpreting the meanings of this, and gathering feedback from the artisans, Creative Bee, potential customers, and the press. We will reflect on this analysis, learn from it, and may need to adapt our strategy accordingly. We will evaluate the success of the Kotpad Instagram account in raising awareness of the endangered craft and increasing sales.

As a global community of fashion and design educators, we have the privilege (and responsibility) to shape the values that will best serve people and planet, by training young designers to be able to challenge the hegemony of mainstream fashion. By consistently embedding localisation deeply in learning and teaching practices – and by privileging local traditions and skills over dominant fashion mores – international fashion schools may decolonise design teaching to support cultural resilience, while developing curricula and activities that offer multiple benefits to students, faculty and the wider community. If collaboration is formed with artisans that have suffered as a result of colonisation and globalisation – and is led by their voices rather than imposed in an unequal power dynamic - there may be opportunity to redress (in part) violence committed by the global fashion system. This research, while focuses on fashion and textiles, may be significant to all other design disciplines emanating from the West.

KEYWORDS | CIRCULAR DESIGN, MEDITERRANEAN CULTURE, CLADDING BUILDING SURFACES

ABSTRACT | The Mediterranean region, renowned for its diverse cultural heritage, faces challenges posed by globalization and environmental factors. Circular Design, rooted in sustainability principles, emerges as a solution to preserve its unique identity. This study explores Circular Design's role in safeguarding Mediterranean cultural heritage amidst global changes.

Circular Design promotes sustainable practices and materials, revitalizing traditional crafts while aligning them with modern environmental standards. It addresses environmental issues like climate change and resource depletion, reducing ecological footprints and enhancing resilience.

This research integrates Mediterranean architectural culture, developing modular ceramic-based products with solar functionalities for construction. These modules, encompassing passive and active solar features, offer innovative solutions for cladding building surfaces. They integrate elements such as solar thermal collectors and photovoltaic systems, utilizing materials like cork, ceramics, glass, copper, and composites.

The resulting system allows versatile applications, demonstrating the fusion of sustainability, aesthetics, and technological innovation. Circular Design fosters a harmonious blend of Mediterranean architectural identity and solar functionality.

In conclusion, Circular Design bridges tradition and progress, ensuring the preservation of Mediterranean cultural heritage. By embracing circular principles, the region navigates towards a balanced coexistence of tradition and modernity, safeguarding its vibrant cultural legacy amid contemporary complexities.

1. Introduction

The project offers us the opportunity to reflect on the evolution of our design practice and our most relevant concerns. Over the last twenty years we have witnessed the new paradigms of cultural globalization. Architecture needs to use mechanisms, forms and materials that link it to its local culture and identity.The growing interest in sustainable architecture is causing an evolution in design processes and project strategies.

> "Solar radiation is the main source of renewable energy. As well as providing a direct source of energy, it regulates the Earth's climate and gives us the opportunity to obtain energy from wind, waves, tides and a host of biological sources [...] As all aspects of the climate depend on the sun, it is logical to define the techniques adopted in buildings to take advantage of this action as 'solar design'." (SMITH, 2001, p.12.)

Our ancestors used simple and ingenious strategies to build their homes, neighborhoods, public spaces, villages and even advanced solar cities. (GUZOWSKI, 2010) The sun and the wind inspired every aspect of Mediterranean architectural development, from construction to layout, from materials to details. Both were always there to cover lighting, heating and cooling needs.

Vernacular architecture that truly utilizes the sun and the wind is more than a sum of passive strategies, technological systems and ecological engineering. Buildings whose forms are defined by these forces of nature reveal how we can utilize renewable resources, promote social, cultural and ecological values and also offer aesthetic values by creating relationships with the place and surrounding environment, supported by references and poetic and modeling attributes of these forces.

Ceramics have a lot of potential as a creative and constructive material for sustainable architecture in a new scenario where the environment in which the city is immersed, the scarcity of resources and the well-being of the community have to be taken into account. Ceramics is a universal material that has been present in architecture for centuries as an ornamental and structural element. Its innovative and avant-garde capacity has led it to become a recurring and prominent material in sustainable architectural projects. Its advantages are increasingly greater than those of other alternative materials. The aesthetic characteristics and customizability of ceramic tiles make it possible to multiply the creative possibilities of architectural projects. In addition to its technical performance and properties, it meets the requirements and assumptions of responsible and ecological construction, minimizing its environmental impact on the environment and its inhabitants.

2. Project Background

> "Ecodesign is the art that reconnects us as sensitive beings who have evolved over millions of years in a marvelous world. We don't need to remake this world, we need to reveal it. To achieve this, we don't need to do more research, we need to rediscover old and forgotten things." (ORR, 2002, p.34)

In the 1990s, sustainability was a matter for specialists, but today it has become a generalized and paramount awareness. Climate change and the scarcity of resources have become the center of discussion. Western societies must reduce carbon emissions by 50 per cent. Construction, a sector that contributes around 40 per cent of carbon emissions and consumes 50 per cent of our societies' energy, must obviously contribute to this goal and the most pressing question for architects and designers at the moment is how they can contribute and how their activity can influence their way of thinking and their professional habits. It's worth considering both options: the passive reduction of energy consumption through intelligent design, and the active application of energy development or energy generation technologies. The new paradigm has to affect the way we design new buildings, as well as the understanding and applicability of these new technologies in pre-existing constructions. (HUTTON, 2009).

The new generation of ecological architects and designers has been developing new and effective ways of integrating passive design and active systems into projects that combine the ancient traditions of bioclimatism with the most advanced technologies. By responding to the forces of the sun (and the related dynamics of wind, climate, place and the cycles of the seasons and the rhythms of day and night) these projects address ecological issues and also fulfill our deepest aesthetic aspirations. The great sense of urgency has provoked a new spirit of innovation and design exploration, as well as a greater commitment to redoubling the efforts needed to achieve a-greater ecological response.

> "Architecture that truly utilizes the sun and wind is more than the sum of passive strategies, technological systems and green engineering. The new solar architecture has a slim profile that optimizes light and air; it employs an ecological envelope that is sensitive to site and environmental forces." (GUZOWSKI, 2010, NP)

Solar architecture cannot be reduced to a few isolated measures, such as installing thermal collectors or photovoltaic panels on the roof. The building must be seen as a complete configuration - a total energy concept that makes the best possible use of local natural resources, such as solar, wind and geothermal energy, to fulfill a series of requirements. Passive and active measures complement each other in this approach, from the orientation and division of the building to the integration of systems to produce hot water or electricity. Flexible façades, regulated by intelligent control systems and capable of reacting to changing climatic influences and conditions, offer interesting contributions (SCHITTICH, 2009). In the main examples of the new solar architecture, there is a hybrid approach, which integrates passive and active systems from the earliest stages of design conception. This will be the path towards sustainable and energy-efficient solar architecture.

> "It starts with the use of passive solar energy, which is easy to implement and reliable [...] it can be adjusted using intelligent, self-regulating control technologies. Finally, it combines passive and active solar systems [...]. The key words in this field are hybrid solar systems, micro-climate building envelopes and self-regulating façades. This development of intelligent solar architecture will lead to new technologies and a new architecture that is eagerly awaited." (HEGGER, 2003, NP)

The project presented here is the result of a complex evolutionary process (survey, analysis, proposal and communication). It was not just the manipulation of forms, but the search for a foundation, at the intersection with other design disciplines and other areas of knowledge. Within his operational context, the designer has to bear in mind, on the one hand, all the cultural heritage derived from the memory of a material culture built up and refined over centuries, and on the other, the evolution of socio-cultural models and new social contents. The project thus gains a condition that allows it to intervene in societies and their values. It has the ability to create new functions and forms of use, to change habits, to activate feelings, to modify the relationship we have with the built environment. Architecture is not just functional, it must be intervening, responsible and transform the perception we have of ourselves, our way of socializing. Searching for the archetypal roots of architecture and the habits or uses it conditions through a design activity that is contextualized in the present become necessary tools for building our identity. In this process, the designer interacts as a filter in the dynamics of the group (society), but also imbues the project with his own language, his perception of the world, his emotions, his cultural values, his personality and his individual identity.

2.1 Design References

Figure 1. Detail of BAHÍA PALACE, Marrakech. Photo: Raquel Salomé, 2010.

After deep reflection on Mediterranean geometric patterns, the natural choice of geometry for the project was the hexagon. According to El-Said, it is the most important geometric figure in Islamic art. (BARBOSA, 2007)

The hexagon, like the square or triangle, is able to cover the plane without the participation of another shape. The realization shown here in figure 12 is the application of the star-shaped hexagon. We are thus trying to determine the basic geometries of the complex Islamic patterns (figure 13).
We tried to dismantle all the formal complexity by analyzing the specific characteristics of Islamic art found in each of these ancient creations in gebs (Moroccan sculpted plaster).

The figure of the hexagon is present at the base of almost all geometries, from interlacing to floral decoration, from calligraphy to mougarnas (honeycombs in stucco decorations, wood, on columns and capitals). The hexagon itself functions as a versatile unit of repetition, and is the most common basis for repetition schemes (El-Said & Parman, 1976). Many designs that are apparently very different from each other are drawn from hexagonal networks, as illustrated in figure 2.

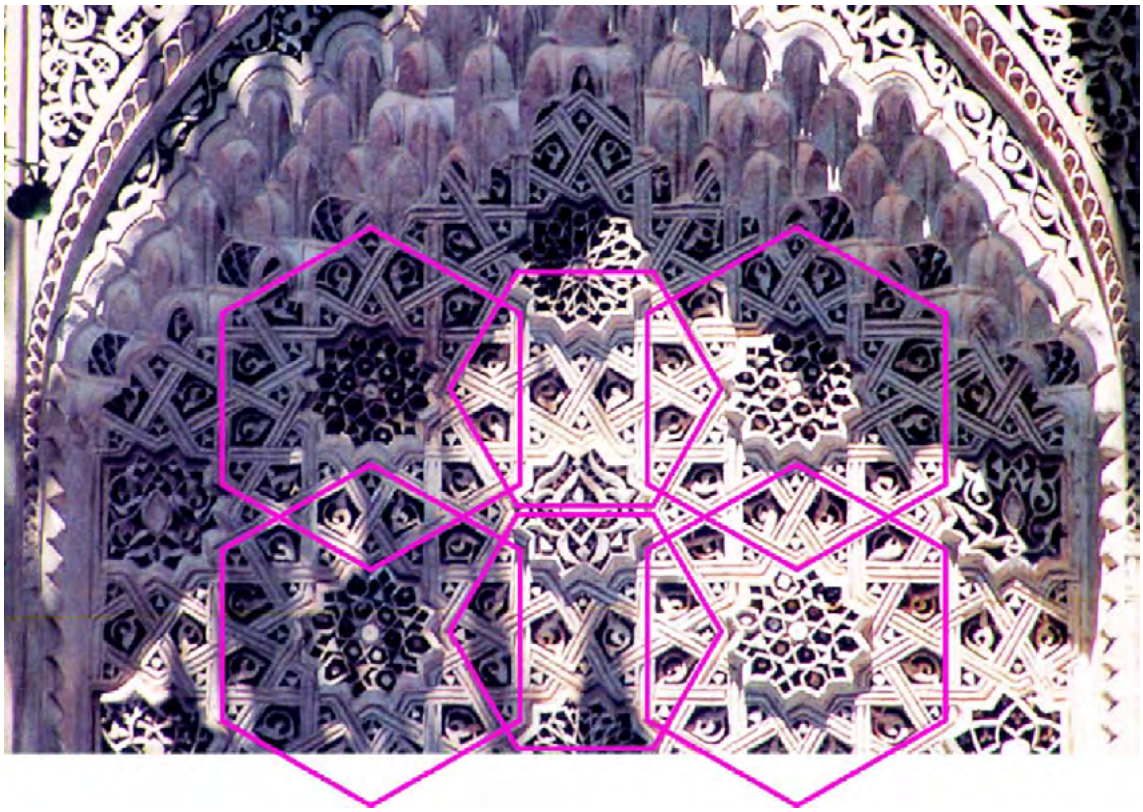

Figure 2. Basic geometries of the complex Islamic patterns. Detail of BAHÍA PALACE, Marrakech. Photo: Raquel Salomé, 2010.

Identification of secret geometries. Here are some of the constructions and properties of the hexagon and the six-pointed star used in geometric drawings.

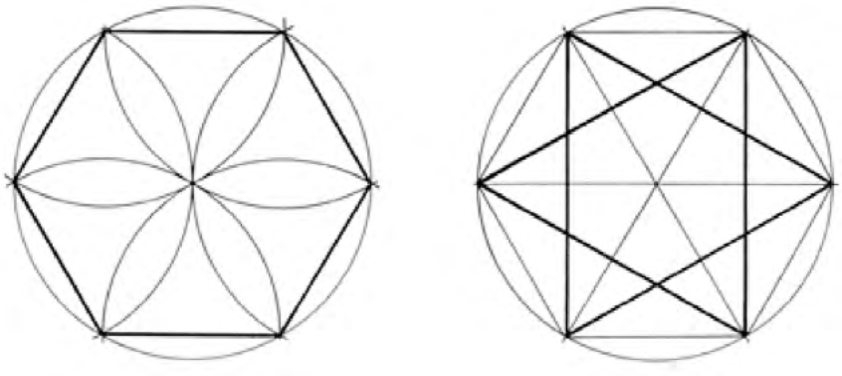

Figure 3. The radius can divide the circumference of a circle into six equal parts. Joining the resulting six points with straight lines creates a hexagon. Joining alternate points with straight lines creates triangles which, in turn, give shape to a six-pointed star.

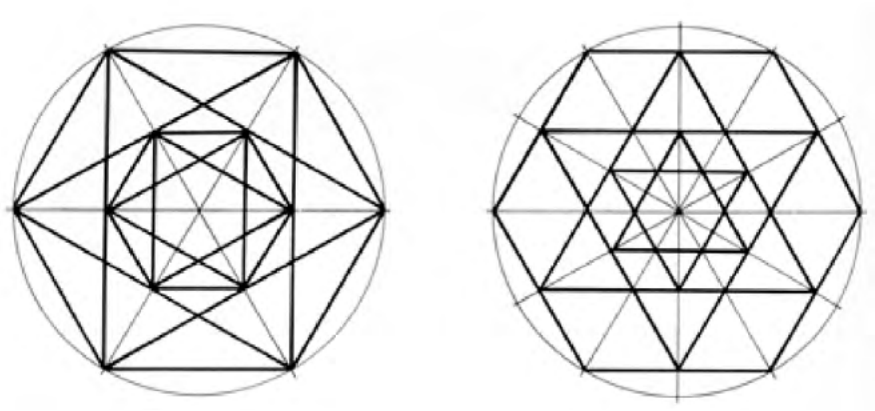

Figure 4. The ratio between the diameters of hexagons based on concentric six-pointed stars drawn from the angles of the hexagon is 1:2.

When the concentric stars are drawn from the midpoints of the hexagons, the ratio between the heights of the hexagons is also 1:2. The ratio between the diameter and height of the hexagons is a root of 3:2.

The repeating unit of the following design was built in two phases: in the top row the double hexagonal frame is based on two hexagons. In the second line, the star is drawn on a grid of three squares (BARBOSA, 2007).

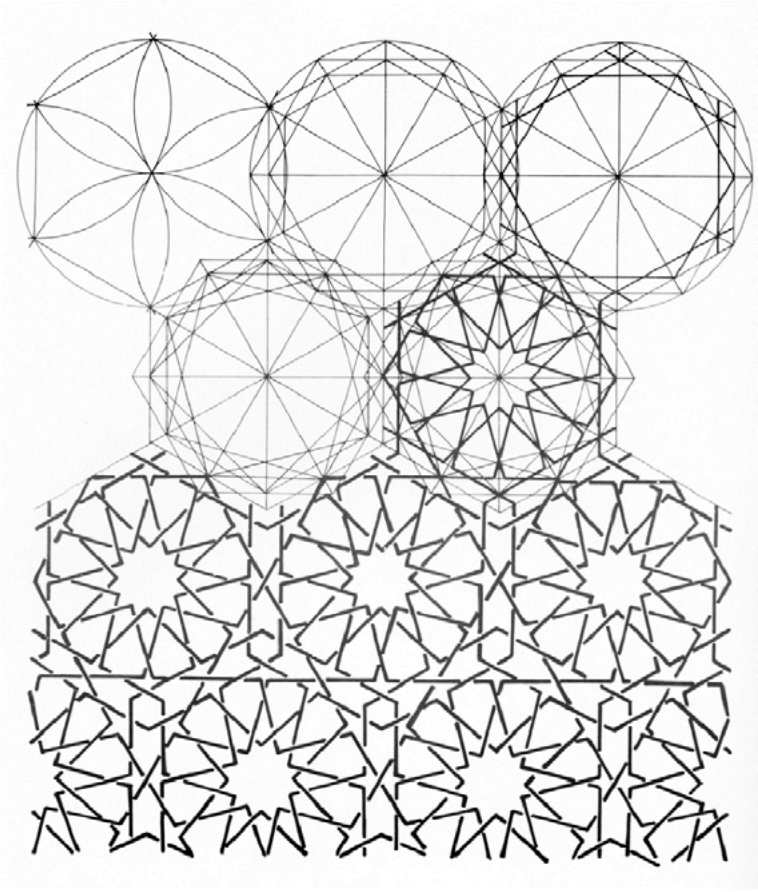

Figure 5. Design created from two overlapping grids (hexagonal and quadrangular).

The motifs were made using a regular weave of hexagons, identical to a weaving. A large-scale hexagonal motif is emphasised above this weave, with a play of more superficially worked areas that act as white dots which, when moving backwards, are read as continuous lines.

Figure 6. Room opening onto the courtyard PALÁCIO BAHÍA, Marrakech, image by Raquel Salomé, 2010.

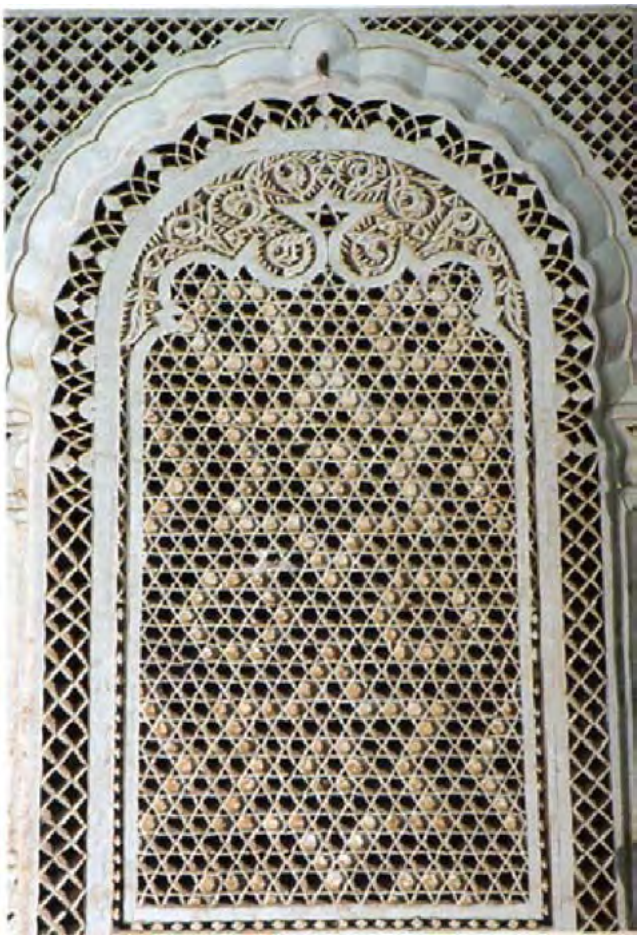

Figure 7. Detail of BAHÍA PALACE, Marrakech. Photo: Raquel Salomé, 2010.

The lacy stucco openings enhance the “venturi effect”. Here are some more magnificent examples of Islamic patterns painted or carved in wood, where the twelve-pointed star inscribed in a hexagonal grid is used (as seen in figure 6 and 7).

2.2 Project Design: Formal/Aesthetic Assumptions

Once the geometry for the construction of the module - the Hexagon - had been found, the process of sketches and drawings that preceded the project began. The aim of the project was not to create a new shape, but to find the essence of the geometrization of Islamic art. The aim was to interpret forms, recreate them and decontextualize them in new contemporary environments.

The advantages and constraints of the chosen shape, the applicability of the selected materials, the support structure and the study of details were identified. Here are some sketches of the preliminary project.

It began as a hexagonal ceramic module, with a glass opening in the centre to let light into the building, an air box to act as a trombe wall, and a copper piping system inside the module for water heating, which ran along the entire façade. The back would be insulated with cork.

The project conceptually resulted in an association of four types of modules with different functions:

1. Ceramic Module (chimney effect)
2. Glass Solar Thermal Module (trombe wall effect)
3. Solar Collector Module for DHW production
4. Brise Module, made of cork (filters natural light)

Figure 8. Ceramic Module (chimney effect).

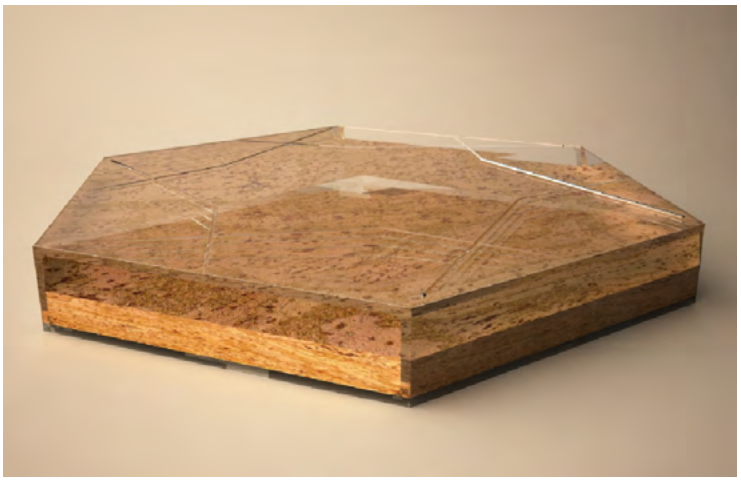

Figura 9. Glass Solar Thermal Module (trombe wall effect).

Figura 10. Solar Collector Module for DHW production.

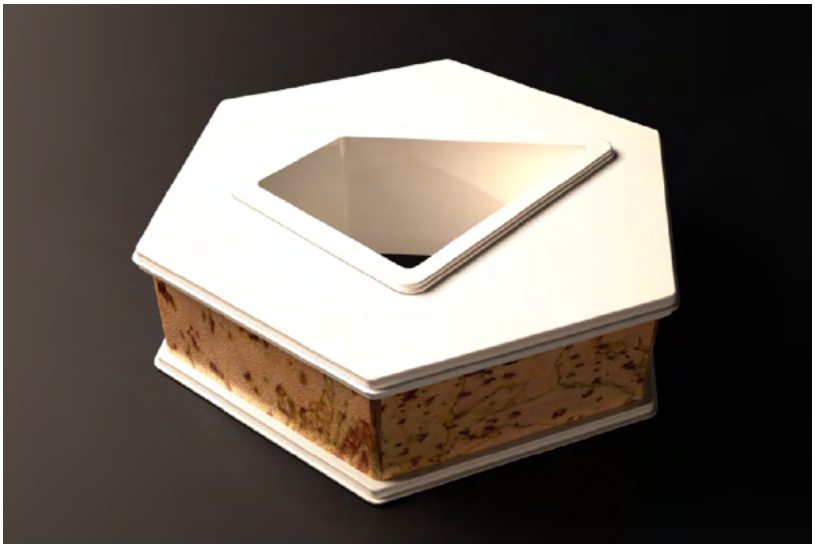

Figure 11. Open BRISE module in cork + ceramic (filters natural light).

Figure 12. Open BRISE module, in cork + ceramic, simulation of the BRISE effect, inside the space. Filters natural light, creates an intimate and introspective atmosphere and protects interiors from direct light.

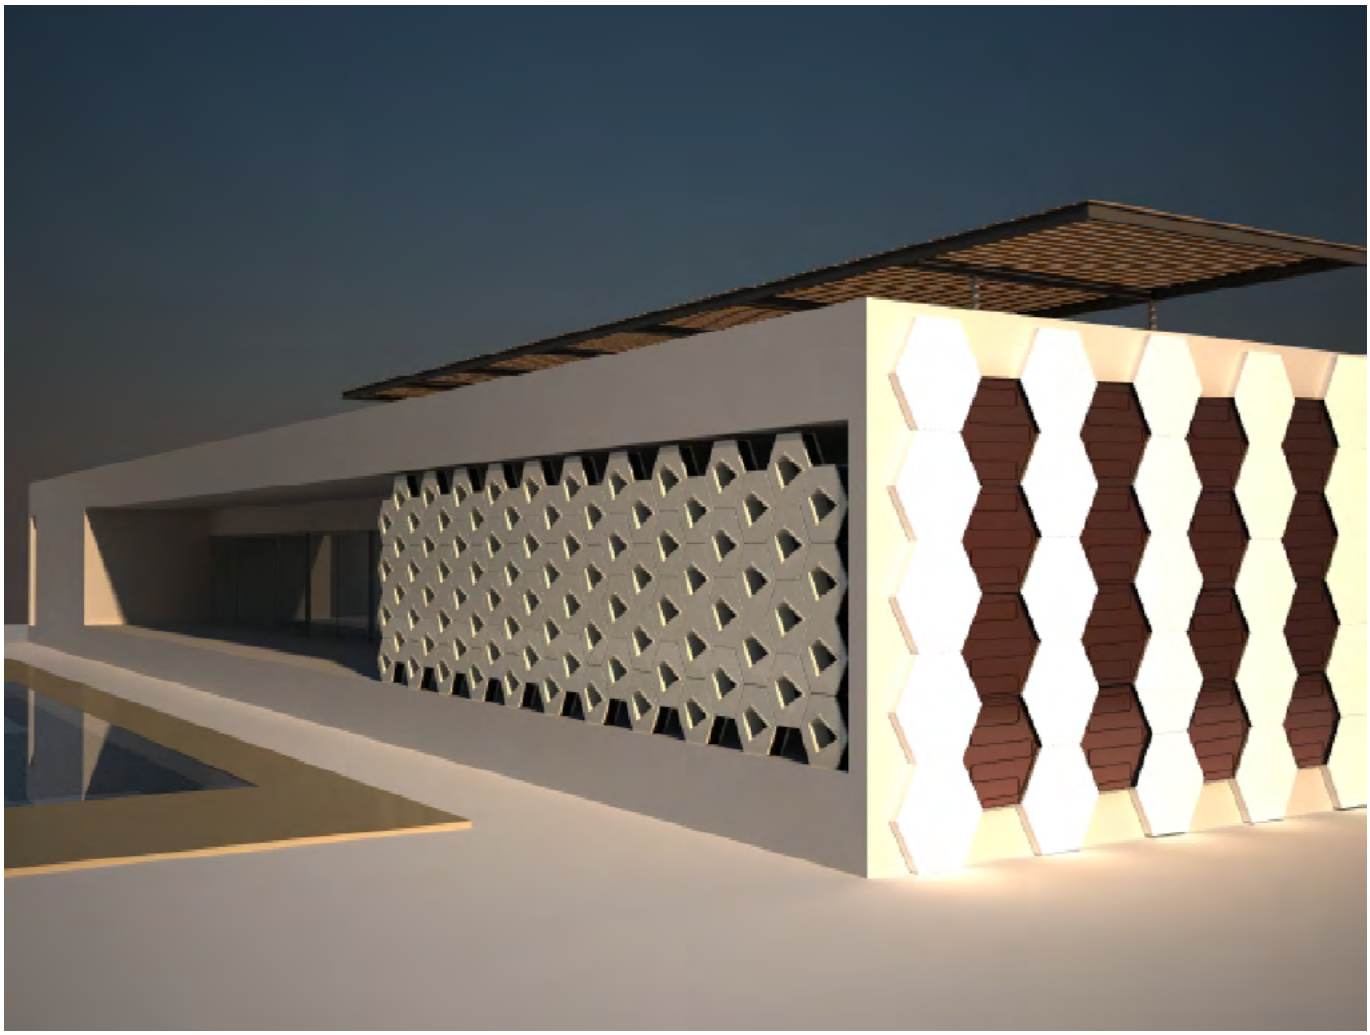

Figure 13. Solar orientation study. The ceramic modules allow cross-ventilation between the north and south façades. Ceramic modules and solar thermal modules, alternating on the south façade. Open BRISE module in cork + ceramic, open on the west façade, adjustable. (All 3D simulation by Nuno Martins).

2.3 Designing Other Geometries

After reflection, we thought about developing a geometry that could be used together with other hexagonal modules that had already been developed. This gave us multiple aesthetic options for architectural cladding.

From a hexagonal grid we can create a new model as shown in figure 12. Module Y (Figure 14) was based on the art of basketry and traditional handicrafts. After a 90º rotation we can combine it with other hexagonal modules, in this case the solar collector module (Figure 13).

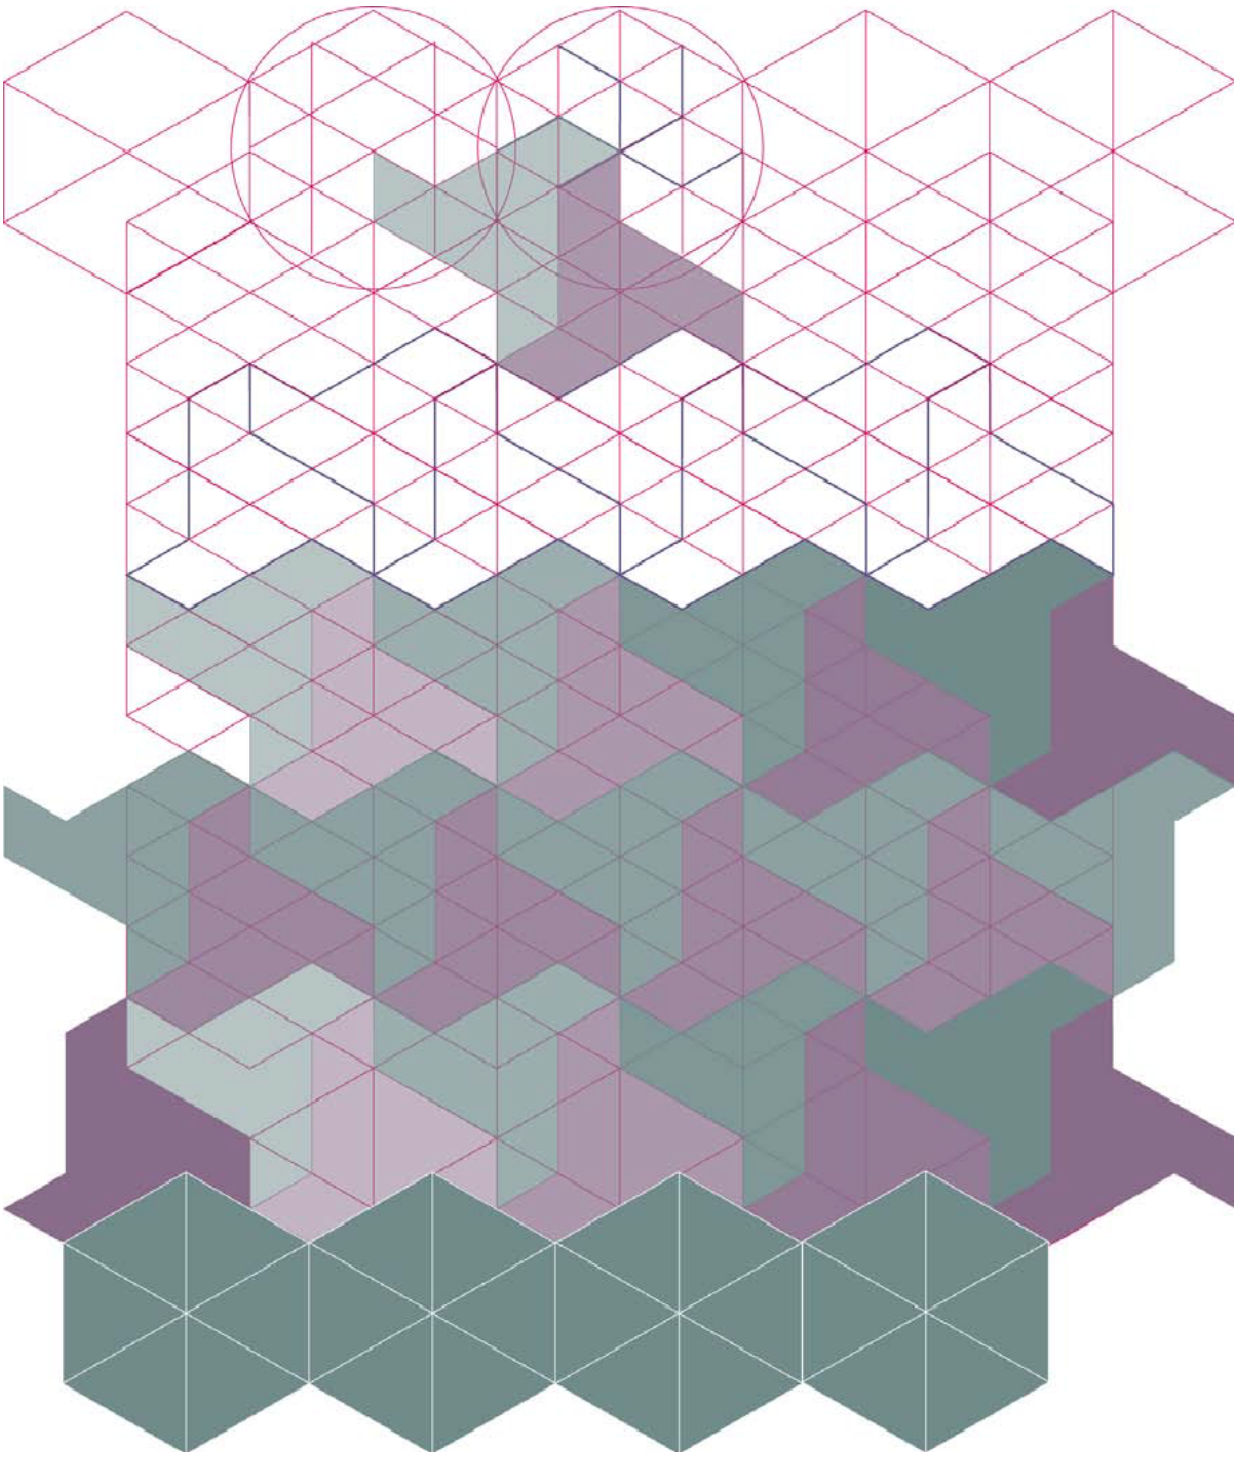

Figure 14. Illustration of the development of the new module Y, using a hexagonal grid as a reference.

Figure 15. Illustration of the combination of the new module Y with the solar collector module, after a 90º rotation.

Figure 16. 3D simulation of the new module Y, based on the art of basketry and traditional handicrafts.

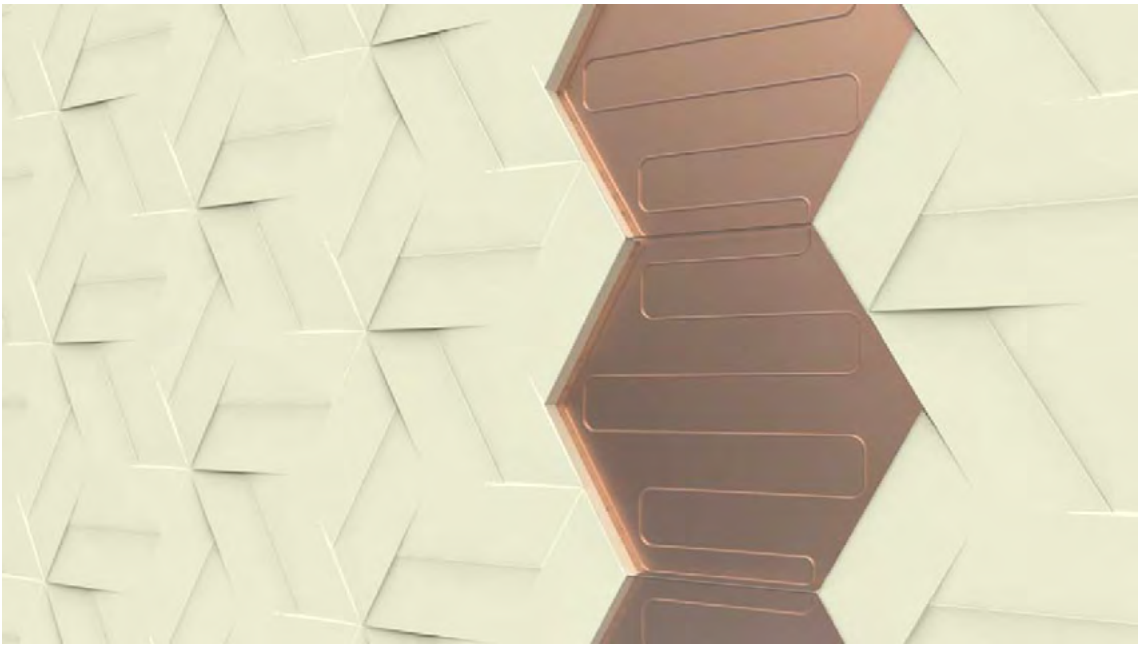

Figure 17. 3D simulation of the combination of the new module and the solar collector module, after a 90º rotation.

The Y-Module applied to the façade harks back to local/traditional references.

We also developed another geometry that allowed us to combine it with other hexagonal modules we had already developed. The conception of new geometry, a design based on a “split dry rope” tile pattern produced in Seville in the second half of the 15th century, with Mudejar geometric motifs known as “crow's feet” (SALOMÉ, 2012), shown in figure 18.

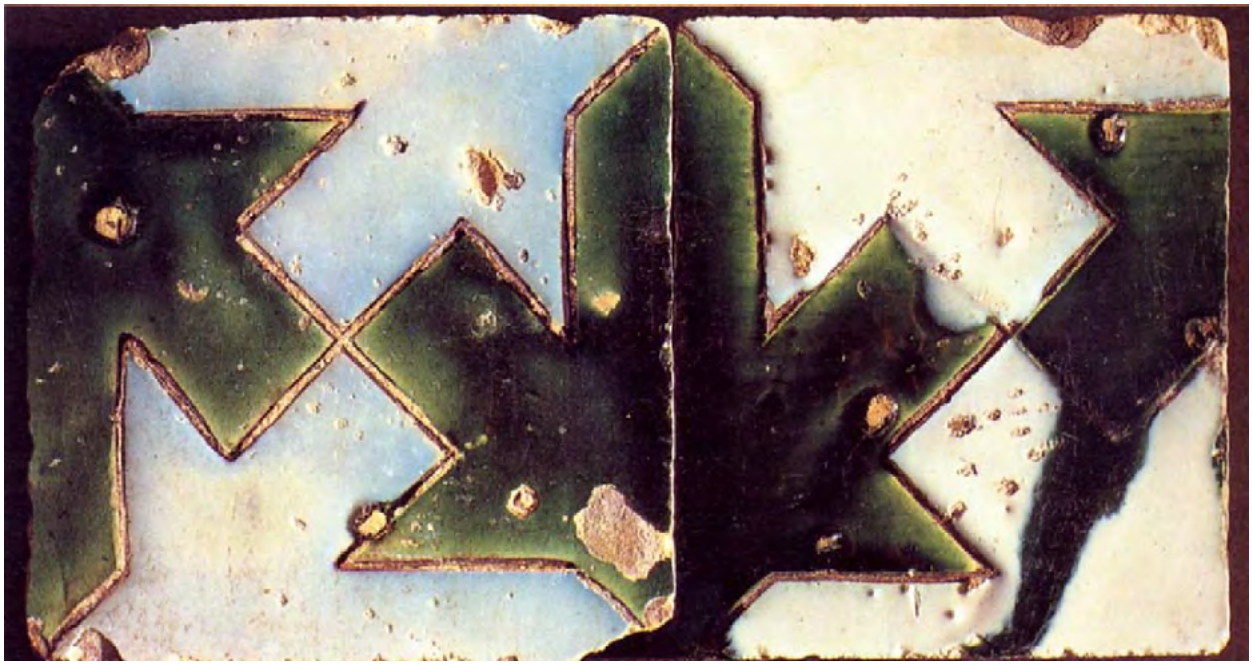

Figure 18. “Cracked dry rope” tile produced in Seville in the second half of the 15th century, with Mudejar geometric motifs known as “crow's feet”. Adapted from (SALOMÉ, 2012).

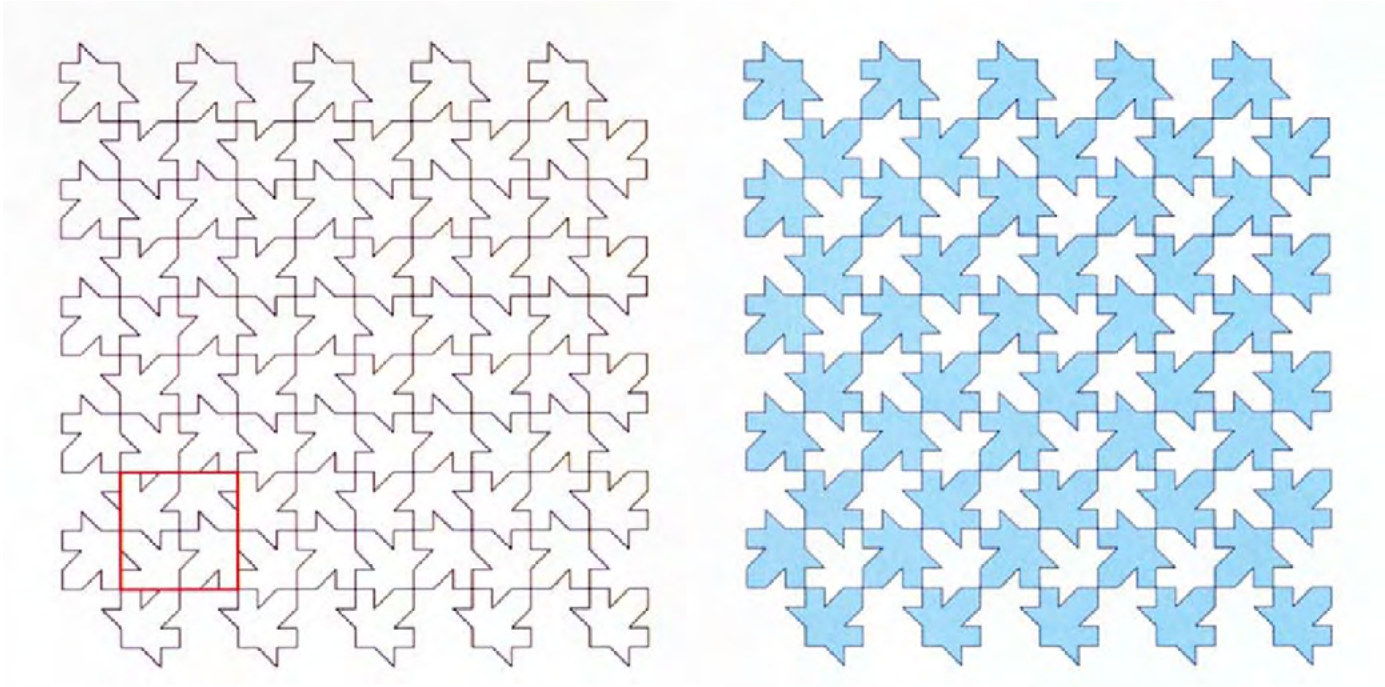

Figure 19. Mudejar geometric. Experiences gained during the design process.

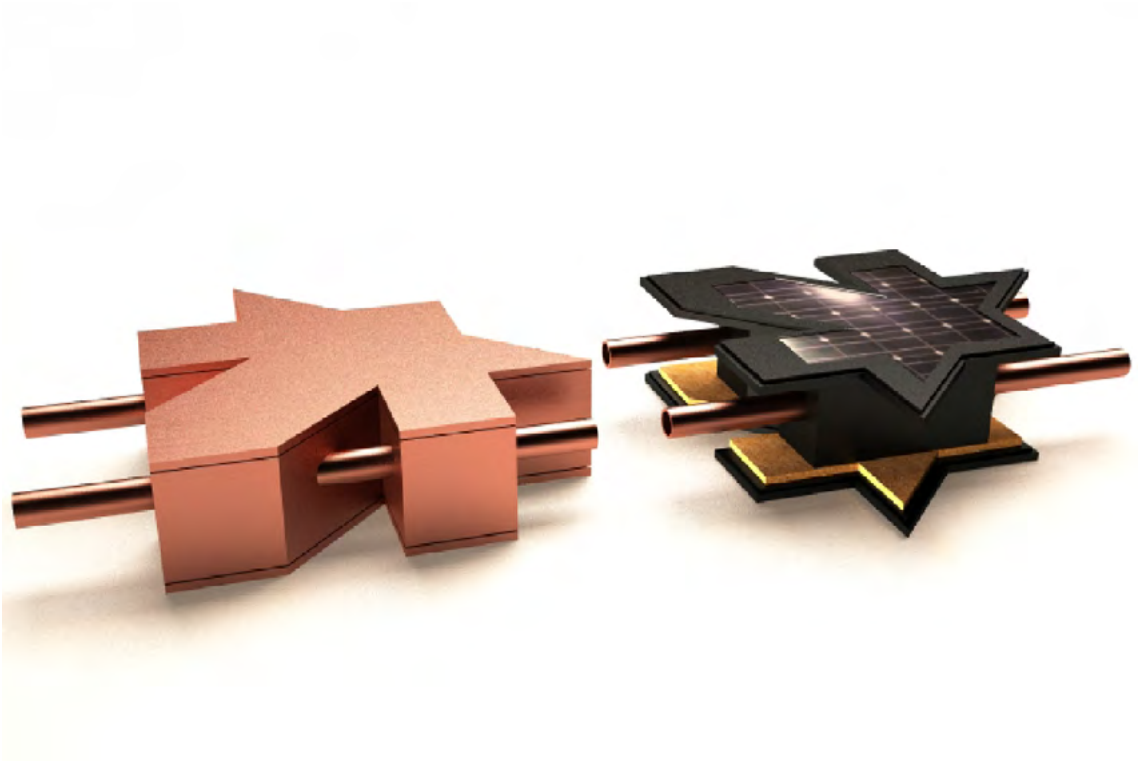

Figure 20. “Cracked dry rope” - 3D illustration of the mudéjare module known as “crow's feet” associated with another incorporating photovoltaic technology.

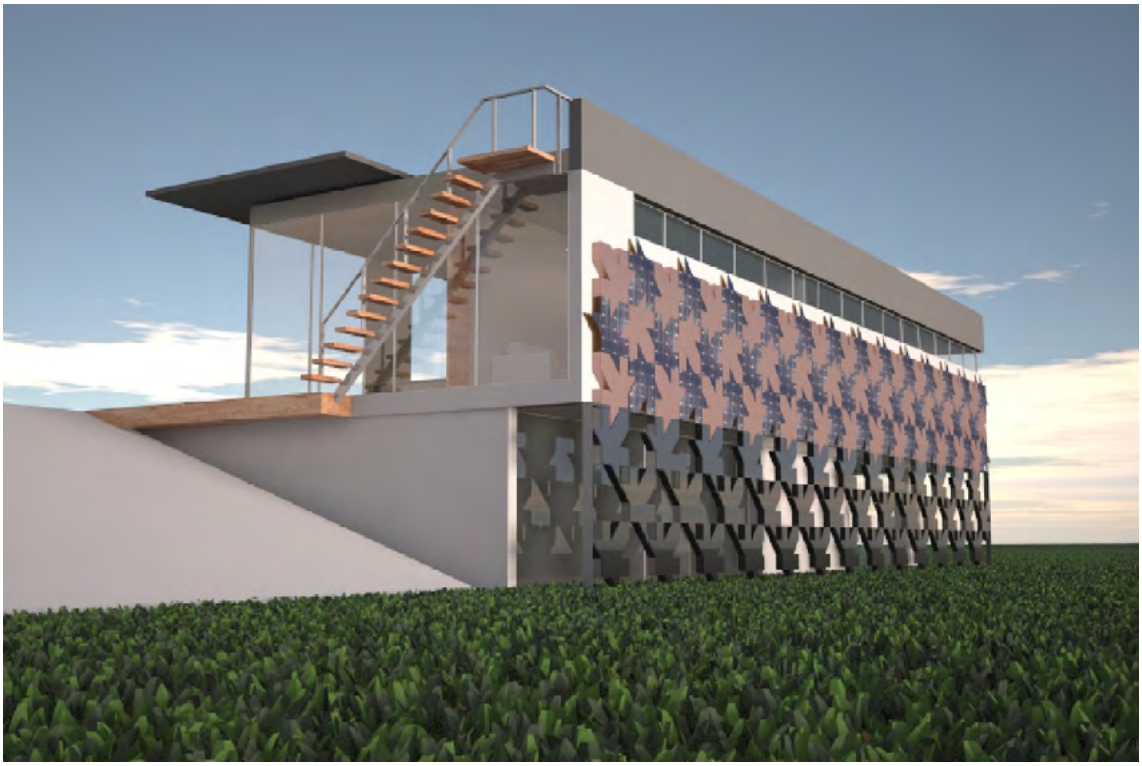

Figure 21. 3D façade simulation of the mudéjare module known as “crow's feet” associated with the photovoltaic energy module.

2.4 Reflection on Results and Literature Review: Mediterranean Cultural Identity and Sustainable Architectural Innovation

The study of the interconnection between materials and sustainability has garnered increasing attention in contemporary academic and practical discussions. Growing environmental awareness and the pressing need to mitigate the negative impacts resulting from unbridled consumption have led to a critical reassessment of the relationship between materials and sustainability. Within this context, two fundamental principles stand out: circularity and efficiency (SALOMÉ, 2012).

Material circularity emerges as a pivotal paradigm to advance sustainable practices by fostering closed production, consumption, and recycling loops. This approach aims to diminish reliance on virgin resources and minimize waste generation. Achieving circular systems necessitates innovative strategies across product design and waste management, facilitating resource regeneration and reducing environmental footprint.

The convergence of renewable energies and agriculture presents a unique opportunity to enhance sustainability and efficiency across both sectors. This synergy not only facilitates the shift towards cleaner energy sources but also optimizes land utilization and encourages sustainable farming practices. The fusion of these domains underscores a promising and mutually beneficial alliance.

Efficiency in material usage stands as a cornerstone in the pursuit of sustainability, involving the optimization of resources, waste reduction, and maximizing material performance throughout their lifecycle. Material selection, considering technical properties, origin, manufacturing processes, and recyclability, plays a vital role in enhancing efficiency and mitigating environmental impacts. So, transitioning towards a more sustainable relationship, between materials and society encounters various challenges, including resistance to change, inadequate legislation, and the necessity for specialized recycling infrastructure. Nonetheless, these hurdles also present opportunities for innovation, research, and the development of new technological and social solutions.

The coexistence of renewable energy installations and agricultural activities is evolving positively, particularly through innovative methods such as agrivoltaics. Through initiatives like the InSPIRE project (2019) which uses solar panel shading to enhance water efficiency and protect crops, tangible benefits are being observed. For instance, a cherry tomato plantation in Arizona has significantly reduced water demand and doubled its yield. Furthermore, advancements in photovoltaic technology, exemplified by Enel Green Power's HJT double-sided panels (2019), are further optimizing land use and increasing efficiency. Debunking myths of excessive land use and conflicts with agriculture, these innovations promise to drive the energy transition while benefiting agricultural practices. Success stories like the photovoltaic-battery hybrid system at St. Luke Hospital in Ethiopia highlight the transformative potential of sustainable energy solutions in enhancing both sustainability and innovation.

Projects aiming to embody Mediterranean cultural identity through design and material selection emphasize the bioclimatic aspects of Mediterranean architecture. By valuing cultural diversity and reconnecting with Mediterranean heritage, such initiatives strive to reintegrate cultural identity through form, materials, and concepts.

Eco design serves as a transformative vehicle for ecological education, prioritizing the cultivation of appreciation and assimilation of ecological principles. By fostering awareness of sustainability's possibilities and limitations, Eco design promotes a harmonious balance between human behavior and nature, amplifying ecological competence and consciousness. Initial tests indicate the potential of tested materials and concepts, underscoring the promise of sustainable practices and innovations in advancing circularity, renewable energy integration, and cultural sustainability. Continued research and implementation efforts are essential to realize the full potential of these transformative approaches in promoting a sustainable future.

The aim is to find a balance between human behavior and respect for nature, promoting awareness of the possibilities and limits of sustainability. Sustainable design thus becomes a way of spreading our awareness of nature and our ecological competence.

After reading and analyzing the results, preliminary tests indicate the potential of the materials and concepts tested. In future work, we intend to continue with the tests, explore new mechanisms, and apply the concepts to new materials and geometries.

The study outlines a comprehensive set of objectives aimed at addressing various aspects related to the promotion and preservation of Mediterranean cultural identity within a global context. These objectives include reflecting on existing methodologies, evaluating the impact of modernity on traditional cultures, bridging industrial production with handicrafts, re-contextualizing traditional materials for contemporary use, analyzing contemporary definitions of design practice, discussing Western material culture, fostering critical thinking for sustainable development, and promoting communication between Product Design and Engineering disciplines. These objectives collectively seek to advance understanding, appreciation, and integration of Mediterranean cultural heritage while fostering sustainable practices and critical discourse in design and engineering fields (RAQUEL, 2014).

This approach not only fosters climate change mitigation but also advances economic and environmental sustainability in rural regions, marking a significant stride towards resilient and ecologically conscious systems. The solution to prevailing challenges is encapsulated in the concept of a “Green Recovery”. This strategy advocates for investments in green technologies, renewable energies, consumption efficiency, sustainable mobility, and the circular economy. Furthermore, it presents an avenue to merge the energy transition with employment generation. Prioritizing social impacts is paramount. Achieving a just transition necessitates dedicated focus on the most marginalized communities, particularly those associated with the coal industry. Mitigating job losses in specific sectors requires concomitant efforts to create new opportunities and implement retraining programs to ensure equitable inclusion for all. In essence, while the energy transition is imperative, meticulous management is indispensable to mitigate disparities. The pursuit of a Green Recovery not only tackles present challenges but also lays the groundwork for cultivating a more sustainable and equitable society.

3. Conclusion: Navigating Towards a Sustainable Future

This comprehensive exploration of the intricate relationship between materials and sustainability underscores the urgency of adopting circular design methodologies. The imperative principles of circularity and efficiency emerge as keystones in the pursuit of a more sustainable and responsible future.

Addressing our immediate challenges, the call for a Green Recovery allows us to identify challenges stemming from unbridled consumption and environmental degradation and necessitates a strategic response. The proposal for a “Green Recovery” stands as a foundational concept, advocating for investments in green technologies, renewable energies, consumption efficiency, sustainable mobility, and the circular economy. (SALOMÉ, 2012) This approach not only addresses the immediate challenges but also presents an opportunity to intertwine the energy transition with job creation, contributing to a holistic and inclusive solution.

Challenges and opportunities in the transition to a more sustainable energy landscape presents challenges that demand careful consideration. A just transition requires a nuanced approach, particularly in supporting vulnerable communities tied to sectors like coal. Mitigating job losses in these sectors necessitates the creation of new opportunities and comprehensive retraining programs to ensure an inclusive and equitable transition. However, that doesn’t mean that energy efficient projects can only be expensive answers to the planet’s problem or first country solutions.

Striking a Balance between energy transition and social justice becomes the overarching goal of a Green Recovery. Not only to build a more sustainable future but also a just society. Balancing the energy transition requires a meticulous management strategy to avoid exacerbating existing inequalities. By addressing social impacts and prioritizing inclusivity, the journey toward a sustainable future becomes a shared responsibility and opportunity.

> "Right now, what's most interesting to me is what we can do to catalyze the most abundant resources we have on the planet, which are our human capabilities. (...) If we consider that we have a very small heavily populated planet, to move to sustainability we have to make best use of all the resources we have." (MANZINI, 2011, NP)

Synergies between circularity and efficiency can represent the future of the relationship between materials and sustainability. In a way it lies in creating synergies between circularity and efficiency. Advocating for a circular economy, where materials are continually reused and enhancing efficiency in production and consumption are imperative steps toward achieving a harmonious environmental and social equilibrium.

Collaborative Engagement for a Sustainable Future The complexity of the intersection between materials and sustainability demands collaborative engagement. The synergy between academia, industry, and governments becomes essential in driving this transition. Through collaborative efforts, society can be empowered to confront emerging challenges, fostering a collective commitment to a more sustainable and responsible future.

A Vision for Tomorrow: Beyond Consumed Resources In essence, this exploration underscores the dynamic and complex nature of the materials and sustainability landscape. Circularity and efficiency emerge as fundamental principles in crafting a future where materials transcend being mere consumed resources. Instead, they become integral elements in a sustainable and responsible vision for the well-being of future generations.

In the words of Tom Dixon,

> "We want to know everything about the materials. Where they come from, how to work with them, how far they can go, what else we can do. And we like them to be as dense, generous, and simple as possible." (2007, NP)

This ethos encapsulates the essence of the journey toward sustainable design, where a profound understanding of materials guides us toward a more conscious and responsible coexistence with our environment.

About the Authors:

Ana Sofia Cardoso has combined university teaching with research throughout her career. She teaches at ESAD - College of Art and Design and has participated in colloquiums, round tables and national and international meetings. As part of her professional activity, she is the author of books and several scientific articles published in specialist journals or presented at international conferences, such as: UD, Aveiro, Portugal; Going Green Global Design Week, Ljubljana, Slovenia; CUMULUS Budapest 2024, Hungary; Design Commit'24, Braga, Portugal; AHFE 2024, Nice, France. She has participated as principal investigator in projects such as "O Bairro está IN(clusivo)" ("Healthy Neighbourhoods" programme, funded by the Portuguese Government); and "Dwelling in transition" (funded by DGArtes). She is currently the coordinator of the Blue Design Alliance short courses.

Raquel Salomé is a researcher and member of the esad-idea Research Unit, adjunct professor and member of the Technical-Scientific Council at ESAD since 2000. She holds a PhD in Industrial Engineering and Management (2012) and a Master's degree in Industrial Design (2005) from the Faculty of Engineering of the University of Porto (FEUP). Her scientific research focuses on Design and Sustainability and the study of eco-efficient materials/systems. As part of her professional activity, within her research profile, she is the author of several scientific articles published in specialist journals and books, or presented at international conferences, such as: Going Green Global Design Week, Ljubljana, Slovenia; CUMULUS Budapest 2024, Hungary; Design Commit'24, Braga, Portugal; AHFE 2024, Nice, France.

KEYWORDS | GEOGRAPHIC BOUNDARIES, MAPS, ATLASES, VISUAL COMMUNICATION, SOCIOPOLITICAL ARTIFACTS

ABSTRACT | The paper focuses on the crucial role played by visual design artifacts in reconfiguring the relationship between the so-called first and third worlds, between centers and peripheral or semi-peripheral cultures and territories, overtaking the societal structures perpetuating a cycle of subjugation and dependency that still affects several regions in the contemporary geography of the world. The aim is to contribute within the international debate about maps as cultural artifacts through a comparative exploration of two artistic experiences coming from different regions of the world. The case studies examined are the work of the South African draftsman Titus Matiyane and the one of the American maps and books artist Doug Beube, whose cartographic representations will be investigated as visual communication artifacts to overcome the "borders" of the map. Aspects under analysis, therefore, will be the ways in which they employ visual elements, symbolic motifs, cartographic conventions and narrative structures for suggesting the construction of an imaginary transnational identity.

The experimental approaches described denounce sociopolitical phenomena that seem viscerally imbued with the history of civilizations and nations by redesigning visually and implicitly metaphorically the cartographic representation of the world. Imaginary, alternative and utopistic forms of maps destroying, and then rewriting and redesigning the boundaries between territories are the object of analysis, addressed as media for creating new perspectives for a more equal geographic shape of the world in which otherness and multiculturalism are values to be preserved.

1. Introduction

Maps are powerful instruments of knowledge. Since the dawn of civilization, territories have been mapped to allow to cross them without getting lost, providing a graphic abstraction and therefore experimenting translating approaches necessary to synthesize a large amount of information in a single image. These graphic visualizations reflect the perception and the knowledge of the world in different historical periods and reveal aesthetic trends and technical abilities of mapmakers and their evolutions through time (Thrower, 2008). According to Norman Thrower, indeed, maps are "excellent indicator of culture and civilization" (Ibid., p.1) and as such they have been performing several functions over time, going beyond the necessary knowledge of the spatial characteristics of a territory.

Over the last decades the act of mapping has evolved and has taken on different purposes, 'alternative' forms and a multidimensional and thematic connotation, overcoming any desire to schematize the world, in favor of a subjective representation of the same (Jacob 1992). The science of cartography [1] has been replaced by a hermeneutics of cartography (Quaggiotto 2016), and mapping has become the prerogative not only of geographers, cartographers, paleoclimatologists, seismologists, but also of chemists, biologists, astronomers involved in mapping the human genome, the universe, the cells, and then philosophers, sociologists, theologians, anthropologists, who began to build "atlases" that describe cultures, migrations, rituals, journeys into interior worlds, spiritual phenomena and topographies of existence. Added to these are the information maps, which have the arduous task of acquiring, decoding and returning complex data, knowledge, processes, physical phenomena and thoughts [2]. The paper explores particular design experiences in which maps are used for rediscovering the territory through an imaginary rewriting of the same, and through the creation of 'other' spaces compared to the measurable ones: spaces of encounters, of transit and emotional crossing, spaces imagined by the sensitivity of the individual.

By observing the transition from the geographic scientific maps to imaginary maps as cultural artefacts, this paper aims at investigating the ability of a map to reinterpret physical spaces, deconstructing and reconstructing them, thus to become a tool for rewriting the territory with cultural and sociopolitical objectives. In this perspective maps can become showcases on imaginary scenarios that demolish boundaries and shorten distances – thus differences – between faraway places, between topographic ontologies seemingly unattainable, between centers and peripheries, and – in a sociopolitical perspective – between the so-called Third and First Worlds. Maps therefore can strategically deconstruct and interpret the world, or a portion of it, conveying choices of a political, social and economic nature.

After outlining critical analyses, and primary sources collected for establishing a comprehensive understanding of the concept of maps as spatial agents for rewriting and remodeling territories and boundaries, the paper will undertake a comparative examination of the work of two artists: Titus Matiyane and Doug Beube. Special attention will be paid to the ways in which the artists employ visual elements, symbolic motifs, cartographic conventions and narrative structures for suggesting the construction of an utopistic transnational identity.

2. Maps as Relational Sociopolitical Artifacts

> "Those who drew the maps controlled the destiny of nations through the very power of delineating space. The graphic impact of maps of exploration, invasion, and rebellion is more memorable and vivid than the long explanatory texts accompanying them." (Envisioning Maps, 2008)

With this sentence the Hebrew Union College-Jewish Institute of Religion Museum Curator, Laura Kruger, on the occasion of the inauguration of the *Envisioning Maps* exhibition (2008) highlighted the power of maps to reflect "the state of cultural activity, as well as the perception of the world, in different periods" (Thrower, 2008, p.1). 'Primitive' civilizations' early maps were attempts to visually represent earth distributions in order to improve its visualization and knowledge. When examined across time these maps

not just demonstrate their power to fulfilled certain purposes, but they illustrate how human cognition has evolved. As previously stated, a map serves many important purposes in the modern world: It is an essential tool for understanding spatial phenomena, an effective way to store data, and a research tool that helps uncover distributions and relationships that would not otherwise be known. In this multifaced scenario maps have been a compelling theme for contemporary designers and artists throughout the twentieth century as these visual artefacts represent any kind of relationships, and not necessarily spatial ones, occurring at or near the surface of the Earth: social, political, cultural, historical and help humans to read and understand them according to the context of investigation. That is why today we are able to give a historical-political justification to compositional aspects of cartographic artefacts of colonial travelers such as Thomas Baines (1820–1875) and Thomas Bowler (1812–1869), whose restitutions of the South African territory mainly concerned the geography of the country and people were excluded or they were represented proportionally on a smaller scale compared to the overwhelming scale of the landscape, like those in David Livingstone's travelogues (Huigen, 2009, p. 209). These representations focused on panoramas of desolate landscapes, as if in preparation for colonial expansion and capitalist exploitation, deliberately excluding indigenous populations considered an obstacle to expansion (Pratt, 2008, p. 51).

This finding corroborates the arguments discussed by Nicholas Gliserman in the article *Unpacking the Meaning of Maps, Power, and Boundaries* (2021) in which the author claims that we must ask ourselves not what a map *is* but what a map *does* to arrive at an all-encompassing definition, and – in perspective – what a map *can do* in the future: by "navigating an environment or visually representing information […] the map can help reconstruct mental and physical […] processes" (Griserman, 2021, p.2) but they can also utopistically and optimistically act as agents that influence the relationship between territories and cultures, thus changing the geography of the world in a reciprocal relationship in which "maps shape a world that in turn shapes its maps" (Matthew 2005, 12). The agency of map as recursive and relational tool can affect and influence different cultural aspects and mapping becomes occasion for territorial rewriting. These performing visual texts break down boundaries and suggest a utopian, imaginary and subjective reconfiguration of the world without inequality, thus becoming a vehicle of social denunciation.

Several non-mapmakers have approached this form of expression for narrating stories asking the viewer to navigate into imaginary spaces that – by altering the representational conventions and the geography of a territory – demonstrate that mapping is a continuous process that relate different aspects of society and reshape identities, relationship, and the idea of the world itself (Kitchin and Dodge 2007).

Map-artists such as Saul Steinberg, Stephen Wiltshire, Dannielle Tegeder, Wopo Holup, Titus Matiyane and Doug Beube are generally considered outsiders that do not follow a precise style and do not have conventional artistic training, but operate within and for the society starting from a personal vision and technique. The works of these artists have relational sociopolitical purposes, as their maps, in any shape they have been designed, flat or tridimensional, with altered scales or faithful to the real proportional relationships between the territories represented, drawn or obtained by assembling elements, tell stories aimed at defining, reconstructing, administering polities and territories, and so at developing national identities and "establishing places in the Community of nations" (Akerman, 2017, p. 2).

3. New Views of the World in Titus Matiyane and Doug Beube's Maps

The work of two map artists will be following examined: the imaginary territorial representations of the South African draftsman Titus Matiyane and the collages and altered atlas of the American artist Doug Beube. Since the late 90's Matiyane has designed imaginary geo-mappings by deconstructing and reconstructing transnational spaces that connect numerous cities of the Western world and South Africa - not by chance an environment with a postcolonial history harassed by the contrast between centers of power and peripheries (Dreyer, 2017, p. 126). Doug Beube between 2003 and 2015 created physical artefacts in which he manipulated the structure of geographical atlases, dissecting them and altering the organization and relationship between the territories represented on the existing maps (Masuga, 2016).

The two artists have been selected - among those previously mentioned - because in both of them the idea of rewriting national borders and transforming the geographic configurations of places which still today shows the consequences of processes of colonization and decolonization strongly emerges. Both in Matiayne's drawings and in Beube's collages and recomposed atlases the imaginary juxtapositions between political geographies and anthropic landscapes seem to produce territories and – as suggested by Kitchin Rob e Martin Dodge (2007, p. 21) – create constructive and not merely descriptive maps. In their works, the choice to show a city or a specific place is not random but strategic and demonstrates a precise desire to translate into graphic visualizations the criticism towards the destruction of the history of entire cities, ethnic groups or nations, also conducted through cartographic representations. An example is the history of road mapping in *apartheid* and *post-apartheid* South Africa described by Thomas Bassett as a clear case of racialized organization of space, and so persistence of racial prejudices (Bassett, 2017, p. 373). Matiyane and Beube denounce – by de-structuring it – classical cartography as it is recognized as a powerful tool of racial discrimination and colonial politics, probably among the most dangerous, "because the eye and mind of the map user are likely to be quite unaware of them" (Akerman, 2017, p. 7). By redesigning borders, distances and hierarchical relationships between cities and nations, therefore, the cartographic act of Matiyane and Beube is strongly politicized, and the following analysis will try to identify the visual codes and the graphic choices adopted to achieve this objective, and then it will compare the emerging overarching trends, and implications.

3.1 The Imaginary and Transnational Maps of Titus Matiyane

The maps of the South African cartographer Titus Matiyane ask the viewer to broaden their physical and ideological horizons towards an imaginary and transnational geographical space that enhances the identities of African territories and cultures (Ekpo, 1995; Adichie, 2020). Matiyane deconstructs the Afrocentric idea of a solitary Africa and a shared system of values and stories (Sidogi, 2018, p. 129), placing in his imaginary views urban contexts that belong to different continents, but which seem to dialogue as they are integrated into scenarios in which individuality and difference coexist as values.

Titus Matiyane began his work as a cartographer in the 1990s, in a decade that saw South Africa recovering from a historical moment of "cruel dehumanization" (Kruger, 2022, p. 199), drawing his monumental panoramas on a small coffee table of 40 x 60 cm outside a house of approximately 25 square meters in which he still lives today with his family (Figure 1). His first panoramic drawings depicted local cities, metropolitan districts and provinces, including Durban, Pretoria and Pietersburg, before moving on, at the end of the decade, to drawing telescopic scenery of foreign cities such as New York, London, Amsterdam and Hong Kong. Matiyane Maps are long strips of paper whose size varies from 6 (as in *Panorama of Hong Kong*) to 46 meters wide (this is the case of *Panorama Pietersburg-Sasolburg*) for approximately 1.5 meters in height (Figure 2). Here the artist reconstructs scenarios created with colored pencils and markers and characterized by strange proportions based on intuition and an admirable attention to detail. Matiyane, in fact, graphically transposes what he pictures in his head, and the visual references of his work are the commercial maps donated by sponsors or purchased from local stationery shops and Google Maps. These images are often his only source of knowledge of the cities of which he then proposes monumental panoramic representations based on his vision of places that, in most cases, he has never visited. Through his imagination, writes Elfriede Dreyer (2017, p. 128), Matiyane "becomes a transnational traveler who produces representations of the geo-history of the most famous cities in the world". Matiyane works as a sort of archivist and produces documents that tell a local history that can't be captured by photography because it is not contingent, but extended over time, in a dimension of intrinsic dynamism and continuous evolution. Matiyane's concern for functioning from the city justifies the cartographer's singular process: he draws what he knows, not what he sees, and this makes his panoramas more like maps than impressionist views (Silverman, 2007, p. 23).

In this new vision of the world, it is possible, indeed prescriptive, that large cities such as New York and London relate to peripheral places such as Soweto and Atteridgeville in a utopian and imaginary geographical restitution. As Dreyer writes:

> "By including less important South African cities and towns in his canon of famous cities, the artist suggests an intervention strategy that deconstructs the paradigmatic perception of the world that associates African cities like Pretoria and Johannesburg with a Marginalized Third World." (Dreyer, 2017, p. 135)

The South African cities designed by Matiyane overcome the social and cultural confinement that emerged with the advent of post-apartheid political regimes and establish a fair dialogue with the territories, architecture and urban planning of that First World seen from the eyes of an African, and therefore perhaps more authentic (de Kler, 2007, p. 17). By operating this hybridization between panoramas belonging to apparently irreconcilable social, cultural and geographical contexts, Matiyane makes graphic choices that convey a very specific sociopolitical communication project. Most of his panoramas include powerful and fast vehicles, planes, trains and boats that can easily cover long distances. The lines and connecting paths are marked - to the detriment of proportion - as to form a global and transnational network. The representation of the buildings becomes homologous, attenuating the aesthetic differences between the so-called Third and First Worlds to the point of almost disappearing. The border lines between towns and cities are invisible and the distinction between territories relies on topography and toponymy: large green areas, endless blue horizons and warm colors to make the anthropic areas recognizable. These panoramas are actually glimpses of a broader reality, of a world without hierarchies, differences or contrasts between those who have and those who have not, therefore between poverty and prosperity, and, above all, of a world free of racial discrimination. To confirm this prospective, Matiyane's cartographic representations lack – As Melinda Silverman writes (2007, pp. 32-33) – specific elements of a decadentism typical of the postmodern condition of third world countries: the settlements of shacks, the dense system of ropes from which linen dangles to "decorate" the skyscrapers of the 1960s, the numerous street vendors who gather on the freeway ramps to sell their products. Of particular importance in the cartographer's drawings is, then, the almost total absence of human figures, except for the symbolic use of the faces of some well-known personalities which strengthen the identity of the places portrayed, for example Princess Diana in *Panorama of London* (1998), Nelson Mandela in *Panorama Pietersburg-Sasolburg* (2004) and Queen Beatrix in *Panorama of the Netherlands* (2000). This aspect, together with the simplified style, the use of color and the inclusion of considerable toponymy, reinforces the ideological, imaginary and transcendent nature of his work.

Another relevant graphic character of Matiyane's cartographies is the erasure of borders. This choice can be interpreted as a further action of deconstruction of the political barriers of South Africa and the world, which is, in fact, transcribed and reconfigured in such a way as to communicate a utopia of depoliticization. The graphic space imagined by Matiyane in his panoramas terminates oppositions and deconstructs the traces of colonialism, apartheid, the hierarchies of national states and the great differences between the First and Third Worlds (Kruger, 2022, pp. 199-200). The cancellation of borders in favor of a geographical, economic and cultural re-mapping does not mean the absence of references to the history and specific characteristics of the territories that are protagonists of the panoramas. The cartographer, in fact, portrays a precise historical moment in his panoramas, a specific event that inextricably and unequivocally characterizes a city or a state, as if his map crystallized on paper a moment of local importance and global resonance. And so, for example, in the 46-meter-wide *Pietersburg-Sasolbourg Panorama*, the cartographer refers several times to the 2010 World Cup; in the 2019 *Panorama of Italy*, the portrait of Pope Francis overlooks the city of Rome; and again, in *Panorama of New York* (1999) the Twin Towers are on fire (Figure 3) (See Hobbs, 2007, p.39).

Matiyane's work is therefore part of a phenomenon that has seen contemporary African artists generally considered outsiders - including the sculptors Helen Martins and Jackson Hlungwani - becoming spokespersons for an authentic, honest and free testimony of decolonial processes.

3.2 The Altered Atlases of Doug Beube

With a very different approach than Matiyane, the American mix-media artist Doug Beube undertakes the deconstruction of maps not through a graphic rewriting, but by physically dissecting and reassembling maps' paper material, thereby engendering the creation of unique territories characterized by altered borders and amalgamating political and geographic identities (cfr. Hoeltzel and Villalonga, 2013)). In the last three decades Doug Beube has produced bookwork, collages, installations, and sculptures and has forged a new source for cultural and artistic understanding of the world trying to rewrite social conventions in a creative way (Masuga, 2016, p. 181).

Since the beginning of his artistic experiments Beube has demonstrated a particular attention to books and, in many artworks, he manipulates, destroys and transforms these objects into cultural artifacts of different nature that provide a new image of the world and asks the viewer to experience "the dichotomy of the physical object and its conceptual status" (Ibid., p. 194), and yet of course to explore the new significances carried on with this process of transformation. Many of the books altered by Beube are, not randomly, geographical atlases, which he reorganizes and transforms into new bodies with and of new images. Beube's mapworks' premises, indeed, stand from the assumption that "maps are not to be understood or trusted as firm markers of meaning. Rather, Beube's works illuminate that maps are often markers of the meaning we seek in them" (Mullin, 2011, p. 55). Diane Mullin in the article *Illuminated maps: the World unzipped but not uncut* argued that Doug Beube's collages question our beliefs about the world in which we live and can be considered:

> "Explorations into nameless territories of our consciousness where the rationalistic and nationalistic zeal that underlies the western enlightenment has become, in and of itself, an almost blind faith in our worldview, no matter how unbearable it is for the planet at large." (Ibid.)

Mullin focused especially on the "Erosions Series" (2004) in which Beube sanded the pages of atlases so that the familiar images of territories disappear and new images of mountain ranges emerging from the center of oceans are created and so he built new elements on the maps such as islands and rain forests

appearing like oases in the middle of deserts. If the images or objects (atlases and books) are artefacts with a big cultural meaning, in a certain way – according to Thomas Mitchell and Katy Masuga – by destroying and restructuring them automatically their transformation questions and suggests the need of a similar rewriting for the cultural aspects that these objects are representations of. In other words, these alterations redesign the boundaries – thus the relationships – between spaces and places that bring with them a stratified tradition of social and cultural conventions (Mitchell, 1996; Masuga, 2016).

Beube concentrated on mapworks and bookworks especially in the first decades of the new century, when he creates a jumbled and practically unintelligible world's geography by dissecting and layering actual vintage maps, insinuating the emergence of a global community that blurs social and political frontiers (cfr. Mallonee, 2013). As revealed by the artists in an interview release in 2018 on the occasion of the exhibition *Books Undone: the art of altered books (2018),* in these pieces, he physically manipulates the obsolete cartographic configuration by cutting, crushing, sketching, drilling, gouging, and sewing maps, pushing their physical ontology until they nearly collapse. By converting a map from its original purpose, Beube suggests reading it non-linearly and transferring decades of devotion for a pervasive object into a challenging shape with new levels of meaning (Beube, 2018, p.6).

This approach is clear especially in five artworks produced between 2003 and 2015: *Fault lines* (2003), the *Erosion Series* (2004), *Border Crossing* (2006), *Fallen Borders* (2014), and *Shifting Borders* (2015) [3].
The first experiments involving atlases and printed maps date back to the artwork *Fault Lines* of 2003 (Figure 4). In this work Beube cut all pages of the atlas into one-inch strips which however remain sewn to the spine of the volume. The book's start and finish are interwoven with the chopped rows "in an arbitrary geopolitical braiding" (Bright, 2011, p. 17) that enables the spectator to examine various topographical perspectives and, in turn, reinterpret the globe. This artwork inaugurated a path of conceptual experimentation that has focused on maps – and in particular borders – as flexible entities that can be deconstructed and reconstructed, thus allowing to re-read the relationship between territorial, geographical, historical, political and cultural identities.

In the *Erosion Series* of 2004 (Figure 5) Beube kept questioning the fluidity of international relations by manipulating pages extracted from world atlases. Moved by the notion of geopolitical adaptability, Beube's process involved a meticulous exploration of color-field relationships and compositional elements within a bunch of chosen maps. With a belt sander on the verso of the pages, he deliberately carved out irregular forms, akin to the erosive actions of insects, thereby redefining the geographical shapes of numerous nations.

When overlapped to underlying pages these irregularly perforated maps lead to unexpected juxtapositions, expanse seas and oceans, and intersect terrestrial masses. This intervention interrogates cartographic conventions, thereby challenging socially-embedded assumptions regarding the representation of physical and cultural boundaries, and so global alliances and political sovereignty.
The resultant artifacts disrupt the reader's accustomed navigation through territorial boundaries, prompting a reconsideration of the inherent complexities underlying border delineations.

By halving atlases pages and affixing separator zippers along the incised edges, in *Border Crossing* (2006) (Figure 6) Beube focused again and reimagined new, dynamic and malleable boundaries as segments of disparate maps can be seamlessly joined, mimicking an analogue version of "cutting" and "pasting". These resultant sheets offer a kaleidoscope of possibilities as they allow to be interchanged and recombined, defying conventional perceptions of geographical demarcations. Whether laid out flat or fashioned into multidimensional shapes such as prisms, these compositions imbue the spatial plane with an illusion of depth, thereby subverting conventional understandings of geographic representation. The integration of a zipper-based system confers a newfound openness, facilitating the addition, removal, or interchangeability of pages at the user's discretion, thus redefining the boundaries between places, people and cultures.
In the bookwork *Fallen Borders* of 2014 the focus of reshaping boundaries gains more and more importance as each page undergoes a transformative process, involving techniques such as cutting, drilling, or sanding, which serve to disrupt and reshape the traditional boundaries of national, geographical, and cultural

identity. The project is conceptualized as a metaphorical battleground, wherein the physical alteration of the book's pages symbolizes the clash and fluidity inherent in the construction and dissolution of borders between nations. Notably, no external elements are introduced to the book; rather, the manipulation of existing materials accentuates the organic evolution of boundaries. The exposed layers of the book's covers, revealing the juxtaposition of green leather and yellow foam cushioning, evoke imagery reminiscent of spilled spaghetti squash, metaphorically suggesting the porous and malleable nature of territorial demarcations. A similar piece to *Fallen Borders* is *Shifting Borders* (2015) (Figure 7), but here every page is altered only by meticulously cutting elements from the overlapping maps of the atlas, thus leaving elements that strengthen the concepts of connection and confusion. Both the works *Fallen Borders* and *Shifting Borders* metaphorically reference the tumultuous process of restructuring national, geographical, and cultural delineations driven by political regimes and authoritarian leadership. They delve into the inherent ambiguity and uncertainty surrounding the establishment and recognition of territorial boundaries, wherein the exercise of power by political entities often results in arbitrary rearrangements of land and property ownership. Consequently, the reliability and clarity of delineating where boundaries precisely commence and cease become subjects of doubt and skepticism. Maps, rather than serving as definitive representations, are portrayed as imperfect approximations, further emphasizing the fluid and contested nature of boundary delineation in the geopolitical landscape.

4. Conclusions: Maps as Sociopolitical Visual Communication Projects

Matiyane's territorial representations and Beube's physical cartographic compositions provide imaginary but conceptually possible geographical configurations. Their visual action provokes new 'deterritorializing' desires as it premediates an a-territorial or a-bordered world (see Deleuze and Guattari, 1987). However, as Gilles Deleuze and Felix Guattari argued in their book *A Thousand Plateaus* (1987), 'deterritorialization' is just a preparatory phase that anticipates the transformative and creative moment of making new connections, reconfigurations and assemblages; and they named this moment 'reterritorialization'. The simultaneously destructive and constructive action of deterritorialization and reterritorialization theorized by the Philosopher and the Psychiatrist is not spatial rather social and cultural in a constant changing scenario. By transcending geographical, material and cultural boundaries the work of the two artists analyzed in this paper follows the same idea of spatial estrangement formulated by Deleuze and Guattari, and intersects spatial and sociopolitical discourse, engaging with issues of power, identity, and representation. Their borderless imaginary worlds, indeed, cause a profound upheaval and reconciliation between the spatial/representational and the social/communicative dimensions of chartography. Matiyane's imaginary maps and Beube's altered atlases can be considered, therefore, powerful visual communication projects, unique utopian panoramas that invite the viewer to experience new places in which spatial relationships are altered, destroyed and then reconstructed, and thus convey sociopolitical messages that underlie the fragility of strategies of transnational abuse and the search for social and economic equality. The described artefacts are indeed messages that "invite us to see and think about what is neither seen nor thought when observing real spaces" (Jacob, 1992, p. 50), but with a different approach, which – to simplify – we could define optimistic, utopian and naive in the case of Matyiane's imaginary maps, more critical, hermetic, apparently destructive in the case of Beube's altered atlases. The articulated structure of graphic elements and compositional criteria described, paraphrasing the words of Maria Linda Falcidieno, makes the manipulation of the representations of the territory conducted by the two designers a privileged form of expression that mediates between objectivity and subjectivity and which, taking advantage of the rich tradition of historical cartography, offers graphic-linguistic and physical-experiential solutions intermediate between a symbolic and iconic representation (Falcidieno, 2009, pp. 115-121). The reading and design of the territory – and above all its rereading and redesign –, therefore, open up to the development of a specific visual language in which the design components dialogue in an unusual but recurring and recognizable way. These works become a manifesto of a new form of pseudoscientific communication of the world, a multicultural simulacrum with a strong sociopolitical meaning. Their maps create new connections and paths, they are visions of a transactional identity ideologically close to a global dimension, they are projects of graphic-visual representation in which otherness and multiculturalism are values to be preserved, they are forms of visual communication of the territory which give "access to otherwise unattainable cultural and human spaces" (Quaggiotto, 2016, p. 228).

The analysis undertaken underscores an additional aspect intricately interwoven with the use of Matiyane's cartographic transformations and Beube's multi-dimensional collages: namely, the maps crafted by these two artists can be interpreted as expressions of a transnational identity within contemporary culture, rooted in the consumption of technology, each emphasizing distinct components. Matiyane's portrayal of cities invites users to traverse and enjoy the magnificence of panoramic vistas, thus navigating "virtual" spatial realms. This immersive experience disregards conventional metrics of dimension, proportion, and distance, fostering subjective and individualized exploration. Implicitly, Matiyane advocates for participatory engagement, facilitating an authentic analogical encounter marked by deliberate attention to localized identity details. Beube's altered maps and atlases, on the other hand, demand active involvement and interaction from viewers, enabling them to manipulate and overlay depictions of diverse terrains and landforms, stitching them together or substituting paper strips to create new configurations. Users are thus prompted to engage directly with the installation, assuming the role of virtual nomads navigating an idealized and imaginary landscape.

Notes

[1] Cartography is a science whose object is the graphic restitution of physical space on flat supports (geographical maps) through the symbolic representation of geographical, statistical, demographic, economic, political and cultural information (Tracanni Encyclopedia, 2010).
[2] The definition of mapping here provided and the listed different uses and graphic configurations that affect the production of maps today, come from the re-elaboration of the reflections conducted by Jerry Brotton (Le Grandi Mappe 2015, p.7), Lorenza Pignatti (Mind the Map 2011, pp.5-7; Cartografie Radicali 2023, pp.7-12), Katharine Harmon (YOU ARE HERE. Personal Geographies 2004, pp.15-19).

ABSTRACT | After the fall of the wall in 1989, the revitalization of the city centre of Berlin, that is located in the former eastern part of the city, became one of the most important directions of the urban planning in Berlin. The leading model of the new planning was called “Critical Reconstruction” of the “European City”. That meant reconstruction and maintenance of the street pattern of the 19th century, of the block structure, of the height of the buildings, of stone facades, and of the open spaces. The structure and function of a vivid downtown, that implies mixed-use neighbourhoods, was not rebuilt. There are many similarities between the planning for American downtown areas and Friedrichstraße in Berlin. This is remarkable, because the official directing ideas of the German planning were the “Critical Reconstruction” and the “European City”. The reconstruction was not critical. The new downtown does not represent a European city, rather it has many components of American central business districts. Strategies to make our cities more livable have to be developed from the actual social, cultural, and economical situation of the city. In the case of post-wall Berlin, local Stakeholders, architects and citizens had very limited possibilities to influence, improve or even change this globalised design. Therefore, the center of Berlin has led to a mainstream design ignoring present local cultures and needs.

1. Revitalization in American City Centers

Modern city planning replaced networks of multi-use neighbourhoods with a model that separated living, working, production, and leisure within the city. The city was fragmented through this reduction of specialized areas to technical functions. This development started between the world wars. After the second world war there was an even bigger flight from downtown with large numbers of apartments and single-family homes being built in the suburbs. In some parts, this also meant racialized transformations of inner cities, including the white flight from downtown areas. Places of work partly persisted in the downtown areas, but offices were also built outside of downtown, following the idea of the decentralized concentration.

Figure 1. New York City Revitalization Project, Promotion. Photo: by the author.

1.1 Malls and Mixed-Use Developments

Shopping centers were constructed extensively in the countryside near the suburbs. They were autonomous compounds surrounded by parking lots, that had given up on the street concept. Leisure activities were directed towards theme parks also located away from the city. These fragments were connected through highways.

After this development downtown areas could only be used as tourists' attractions, if they had an attractive, historic core, which concentrated monostructurally and seasonally on visitors' activities. If they did not have an interesting heritage, they were ruined by neglect and often became ghettoized areas. This is the reason for the density of the city center to decrease while the density of the suburbs increases. In many cities in the USA, the suburbs have de-colonized the city. The suburbanites do not even come downtown to work, to go to the cinema or theatre, or to shop. They find all these amenities in their own or in a neighboring suburb. This flight from downtown has led to a deurbanization of downtown areas. Important attributes of city cores such as density, mixture of functions, and public transport were lost.

Following the decline and destruction of many buildings, the downtown was no longer a place with central functions and central importance, no longer a place of identification with the city. The centers have been deurbanized, and the downtown areas themselves have become suburbs of their own suburbs.

Figure 2. Car-Oriented City Centre Memphis, Tennessee. Photo: by the author.

Because of this development city officials and developers thought of two attempts of revitalization:

- Malls and mixed-use developments with own circulation systems in the sixties and seventies;
- Revitalization of the historic Main Street in the eighties.

In the sixties and seventies mega structures were developed to try to save the dying North American downtown areas. Mainly office towers, some shops, and few apartment buildings were built in city centers. These huge autonomous compounds also contain shops, hotels, conference rooms, and restaurants. They were frequently linked through skywalks. In cities with hot climate tunnels were constructed.

Figure 3. Inward-Oriented Shopping Center Eaton Plaza Toronto, Main Street Revitalization Atlanta, Georgia. Photo: by the author.

The mixture of types of buildings and of functions was given up in the center. Variety was only achieved by esthetic means through use of different materials, form or color of the buildings, rather than through different functions or variety in use.

Urban life was concentrated in certain locations, certain hours, and certain categories of 'acceptable' activities. After working hours and on weekends, the center is devitalized through the functional monostructure.

Figure 4. Downtown by Car in Boston, Massachusetts, Driveway New York City. Photo: by the author.

The main entrances are directly from the underground parking. Blank walls homogenize the streets. The compounds do not animate the surrounding streets and sidewalks. They are self-centered, and lack direct street relation. Their inner circulation systems inverse indoor and outdoor space. Public streets are

emptied through parallel circulation systems as passages or skywalks. Moreover, streets become more and more dangerous, because they are not observed and controlled by passers-by anymore.

Originally passages were thoroughfares or shortcuts between streets. However, they were developed as systems that attract their own population and divide it from the ordinary person on the street. The mixture of the urban population to be observed on public streets is hardly possible in malls and indoor plazas, and it is not wanted. The indoor worlds are realms with special regulations. Users have to be willing to follow the rules, e. g. to consume, or they are excluded. Groups of people are thereby segregated. “The public” is divided into several “publics” of populations of the same descent, education, income, and way of thinking.

The indoor worlds such as shopping malls, arcades, atriums, underground cities, and skywalk systems want to substitute for the lost public space in streets or on plazas. These spaces are nearly always privately controlled, offering privatized versions of the once-public street life. The potential for these plazas to be truly public is highly dependent on the owner’s attitude. Therefore, the result is privatization and control of open space and public life.

Therefore, the construction of huge, autonomous mega structures did not lead to a livable city center. These compounds did not animate their surrounding open spaces. The cities’ physical appearance became similar throughout the continent. The downtown areas therefore lack individual character.

1.2 Simulated Main Streets as Revitalization Strategy

In the eighties and nineties, the disadvantages of this development were taken into account by planners and politicians. They looked for a new strategy to revitalize the deserted and unsafe downtown areas, and they wanted to give their cities a new identity. Preservation of the historical heritage of small-scale buildings directed towards the streets, emphasis on walking instead of driving, and a vital street life, became the new guidelines for the restoration and creation of the American downtown areas. Where historical complexes were already destroyed, new buildings with historical appearance were erected. Naturally grown cities were simulated.

Figure 5. Atlantic City Building Type Simulation. Photo: by the author.

2. Revitalization in a European City Center: Friedrichstraße in Berlin

From an urban design point of view, the situation in the city center of Berlin after the fall of the wall in 1989 can be compared to the situation in some American city centers in the sixties. The reasons for this and the history are very different, obviously, but the situation of the central area in Berlin in the year 1989 resembled many American downtown areas. A disperse building structure with many voids was prevalent, there was no vital street life but many deserted open spaces.

2.1 “Critical Reconstruction” as Urban Planning Goal

After the fall of the wall, the revitalization of the city center, that is located in the former eastern part of the city, became one of the most important directions of the urban planning in Berlin, mainly for political reasons. The political situation was very different from the one in North America, evidently, but the dynamics and intentions for the revitalization were similar.

The leading model of the new planning in Berlin’s center was called “Critical Reconstruction” of the “European City”. That meant reconstruction and maintenance of the street pattern of the 19th century, of the block structure, of the height of the buildings, of stone facades, and of the open spaces. It was developed by the municipal city planning office with very little influence of the local people or by local architects. The main driving factors of this development were commercial ones.

Besides Potsdamer Platz and Alexanderplatz the Friedrichstadt with the central Friedrichstraße was one of the main revitalization areas. It was based on a street concept. The building type that was introduced to fill the street was called a “mixed-use commercial building”. It consists of nine stories above ground and four below ground. The first and second floors as well as the first basement floor were filled with shops and restaurants. From the third to the seventh floor offices were planned. The eighth and the ninth story were reserved for apartments, and the remaining three underground floors contained parking.

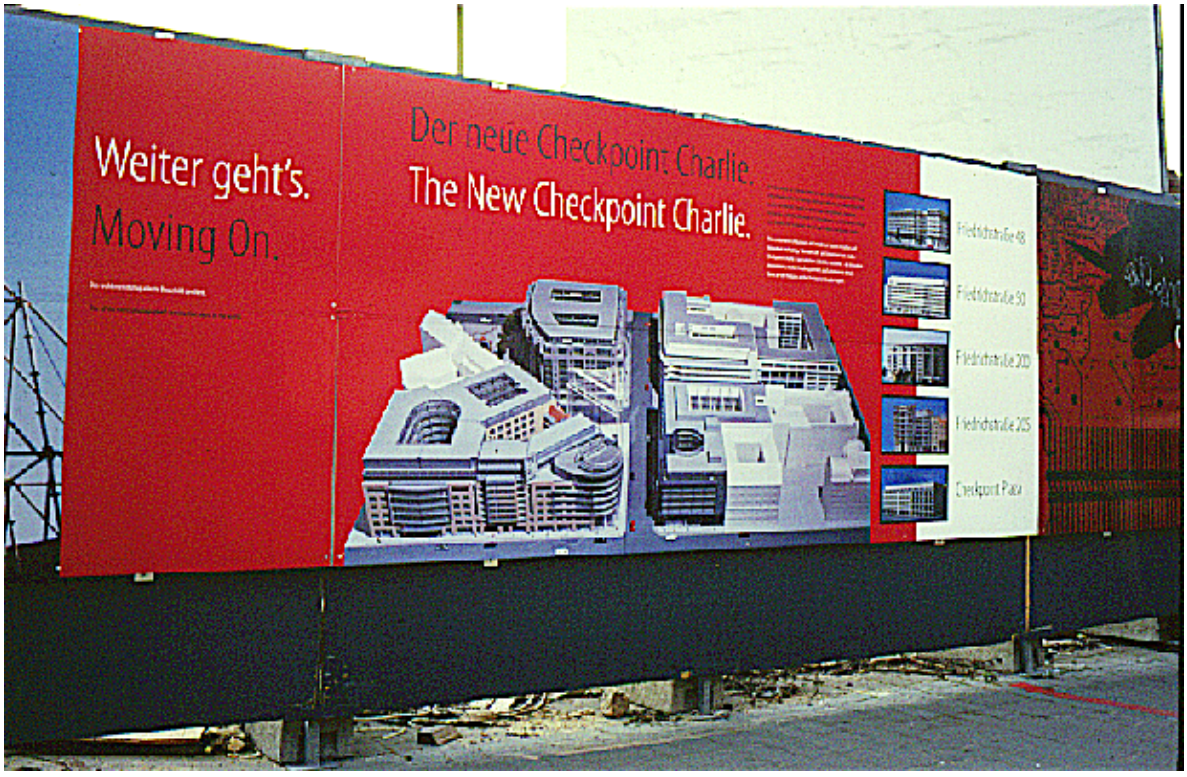

Figure 6. Berlin, Checkpoint Charlie at Friedrichstraße Revitalization Project. Photo: by the author.

Figure 7. Friedrichstraße Building Type. Photo: by the author.

2.2 Simulation of Historic City Patterns

These “historical downtowns” can be interpreted as theme parks of history. The functions in these new, pseudo-revitalized city centers and in the renovated areas were directed towards tourism and shopping, not towards living and working in an urban environment. Downtown areas were transformed into museums or into drive-in shows.

The simulation of city life did not lead to a revitalization of the downtown areas based on real and diverse urban life, but it intensified the negative tendencies that were already introduced in the sixties: monostructure of functions, commercialization, segregation of the urban population, privatization and control of open space. Malls and revitalized Main Streets are similar concepts. Housing had to be 20 per cent in this building type.
This was achieved with small luxury apartments on top of the buildings as well as apartment hotels. In comparison to other city centers in Germany this figure is very low. Housing occupancy in the center normally is 50 to 80 per cent.

Figure 8. Is Berlin Located in the USA and Only Accessible by Car?. Photo: by the author.

The most prestigious project in these areas is the Friedrichstadt Gallerias (“Friedrichstadt Passagen”). They form three blocks in the center of the Friedrichstrasse, near the legendary boulevard “Unter den Linden”. (Block 207: architect Jean Nouvel, investor: Roland Ernst; block 206: architect Henry N. Cobb, investor: Tishman Speyer Properties; block 205: architect Oswald Mathias Ungers, investor: Arc Union/Bouyues).

1400 million DM was invested for a brut floor area of 99600 square meters, containing 35 per cent shops and restaurants, 59 per cent offices, 5 per cent apartments and 1 per cent cultural functions. The floor area ratio is 6.5. The three complexes are connected by an underground passage.

Figure 9. Friedrichstadt Gallerias Shopping Mall, Block 205, Block 205. Photo: by the author.

2.3 Similarities in City Planning – Globalised Design

Comparing this German strategy of downtown revitalization with the one in North American city centers, several similarities are notable. What both have in common is the reevaluation of the city center. But this return to the center is mainly a geographical one. The structure and function of a vivid downtown, that implies mixed-use neighborhoods, was not rebuilt.

Historically, the city of Berlin consisted of many similar mixed-use neighborhoods. The center is now directed towards service and business, whereas huge housing areas are built as suburbs outside of the city. Berlin is fragmented by this specialization.
The displacement of housing towards the suburbs leads to a deurbanization of the center by means of depopulation. The center is only frequented during rush hours and lunch breaks. At night and on weekends, it is becoming a deserted area. In Germany, there is a high demand for housing in the city center. Therefore, this planning means mismanagement.

The regulation of street width (22 meters) and the height of new buildings (22 meters) was set up to create a homogeneous streetscape. However, homogeneity in a negative way results from monostructures. The new buildings in the Friedrichstrasse contain shops, banks, automobile showrooms, offices, and hotels. The center now is a central business district displaying multi-national chain stores and not an individual city center. Moreover, this one-dimensional monostructure of functions can hardly adapt to changing needs of different uses.

The banks and car showrooms of the Friedrichstraße do not encourage window shopping and strolling along the sidewalk. The shopping compounds and indoor galleries do not attract street life, in fact they lack a direct street relation. The autonomous complexes of the Friedrichstadt Gallerias are directed towards their interior rather than towards the street. Private indoor plazas like the “Place Voltaire” in block 206 want to substitute for outdoor public streets and plazas. These commercial buildings have direct access from the parking garage. This leads to a social devaluation of the street.

Figure 10. Inward-Oriented Building Type and Simulation of Building Type in Berlin. Photo: by the author.

The tendency of gentrification is also obvious in the Friedrichstraße. Small shops and little trade and craft businesses, families and subcultures were expelled through demolition of old buildings or high rents. The new trade spaces and luxury apartments are directed towards high-class shops, high-profile businesses, and high-income professionals.

The regulations, which have directed the design of Friedrichstraße, originate in the late 19th century city (street pattern, block structure, height of the buildings, stone facades). In some places this also led to a simulation of a naturally grown neighborhood in blocks that were divided into pieces simulating different architectural styles and ages, and to the construction of new buildings that pretend to be old.

The historical tradition of Friedrichstraße as a nightlife area, as it was in the twenties, with many bars, clubs, and theaters is an image which the new builders want to promote in their advertising, to give the street back its historical value as an address. But they did not supply the street with the functions that make a street vivid.

There are many similarities between the planning for American downtown areas and Friedrichstraße in Berlin. This is remarkable, because the official direction of the German planning was a regional one: the “Critical Reconstruction” and the “European City”. There were inhabitants, researchers, planners and architects who raised their voice against this development. This only had a minor effect. The public discussion and the economical promotion of Friedrichstraße were hypocritical. The new downtown does not represent a European city, rather it has many components of American central business districts and therefore is an example of globalization in architecture and urban design.

Figure 11. You are leaving the American Sector, Friedrichstraße at Checkpoint Charlie, Berlin. Photo: by the author.

3. Conclusion and Outlook

If we want our cities and their public spaces to be open, human, accessible, and adaptable to changing causes and fashions, how can we achieve it?

Developing general guidelines for city planning is not the right direction. Efforts that are made to solve the city through developing general city patterns are questionable as revealed above concerning the recent development in Berlin. Strict guidelines often become recipe books that contain overall proposals for urban planning. They are based on the wrong assumption that common design guidelines can fit every city and every town. But every city has its own language, pattern, history, and requirements, and thus it has to be analyzed and designed individually. But some points should always be taken into account concerning planning and revitalizing cities:

The downtown area has an important role for the whole city. In economic terms, constructing in the center is desirable, because the technical infrastructure already exists, whereas in a new suburb it has to be constructed newly. Public transport often serves the center, if it has not already been dismounted. For ecological reasons, a city should be planned and built in a dense and urban manner in order to stop the urban sprawl.

City planning has to direct towards the urban population. Each city and each business are dependent on their users, consumers, and passers-by. A city center that is not planned according to the residents' needs and desires will not survive, neither in an economical, nor in a social way.

The planning process has to become more democratic. City planning may not be dominated by speculation. Local community groups and local architects should be involved in the planning.

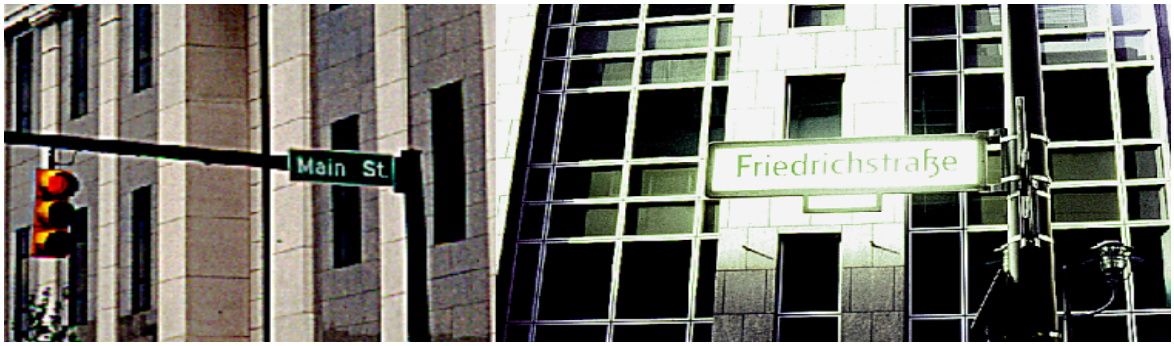

Figure 12. Similarities between US Main Streets and Friedrichstraße in Berlin. Photo: by the author.

Adaptability and flexibility are key words in city planning. Historical cities have survived because they are based on flexibility. Monostructures and the creation of a final situation of a city, as it was done in the Friedrichstrasse in Berlin, contradict the adaptability of the city to changing needs.

One essential quality of the open spaces is accessibility and multifunctional use. Plazas and streets, that are only accessible to a limited part of the population, and that are only serving one function, are not truly public.

There are, however many examples of successful revitalizations in Berlin and elsewhere. Strategies to make our cities more livable have to be developed from the actual social, cultural, and economical situation of the city. For every planner concerned with the urban environment, this presents a tremendous challenge.

KEYWORDS | DESIGN EDUCATION, SUPERVISION, REFLECTION, COURSE BOOK

ABSTRACT | The contribution outlines a research project exploring the supervision of design research. ‘Design Research Incubation’ aimed to foster exchange between different perspectives on design research from regional and disciplinary contexts. It also searches to contextualize design research within more expansive geographical environments of centres and peripheries. These goals were motivated by our observations that the nature of design research in relation to design practice and research in other subjects often confuses students, supervisors, and colleagues. Additionally, interpreting research findings requires an understanding of cultural, demographic, socio-economic and geographical contexts.

The research was a collaboration between the German University in Cairo (GUC) and Anhalt University of Applied Sciences in Dessau (HSA). Both institutions have diverse student and faculty populations. At GUC, design students from various backgrounds in Egypt study with an internationally diverse faculty. Anhalt University offers two English-language design master programs and has research centres in architecture and design.

1. Introduction

The project brought together six design master students from the German University in Cairo (GUC) and their peers at Anhalt University of Applied Sciences in Dessau Germany to discuss their design research projects. Workshops focused on critical reflection, including clarifying research questions and projects, relating theoretical and practical research, and visualising topics and processes.

Observations from these discussions prompted the development of a 'speculative course book' compiling sources to support design research supervision. It includes five modules: 1) Design Research as an ethical position, 2) Design Research as an expedition, 3) Design Research as knowledge circulation, 4) Design Research as context, and 5) Design Research as supervision. The modules are not finalised course descriptions but provide conceptual and practical guidance on engaging with different phases when supervising a design research project. The defined modules may help to enrich environments and processes for conducting and supervising academic design research in most settings, such as master or PhD programs in other regions of the world. At the same time, these modules aim to encourage attention to contextually specific characteristics in different cultural, demographic, socio-economic and geographical environments.

One of the main challenges deals with uncertainty student researchers experience in the design research process. In their studies students have come to rely on following the rulebook and applying design methods, e.g. design thinking, often in a top-down process, which makes them feel safe. As design researchers however they have to resist the urge of applying this top-down rationality, but instead remain open to new findings and emergence. For many this resilience to insecurity is a challenge and needs to be learned (Hall & Hohl, 2023).

The course book invites others to contribute ideas and join ongoing discourse and experimentation in the field. It is a starting point for collecting a broader range of supervision materials and further exploring design research's nature, scope, and methodologies of design practice and research relating to other disciplines. Therefore, we invite interested parties to join us in expanding this peer-to-peer exchange and developing frameworks, strategies, and practices for further design research supervision in different regional and institutional settings.

2. Course Book as a Sourcebook: A Critical and Speculative Compilation of Ideas, Concepts and Tools to Support Design Researchers

During our research project, each of us was supervising design researchers. Anhalt University offers three design master programs. One is the Master of Arts in Integrated Design (MAID), and the other is the more cultural history-oriented Master of Sciences COOP Design Research in cooperation with the Bauhaus Dessau Foundation and Humboldt University in Berlin. Both are conducted in English, while the Master of Arts in Intermedial Design (MID) is mainly in German. Anhalt University also has specialised research centres, such as the Centre for Doctoral Research in Architecture and Design and the Materiability Lab. Most master students in Dessau pursue their postgraduate studies as full-time students. At the GUC, students pursue their Master of Sciences in Design individually under supervision by one of the faculty members. Prior, they complete the so-called premaster year, consisting of semesters nine and ten of their bachelor studies. In Egypt, a bachelor degree requires ten semesters of study, but the curriculum at the GUC adapts a typical German bachelor curriculum of eight semesters. In these semesters nine and ten students complete compulsory studio and theory courses, required for obtaining a bachelor degree. However, those students who wish to can use those courses, which they share with the whole bachelor batch, to prepare for a potential master thesis. These two semesters then become also the first two semesters of a three-semester-long master program. However, in reality, those students who are interested in a master degree usually begin a new research project after the premaster year and spend longer than one semester on completing a thesis. Most of them are also teaching assistants and conduct their research part-time.

Despite the differing formats and conditions of the master programs at Anhalt University in Dessau and the GUC in Cairo, as supervisors of young design researchers, we found that our experiences overlap. Thematic areas or challenging phases in the research process, e.g. identifying research interests while new design concerns continue to emerge do not differ much for design researchers and supervisors in Cairo and Dessau. Therefore, we defined five modules, which form the basic structure of the publication 'Design Research Incubation'. The modules take the style of speculative course folders. They are not finalised course descriptions with defined learning outcomes, readings, tools and other materials but try to provide food for thought for engaging conceptually and practically with a design research project during different phases. We extracted the following five modules from our discussions during the project:

1. Design research as ethical position: How to identify values, mindset and principles
2. Design research as expedition: How to immerse into an unknown voyage
3. Design research as knowledge circulation: How to structure, express and communicate research in a thesis
4. Design research as context: How to embrace diverse circumstances in research
5. Design research as supervision: How to be accompanied in the design research process

The book also briefly documents our research visits to Dessau and Cairo because many of the ideas for the modules emerged during the conversations with the master students who participated in this research project. They made us realise that our initially anticipated goal to formulate guidelines for supervising design research was probably not the most helpful outcome due to the manifold topics and their different research requirements.

The modules are a starting point for collecting more helpful material for design research supervision. Moreover, they aim to foster a broader discourse on design research relating to design practice and research in other subjects. What are the nature and the scope of design research projects? How do they differ from the research inherent to every design project regarding users, target groups, market surveys, resources and the like? What implications do such differences have on methodological approaches? How can we debate and explore design research with students embarking on this journey? Other researchers have already discussed these questions (Findeli, et al, 2008). We consider our course book as speculative because we speculate about how to foster design research conceptually and practically in the five modules, which are briefly outlined in the following section.

3. Course Book Modules

3.1 Module 1 – Design Research as an Ethical Position: How to Identify Values, Mindset and Principles

In the design realm, practicality, ingenuity, and empathy guide the process alongside skills acquired during education (Cross, 2006, p.3). However, for emerging academic design researchers, additional emphasis is placed on ethics, critical thinking, and meticulousness. This transition challenges the conviction of designers with the scepticism of academic researchers. The mindset of a researcher calls for critical thinking, self-awareness and humility in order to navigate ambiguity and diverse perspectives. Therefore the following aspects gain importance:

Posture and mindset: Terry Irwin (2015, p.235) argues that "Living in and through transitional times requires a mindset and posture of openness, mindfulness, self-reflection, a willingness to collaborate, and 'optimistic grumpiness'." As designers we might be experts, but as academic researchers we are becoming learners again. We might be wrong, and we might make errors. Our perspective is one among many different perspectives.

Practice-based design theory: Design research discussions aim to engage with practice and theory equally, integrating theoretical knowledge into practical contexts and vice-versa. The goal is to foster knowledge of practices within academic institutions while ensuring discussions reflect the diverse domains and communities represented (Hohl et al, 2020).

Ethics and aesthetics: Balancing efficiency and effectiveness by acknowledging the impossibility of perfect objectivity. Second-order cybernetics views the observer as a part of the observed system, where he influences the design and research process. Reflective practitioners consider both efficiency and effectiveness as important, weighted by the values of the ends achieved. They recognise the impact of their values, postures and mindset on expectations and interpretations (von Foerster, 2003).

Gatherings: These encounters provide inclusive spaces for diverse perspectives on design research, encouraging reflection and challenge. Regardless of background or experience level, participants contribute insights from lived experiences. The following rules of engagement in gatherings guide the ethical position of design research, promoting critical reflection, inclusive dialogue, and ethical conduct in academic discourse:

- Gatherings as spaces where teaching, learning, and research intersect, inviting all references and insights from all parts of lived experiences of people with diverse backgrounds and experience levels who participate;
- Respectful disagreement with a generous attitude towards all present;
- Use straightforward language to make the forum accessible to everyone, never assuming that other people know what we know, always avoiding name-dropping, unsubstantiated references to unexplained arguments, and explaining the meaning of jargon if it is necessary;
- Use English as the language of communication while welcoming comments and questions in the language the participants feel comfortable with which experienced members will help to translate;
- Inclusivity, where in case of specific accessibility needs, the organisers will find solutions;
- Respectful treatment of everyone (in presence and online) and the creation of a welcoming environment, for which everyone takes care that the behaviour meets these standards;
- Empathy to the vulnerabilities of others and avoidance of violence through words or images, discussing with experienced members and organisers if there is a need to share potentially disturbing material.

3.2 Module 2 – Design Research as Expedition: How to Immerse into an Unknown Voyage

Aspiring design researchers, such as master students, often enter their projects with preconceived notions of the outcome – a product, a campaign, or even an app. However, this assumption highlights a common misunderstanding: the belief that the research result is predetermined. However, design research diverges from traditional design practice as it involves exploring abstract concepts through practical experimentation and theoretical reflection alike.

Design research encompasses diverse approaches, including investigations about design historical and contemporary practices as well as practice-led inquiry where design work is used as a research method to explore the concerns and questions at hand, e.g. how to bring innovative practice in different design disciplines forward. Research results may not necessarily be final design projects but critical analyses, speculative concepts, or frameworks guiding future design practices. Challenging the notion that design researchers must solely solve problems, the process is more about embracing open-ended exploration. Practice-led research involves continuously asking and expanding the canon of questions, experimenting and offering valuable learning opportunities through successes and failures alike. Embracing the uncertainty and serendipitous discoveries enriches the research journey, leading to novel insights.

In fostering rigour, honesty, and values in research, doctoral-level and master-level inquiry demands critical, reflective, thorough, exhaustive, accurate, systematic, and honest approaches. This rigour emphasises both breadth and depth of understanding and a commitment to questioning assumptions and scrutinising every facet of the research process.

A proposed course on critical thinking in design research aims to equip students with theoretical and practical competencies. Students develop critical thinking skills for innovative design research by exploring diverse research methodologies, perspectives, imagination and storytelling, and engagement with diverse cultural knowledge systems (Escobar, 2017). The course shall encourage students to apply design research methodologies to real-world challenges with a critically reflective mindset. The preliminary syllabus covers fundamental concepts of design research, practical research methodologies, and the application of critical thinking to design projects. Students will engage in critique sessions and presentations, fostering intellectual growth and creative problem-solving skills. The course syllabus serves as a framework, adaptable to meet students' and instructors' evolving needs and interests by facilitating a dynamic learning environment. Three relationships we found to be vital for developing a researcher mindset in design (Fig.1):

1. Making and practice through ideas that are developed and refined;
2. Research questions that emerge from design problems in design practice;
3. Importance of embracing failure and error in practical experimentation for research insights.

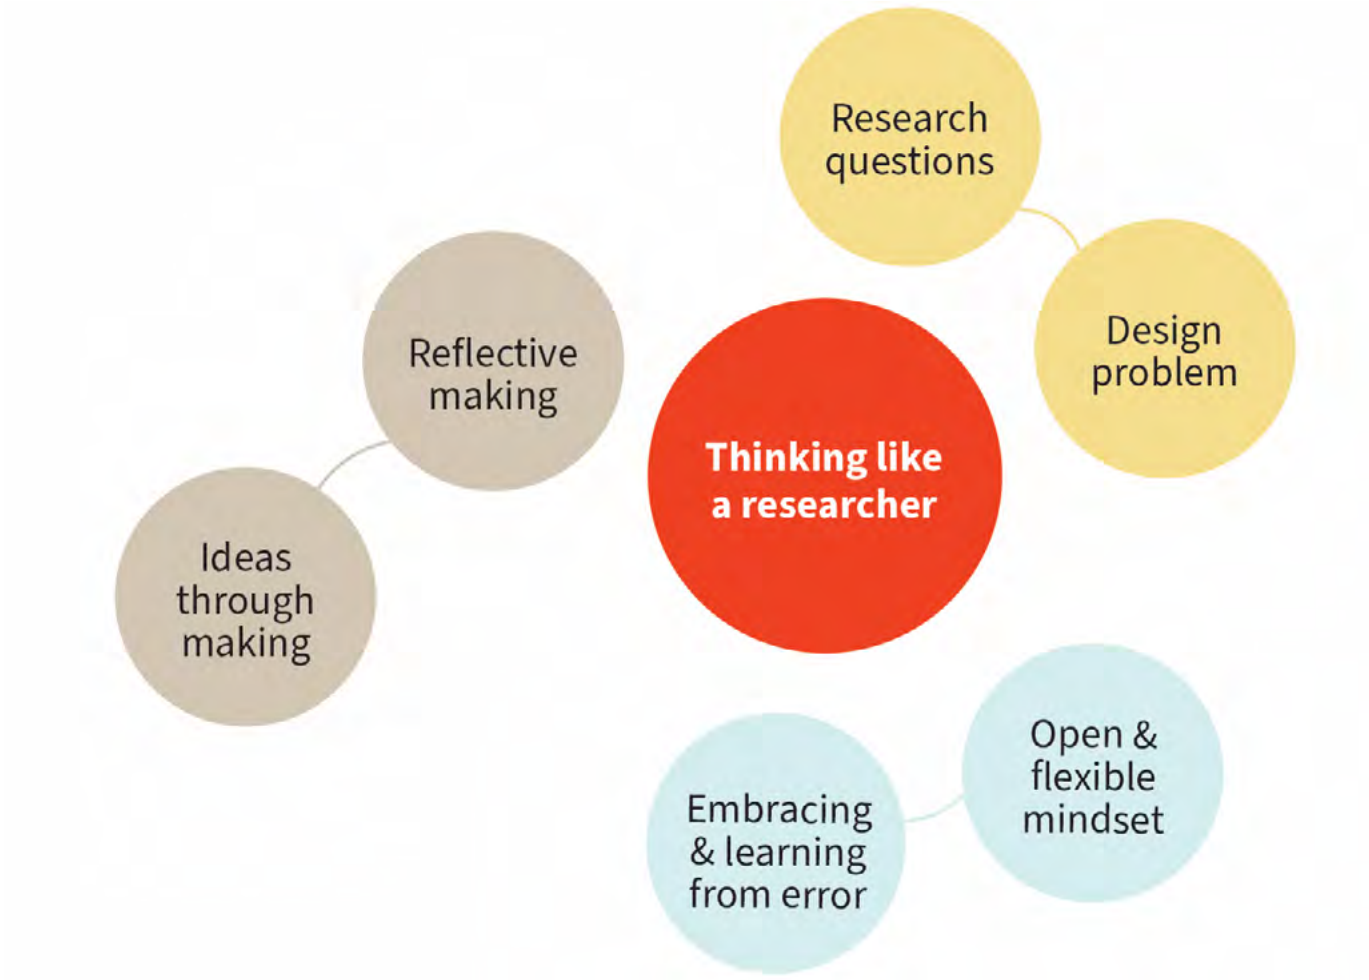

Figure 1. Mindset of a researcher. Developed by the authors during the research project.

3.3 Module 3 – Design Research as Knowledge Circulation: How to Structure, Express and Communicate Your Research in a Thesis

Design researchers, especially new ones, often conduct their research with much consideration. They define a research methodology, collect data accordingly, and try to make sense of their insights. They experience the highs (when making exciting discoveries) and lows (when being lost and confronted with more questions than answers) like many other researchers.

Writing a thesis about their research process and results is challenging for most design researchers. They never got used to writing. Structuring and writing texts have usually not been at the core of their previous studies. Unlike students and professionals of other academic disciplines, designers do not usually write much apart from small descriptions in project presentations and documentations.

However, the ability to communicate design research projects is vital (Fig. 2). We think it would be beneficial to design a course that focuses mainly on academic writing skills for designers, including hands-on exercises and developing competencies in using up-to-date digital tools. A course description could look like this:

> **Course description: Reflective writing and communication**
> Effective communication is vital for design researchers to share their insights and findings. However, many designers face difficulties structuring and expressing their research in a thesis format. This course addresses this gap by equipping students with practical knowledge and insights in reflective writing and communication. Students will learn how to apply language effectively, ensuring correctness, clarity, engagement, and delivery. Additionally, they will gain proficiency in standard academic writing rules, language styles, and citation formats. Emphasis is placed on utilising digital tools for writing, particularly for non-native English speakers.

Figure 2. Impression from the workshop in Dessau, 2023: gatherings and discussions on communicating design research projects.

3.4 Module 4 – Design Research as Context: How to Embrace Diverse Circumstances in Your Research

Design research necessitates understanding context, which we define as the circumstances surrounding an event or idea. This contextual awareness is crucial as it influences the thematic focus, research methodology, and outcomes of design research endeavours. Various factors, such as geographical

location, cultural norms, and socio-economic conditions, significantly impact research processes and conclusions.

Design topics may initially appear universal but require consideration of diverse contextual factors. For example, waste management strategies differ between Cairo and Berlin, Egypt and Germany, and other places, or between rural and urban areas. Similarly, cultural attitudes towards consent and data collection methods vary. For example, Egyptian students face problems when they ask informants to sign consent agreements as informants become suspicious of the researcher and less willing to share information freely. Accessibility to research locations and power imbalances caused by demographic and socio-economic differences between researchers and participants affect many research processes. Moreover, context extends beyond tangible factors to encompass differing worldviews and knowledge systems. Clarifying understandings and avoiding assumptions are vital when engaging with participants from diverse backgrounds. In feminist theory, context is an intrinsic component of situated practice, highlighting the interconnectedness of circumstances within a specific situation:

> "We do need an earthwide network of connections, including the ability partially to translate knowledges among very different – and power-differentiated – communities. We need the power of modern critical theories of how meanings and bodies get made, not in order to deny meanings and bodies but in order to build meanings and bodies that have a chance for life." (Haraway, 1988, p.580)

On a different level, looking at feminist theory also offers a valuable perspective on the 'context' of young design researchers. Following Donna Haraway, only "situations" exist, including the circumstances creating the situated practice. According to feminist sociologist Adele Clarke, context does not exist outside the actual situation but is a component of a specifically situated world: "The conditions of the situation are in the situation. There is no such thing as 'context'" (Clarke, 2005, p.72). The diagram of a situation mapping presents all conditions influencing a master student's situation besides the thesis project (Fig. 3).

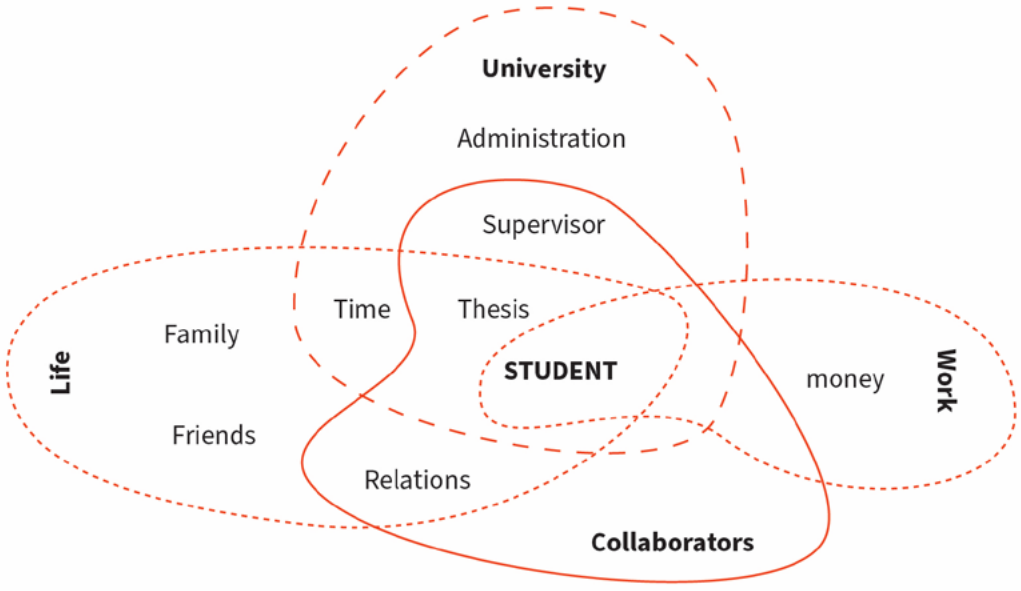

Figure 3. Situation mapping of doing a thesis.

Transitioning from design practice to academic research can evoke vulnerability and uncertainty. Accustomed to confidence in the creative process, designers may struggle with doubt and scepticism in research. Furthermore, designing is a research-driven process, blurring the distinction between the role of the designer and the researcher. In conclusion, embracing diverse circumstances is integral to effective design research. By acknowledging and navigating contextual complexities, researchers can generate nuanced insights and contribute meaningfully to their different fields of interest.

3.5 Module 5 – Design Research as Supervision: How to Accompany a Design Research Process

This module briefly outlines our view of design research supervision at the master and doctoral levels. We discuss the roles and responsibilities of the supervised learner and the supervisor.

Supervisor: In our view, a supervisor is a 'guide on the side'. It is not the supervisor's thesis project. He or she tries to support the learners in finding their way, thus taking ownership of their research and learning process. Supervisors guide through recommendations, giving information, and communicating reliably, regularly, constructively, and clearly. We also strongly support the idea that those who supervise thesis projects have regular exchanges with other supervisors, sharing their observations, knowledge and experiences and recommend offering workshops for supervisors about supervision responsibilities.

Learner: What can the supervised student expect from their supervisor?

At the first meeting:

- Information about roles, expectations and timescale, the relationship between project work and written thesis, theory and practice, assessment criteria, ethics, honesty, and consequences of cheating and plagiarism;
- Agreement on the frequency of meetings, possibly more frequent in the early research stages.

During the process:

- Time for regular meetings and tutorials;
- Relevant and constructive feedback;
- Timely responses to email enquiries.

From the supervised design researcher/learner the following is expected:

- Responsibility for their research process;
- Honest communication with their supervisor;
- Motivation and reliability;
- Preparation for tutorial meetings;
- Reaction to feedback from supervisors;
- Own decisions regarding the research project and discussions about those decisions;
- Establishment of practical and theoretical knowledge to build on;
- Management of own work plan, including goals and pace of work;
- Clear communication that includes worries and doubts;
- Acceptance of advice;
- Proactivity in sending agreed outputs on time.

One critical message supervisors can communicate to young design researchers is that finding answers to questions can be limiting. Research that opens up more questions and hence inspires further research can be classified as successful research (Fig. 4).

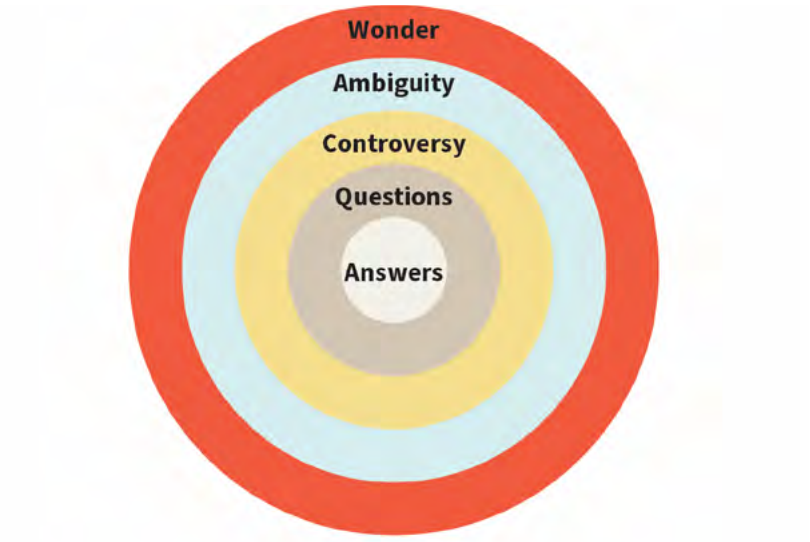

Figure 4. From answers to questions to wonder and curiosity in research (adapted from Wesch, M., 2014).

In school, students learn that knowledge is about how to answer correctly. In graduate studies, young researchers might learn how to ask questions, have discussions and realise that beyond the syllabus, knowledge is steeped in ambiguity and controversy, that there are different perspectives, and that there may be many possible answers, perhaps none of them entirely satisfying.

As reflective practitioners (Schön, 1984) and researchers, those researchers also learn how to reflect, question and be sceptical. As researchers, it is here where they might find new avenues for research worth exploring. However, they must suspend their desire for certainty and learn to embrace ambiguity, uncertainty, and curiosity, and as such trust that through the research process new insights will emerge. They must become more interested in questions than answers, as questions, observations, and critical thinking may drive their research and learning. It may conflict with their learned stance of seeking answers instead of seeking questions. Sometimes, unlearning is the most promising road forward.

At the beginning of an academic design research expedition usually comes the proposal that outlines the research interest and its methodological approach, which is not an easy task. In order to support design researchers at the starting point of their expedition, the following worksheets have provided supportive guidance since they were first introduced to prospective GUC master students (Table 1).

Table 1. Support for framing a design research topic.

01. What design research topic do you propose?		
Guiding questions:		Open questions and comments:
What is it that you are interested in?	How did you become interested?	
What do you want to investigate?	From your personal experiences?	What are you still insecure about?
What are your questions?	From your academic experiences?	
What challenges do you observe?	From your professional experiences?	
02. What is the character of your research?		
What makes your research design research?		Open questions and comments:
What distinguishes your research from research in other disciplines?		
Are you researching design practice, historical or philosophical design aspects or design by others?		What are you still insecure about?
Are you researching through design by exploring through practical design experiments)?		
Are you researching for design (improved design practices)?		

03. What is the story of your topic?	
Problem statement: Tell a story of how and why you became interested in exploring this topic.	Open questions and comments: What are you still insecure about?
04. What are your research questions and your purpose statement?	
Narrow down your primary research question(s): Based on your responses above, state what you want to explore in question form here! Try to make it as focused and specific as you can. What are your questions?	Purpose statement: Turn your question into a purpose statement, which conveys the same information as the research question(s)Example: 'The purpose of the study is to …' State why your research is significant and to whom?
	Open questions and comments: What are you still insecure about?
05. What is your methodological research approach?	
Anticipate your research Research changes in the process, but it is good to anticipate how you will find out what you are interested in — even if you might not implement it exactly like this. Describe how you think of conducting your research! Which research methods do you have in mind?	Open questions and comments: What are you still insecure about?
06. How would you visualise your research process?	
Sketch and map different aspects of your research: Interest Methods Involved research partners Locations	Open questions and comments: What are you still insecure about?
07. Which terminology do you need to familiarise yourself with and define?	
Clarify terminology: Which terms belonging to the field of your research interest are unclear to you? Which ones are ambiguous? Define them for your research based on dictionary definitions or literature specifications!	Open questions and comments: What are you still insecure about?

(Based on worksheets prepared in 2022 by G. Kulick using a preliminary worksheet set developed by R. Sadik in 2013)

4. Reflections: What We Think is Needed for a Better Design Research Supervision Ecosystem

So, what can we do as supervisors to mitigate the confusing situation experienced by practitioner-researchers, pay attention to cultural, socio-economic and other differences and as such also negotiate the tension between centre–periphery when it comes to applying research methods and ethics in design? Summarising this paper, our common experiences across different cultural and institutional environments regarding design research and the supervision of design research include (but are not limited to):

For the young design researchers:

- The difficulty of trusting an open-ended research process instead of pretending to already know the outcome at the beginning of the research process, which would feel safer;
- The confusion about the role of design practice in design research and the resulting negotiations of this relationship in each design research project;
- The challenge of writing an academic thesis while not being familiar with this process from undergraduate studies.

For the supervisors:

- The difficulty of defining a supervision structure that delegates responsibility to the researcher while assuring him or her that they can get guidance from their supervisor when needed;
- The situation that research topics are so diverse that a supervisor cannot always have detailed knowledge about each topic.

There were also differing experiences: while at Anhalt University master students study in one of three structured master programs, at the GUC the master students study on their own and consult individually with their supervisor.

What both young researchers at master and PhD levels as well as supervisors experience as fruitful is a regular exchange, sharing their research progress and receiving and providing input from and to each other.

Through our exercises with the GUC and Anhalt University master students, and the exchange with them, our colleagues, and ourselves, we identified a few points that require attention when supervising design research projects. The following list is not static but an invitation to develop a 'community of practice' (Wenger et al., 2002) between design research supervisors and design researchers in more institutions. As a side note, a 'community of practice' requires 1) a domain consisting of shared particular expertise and interest areas (not just any loose network of people), 2) a community sharing activities related to the domain regularly, and c) a practice, which is more than sharing viewpoints and theories, but means to work together actively (Wenger, et al, 2002; Wenger-Trayner & Wenger-Trayner, 2015).

What do we need then to develop such a community of practice around design research supervision?

1. An understanding that the knowledge of what design research comprises is not a static knowledge base but changes alongside the emergence of topics, theories, research methods, tools and methodologies;
2. Opportunities through collaboration and exchange with fellow supervisors and researchers inside our institutions and other institutions, for developing and creating access to resources that support design researchers and their supervisors;
3. A culture of critical reflection and exchange with colleagues that we must continue to research, supervise and foster;
4. The ability and the will to learn how to listen with the intent to understand and communicate often and with clarity;
5. Curriculum strategies at the undergraduate level, that convey the essential role of critical reflection in successfully learning how to design for current and contextual design concerns;
6. Prerequisites that enable us to implement our ideas for such a more dynamic research environment, including the creation of programs, extracurricular platforms and events such as conferences and symposia, focusing on supervision strategies for design research.

What we find important is to mention that this need for a community of practice of design research supervision differs from other design research communities, of which already many exist, insofar as the focus is on supervision strategies.

Some of these strategies or parts of them have already been attempted. For example at the GUC a master course is currently not part of the curriculum but a master colloquium has been implemented in fall 2022 and spring 2023 informally for those students who participated in this project. Much of the learnings discussed in this paper stem from this experiment, which is currently on hold but will continue following the positive feedback, possibly as a formal integration into the curriculum. Within this colloquium, some of the suggestions above will be implemented. What has worked well so far were the regular presentations of the master students to their peers and for those who just joined and identified topics questions in were helpful (Table 1).

At Anhalt University master students already experience assignments and research tasks that focus on a critically reflective practice in their regular theory courses. Students, among others, are encouraged to keep a reflective journal that is used at the end of every seminar. In it, they reflect on their learning and role in the seminar, and how they could have acted differently. This allows them, over time, to realise the value of reflective practice and this record creates an awareness of their emerging skills, confidence and growth.

However, to foster design research and design research supervision further, in our daily work at our institutions and in transcultural networks, we must stay curious and updated and actively participate in shaping the field with fellow supervisors and research candidates. Therefore, we hope that we will be able to continue with our shared project, try out some of our modules, refine them and develop more tools, methods and supervision strategies, ideally with fellow design research supervisors from other universities joining us.

About the Authors:

Judith Dobler has been a research associate and coordinator at Anhalt University in Dessau Germany since 2020. She has multiple qualifications as a carpenter (journeyman's certificate), graphic designer (diploma FH), design theorist (MA) and a doctorate in media studies (Dr. phil.). Her research topics include visual thinking, embodied design knowledge, performative design discourses, and theories and practices of embodiment.

Gwendolyn Kulick has been an associate professor of design theory and research at the German University in Cairo, Egypt since 2018. Prior she taught at Beaconhouse National University in Lahore, Pakistan for eleven years. Her PhD from Wuppertal University is a systemic analysis of stakeholder relationships, methods and motivations in craft projects in grassroots empowerment in Pakistan.

Michael Hohl is a professor of design theory and history at Anhalt University of Applied Sciences, Dessau, Germany and supervises PhD students from Art, Design and Architecture at various universities internationally. He holds an interdisciplinary, practice-led PhD in fine art and computer science

Acknowledgements: We would like to thank the German Academic Exchange Service (DAAD) and the Federal Ministry of Education and Research (BMBF) for receiving the 2023 Mobility Grant through which this research project became possible, and the German University in Cairo and Anhalt University in Dessau for their organisational support. Further, we thank Sandra Giegler, Alberto Iberbuden, Karsten Schuhl, and colleagues from the Materiability Lab and the Research Centre for Doctoral Studies in Architecture and Design in Dessau for their fruitful input. Last but not least we thank the master students in Cairo and Dessau for sharing their exciting research interests and feedback with us in diverse workshops activities.

KEYWORDS | URBAN JUGAAD, CONSTRUCTION WORKERS, AHMEDABAD

ABSTRACT | The developing world is currently undergoing a great rural to urban migration. It is a necessary and inevitable trend, yet failures of urban planning and political consideration result in diminishing opportunities for the rural migrants. Activist architecture that attempts to deal with these problems is often focused on the physical manifestation of the failures of this arrival process: the urban slum. This paper explores the lived experiences and practices of seasonal migrants who come from the tribal borderlands of central India to work as construction workers in the city of Ahmedabad. The case study attempts to understand the factors and dynamics that shape these seasonal migrants' housing experiences, practices, choices, and constraints in Ahmedabad. These migrant colonies generate a Kinetic City[1]; an incremental city in motion, characterized by reusing easily available construction materials on and around the worksites, bursting with constant modification and reinvention through the practice of Jugaad Urbanism. These quick fix colonies are highly suffering from a lack of any basic infrastructure. Access to basic services like water and sanitation is lacking or profoundly inadequate in most instances while access to social infrastructures of health and education for their children is a major challenge. With interventions in Indian cities being driven by exclusive imaginations of "global cities" and "world-class infrastructure," and more recently of "smart cities," these urban migrants have often been thrown by the wayside. The root of the problem lies in social and political acceptance and interventions. The onsite living conditions of the migrants are mapped taking in consideration 5 representative construction sites in Ahmedabad. Here the documentation communicates the spatial configurations, fundamental materials and structure used in these colonies and throughout the Kinetic City. The mapping documents the struggle to employ architecture as a means of achieving a desired standard of dignity for the migrants. The study concludes stating a need for solutions which anticipate and make room for the innovations of Jugaad Urbanism[2], employing local techniques and incremental improvements, rather than by imposing a one-off, technologically advanced solution not forgetting that addressing basic necessities of accommodation and sanitation is of utmost importance. The research emphasizes the need to address both on-site living conditions and housing arrangements made by workers at labor "Nakas"[3] in cities. It builds upon earlier recommendations emphasizing the essential role of political and administrative commitment as well as advocacy and mobilization of migrant workers.

[1] Kinetic City - The Kinetic City is not perceived as architecture, but in terms of spaces, which hold associative values and supportive lives. Patterns of occupation determine its form and perception. It is an indigenous urbanism that has its particular 'local' logic. It is not necessarily the city of the poor, as most images might suggest; rather it is a temporal articulation and occupation of space that not only creates a richer sensibility of spatial occupation, but also suggests how spatial limits are expanded to include formally unimagined uses in dense urban conditions. (Mehrotra, 2018)

[2] Jugaad Urbanism - The spirit of jugaad urbanism, is defined by Argawal as a "resourceful and innovative bringing together of disparate parts." The strategies go beyond "making do" and improve and reveal new possibilities within the existing realities of urban life. Jugaad "thinks beyond the object," stated Argawal. They engage with the surrounding "urban milieu" to harness the energy of the street, which is perhaps the most critical resource of all. (Argawal, 2011)

[3] Nakas – (India) A place where workers assemble to seek employment. (Wikipedia, n.d.)

1. Introduction

India is one of the most populous countries in the world consisting almost one-sixth of the world's population. According to UN estimates, India overtook China in having the largest population in the world with a population of 1,425,775,850 at the end of April 2023. (Metrics, 2023) Indian cities are also growing at an exceedingly fast rate; in the period from 2001 – 2011 the urban population grew from 286 million to 377 million, and is expected to rise to 600 million by 2030. (UNDESA, 2023) With this rapid urbanization, comes the demand for mass housing to cater to the growth of a new middle class[4]. This has resulted in an abundance of large-scale gated communities situated around the outskirts of cities throughout India. The rate at which these developments are being built comes at a cost; the construction industry thrives on exploitation of migrant construction workers and maintains a low standard of building construction. Construction workers constitute one of the largest segments within the service provider community in urban areas, yet their significant contribution to the economy often goes unnoticed, mirroring the plight of many informal sector workers. In Ahmedabad alone, there exists an estimated population of 100,000 construction workers, more than half of whom are seasonal migrants from both intra-state and inter-state regions (Homeless, 2013). Originating from tribal districts of Gujarat, Rajasthan, and Madhya Pradesh, as well as other states such as Maharashtra, Uttar Pradesh, Bihar, and Jharkhand (Desai, 2020). Many of these workers have been integral part of the city's construction landscape for over a decade. Typically, they spend anywhere from 6 to 10 months in the city, periodically returning to their villages for short durations ranging from 15 days to a couple of months during festive seasons and the period of agricultural activities (Homeless, 2013). Despite the essential role of these migrant construction workers in shaping the urban environment, the intricate dynamics of their employment, migration patterns, and their housing needs within the city remain poorly understood.

Although laws exist for the rights of construction workers, systemic corruption impedes enforcement for these laws (Homeless, 2013). These workers will move with the contractors not only within Ahmedabad, but also to other cities. The workers belong to the most poor and disadvantaged sections of Indian society, the majority from poorer states, such as Uttar Pradesh and Bihar as well as bordering states such as Rajasthan and Maharashtra. (Desai, 2020) Migration provides survival to these workers and their families, but also exposes them to a cruel and vulnerable existence. As these workers are in a setting far from their place of origin, they stay at the construction sites in labor colonies. The labor colonies are made up of individual Jhuggis[5], where living conditions are so poor that they deprive the workers of basic human dignity. The living conditions these workers are subjected to are harsh and require architectural interventions.

[4] New middle class - The ‘new middle class’ in India refers to the socio-economic group that emerged in the post-liberalization era of the 1990s, characterized by rapid economic growth, globalization, and the rise of the service sector. This group has experienced significant upward social mobility and has become an influential force in shaping the social, cultural, and political landscape of India. (Fernandese, 2016)

[5] Jhuggis - a house, usually made from mud and or sheets of iron, that is dirty and in bad condition, and located in a very poor area of a city. (Oxford Learners' Dictionary , n.d.)

Figure 1. Accommodation built by one of the RCC – Masonry – Contractors in Ahmedabad for a project duration – 3 years.

2. The Documentation of Conditions at the Construction Sites

2.1 Mapping the Scenario of Construction Sites in Ahmedabad

There is no reliable data to estimate the scale of construction activity in Ahmedabad and its peri-urban area, finding the actual the number of construction sites is also difficult in comparison with the number of sites registered.

I draw upon the following dataset to provide a picture of the number of construction sites in Ahmedabad:

This data-set consists of construction sites registered in Ahmedabad district under the BOCW Act 1996 6 (see Table 1). Construction sites which employ ten or more building workers for any building or construction work and where the total cost of construction is more than INR 1,000,000 are required to be registered under the BOCW Act. (bocw-act, 1996). The registrations under the BOCW Act are done district-wise and the data is not available at the city level, therefore, the data is presented for entire Ahmedabad district, which covers an area of 8107 sq.km.

Table 1. Construction sites registered in Ahmedabad district under the BOCW Act 1996.

Year	Sites Registered	No. of Workers declared by registered sites		
		> = 100	100 - 500	< 500
2017 (Jan-Mar)	45	34	10	1
2017-18	237	192	43	2
2018-19	485	392	84	9

* There is a possibility that the numbers of workers are often under-reported. (Desai, 2020)

[6] BOCW Act, 1996 - The building and other construction workers (regulation of employment and conditions of service) act, An Act to regulate the employment and conditions of service of building and other construction workers and to provide for their safety, health and welfare measures and for other matters connected therewith or incidental thereto. established on the 19th of August, 1996. (bocw-act, 1996)

2.2 Field-Visits and Questionnaire at Construction Sites

This paper consists of data form 5 construction sites to document the housing and basic services provision to construction workers (see Table 1). The details of all the construction sites, their developers, contractors, etc. are kept confidential in this report. These 5 sites cover projects such as a residential, a commercial, a hotel, a university building and a road development project. These 5 sites included 2 projects in which different medium and small-scale contractors had been hired for almost each of the construction activities such as excavation, RCC, masonry-plastering, flooring, painting, waterproofing, aluminum windows, grill fabrication, plumbing, electricals, etc. When the project consisted of multiple buildings, often more than one contractor was hired for each of the activities. The remaining 3 projects out of 5 projects were executed by 3 different large construction companies – the large construction company had been hired for the civil work (excavation, RCC and masonry-plastering) and in most cases, for a few other construction activities as well.

A questionnaire was filled at each of these sites to document the following details of the construction project:

1. The number of construction workers employed for various construction activities;
2. Who among them lived at the worksite;
3. Who provides the accommodation other facilities for the workers living at the worksite;
4. The nature of these facilities (Annexure 1).

The questionnaire was filled through a combination of personal observations and detailed discussions with the relevant on-site staff of the developer / contractor (e.g. project manager, safety officer, admin manager, admin in-charge, etc). In a few cases, the questionnaire could not be filled comprehensively due to various reasons. Nonetheless, substantial data could be collected.

Annexure 1.
With regard to the mode of provision and nature of provision, the following aspects were documented:

1. Provision of land for the labor colony;
2. The building of labor accommodation;
3. Creche for the workers' children;
4. Provision of water infrastructure - for drinking and other uses such as bore-well, water pipeline, water tankers, water storage tank, water filter;
5. The building of sanitation infrastructure - toilets, bathing spaces, spaces for washing clothes and utensils, sewage disposal and drainage;
6. Provision of electricity.

Note – Details regarding the provision of health services for the workers and their families, tie-ups with medical clinics or hospitals could not be documented. Provisions of the housing and basic services were documented through photographs.

2.3 Interviews with Developers and Contractors

Interviews with developers and contractors of construction companies were an important part of this study, in order to understand how they view their workers' housing question and how this housing can be improved.

Surprisingly there is a very little systematic information available about the current practices in the construction sector vis-à-vis the provisions made for worker accommodation and other facilities for workers at construction sites. In fact, one developer, when asked about these practices across Ahmedabad, reflected on the lack of information about these aspects within the developer community itself:

> "We never discuss it. We discuss FSI when we meet with other developers or in public forums or in conferences. Nobody – not one topic, not even 15 minutes are spent on discussions pertaining to these aspects and what one should do for them. Which is really a reflection on some people [pause]… actually it is a reflection on us, that we don't think of these things. That we don't consider them worthy of discussion. We don't ask each other what are you doing at your site; who is providing housing to the worker. We may be doing something for worker at our site, but we don't discuss this when we meet other developers. We don't give this importance enough for it to figure in the conversation." (Pavan Bakeri, Bakeri Group, discussion in 2018)

2.4 Study of Regulatory Framework for Housing and Basic Services for Workers

In the 2017, CIRA7, the existing regulatory framework was studied to understand the mandated responsibilities of developers and contractors with respect to housing and basic services provision for migrant construction workers (Desai 2017). The study included worker legislation, along with the follow-ups done in the present study to understand the implementation of the provisions of BOCW Act for registering construction sites and regulating housing and basic services provision for workers at the construction sites. The 2017 study by Renu Desai also noted that, though ambiguous, the development permission (DP) has a provision for regulating housing and basic services for these workers. The RERA, 2016 8 – which is part of the regulatory framework for real-estate construction projects and requires registration of these projects before project launch – was also briefly examined to see if it could play any role in regulating housing and basic services provision for these workers. These regulatory frameworks were studied through discussions with government officials as well as relevant documents/data obtained using Right to Information (RTI). The data obtained was also used to estimate the number of construction sites in Ahmedabad in the recent years.

2.5 Labor Legislation and Governance

Based on a previous study on the entitlements of migrant construction workers (Desai 2017), and follow-up research on the implementation of the BOCW Act, this section outlines aspects which shape how worker legislation and its implementation impact provisions by employers for housing and other facilities for workers at construction sites.

Besides the question as to whether or not a construction site is registered under the multiple worker laws that are applicable to it, the provisions vis-à-vis housing and other facilities to be provided by the employers for workers vary across these laws. While the ISMW Act9 and related central rules have some of the strongest and least ambiguous provisions on housing and other facilities, the enforcement of this law in general is weak due to various reasons. Enforcement of the BOCW Act and related Central and Gujarat State rules is deficient but better than the ISMW Act, but BOCW Act has ambiguous provisions for housing and other facilities for workers (Desai, 2014). Different regulatory actors to enforce the different worker laws applicable to construction sites The CL Act10 and the ISMW Act are to be implemented by the Worker Commissioner wing of the Labor and Employment department of Gujarat government, while the BOCW Act is to be implemented by the Directorate for Industrial Safety and Health (DISH) wing of the department. The BOC inspectors, who were recruited in 2017 under DISH to enforce the BOCW Act most of the times do not

[7] CIRA - The Contract Labour Regulation and Abolition Act, 1970, An Act to regulate the employment of contract labour in certain establishments and to provide for its abolition in certain circumstances and for matters connected therewith. (CIRA, 1970)
[8]RERA - Real Estate (Regulation and Development) Act 2016 - An Act to establish the Real Estate Regulatory Authority for regulation and promotion of the real estate sector and to ensure sale of plot, apartment or building, as the case may be, or sale of real estate project, in an efficient and transparent manner and to protect the interest of consumers in the real estate sector and to establish an adjudicating mechanism for speedy dispute redressal and also, to establish the Appellate Tribunal to hear appeals from the decisions, directions or orders of the Real Estate Regulatory Authority and the adjudicating officer and for matters connected therewith or incidental thereto. (RERA, 2016)
[9] ISMW Act - INTER-STATE MIGRANT WORKMEN Act, 1979, Is an Act to regulate the employment of inter-State migrant workmen and to provide for their conditions of service and for matters connected therewith (ISMW, 1979)
[10] CL Act - Contract Labour Act, 1970 - Chief Labour Commissioner (Central) - This act has been enacted to regulate the employment of contract labour in certain establishments and to provide for its abolition in certain circumstances and for matters connected therewith.

know, and are not responsible for enforcing, the provisions in the CL Act and ISMW Act at the construction sites they visit. It is unclear how frequently inspectors from the Worker Commissioner wing visits the construction sites to enforce the CL Act and ISMW Act. During discussions on construction sites in the Labor Commissioner's office for a previous study, the officials often declared that they did not have much to do with construction sites and that one should go to the DISH wing since the BOCW Act was under their purview (Desai 2017). These reasons include, but are not limited to, lack of policies.

3. Current Practices of Providing Housing and Services for Workers Living at Worksites

The RCC and masonry-plastering workers, who form the largest proportion of the workforce in any project, predominantly lived at the worksite in all the 5 projects covered in the study. These workers were circular migrants[11]. On a few projects, there were also a few RCC and masonry-plastering workers who were locals or settled and lived off-site; while some of them were Naka workers brought in intermittently, some were also attached to contractors on a regular basis. With respect to the workers engaged in other construction activities in the 5 projects, there were variations across the projects in terms of whether and how many workers engaged in each activity lived on the worksite and off-site in their own arrangements.

This seems to depend on a combination of factors such as:

1. Migrant's status of the workers engaged in a specific construction activity (see Table 2);
2. Duration of work for that activity;
3. Scale of the project;
4. Kind of accommodation;
5. Services provided for them at the worksite;
6. Off-site accommodations provided by contractors (seems to be very rare);
7. Workers' preferences between offsite / onsite.

[11] Circular migration - Circular Migration can be understood as "the temporary, recurrent movement of people between two or more cities / countries, mainly for purposes of work or study" (UNECE, 2016) For the migrant worker, however, circular migration is a survival strategy when economic opportunities do not respond favorably at home. Moving between the host and the sending economies offers an opportunity of social and economic mobility for the migrant. But the rhetoric of an all-benefit situation arising out of circular migration, nevertheless, stops short in face of labour rights and well-being. Circular migration strikes a high personal cost for the migrant, which is for most of the time unnoticed and the labour invested in earning a bare living, unprotected.
[12] Saliya Kaam - Bar bending work (In Gujarati language - a colloquial term) is the process of making and bending steel reinforcing bars and beams, also called "rebar," which are used to strengthen concrete in buildings.
[13] Bharai - Filling Work - A filling refers to a quantity of earthen material such as soil, rock, aggregate, shingle, and sand that is placed and compacted in trenches, foundation, and under floors for the purpose of filling in a hole or depression.

Table 2. Type of work and workforce at the construction sites registered in Ahmedabad district under the BOCW Act 1996.

Type of Labors	**Family type description**	**Place of living**
RCC – centering & saliya kaam [i]	Single male migrants	Worksite
RCC - Masonry-plastering	bharai [ii]	Worksite
	Local / settled workers	Off-site
	Mostly migrant families but also single males (women work as unskilled helpers)	Worksite
Flooring	Local / settled workers	Off-site
	Single male migrant	Worksite or Off-site (shared rental rooms where workers pay the rent)
	Migrant families (women work as unskilled flooring workers)	
Painting	Single male migrants (majority of the painting workers)	Worksite or Off-site (shared rental rooms where workers pay the rent)
	Migrant families (women do not working in painting)	Worksite (rental rooms were workers pay the rent)
Waterproofing/China mosaic	Mostly migrant families	Worksite
	Local / settled workers families (women work as unskilled workers)	Off-site
Electrical work	Local / settled workers	Off-site
	Single male migrants	Worksite
Depart workers	Often migrant families	Worksite

The accommodation for all workers living at the worksite was built by the developer at all of the 3 projects. The nature of accommodation varied across the projects. At Site 1, rooms with verandahs and walls made from pre-cast concrete panels were built by a contractor specifically hired for making these rooms.

Additional rooms, made during peak construction time when the above-mentioned rooms were inadequate for the number of workers, were built from corrugated metal sheets – it was unclear if these were built by the developer's depart workers or the RCC contractor's workers. At Site 2, room-like enclosures were built with corrugated metal sheets by the developer's depart workers in the basement of an under-construction building. At Site 3, the developer hired a contractor to specifically build the worker colony which was intended to be a "model colony"; here, the rooms were arranged around communal verandahs and were made from a combination of materials like corrugated metal sheets, PVC plastic sheets and agronets. In the remaining 2 projects, the contractors were involved in building some of the or all of the workers' accommodations.

Figure 2. Overview of the 5 construction sites in Ahmedabad.

As explained later, the nature of accommodation built by the contractors varies, with large construction companies often building relatively better rooms than the medium/small-scale contractors. Furthermore, a contractor will generally build rooms only for his own workers. Therefore, in a project with multiple contractors, often more than one entity builds rooms for the workers, leading to variations in the worker accommodation built for a single project. Thus, in 5 projects involving multiple contractors, one or more contractors-built accommodations, each for their own workers; whereas the developer-built rooms for it depart workers and the workers of the remaining contractors.

Corrugated tin sheets act as both wall and roof, they are tied with wire and nails to odd pieces of metal scaffolding and occasionally bamboo poles. Wooden off cuts provide a frame for an opening. The roof is held down with rocks, branches, shoes, helmets etc. These things are also kept here for storage. A stiff plastic tensions cable wraps around the front of the houses keeping things in places as well as providing a clothes rack for drying laundry. A day bed rests on its side against the front of a house to allow room for the laundry above to dry on the tension cable. When the cable is not being used for laundry, it acts as support for cloth to drape over for shade while occupants rest below. The concrete poured on the ground in front of the houses claims an area used as an outdoor social space.

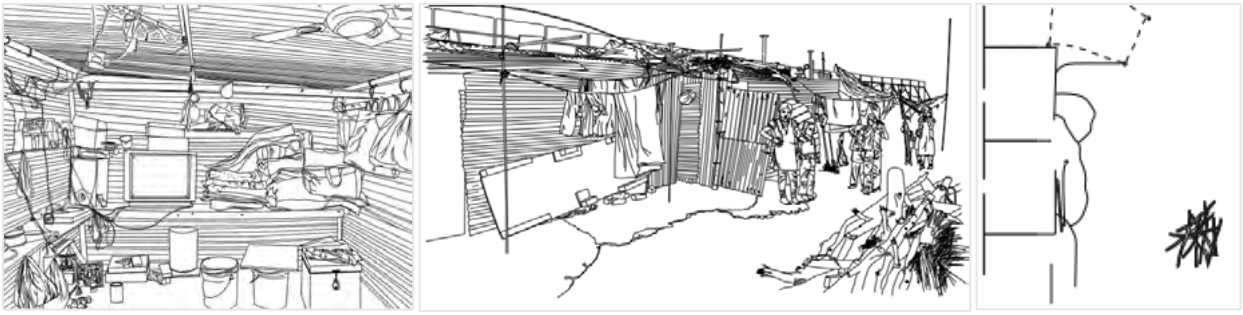

Figure 3, 4. Interior of construction worker's house and a typical construction worker's housing.

Figure 4 shows a one room house, shared by a family of seven, at the construction site. During the day all of the bedding is folded and stacked on a shelf which also act as structural bracing. The beams all have nails and hooks attached to provide storage. The cables providing electricity come in through small gaps where the corrugated tin sheets meet and are hung from the beams.

Figure 5. Frame structure made by fabrication onto which corrugated metal sheets are bolted, also a single storied structure is seen built with the same assembly.

Figure 6, 7, 8. Rooms made from Aerocon panels (Aerocon sheets are cement sandwich panels, made of two fibre reinforced cement facing sheets on either side of a light-weight concrete core).

Figure 9. Workers living in an under-construction building.

Figure 10. Makeshift bathing enclosure seen to the left of the room, below the plastic sheet or cloth.

Figure 11. Hanging electrical wires to make arrangements for a bulb, extension board and fan.

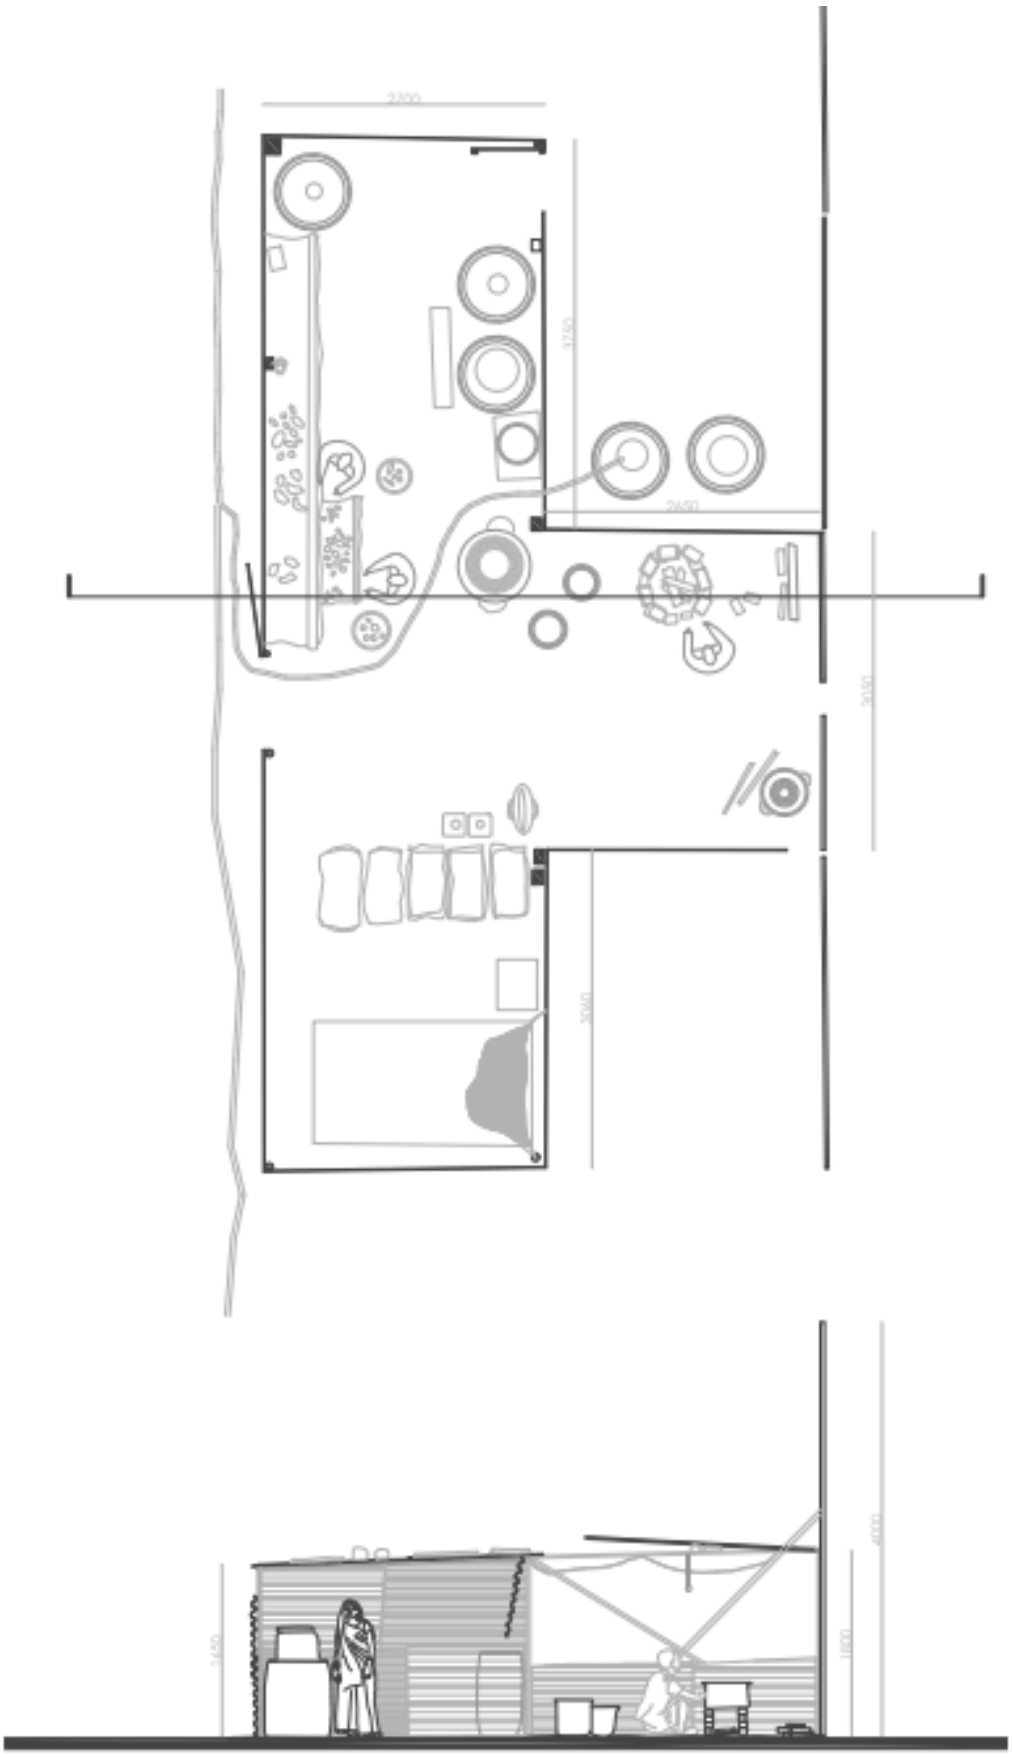

Figure 12. Communal Kitchen.

Figure 13. Children's Creche.

Overall, with regard to the mode and nature of provision, the field visits and discussions across the projects revealed that corrugated metal sheets were widely used to build the rooms – by large construction companies, most medium/small-scale contractors and developers – but there was a variation in the quality of the rooms. The worker accommodation made by many of the medium/small-scale contractors was poorly built with recycled materials that were in very poor shape and with no proper flooring. However, some of these contractors had built better rooms using concrete blocks with relatively better flooring. In general, rooms made from corrugated metal sheets created harsh spaces to live in during summers. There were no windows and the doors, leading to inadequate natural light and ventilation. The aspect of environmental comfort was rarely a consideration.

Let's focus on the rationale of large construction companies for using an insitu fabrication system for the structure is that this allows for quick erection, dismantling and re-erection. The rationale behind the wide use of corrugated metal sheets for the walls / roofing – whether they are roughly erected or erected through in-situ fabrication system – is its low cost. It is not only cheaper than using other materials like Aerocon panels or pre-cast concrete panels but also easy to handle, possible to re-use several times across different worker colonies, and furthermore fetches a price in the scrap market when finally discarded. Among all the different kinds of rooms built across the 5 sites, there were however a few cases where an attempt was made to address light and ventilation for the rooms and use more climatically appropriate materials and design. While there were still limitations in the materials / design / cluster-layout, it may be possible to learn from and build on these "better practices." Rooms meant for a family or a group of 4-5 single males were generally 8 feet x 10 feet (7.5 sq.m) or 10 feet x 10 feet (9.3 sq.m). At some sites, bigger rooms were made to accommodate large groups of single male migrants. At one such site, groups of 10 male workers were accommodated in rooms of 20x20 feet (37 sq.m). Compare this to the ISMW Act which mandates a norm of 10 sq.m. room for a family, and a norm of 6.5 sq.m. per person in barracks for 10 workers.

Figure 14. The image displays a 800 mm X 2030 mm corrugated sheet commonly used for the worker housing.

Figure 15. Use of commonly available materials and impromptu joinery details.

Figure 16. The toilet areas covered with tarpaulin sheets with improper drainage left to run along the site peripheries.

Figure 17. Use of commonly available materials and impromptu joinery details.

4. Research Findings

4.1 Tenure Security

On-site settlements have high tenure security for the duration of the construction work. Among off-site settlements, rental housing in the city's recognized slums have highest tenure security even though the rental agreement with the landlord, who is an informal occupier of the land, is undocumented. The other two off-site typologies have low tenure security despite residents having lived at the same location for many years. The most vulnerable are the shelters / settlements on pavements and street edges, under flyovers and bridges, where residents often face violence in the form of evictions and harassment, leading to losses of belongings and investments they have made in their housing as well as an everyday experience of uncertainty and insecurity about their shelter and belongings. This is also true of some shelters / settlements on government or private lands which are non-recognized slums, especially those on railway lands and government lands being reclaimed by the local authority. This low tenure security is a direct result of the state's attitude towards informality and the urban poor, compounded by its attitude towards recent and non-permanent migrants from lower-income backgrounds. These tenure conditions deny large numbers of construction workers a secure space in the city and access to basic services.

4.2 Housing Quality

Four main types of shelters were found in construction workers' settlements in Ahmedabad:

1. The first is potla type shelters which are arrangements where residents tie up their belongings with tarpaulin during the day when away for work and open the potla in the evenings to set up a sleeping and cooking area. This is found in the off-site settlements with very low tenure security. These shelters are extremely vulnerable to weather conditions, rodent and mosquito infestation and theft of belongings.
2. The second type is kutccha shelters made from tarpaulin, and is found in off-site settlements with low tenure security as well as on-site settlements of smaller construction sites. They are unstable structures vulnerable to weather conditions, rodent and mosquito infestation, theft of belongings and flooding in case of waterlogging in the settlement.

3. The third type is kutccha shelters made entirely from tin sheets. These are found in on-site settlements of small to medium-size construction sites. They are susceptible to over-heating and have little or no ventilation, leading to extreme discomfort for its residents and posing health risks.
4. The fourth type is the semi-pucca shelter consisting of brick walls and tin sheet roofing. They are found in on-site settlements of larger construction sites, and off-site settlements of rental housing and the more consolidated and secure settlements on government land. These are less vulnerable to weather compared to the other three types, although the tin roofs still lead to heating up of the shelters. Rodent and mosquito infestation can be controlled and the structure provides security of belongings.

In off-site settlements, residents choose to build a particular shelter type depending on the tenure security, migration pattern which shapes their willingness to invest in housing, and affordability. In on-site settlements, there is an absence of government enforcement of existing regulatory frameworks (Interstate Migrant Workmen Act 1979, The Building and Other Construction Workers Act 1996, PWD and CPWD guidelines, etc) to provide proper housing to construction workers as well as inadequate provisions in these frameworks. As a result, shelter type is linked to the size of the construction site and duration of work, since currently, it is the scale of the project which determines whether a developer / contractor thinks it is worthwhile to invest in better shelters or not.

4.3 Basic Services and Amenities

Off-site settlements:

Generally, do not have any basic services like water, sanitation and electricity. Residents often have to pay or do some worker to get access to water. Most lack toilet facilities, nearby pay-and-use facilities are not affordable, and most residents resort to open defecation as a result. Bathing facilities do not exist and many residents have built temporary enclosures for bathing, however, women face privacy issues in these, requiring them to bathe early morning or at night when it is dark. Rental housing may have access to water but sanitation and provision of electricity is usually inadequate or nil. Most settlements are prone to waterlogging due to lack of drainage.

On-site settlements:

These are often provided with water, however, at the smaller private-sector construction sites and public-sector flyover construction sites, potable water is not always provided and water storage facilities are often unhygienic. Toilet facilities were not provided as per the case-study of public-sector flyover construction site, and while toilet facilities were provided in the other on-site settlements, they were not well-maintained, leading to open defecation. The public-sector construction site of IIT Gandhinagar was found to have the best facilities of water, toilets and bathing facilities, and electricity, as well as a crèche and regular health camp. This was due to the keen interest of the IIT Gandhinagar administration in the issues faced by construction workers and their families.

4.4 Documents for Rights in the City

Documents showing proof of residence in the city such as ration card, election card, property tax receipts, and electricity bill are important for the urban poor to build claims to their informal housing spaces and basic urban services as well as realize entitlements to government schemes, including housing programs. Almost all the seasonal migrants in the study were found to have these documents only for their villages and were not willing to give up these to get new ones at their city address since their migration patterns require them to keep their village documents. However, the lack of documents for entitlements in the city

leads to high vulnerability. Alternate documents for such migrants could be obtained through registration with the Building and Other Construction Workers' Welfare Board, however, registration with the Board is currently difficult. Therefore, construction workers cannot avail the Board's schemes, including housing scheme, let alone access housing schemes of the local urban authority. Any policy intervention to improve the housing conditions of construction workers will have to take this into account in its design and implementation so that city-based documentary requirements do not lead to exclusions.

4.5 Construction Work, Migration and Housing

The typology of settlement in which construction workers find shelter, the mode of obtaining construction work (finding work at a Naka, or by being part of a worker gang, or by getting regular contract work through contacts one has built up over time) and the dynamics of migration (which include type of migrant household and migration pattern) are interlinked aspects which need to be understood to propose housing interventions that are viable for construction workers. Naka workers and regular contract workers live in off-site settlements. Local and permanent migrant Naka workers are found across the off-site typologies, depending on the individual family's socioeconomic condition. Local and permanent migrant regular contract workers are relatively better-off and thus do not live in the most vulnerable off-site settlements, that is, pavements and street edges, under flyovers and bridges. Seasonal migrant Naka workers are found across the off-site typologies, depending on the individual family's socio-economic condition and also the migrant household type. Thus, only the single males among them live in rental housing. Significantly, the rental housing is affordable to them not only because they share the rent with other single male migrants, but also because arrangements with the landlord and their sharers to pay rent only for when they are living in the city. This rental housing is not affordable to the seasonal migrant Naka workers who come to the city along with families (with children or couples) and it is this group that lives in the most vulnerable off-site settlements. Construction workers who find work through worker gangs are mostly seasonal migrants and live in onsite settlements as they are provided housing for the duration of the work. However, among this group, those who work in public-sector or private-sector infrastructure-laying work such as road-building or pipeline-laying are not provided housing and they live in off-site settlements on government or private lands, access to which may be informally negotiated by the contractors. The study also found that kinship and community ties play a central role in determining the settlements that seasonal migrant workers choose to live in. Another important finding was that Naka workers, especially the seasonal migrants, walked a maximum distance of 15-20 minutes to reach a Naka. This is important since they do not have to incur transport costs to reach a Naka where there is no guarantee that they will obtain work every single day. Majority of Naka workers obtain work for 10-15 days a month. Housing interventions would have to be sensitive to these aspects.

4.6 Household Income and Housing Expenditure

Monthly household income amongst construction workers depends on number of earning members, their skill levels and mode of obtaining work which determines daily wage rates and the number of days for which they get work in a month. The study calculates that for Naka workers who have a single earning member household, monthly income is Rs.3000-4500 if he is unskilled and Rs.5000-7500 if he is skilled. For two earning member households, monthly income is Rs.6000-9000 if they are unskilled and Rs.8000- 12000 if the male is skilled. (Naik, 2015.)

The study found that construction workers live in rental housing with monthly rents in the range of Rs.800-2500, often with additional charges for basic services. (Desai, 2020) Single male migrants share a room, each incurring Rs.300-500 per month for rent and basic services. This is 7-15 per cent of an unskilled single male migrant's monthly income and 4-10 per cent of a skilled single male migrant's monthly income. Thus, rental housing is affordable for single male migrants when they share amongst 4-6 males, and each is paying no more than 4-15 per cent of their income on rent and basic services. (Desai, 2020) Those who live on pavements and street edges, under flyovers and bridges, or on government or private lands which are not recognized slums, incur expenses on building / repair of shelter but this is difficult to estimate. Some of

them spend around Rs.300 per month for buying water. For families who live in these types of settlements, rental housing would entail higher expenses of Rs.900-2500 per month, which would be 16- 25 per cent of their income. (Desai, 2020) Such a regular expense is unaffordable to them, due to which they do not choose rental housing.

5. Summarizing the Argument

Seasonal migration stands as the primary mode of economic mobility for the impoverished, particularly amongst the economically weaker sections of the society. This migration tends to be circular, driven by the need to maintain ties with hometowns during the agricultural season and hindered by barriers to permanent settlement in urban areas due to a lack of social security. Addressing the housing and basic service needs of these marginalized urban poor is imperative for inclusive city development. Urban planners and policymakers must grasp the dynamics influencing the lives of seasonal migrants to effectively accommodate them in the cities. Urban governance significantly impacts migrants' housing conditions through informal settlements and rentals. Current urban policies largely exclude seasonal migrants due to eligibility criteria reliant on city residency documentation (Desai, 2020). Housing programs primarily focus on homeownership, neglecting rental options favored by migrants. Although some efforts, like the Shelter for Urban Homeless (SUH) scheme exists, inadequacies persist in shelter availability and suitability for migrant families. To address these challenges, policymakers must integrate seasonal migrants into urban planning and housing policies. Collaboration between construction workers' welfare boards, municipal governments, and housing departments is crucial. Informal settlements should be viewed as viable habitats and upgraded rather than eradicated. Investments in basic services and sanitation are necessary, alongside measures to ensure affordable access, such as subsidizing pay-and-use facilities. Systematic mapping of worker markets, such as construction worker Nakas, is vital for designing inclusive urban spaces. Understanding migrants' specific needs and their adaptation of inadequate spaces is essential for effective policy formulation. Ultimately, building inclusive cities necessitates recognizing migrants' rights to a decent and dignified urban life. Efforts must prioritize enhancing housing options, providing basic services, and integrating seasonal migrants into urban planning processes. By acknowledging their presence and needs, policymakers can pave the way for more inclusive and equitable cities.

6. Initiatives in and Around

In recent years, there have been some initiatives that address the housing of migrant workers in the cities. These include interventions and proposals for homeless shelters, some under the national-level Shelter for the Urban Homeless (SUH) scheme, in Ahmedabad, Surat and Bhuj; the Apna Ghar projects by the Kerala State government; migrant hostels in few cities by the NGO Pratham under its Project RISE program; and the Garima initiative in Kozhikode, Kerala (SUH, 2018). Following section outlines the initiatives in Ahmedabad and other cities for migrant construction workers – those who live at worksites as well as those who go to worker Nakas and arrange for their own housing. Following section further discusses interventions on migrant workers' housing in countries like China, South Africa and Singapore.

6.1 Night Shelters or Ren Baseras

Night shelters, also known as Ren Baseras, have been established in numerous Indian cities following directives from the Supreme Court in 2010. While initial implementations faced challenges related to location, design, and management, there have been notable improvements in some cities over time, often driven by pressures from the Supreme Court and civil society organizations. These shelters have played a crucial role in providing better housing options for migrant workers who would otherwise be homeless or living in extremely vulnerable conditions. Many of the enhancements have been facilitated by the national-level Shelter for the Urban Homeless (SUH) scheme, launched in 2014. (Desai, 2020). The SUH scheme's guidelines envision these shelters as 24-hour facilities offering a range of services, ultimately serving as a space to connect the homeless with various entitlements.

6.2 EWS Site Converted into Family Shelter in Ahmedabad

In Ahmedabad, the AMC converted an EWS housing site which had been lying vacant into a family homeless shelter in 2019. It consisted of 36 four-storey buildings (about 1150 flats). The AMC has begun allotting these flats to homeless families who had been shifted to one of the other homeless shelters in the city and had lived there for several months or more. The families who have shifted to this family shelter have been verbally told by AMC that they will have to pay Rs.500 as monthly rent, however, there has so far not been any rent collection even from families living here since 2-4 months (Desai, 2020).

6.3 Apna Ghar Initiative, Kanjikode, Kerala

In Kanjikode, approximately 5000-6000 inter-state migrant workers are employed across various industries including metal works, ice-cream manufacturing, packaging material manufacturing, mattress-making, aluminum works, and lamination. The majority of these workers hail from states such as Orissa, West Bengal, Assam, Chattisgarh, Jharkhand, Bihar, Uttar Pradesh, and Madhya Pradesh. To accommodate these workers, Apna Ghar provides housing facilities with a capacity to accommodate 620 individuals. The infrastructure includes a four-storied building with 64 rooms, out of which 62 rooms are allocated for worker accommodation, 1 room serves as lodging for the hostel warden, and 1 room functions as an office. Each of the 62 rooms designed for workers' accommodation houses 10 individuals and is equipped with 5 bunk-beds and 10 lockable storage units. Additionally, the facility features 32 community kitchens and 8 dining halls arranged in kitchen-dining blocks. Each block comprises 4 kitchens, each furnished with a gas stove featuring two burners and an LPG connection. These kitchens are shared between 2 rooms or 20 persons, providing one burner per room or 10 persons. Furthermore, each dining hall within the block is equipped with amenities such as a television, filtered drinking water, and wash basins, catering to the needs of 8 rooms or 80 individuals. Other amenities include 96 toilets, urinals, washbasins, bathing spaces, and areas for clothes washing and drying. Additionally, communal seating areas, a lawn, and a volleyball court are provided for recreational purposes.

6.4 Initiatives in Other Countries: South Africa, China, Singapore

South Africa

The migrant hostels in South Africa have a deeply rooted history stemming from the colonial era, particularly during apartheid (1948-1994), when they were established as single-sex institutions to accommodate African migrant workers in white urban areas. These hostels were tools of racial discrimination and economic exploitation, embodying the apartheid regime's strict controls over the movement and living conditions of black workers. Despite being intended solely for labor containment, families began inhabiting these hostels over time, leading to severe overcrowding and deteriorating living conditions. Around 1997, there were approximately 604,000 hostel beds in South Africa, with many accommodating whole families, totaling about 1 million people. The hostels varied in ownership and location, with public and "grey sector" hostels typically situated in segregated black townships, often on city peripheries. The conditions within these hostels were often appalling, with overcrowding, inadequate facilities, and neglect contributing to a dehumanizing environment for residents. Efforts to improve hostel conditions gained momentum in the early 1990s, driven by mounting criticisms and community advocacy groups like the Western Cape Hostel Dwellers' Association. The National Hostels Redevelopment Program aimed to convert hostels into family units, but the extent of its implementation and outcomes remains unclear. Some redevelopment projects have shown promising improvements in living conditions, but sustainability concerns persist, particularly regarding long-term management and rental revenue. Additionally, the experiences of rural-urban migrants and migrants from other African countries living in informal settlements warrant further research to understand the broader impact of urban policies on migrant tenants in South African cities.

China

Since approximately 2008, the Chinese national government has embarked on an expansion of public rental housing and relaxed the hukou[12]-related distribution system, aiming to facilitate migrants' access to housing. This shift was notably influenced by the "New Urbanization Plan" (2014-2020), which gradually prioritized migrant benefits in destination urban areas. Zhou (2018) particularly focuses on Chongqing's public rental housing program, which, despite preceding the New Urbanization Plan, served as a significant model for national housing development and migrant welfare improvement. By 2011, Chongqing had constructed public rental housing equivalent to 10% of the nation's total output, reaching 670,000 units by 2013 (Knowles, 2016). The program also aimed for eventual ownership by allowing eligible tenants to purchase units after a five-year rental period. Additionally, Wang, Li, and Zhang (2015) introduce an integrated prefab accommodation system designed for construction workers residing on worksites. This system, utilizing modular construction technology, was experimented at a prominent developer's project in Xuzhou.

The accommodation units, made of colored steel plates meeting national fire-protection standards, featured 8.4 m^2 rooms shared by two occupants, each equipped with private amenities such as toilets, bathrooms with water heaters, and air conditioning. Smart-card locks ensured security, and on-site facilities included storage rooms, dining areas, kitchens, convenience stores, and recreation/training rooms. Management was proposed to be handled by a professional agency, with developers or investors procuring accommodation and services based on contractors' and subcontractors' requirements. Despite the higher cost (1639 Yuan per worker per year compared to 1165 Yuan), the additional expense (474 Yuan) was offset by charging migrant workers a fee, representing 1-1.5% of their daily wage. Alternatively, developers or investors could cover the increased cost, adding less than 1% to project expenses.

Singapore

In Singapore, there are over 1.3 million transnational migrant workers, predominantly from Malaysia, China, Bangladesh, India, and other Asian countries, including domestic and construction workers (Kirk, 2015). Singapore's temporary contract labor migration system confines foreign workers to transient statuses, restricting job mobility and bargaining power. Employers, responsible for housing, often avoid public housing estates due to citizen opposition, leading to migrant workers primarily residing in dormitories, often converted industrial spaces or unregistered accommodations. The Ministry of Manpower enforces housing regulations, but inspections reveal persistent overcrowding and inadequate ventilation in registered dorms. Purpose-built dormitories (PBDs) offer better conditions, exemplified by Tuas View, accommodating up to 16,800 workers (Lee, 2016). While PBDs provide amenities and spacious accommodations, concerns arise regarding surveillance measures and social isolation, prompting comparisons to apartheid-like segregation. Worker advocacy groups praise improved living conditions but critique the isolation fostered by PBDs, suggesting they serve as containment strategies following a 2013 riot involving migrant workers. Brenda Yeoh highlights the state's dual approach of control and care, immobilizing workers within isolated spaces away from mainstream society. Despite government incentives for PBDs, many employers persist in substandard housing practices, facilitating worker exploitation and coercion. Overall, while PBDs offer improved living conditions, concerns persist regarding social isolation and surveillance, reflecting broader tensions between labor control, migrant welfare, and urban development in Singapore.

[12] Hukou - 'Hukou' refers to a household registration system in China that is inherited from one's parents and can be moved based on certain criteria such as income, education, and property ownership, impacting individuals' economic status.

7.Way Forward

The rural-to-urban migration trend necessitates addressing failures in urban planning, particularly in providing opportunities to migrants. This study explores migrant housing experiences, emphasizing the Kinetic City concept marked by Jugaad Urbanism, especially when these colonies lack the basic infrastructure such as access to clean water, sanitation, etc., highlighting the need for social and political interventions. Even though there are legislations protecting the interests of the rural migrants at central and state level, lack of synchronization between the concerned bodies executing these legislations, defeat the basic purpose of these regulations. At present, the impact of the increasing number of non-governmental organizations, which strive to strike a co-ordination between the various functioning bodies and end-users, is felt only at a local scale. The accommodations provided by the government agencies to the construction workers is a positive step but these facilities do not comprehensively address the daily needs of the workers. Hence, a deeper investigation is needed to go beyond addressing basic needs to improve migrants' quality of living, incorporating local techniques and incremental improvements. Policies, such as the National Urban Rental Housing Policy 2017, propose interventions with respect to social rental housing and worker hostels. However, translating policies into action requires detailed guidelines, budget allocation, and state-level initiatives. Other challenges include land availability, affordability, and regulation of the informal rental sector in the city, etc. The study highlights the dire need to investigate this topic in details to map the complex interactions between the various actors, identify the systemic loop holes and bridge them to establish a comprehensive solution to the woes of the rural migrants.

KEYWORDS | INTERCULTURAL CO-DESIGN, FUTURE ARTISANS, GLOBAL DESIGN CULTURE, TEXTILES

ABSTRACT | In May 2022 rural women weavers from the Jaipur Rug Foundation and BA Textile Design students from CSM, embarked on a design project exploring new channels of knowledge exchange and remote co-creation.

This paper reflects on the project's aim to facilitate non-hierarchical creative dialogues between international design students and artisan-weavers from the Global South to co-design a collection of handwoven rugs. Participants challenged existing stereotypes and hierarchies, through a process of mapping textile skills and design methods as well as inviting storytelling, gaining a richer understanding of the material and social networks afforded by their diverse contexts. Together they negotiated different cultural starting points towards the development of twelve co-designed rugs using visual, material-based and digital communication methods.

The authors discuss future skill sets for designers and artisans to effectively navigate a rapidly changing global design culture, to reposition themselves within complex power dynamics. Challenges and opportunities for cross-cultural co-design and creative dialogues are identified as connected to existing Western-centric design school thinking such as individual authorship and a linear generic design development process. If textiles can become a tool for social connectivity, how can design educators enable their students to learn non-hierarchical communication and design facilitation methods to develop inclusive and diverse design mindsets?

The paper concludes by proposing new evolved pedagogies including the ethics of design collaborations, visual storytelling, empathy building as well as connecting local heritage to post-colonial contemporary global design culture as key considerations to move towards more inclusive teaching approaches.

1. Introduction

In 2022 artisan-weavers from the Jaipur Rug Foundation [JRF] and BA Textile Design students from Central Saint Martins [CSM], part of the University of the Arts London [UAL] embarked on a design project exploring knowledge exchange and co-creation. The project was funded by the British Council Crafting Futures India programme.

JRF is an NGO, adjunct to the Jaipur Rugs design company, working with over 40,000 artisan rug weavers across 660 villages in five Indian states. They aim to revive hand-weaving techniques and provide access to social and financial support. Over two-thirds of the JRF artisan-weavers are female, collectively weaving rugs from home. Central Saint Martins is a renowned art and design college with a creative community of over 5000 British and international students.

The intention of the collaboration was to provide artisan-weavers with design tools, access to international knowledge resources and opportunities to translate their creative capabilities into economic potential. The project addresses the skill gaps experienced in marginalised communities in rural Rajasthan, India, where 90% of the artisan-weavers live below the poverty line. For CSM students, the focus was to explore different approaches to global design communication through a diverse and intersectional experience.

The JRF team recruited 25 artisan-weavers and set up a community learning space including digital access and a translator. CSM academics co-delivered 12 lectures, ranging from ethics of intercultural collaboration to sustainable design practices and regenerative leadership. Through online workshops students and artisan-weavers learnt together, exchanging design insights, technical expertise and personal stories. The collaboration led to a collection of co-designed hand knotted rugs which encapsulate the multi-facetted journey of this project (Figure 1).

Figure 1. Two female JRF artisan-weavers with several co-designed rugs from the final JRF X CSM collection.

2. Background

2.1 Global Design Context

Globalisation of the textile industry has led to a decline in manual labour in the West, a gap filled by the exploitation of cheap labour in the global South. With this structural shift the artisan is losing direct connection to their customer and market, and subsequently adopts the role of the invisible maker, whilst the designer is, in many cases, increasingly detached from the process of hands on making. Dr Kevin Murray, World Craft Council Asia Pacific Region, states that:

> "Globalisation has impacted negatively on traditional crafts... this has left many traditional crafts in an unsustainable position." (2010, p.5)

This detachment and change in working structure have led to a hierarchical situation whereby the designer, holding the market knowledge, strongly influences both the power dynamics and economics. This power inequity is particularly felt by female artisans, often invisible in craft production, who work in craft production largely because it offers them flexibility in terms of both schedule and work location. Readdressing the power imbalance between artisan and designer is a means to tackle the issues of gender equality and women's empowerment.

A shift in the craft landscape is emerging, with a new breed of designers looking to rebalance the hierarchical dynamic between artisan through equitable knowledge exchange. Digital platforms such as that created by The Anou Cooperative offer opportunities for direct market access connecting artisans to potential clients. These new platforms allow artisans to navigate the complexity of global commerce and gain market insights resulting in increased economic opportunity. These platforms of democratisation give the artisan greater agency, positioning them to initiate external design collaborations. Artisans, together with designers, are now addressing the systems through and by which products are developed, skills exchanged, and communities and knowledge systems regenerated and shared.

Educators have a key role in equipping students with the skills needed to navigate these new territories of collaboration as future designers. Building new skills of empathy, knowledge exchange and equity. Textiles are now being used as a tool for connectivity and as a catalyst to changing ideas and system innovations.

Over recent years, driven by global environmental challenges, we have seen the emergence of a more politicised ethical consumerism and consequently a renewed interest in global artisanship and transparency in supply chains. Fashion Revolution, established in 2013, is a key player in this field with a belief "in a global fashion industry that conserves and restores the environment and values people overgrowth and profit." (Fashion Revolution Website, n.d.).

Advocating for citizens everywhere to demand greater transparency in the supply chain and enabling the consumer to connect more closely with the people who produce the fabrics and raw materials used in textiles has led to artisans becoming more central to this conversation. Whilst this movement goes a long way in promoting greater transparency, these narratives highlight technical, material and making skills rather than focus on "design" or other knowledge bases. Digital platforms are increasingly used to reinforce the role of the artisan as maker, whilst increasing the profile of the artisan these gestures frequently mask the deeper inequities.

The project JRF X CSM seeks to challenge this hierarchical narrative and disrupt power dynamics between artisans and designers through a model of learning together and knowledge sharing, challenging the "Designed By" and "Made By" narrative.

Increased market understanding and design confidence through effective partnerships and material knowledge can support the artisan towards more sustainable livelihoods and agency. Through collaborative knowledge sharing new roles for both designer and artisan are evolving. Woven rugs offer an authentic tool for storytelling and collaboration, through materials, images and techniques social stories are played out and diverse world views rooted in culture, place and time are brought together.

> "The rural arts of India are the arts of settled villages and countryside, of people tuned to the rhythm of nature and its laws of cyclical change." (Jayakar,1989 quoted in Chatterjee, 2016)

Design and craft-making have the material power to challenge traditional arrangements of agency and domination and foster empowerment (von Busch, 2022).

2.2 Knowledge Systems

Examination of the knowledge systems held by both artisan and designer offer insights into the potential new working relationships which can be achieved through knowledge sharing and the re-evaluation of existing power dynamics.

Traditionally artisan knowledge draws on skills of making and materiality, these haptic skills offer insights into both sustainability and local economics. The approaches traditionally adopted by artisans whereby materials are sourced locally, used efficiently with minimal waste and products are developed to commission, embody key sustainable approaches. For textile artisans, knowledge is embedded in the system of the artisan community as a whole. Mazzarella, Mitchell and Escobar describe this:

> "The holistic contribution of textile artisan communities can be seen to support sustainable development through social engagement, environmental stewardship, boosting the creative economy and preservation of cultural heritage." (Mazzarella et al., 2017, p.1)

Artisan knowledge includes not only how a material might be selected, sourced and prepared, but how it might be coloured, woven, and repaired. Material innovation and deep technical knowledge of the specific craft are key and applied to all stages of the production process (figure 2). Artisans typically work collectively with organisation taking place at a familial or village level to navigate the various structures and dynamics within a community.

Figure 2. Close-up of an artisan-weaver hand-knotting one of the co-designed wool carpets.

Most frequently the artisan learns through generational, direct knowledge transfer. Approaches to making are held within families and communities. The artisan-weavers working with JRF evidence a specific collective identity through their rugs. This collective identity is known as Manchaha (expression of the heart). Through the approach of Manchaha, artisan-weavers are:

> "Given the opportunity to express themselves through their rugs with a mix of personal stories and elements of their own culture and surroundings." (Jaipur Rugs Website, n.d.)

Both artisan-weavers and textile designers have the knowledge required to facilitate the sustainable development of a product, inputting their knowledge at specific stages of the value chain. Textile Designers evidence a "specific blend of knowledge" (Igoe 2010, p.3) a way of thinking which allows them to assimilate various stimuli. This tacit knowledge which brings together thinking, knowing, and making equips the designer to challenge existing patterns of creation and production.

> "Tacit knowledge can be defined as skills, ideas and experiences that people have in their minds and are, therefore, difficult to access because [they]… may not necessarily be easily expressed." (Chugh, 2015, p. 128)

Textile designers have knowledge in relation to research skills, visualization and communication. Tangible tools are essential for collaboration.
These varied and complementary knowledge systems evidenced by artisans and textile designers, supported by a risk-taking approach from textile students can support effective co-creation. New channels of knowledge exchange and "collective creativity" (referred to as acts of creativity that are experienced jointly by two or more people) are emerging. Sanders identifies a move towards Co-creation rather than individual authorship (Sanders, 2013; Sanders and Stappers, 2014).

2.3 Co-Design

The concept of co-designing has been widely discussed and multiple definitions have been published since the 1960s. Fundamentally creative agency is shared by the involved researchers, designers and participants, which can be consumers (Prahalad and Ramaswamy, 2000), urban stakeholders (de Koning et al., 2016) or medical patients (Vargas et al., 2022). Whilst the principle of participatory design and co-designing is based on knowledge sharing, the understanding of process dominance and empowerment (Wang, 2023) has shifted to question hierarchies and stereotypes of 'non/expertise'.

For this paper the authors aim to focus on the unique context of co-designing with artisan-weavers situating the process in a distinctive area between design and craft, education and industry, digital and physical, and intercultural communities of practice (Wegner, 1998). The following is a glossary of terms relevant to the nuances and differences to the specific context of the JRF x CSM Co-design project.

In *Participatory design* participants are seen as beneficial contributors to the design process by offering their expertise and knowledge as a resource (De Koning et. al., 2016). Ehn describes participatory design as design "with a special focus on people participating in the design process as co-designers" (2008, p.93).

Co-design is defined as the creativity of "designers and people not trained in design working together in the design development process" (Sanders and Strappers, 2008, p.6) whilst Brant, Binder and Sanders outline the three key components of this process as a multi-circular triad of making, telling and enacting (2012).

Co-creation is often seen as a more extensive process ranging from conceptual to spiritual – with Vargas et al. describing it as:

> "The collaborative approach of creative problem solving between diverse stakeholders at all project stages. It emphasises diverse stakeholders at all parts of an initiative process, beginning with determining and defining." (2022, p.2)

Sanders and Strappers see co-creation as the collective creativity of collaborating designers ranging from the physical to the metaphysical and from the material to the spiritual (2008, p.6). In contrast some designers use co-design to describe the process of collaboration in which co-creation can take place, so they see co-creation as subordinate to co-design. (De Koning et al., 2016)

Cross-pollination is a craft community specific term introduced by Dhaundiyal and Pant (2020), who define a more fluid and open process between designers and craftsmen as consisting of four different collaboration stages: Sharing, Connecting, Framing and Cascading.

The concept of 'boundary objects' was first introduced by Star and Griesemer in the zoological museum context and defined as both "abstract and concrete" (1989, p.393) and are used to enhance the interaction with members from different social groups. Zamenopoulos and Alexiou expand on this in relation to co-design and linking different communities:

> "Shared material objects and processes arise at the boundaries across different 'social worlds' defined as the wider contexts as a set of shared practices, ideologies and norms." (2018, p.140)

Whilst the closely related pedagogic practice of object-based learning is defined as multi-sensory experiential learning (Chatterjee and Hannan, 2016) involving collective material culture.

The focus of this paper is therefore on the exploration of intercultural co-designing with artisans as a form of non-transactional creative exchange between design students and artisan-weavers. There is a fine line between design influence which "happens organically" (Altbach, 2013) and employing an outside perspective that is not culturally sensitive (Janzer and Weinstein, 2014, p.338–339) which could at worst become as a form on neo-colonial design intervention. Mamidipudi identifies the following three scenarios for designers co-working with artisans: intervention, in which designers plan while artisans implement to develop a commercially driven outcome; interaction, in which designers "constrain their agency" and involve different craft communities to produce a socially concerned craft outcome; as well as mediation, in which designers:

> "Act as translator and mediator of cultures and leave room for artisans to actively shape culture, exhibiting a cultural concern." (Mamidipudi, 2018, p.44)

In the context of intangible power dynamics between indigenous artisans and art school-trained designers it is helpful to recognise Barcham's (2023) recommendation of using new design approaches involving storytelling as an equitable co-design methodology, which brings Brant, Binder and Sanders' model of "making, telling and enacting" into a different global context. Whilst the "empowerment" of artisans as part of the co-design process has been widely documented the authors aim to amplify and reflect on the powerful creative assets and craft skills of artisan-weavers and how these can inform future design-craft exchanges.

2.4 Educational Perspective

Students taking part in the co-design project were Year 2 students who had specialised in Woven Textile Design. The cohort comprised of 25 students from diverse cultural, class and creed. In the context of teaching international cohorts within a western institution "the world of practise in art and design, higher education in the UK means understanding its western context and traditions," both tutors and students are being asked to

> "Review and interrogate your own culture and values… actively pursuing intercultural engagement (...) seeking opportunities to learn about the national and cultural perspectives of others." (Austerlitz et al., 2008)

The JRF X CSM Co-design project provided a unique opportunity for staff and students to pursue "intercultural engagement" both across the student cohort and with participants in Jaipur.

Within *Art & Design Pedagogy in Higher Education* Orr and Shreeves outline the "pedagogy of the project" (p.109) as an alternative model to traditional academic pedagogies. At CSM the students are often exposed to "brief based or project centred learning" (p107). The JRF X CSM Co-design project tapped into an emerging type of project, an evolution of the "Live Brief" defined by Orr and Shreeves as: "Projects set by, or in conjunction with, an external party" (p.111) where traditional power dynamics between industry and students typically play out. Live briefs aim to improve employability of students through experiencing scenarios aligned to employability credentials within traditional industry models.

Live projects have traditionally been focused on equipping students to work within established sectors and industries. Co-design projects can build on the traditional notions of professionalism but challenge the transactional nature of work live projects (Orr & Shreeves, 2017, p.111). Co-design as defined "a practise where people collaborate or connect their knowledge, skills and resources in order to carry out a design task" (Zamenopoulos and Alexiou, 2018, p.10). Unlike live project, where students work individually to briefs set by external stakeholders, the co-design project seeks to foster engagement between the internal and external stakeholders. If we accept bell hook's notion that:

> "The decentring of the West globally, embracing, multiculturalism, compels educators to focus attention on the issue of voice. Who speaks? Who listens? And Why?" (bell hook, 1994, p.40)

Then the co-design project model encourages both educators, and learners, to question this.
UAL's "Creative Attributes Framework" (UAL, n.d.) was put in place with the aim "develop ethical and wide-ranging qualities, abilities and behaviours" in students with a view to improve their employability. The Creative Attributes Framework is embedded into curriculum at CSM to support the development of key skills, behaviours, and abilities. The JRF X CSM Co-design project developed student knowledge and skills across all three capabilities with a particular focus on Showcasing Abilities and Navigating Change.

3. Methodology

> "People do action research as a way of helping them understand how they can influence social change. This commitment is contained in Marx's idea that it is not enough only to understand the world; the intent is to change it for the better." (McNiff, 2002, p. 25)

We applied an Action Research Project methodology [ARP] as defined by Jean McNiff in Action Research for Professional Development as

> "Identifying a problematic issue, imagining a possible solution, trying it out, evaluating it (did it work?), and changing practice in the light of the evaluation." (Jean McNiff, 2002, p.7)

Within this framework the JRF X CSM Co-design project identified the problematic issue of traditional artisan/designer collaborations reinforcing colonial mindsets of exploitation and hierarchy. The Co-design project typology provided a possible solution and the JRF X CSM Co-design project provided an opportunity to apply, evaluate and inform future practise. This was a course wide ARP, requiring the authors and members of the wider BA Textile Team to reflect on their own practise with a view to advancing the holistic course practice.

As part of the ARP qualitative research approaches were employed, collecting data from multiple sources including student artisan-weavers and design-student interviews, object analysis, questionnaires, photographs and WhatsApp exchanges. Thematic data analysis was carried out, taking into consideration the authors positionality and aligned to Braun and Clarke's notion that:

> "Themes do not passively 'emerge' from data but are actively produced by the researcher through their systematic engagement with, and all they bring to, the data set." (Braun and Clarke, 2022, p.8)

4. Case Study

The Design intervention was set up to offer a unique and innovative collaborative learning opportunity for both artisan-weavers and design students focusing on the sharing of personal stories, skills and life perspectives. The intention of the collaboration was to build on design skills and creative confidence of rural artisan-weavers and to build on design and communication skills and cultural capacity of design students.

The content of the workshops was co-developed by the CSM BA Textile Design team and JRF team and covered a range of skill building workshops. Over a series of weeks and conducted through online teaching platforms the design workshops covered a range of topics including design and storytelling, market awareness, materials and sustainability and a technical session led by JRF. The focus was on creating non-hierarchical creative dialogues through shared practical workshops and design experiences. The practical design aspects were complimented by an innovative and participatory workshop on female leadership (figure 3). For a meaningful and personal exchange of ideas, artisan-weavers and design students were partnered: 2 design students working with 2 artisan-weavers. This medium group approach intended a more meaningful and personal exchange of ideas and invited storytelling in a safe environment where each participant felt able to contribute.

Both tangible and digital approaches were used to promote connectivity between artisan-weavers and design students throughout the project. Tangible approaches included the exchange of "cultural parcels" - boxes containing inspirational and technical materials, objects, and personal items at the outset of the project and tangible mood boards and design inspiration to support the artisan-weavers in the final stages of design. These boundary objects (Star and Griesemer) formed creative toolkits that were essential for facilitating object-based learning, knowledge sharing and co-design.

An accessible research theme 'everyday journey' was identified. Both artisan-weavers and design students shared personal and cultural stories through the identification and documentation of everyday objects of personal interest from their journey, either around their village or to college.

These images, videos and sounds were shared through WhatsApp groups, each artisan-weavers/student designer group were assigned a specific visual icon to facilitate communication and navigate language and literacy barriers. WhatsApp enabled an easy exchange of content, facilitating a visual dialogue of design inspiration. Through regular weekly online meet-ups artisan-weavers and design students shared and discussed stories relating to the WhatsApp images, videos and sounds (figure 4). Artisan-weavers contextualised the images of village celebrations, harvesting tools, food items and rural landscapes they had shared. Design students shared images and narratives of their commute through urban environments, reflecting the contrasts of the city and differing cultural and material starting points.

Figure 3. Screenshot from one of the online workshops where artisan-weavers are enacting their notion of collective sustainable leadership.

Collaborative visual design resources through the digital platform Padlet were set up to create opportunities for sharing imagery and sound. Artisan-weavers and design students were represented on the Padlet page through profiles and examples of previous work encouraging connection between group members. Design resources were co-created including a glossary of technical words and inspirational images of weave and dye processes.

The environment and wider issues around sustainability including material provenance and life cycle were discussed in workshops where design students and artisan-weavers learnt alongside each other in the digital space. The artisan-weavers shared innovative sustainable approaches to dye techniques and the repurposing and coloration of waste yarns.

Sketchbooks and experimental ideas were developed by design students combining artisan-weavers' images and materials with their own research journeys. Artisan-weavers further develop these sketches through group discussion in collaborative teaching sessions moderated by a translator.

Tangible mood boards offering additional inspiration for final rug development were shared with artisan-weavers to facilitate a collaborative design approach (figure 5). Design "spaces" were created with design students leaving space in their designs to encourage spontaneous design adaptation by the artisan-weavers during the making process. This was a conscious decision between CSM team and JRF to ensure artisan-weavers familiar design approach could be applied, whilst looking to avoid control over methods of designing.

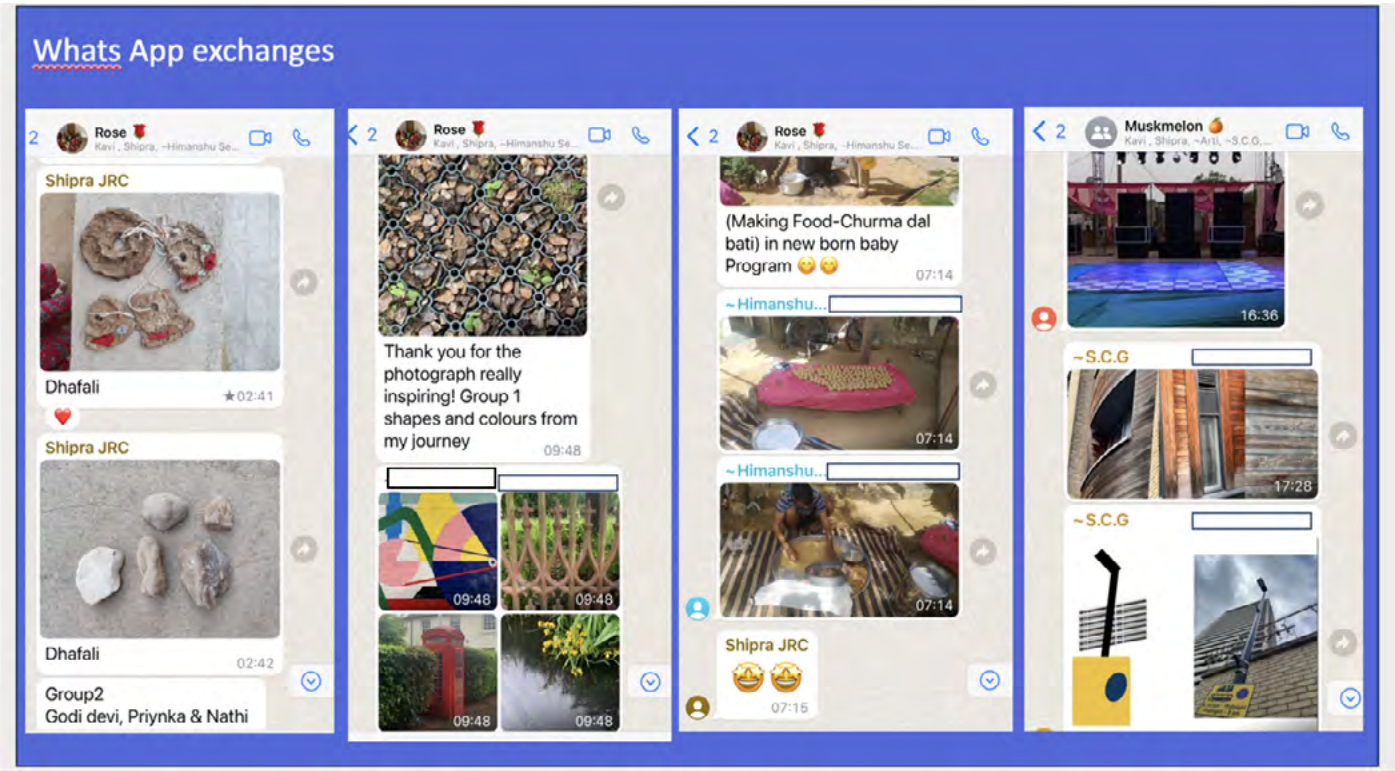

Figure 4. Co-produced Padlet board showing imagery shared by artisan-weavers and student designers through WhatsApp.

The artisan-weavers, whilst tasked with the interpretation of the co-created design, also had the freedom to reinterpret, change and modify the design. In some cases, adding authorship to the final woven pieces through signatures, demonstrating confident ownership of the co-created design. The final outcome, a collection of rugs, was effectively shaped by both the craft skills and deep material knowledge of the artisan-weavers, the risk-taking and image making approach brought to the project by the students and the specific tools built in to facilitate the co-creation/co-design process.

5. Findings

During the JRF X CSM Co-design project there were hidden power dynamics at play such as tutor-students and employer-artisan as well as apparent, noticeable differences between Global West- Global South, rural-urban, educational, gender as well as ethnic and economic differences. The authors acknowledge the limitations of the above findings as they themselves are intrinsically embedded in the power structure of the project's setup, potentially preventing them to fully capture authentic responses from all participants.

Key to the perceived success of the collaboration was the co-development of the programme from the initial funding application stage to making time to understand the different work cultures, physical and economic restrictions, existing expertise, and knowledge gaps to plan meaningful interventions. The starting point of the collaboration was an emphasis on horizontal team structures allowing consensus in decision making through deep listening, inclusive language and clear communication.

Students and artisan-weavers successfully developed a culture of mutual trust and a sense of belonging enabling participants to take micro-risks within a safe online space and embrace the encounter of unfamiliar cultural perspectives and textile approaches. Holley and Steiner propose a safe classroom space which allows students:

> "To feel secure enough to take risks, honestly express their views and share and explore their knowledge, attitudes and behaviours. (…) Being safe is not the same as being comfortable. To grow and learn, students must confront issues that make them uncomfortable." (2005, p.50)

Agreeing on shared ethics and values from the outset of the project helped to set a framework around celebrating unique identities and having an equal voice. JRF artisans-weavers commented in their project feedback: "They [CSM tutors] emphasised the significance of love in collaborative work a principle that became integral to infuse the essence of our carpets".

Many micro-risk steppingstones were built into the project, enabling participants to unlock and mobilise their knowledge and creativity. For example, during the first shared lecture, CSM students and staff were challenged on their preconceptions of female artisans as defined by excellent craft competence, rural lifestyle and raising a family – instead of associations with entrepreneurial or design skills. Highlighting unconscious biases demonstrated to staff and students a need to actively and reflectively engage in the co-design process to ensure equity or ideas and input was maintained. For the students this was a new consideration to their usual curricula but an important skill to take through into all forms of collaborative working.

Figure 5. A co-designed mood board and colour palette for a rug - bringing together visual representations of 'everyday journeys' including photographs of Jaipur artifacts and London shop front textures.

Working towards the same accessible design theme 'everyday journey' worked as a connecting point and led to some inspiring visual storytelling as part of the co-design process. Tutors specifically encouraged personal contributions, valuing differing individual and collective identities. Carefully selected medium size groups fostered a sense of personal responsibility and shared ownership. Knowledge sharing through digital Show & Tell workshops expanded the "telling" component of co-design. Working within a group context, through digital mediums, pushed students to be accountable, both to their group members, but also to the wider participatory process, turning on their cameras and engaging visually when unable to communicate verbally.

Building connections through digital platforms and shared learning resources was important to bridge varying levels of language, digital and material literacy. The authors' model of co-designing between artisan-weavers and design-students (figure 6) identifies the access to shared digital and physical tools as

vital to navigate different learning environments and enabling an equitable creative process. The WhatsApp groups were successful as an accessible tool to share visual storytelling through images and films. The glossary of design terms and the session on local rug weaving approaches helped spark further co-creativity and understanding. Artisan-weavers stated, “This was the first time we have seen such design references” whilst students had not heard “knot counts” and other rugmaking vocabulary before.

The exchange of boundary objects such as yarn samples, cultural objects, everyday snacks and gifts was a pivotal moment in the project, creating tangible representation of both design cultures. CSM students enjoyed the personable, joyous aspect stating: “It is very exciting to work with artisans with such knowledge and to work with a community that experience things in such a different way, to laugh and learn together”.

Each group of students collaboratively developed collaged textile design outcomes which represented collected ‘everyday journey’ references from Jaipur and London. These were presented on paper by the students who learnt how to negotiate different elements and to be less precious about a preconceived design language. Artisan-weavers were confident in expressing themselves further as part of the co-design making process, specifically when adding spontaneous motifs to the blank ‘design spaces’ as an open invitation to add a final layer of dialogue into the physical rug design. Each maker added their signatures to the rugs to amplify their role as both co-designer and weaver.

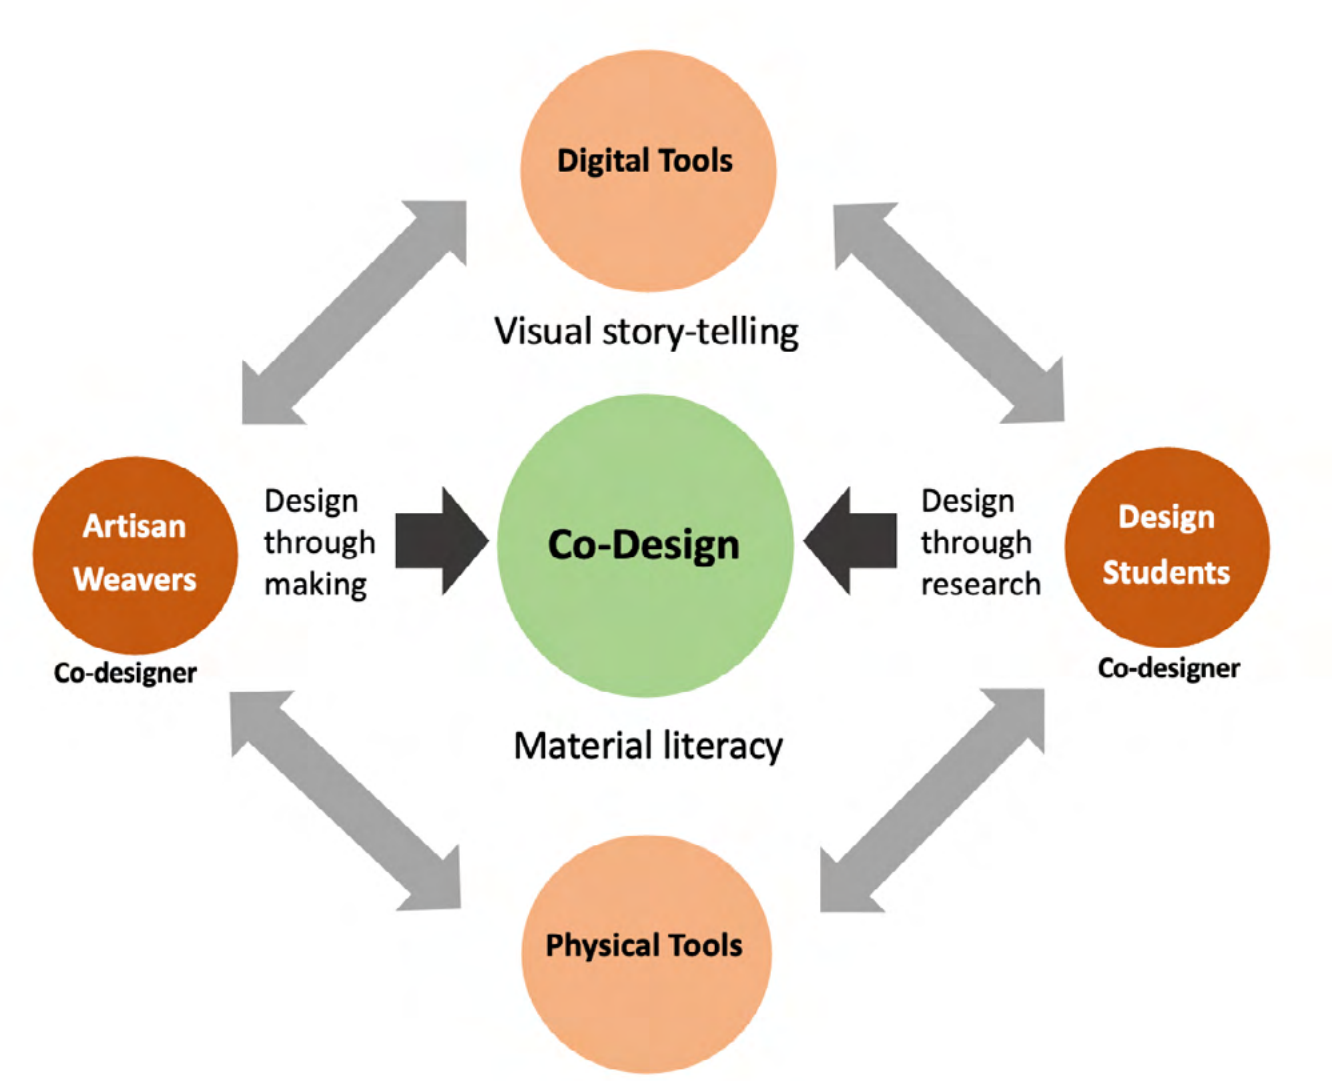

Figure 6. Co-designing between artisan-weavers and design students.

Alongside the practical skills such as active listening and empathy building the students also expressed a wider impact of the project was their engagement in the topic of equitable design systems. For a predominantly white student cohort, asked to actively engage in challenging and deconstructing traditional hierarchies, this project enabled students to engage in de-colonial conversations around their work. The feedback evidences new threshold levels in learning, as one of the design students' comments: “This project gives us the opportunity of discovering what is really design and designing in the real world – how it works, working with other people, collaboration.”

Challenges were inevitably numerous. Logistical hurdles in bringing together artisan-weavers from distant villages had to be overcome. Practical challenges included time difference, translation, communication and internet connectivity. Wider challenges related to the learning experience and the realities of the differences in life situations. Both artisan-weavers and design students had different expectations and motivations; the artisan-weavers were salaried as part of their engagement and the design students were being assessed, the fact that the collaboration activities were non transactional between artisan-weavers and design students facilitated a more open, safe place. Additionally, ownership of Intellectual property [IP] presented a challenge due to the collaborative nature of the outcomes. For the purpose of this project a collective decision was made to assign all IP rights to the charitable foundation (JRF).

CSM Staff were challenged as to how best to accommodate intercultural collaborative experience within the constraints of an already loaded curriculum and industry expectations. Initial concerns around how to create equitable environments of shared learning and co-creation were dispelled once design students and artisan-weavers became unified in their aims and personal connections formed between group members. A lack of a shared spoken language, whilst initially perceived as a hurdle, soon became the catalyst for a more visual and in turn richer learning experience. The cultural unfamiliarity as experienced by both design students and artisan-weavers became a tool to facilitate engagement and curiosity, the navigation of cultural unfamiliarity contributed to the interest, humour, and shared learning on all sides.

6. Discussion

When we establish an enabling environment and materials to support and provoke collective creativity (Sanders 2013) we create a design studio space that supports the exploration of innovative ideas, even in wicked problem situations Sanders (2015). Mazzarella et. al proposes that designers have the ability to trigger micro-transformations (2016), the authors extend this notion to say that artisans can equally trigger micro-transformations in designers. The project’s embedded co-creation process enabled micro-transformations in the design and making approaches of both artisans and design students and their tutors.

Collaborative making through the telling, making and enacting process supports an understanding of potential power dynamics at play whilst micro risk-taking by both designers and artisans create confidence to navigate diverse voices. A shared textile co-design mindset can break down cultural boundaries and explore new intercultural outcomes.

Barriers such as language and digital literacy have less impact on co-designing textiles, as a significant part of the process is through visual materials and thinking through making. Noticeably design students apply a more controlled design lens to the process rooted in Western Bauhaus and Arts and Crafts education, which puts individual authorship at the centre. In contrast artisan-weavers have usually been generationally trained by family and operate in a local community context. Interestingly artisan-weavers do not use sketch books to draw their layout ideas before weaving, following a more intuitive, spontaneous, design process developed from within the hand knotting process, often resulting in a series of linear figurative motifs on small scale.

With the artisan-weavers as creative partners in the development process the design students were positively challenged to find new methods to communicate design intentions– such as leaving open blank

layout spaces to be filled in during the making process as well as negotiating collective design ownership (figure 7). At the same time the initial co-research phase was new to the artisan-weavers, this encouraged them to establish colour palettes, sketchbooks and small material samples. Zooming out and creating a large-scale layout meant that the co-designed rugs displayed a mix of macro abstract textures and micro motif patterns.

The navigation of unfamiliar scenarios approaches led to increased confidence and a more effective co-design process. Design students and artisan-weavers were supported to develop 'listening' and 'sharing' skills through specific storytelling sessions and open-ended questions. Digital literacy and accessibility limited the possibility of synchronous designing through online platforms. In future scenarios this could be overcome.

Collaborative textile making between artisan-weavers and designers offers the possibility to share stories and create new sustainable material solutions through collective inter-cultural narratives. Where students are active players in their learning experience and step outside their comfort zone, the learning experience is more transformative.

Figure 7. One of the co-design rugs with a 'free-style' artisan-weavers motif strip was added into one of the blank layout spaces during the final making process.

7. Conclusion and Recommendations

What could artisan knowledge and designer approaches look like in the future?
How best to build equitable knowledge exchange and creative connectivity into the curriculum?

The authors propose evolving new pedagogies including the ethics of design collaborations, visual storytelling skills, recalibrating creative attributes such as empathy as well as understanding local heritage and how this relates to post-colonial contemporary design culture as key considerations to move towards globally inclusive teaching approaches.

Western art schools should actively engage with local and global communities to permeate teaching silos and reconnect with the making process, supply chain and materials. Much can be learnt from other global

educational practices around reversing power dynamics by employing artisans as design tutors. At the same time, it is important to develop resilient future design knowledge to go beyond craftsmanship and amplify the cross-pollination of local knowledge and traditional making skills with critical design thinking, digital literacy, and open-ended research approaches:

> "to activate craft communities to gain critical insights into local contexts, collaboratively develop a sustainable mindset to envision alternative futures, and reframe craft sustainability into actual actions." (Wang et al., 2023, p.65)

Future designers will be playing a broader role requiring collaborative, communication and facilitation skills. What will the essential design knowledge for future students be?

At a personal level, the authors recognise the benefits to their own skills and knowledge in intercultural facilitation, through the engagement, planning and delivery of the co-design workshops. A future design curriculum should support students in understanding the ethics of collaboration as well as how to effectively facilitate co-creation and connectivity. Developing workshopping skills alongside active listening and observation skills will support both the artisan and design student to navigate these new roles within a changing global design culture.

Future artisans, designers and educators will require intercultural communication skills to build confidence and agency to establish effective and sustainable partnerships. The role and value of future artisan and craft practices is shifting, and the global artisan will play a key role in rebalancing the dynamic between design, artisanship, and market. This paper concludes that through co-creation and non-hierarchical design dialogues artisans and designers can positively challenge the top-down power dynamics towards a more equitable future.

About the Authors:

Anne Marr is the Programme Director for Jewellery, Textiles and Materials at CSM. Her research is based around the socio-cultural context of textiles and materials, exploring interdisciplinary creative knowledge exchange to respond to societal needs and co-create more empathetic communities.

Rebecca Hoyes is a textile designer and an Associate Lecturer at CSM. Her research interests lie in material narratives, sustainable practices, and the interplay between digital and craft processes. Rebecca has extensive experience in cross-cultural knowledge exchange through textiles and materials.

Stephanie Rolph is a woven textile designer with expertise in circular and regenerative material innovation. Over the past decade, she has collaborated with prestigious global brands across diverse industries. Stephanie is a Senior Lecturer at CSM and a UAL postdoctoral research fellow.

Acknowledgements: The authors would like to thank to thank everybody at the JRF for their generosity and continued support for the collaboration. All figures have been included with the participants consent. We would like to thank our colleagues and students at CSM for their engagement, enthusiasm and flexibility to make the project happen. We would also like to acknowledge the funding provided by the British Council India Crafting Futures India as well as in-kind support from the Jaipur Rugs Foundation as well as UAL.

IM/POSSIBILITIES FOR PLURIVERSAL DESIGN EDUCATION: A FIELD GUIDE FOR NOTICING INSTITUTIONAL LIFE.

Andrew Whitcomb*[a]

KEYWORDS | DESIGN EDUCATION, PLURIVERSAL DESIGN, ACADEMIC INSTITUTIONS, HIGHER-EDUCATION, FIELD GUIDE

ABSTRACT | A growing body of scholarship supports the development of pluriversal curricula towards healthier ways of being, knowing, and designing. At the same time, the notion of the pluriverse raises thorny questions for the dominant university-based model of design education. Pluriversality challenges us to consider how institutional arrangements, disciplinary habits, and cultural norms privilege certain ways of learning over others and then begin reworking—or making new—ways to practice design education. Yet, despite growing interest in pluriversal design education, we lack references of how people grapple with practicing design education differently on the ground. As an invitation to enrich conversations that transform design education, this exploratory paper sketches a variety of components at play in the institutional machinations and day-to-day experiences of educators and students. The sketch is presented in the form of an ecological field guide to institutions. The field guide aims to support educators in noticing how the interconnectedness among the day-to-day tasks, positions, relationships, agreements, infrastructures, and risks of a particular context can constrain and expand possibilities for transforming institutions of design education toward pluriversality. By making public the everyday practices of educators, we can keep critical reflection on design education futures grounded—resisting the pull to standardize while informing local, pluriversal, action toward healthier ways of knowing and being.

1. Introduction

> *"Are you excited by budgeting? Do you love scheduling courses? What about caring for your favorite learning management system? For many design educators, such activities represent what it means to work with an institution. But what if, rather than approaching our institutions as bureaucratic task masters, we engaged them as living ecologies, full of change and possibility?*
>
> *In this field guide, we invite you to explore the rich institutional life you take part in as a design educator. By taking more notice of our institutions, we believe you'll find new and unexpected possibilities to practice education that are in tune with the myriad ways of living, being, and knowing in the world. Perhaps there are events or projects already happening that—when noticed differently or more fully—hold potential for fostering pluriversality wherever you practice design education.*
>
> *As you go about noticing, you will likely realize that the various features of institutions do not have distinct boundaries. We agree! Nothing in our institutions exists in isolation. As such, we encourage readers to pay particular attention to the relations among the things you notice and what nourishes, sustains, and interrupts them."*
>
> — Draft Introduction to A Field Guide for Noticing Institutional Life

Take a moment to consider the faculty meeting. At first, the event seems relatively mundane: a routine occurrence where you and your colleagues walk through a list of administrative updates, committee reports, and new issues affecting your design department. Pay more attention, however, and you might discover that these meetings play a vital role in how education happens. Colleagues engage in chit-chat that builds bonds or reveals unexpected insights about why things in the school work the way they do. Ideas emerge for new initiatives. People nominate each other for task forces to set standards or review applications of incoming faculty and students. A volunteer records meeting notes and sends them out afterwards, turning the conversation into a textual object that contributes to further meaning-making and action. All of this plays out in an hour, maybe two, once a month over the course of the semester.

The future of design education is a perennial topic in design academia, but discussions of it rarely delve into things like faculty meetings. Yet, such moments can have a profound effect on the way we educate designers. And, of course, meetings represent just one aspect of the rich ecology of institutional life where so much formal design education takes place. There are also scheduling calls, cloud-storage platforms, learning outcomes, contractual obligations, accreditation reviews, and mandatory trainings—the list goes on. For those of us in the thick of it, it can be difficult to step back and identify just what we have to work with as we participate in designing our institutions. However, as we confront strong arguments that our dominant model of design education falls short in its ability to prepare students to engage with on complex socioecological issues (Davis & Dubberly, 2023), we need to question not just what we teach design students, but how we conduct design education itself.

Questioning the institution of design education may feel like a daunting task. How many times have we expressed resignation over the stifling bureaucracy of our universities and colleges? Despite the situation, design educators may still find ways to operate at different speeds, engaging values that seem to run counter to the prevailing winds of their institutions. These small instances of educators working "otherwise" (Nicholls et al., 2021) within the system offer hope for transitioning to a model of design education that honors the diverse ways of living and being necessary for shared flourishing. The educators who figure out how to support pluriversal education from an insider position have noticed potentialities in the life of their institutions; they connect, leverage, or reconfigure practices to make space and time for pluriverse-supporting activities that do not fit dominant standards.

This article seeks to expand and enhance how design educators notice institutional life. Presented as an ecological field guide to institutions, the content serves as an invitation to examine how we can work within academic institutions to put pluriversality into practice. This sketch of the field guide is partial, developed largely from the position and perspective of an early stage faculty member at a large public research university in the USA. As such, publishing this sketch of the field guide to the wider academic community is an effort to subject it to critique and dialogue as a tool and orientation to change. Inspired by work such as Rob Walker's *The Art of Noticing* (Walker, 2019) and the popular genre of environmental field guides (Izaguirre, 2021), the guide provides a variety of prompts meant to hone the reader's attention to easily overlooked things around us. In the following pages, we provide a brief rationale for why it is worth considering institutions when exploring potential to make pluriversity happen in design education. After that, we move on to present the initial fragments of a "field guide" that explore a few propositional features of institutions to notice, and how, through attending to them in our everyday practices as educators, we might find possibilities—and likely impossibilities—for pluriversality.

2. Why Does (Not) Noticing Institutions Matter?

The ways we practice design education are not merely a matter of leadership decision-making or organizational designing. The practice of education is entangled with complex economic, political, and technological developments (Berman & Paradeise, 2016; Perkin, 2007). Even the ambitious projects of design education, such as the Bauhaus and The New Bauhaus were products of their time (Cross, 1983; Findeli, 2001; Findeli & Benton, 1991), and through various social practices—for instance, replicating curricula—such projects continue to exert influence on our time (Davis & Dubberly, 2023). As such, it behooves us as educators to focus not only on the content we teach, but also the social forces that affect the shape and focus of our activities. Yet, to look at design education through institutional and organizational lenses, it helps to clarify just what we mean by those terms and how they might be helpful in exploring potentials for pluriversality.

Institutional Theory has a rich history of scholarship, albeit potentially too rich. As Alvesson and his colleagues point out, the concept of institutions has become so expansive that it can be hard to identify what it cannot explain (Alvesson & Spicer, 2019). Not only that, scholars have discussed institutions and organizations using overlapping or conflicting concepts. We follow Charlotte Linde's (2008) distinction of "institution" as a broader category identified primarily through established and recognizable practices, while organizations represent primarily formal and legal structures. For the purposes of the field guide, we consider "design education" as an institution and specific "design programs"—whether embedded in universities or colleges—as distinct organizations. The institutional lens on design education highlights practices that commonly extend across design programs, such as project-based learning, studios, and critiques. Yet, despite sharing many characteristics, these practices play out differently depending on the particular organization of a design program. Class sizes, content, and number of faculty per section may be different from program to program. With this in mind, we see the potential for both lenses to orient our attention to aspects of design education that extend beyond—but are also enacted in—pedagogy and curricula.

2.1 Institutional Influences and Design Education

To understand the relationship between institutional forces and design education, we can consider an example related to design-at-large. For the past century, design has had an intimate relationship with modernity and capitalism. Design researcher Yoko Akama presents the notion of "Dominant Design" and argues that it "has accompanied modern world-making practices to be useful, effective, functional, durable, seductive, convenient, original and innovative, and has been used to solve problems for others, grow market share and increase customer satisfaction" (Akama, 2021, p. 107). In many ways, Dominant Design represents a powerful institution, one that is instilled and reinforced in practice. Frameworks such as IDEO's Feasibility, Desirability, and Viability position design's value firmly in service to solving problems and contributing to success in the marketplace. Following this logic, many design professionals have adopted design

ethnography and user research as ways to identify “unmet” needs and problems for (potential) customer segments. With the problems of others found and framed, Dominant Design practice moves on to prototyping to arrive at an optimally pleasing final product. This approach, Akama highlights, has deep connections to European philosophical traditions of the 20th century that privilege rationality (ibid). Indeed, prevailing conceptions of who designs, what gets designed, how we determine value in design, come from a legacy of the “one-world” reality from the global North (Law, 2015) that has overpowered so many other ways of being, knowing, and valuing—many of which are more in tune with the health of the planet.

The relationship among modernity, capitalism, and design, highlights the importance of attending to ourselves, our practices and the worlds we create or deny through design. This is no easy task. It requires confronting our personal habits and our relations with institutions. When it comes to education, we see the power of these institutional forces first hand. Wrapped up in the relationship between design and marketplace success, many design programs have launched initiatives that position design in service to this dominant paradigm. In such cases, educators gain recognition for working with industry. Students feel engaged by working on “real world” projects. The program positions itself as innovative. Industry partners feel invigorated by the breadth of new ideas generated in just a few weeks or months. These institutional forces work together, play out in practices—full of embodied understandings, habits, rules, and material arrangements—that make certain activities for educating easier, or even possible, while constraining or inhibiting others (Schatzki, 2019). This becomes especially important to recognize for design educators seeking to work with pluriversality.

Drawing on the work of anthropologist Arturo Escobar, Lesley-Ann Noel and colleagues —writing for The Future of Design Education working group on pluriversal design—advocate for a richer framework for design education based on the recognition that diverse worlds can—and should—fit. In support of this effort, they recommend focusing on relationality in design education, which “values trust-building, long-term commitments, and dedication to understanding constituents and their future prosperity” (Noel et al., 2023, p.183). The authors also highlight the importance of approaching design education through locally rooted knowledge and radical participation with, through, and by people affected by design. Yet, how do design educators proceed in fulfilling these aspirations when our daily practices are wrapped up in institutional life that pulls our actions toward productivity, universalization, and return-on-investment?

The pervasiveness of dominant institutional forces makes it daunting to imagine alternatives. To support pluriversality design educators need to face our institutional entanglements, recognizing that our universities and colleges enable and restrict certain courses of action. Additionally, as individuals often trained via the dominant system that limits pluriversality, there is undoubtedly a fair bit of “unlearning” (Akama, 2017) for us to undertake ourselves. We find hope for alternatives by approaching institutions on the ground, where everyday actions afford opportunities for creative maneuvers that redirect and resist dominant forces to support pluriversality. Our lives are full of potential ways for acting otherwise, but sometimes we could use a little help finding them.

3. Ways of Noticing Institutional Life

Our attempt with the field guide is to offer a humble starting point for our work toward pluriverality in design education. To some, noticing may seem like just another way to say “ethnographic research,” however, our proposition is much less formal. Our field guide is informed by an ethnographic attitude, but we do not suggest that design educators conduct ethnographies of their programs. The intention of this field guide is not to analyze design education as an institutional phenomenon. That said, our orientation shares much in common with what Sara Ahmed describes as a “phenomenological approach” to studying institutions (Ahmed, 2012): the field guide suggests a “thick” approach to institutions in an effort to “attend to what is looked over, to allow what is ‘‘overed’’ to surface” (ibid). Importantly, this perspective invites us to look at how everyday practice—activities, affectations, agencies, materials, norms, and understandings—create a sense of stability that we recognize as an institutional force, as well as “generative potentials” (Simpson & den Hond, 2022) for change.

To enrich our guide to noticing institutions, we find inspiration in theories of practice (Reckwitz, 2002; Schatzki, 2021; Shove, 2016). The power of looking at worlds through practices "lies in its capacity to describe important features of the world we inhabit as something that is routinely made and re-made in practice using tools, discourse, and our bodies" (Nicolini, 2012, p. 2). Institutions, according to this view, are not static, deterministic, entities, but "combinations and configurations that are regularly *reproduced* [emphasis added]" (Blue, 2019, p. 931). Looking closely at how people's actions are bound up with institutional life through everyday material engagements has led scholars to identify how such things as commitments (Kanter, 1968), rhythms (Blue, 2019), narratives (Linde, 2008), and infrastructures (Star, 1999) play a role in how work and change happen. This is the orientation we aim to support with our field guide: a search for relations among the everyday stuff of muddling through our work as educators and the pathways, ruts, openings, and dead-ends of institutional life.

3.1 A Caveat About Field Guides

Presenting this sketch in the genre of the field guide might imply a certain amount of stability and objectivity to institutions. Indeed, popular field guides for birds or plants may communicate about the world through matter-of-fact descriptions associated with the natural sciences. As Izaguirre highlights, even field guides to birds have presented different orientations and expressions of "nature" over the years (Izaguirre, 2021). Our articulations of nature are tied to countless everyday cultural practices—there are many modes of naturing (Swanson et al., 2018). As such, what readers are invited to "see" via natural field guides depends on the context, and thereby perspective, from which the guide was written. Just as the articulation of nature used in field guides and policies depends on sociotechnical traditions, our field guide frames design education in a particular way, namely in terms of institutional life.

As such, this field guide relies on a sociomaterial understanding of institutions, where elements are not fixed, but are dynamic and context-specific. There are many modes of institutioning (Huybrechts et al., 2017). Thus, we do not provide a list of places to look or things to look for, where one can consistently expect to find specific things that support pluriversality. Just like the ways in which practice theory seeks to stimulate "research capable of rendering visible phenomena and contexts that were previously off the radar" (Reckwitz, 2016, p. 115), this field guide aims to prompt design educators to attend to their practices in hopes of discovering opportunities for pluriversality in their particular contexts. As such, readers of the field guide will not find an exhaustive list of aspects of an institution. Instead, the guide calls each reader's attention to characteristics that appear relatively common to institutional life in design education.

4. Sketching a Guide to Institutional Life

> *Our field guide introduces four features of institutions for design educators to explore and make discoveries: Accessing, Evaluating, Planning, and Knowing. Bound up in these features you'll likely find all sorts of bodies, feelings, materials, processes, tools, rules, spaces, and values. Working together, these common, everyday aspects of our lives carry potential for courses of action that can support or suppress the various realities we touch through design education.*

This brief overview frames the orientation of the field guide. As presented in the introduction, the four features are not meant to classify separate aspects within an institution. Rather, they are connected, overlapping, and entangled. Articulating these four features is a way to provide starting points for noticing. From these starting points we invite noticers to explore the rich complexity of connections that make up the practices of design education. In the following paragraph, we provide a brief description and an example exercise for each of the four features, Accessing, Evaluating, Planning, and Knowing. The examples are provisional, meant to show how the field guide might support design educators in paying attention to their everyday sociomaterial practices and discover potentials for pluriversality. Even in taken-for-granted, background activities, like preparing for a critique or structuring class time we act in ways that make some realities im/possible for design education.

Accessing

Many design programs have dedicated teams, or at least work streams in the administrative team, focused on admissions. However, if we start attending to the entrances and exits of our programs, we confront the realities of access: certain things—credentials, metrics, evidence—restrict or grant passage; rules make it easier for some people to fit than others; pathways are more or less visible depending on your location.

An Exercise to Notice Accessing: Doors

Take a moment to consider, perhaps, the simplest starting point for attending to access: doors. Who walks through the doors of our institutions of design education? Do different people walk through physical doors compared to virtual ones? How do people find their way to our doors? When do doorways begin and end? When are doors locked or open? Who (or what) opens and locks our doors? What is allowed to come in, or out of, doorways? How do we feel as we approach the doors of a particular building or room?

By noticing doors, we might also attend to the spaces and locations where they exist. The doors we notice might lead into buildings just off a pristine courtyard on a college campus or from a bustling urban sidewalk. Doors also invite us to notice how we relate to others through control of spaces. We tell students we have an "open door" policy for our office hours or to "lock the studio door" to protect their projects and things. Take a moment to map out the "doors" of your program, where they're positioned, and how they shape access to design education.

When we attend to the humble door as an entry point for noticing access, we may start noticing the positions and attitudes that our sites of design education present towards others. When it comes to pluriversality, we can identify how the position of doors imply who design education is for, under what terms, and in what capacity. Primarily, the doors of design education reside in schools, places for formally approved students and faculty. At the same time, design programs are rarely confined to a single building. Studios, galleries, and classrooms often extend out into our surrounding neighborhoods. These extensions may afford different forms of access at different times. What made these extensions possible? How are they related to the communities in which they are embedded? Reflecting on the power of doors to include and exclude, Carol A. Taylor invites us to image, "What possibilities grow out of doors left ajar, doors unhinged, doors kept open by door wedges, softly closing doors" (Taylor et al., 2024, p. 17) This example exercise shows just one prompt of how to explore access from the relatively mundane starting point of an everyday object.

Evaluating

Design educators thrive on judging quality. Whether through design contests or final reviews that feature industry professionals we engage any number of practices that assess the aesthetic, functional, and economic value of design work. We rely on all manner of tools and materials for making these judgments, many of which themselves are wrapped up in systems of economics and politics. Our evaluation practices influence what counts as positive impact, for whom, and with what consequences.

An Exercise to Notice Evaluating: Critiques

Let's see what we can notice about evaluating through the example of a classroom critique. On the day of a critique, pause for a moment and sense the atmosphere of the room. How is the room arranged and how did it get that way? Where are you positioned in relation to the others in the room? Are there guests in the space? If so, who invited them and how did they get there? What about non-human guests, such as video cameras and microphones? In what format is work being shown? How long will this assembly last?

For many design educators, critique plays a central role in our practice, but there are different flavors; they vary in scale, pressure, orientation. Critiques are events where we bring to bear and reinforce expectations of what constitutes "good work" in design. They also put on display certain roles or positions for the participants. If we shift attention away from the work, and the student presenting it, we can notice the factors shaping the judgment of value in critiques. Approaching critique as an event in time, we find that our evaluations do not have a clear beginning and end; histories and habits infuse the evaluating that happens in the moment.

As one example of the evaluating—or "valuation"—that happens in design, critique can tell us much about potentials for pluriversality in design education. On a very basic level, the evaluating that happens in a critique is wrapped up in norms of communication (Coughlan, 2023). Critiques set expectations for quality not just through execution of craft, but also through their use of language (García-Sánchez, 2015). Students exercise storytelling, articulateness, and verve as they take their turn in the spotlight, developing the type of communication they need to succeed in the professional community. Critique can easily turn evaluation into a means of narrowing what we celebrate and promote as good design. When it comes to pluriversality, therefore, we might challenge ourselves to notice how critique values and devalues aspects of design. Rather than focusing on the relative loudness of style and utility (Ober, 2022), what about the subtler expressions of solidarity, way-finding, curiosity, and personality? Upon noticing these expressions we might look for the aspects of our practice that elevate them. Do they come forward in certain formats more than others? How does location, tone, or time influence the potential for other—typically marginalized or even erased—values to enter our evaluation of good design?

Planning

Design education is a social affair. As educators, we come together in various constellations and tempos to discuss how things are going and what, if anything, we might want to do differently. Visions and performance indicators come from within our department and also beyond it, handed down (notice direction and the power it implies) from the office of a Dean or Provost. From a Planning perspective, it is tempting to see pluriversality as a desired outcome. However, the very organization of Planning activities makes certain realities more possible than others. Let's tune in to investigate how.

An Exercise to Notice Planning: Faculty Meetings

Take a moment to list out the things that make up a faculty meeting. What technologies participate in the meeting? What tools are people using? What about spaces? What impact do those tools have on the way people interact? What items are on the agenda and how did they get there? Where do the items direct the energy of the meeting? Where do agenda items travel after the meeting? What role do they play in your future activities and engagements?

Among other various administrative activities, faculty meetings represent events for coordination, dialogue, and keeping track. Tools and technologies undoubtedly play a role. We glance at clocks to stay on schedule because we have classes to teach or other meetings to attend. We type up "action items," or materialize documents to bear on the conversation. At the same time, these meetings present moments to express care for each other, to be together in a particular place, nurture and relationships. Attending to the subtleties of faculty meetings can surface possibilities for acting in congruence with, or in resistance to, the gravitational pull of our institutions.

The mass of institutional things creates gravity that pulls activity to not only maintain the current institution, but also make progress according to the dominant narratives of our programs. Through the above example exercise, we invite readers to focus on how routine events like faculty meetings can reinforce prevailing activities or plant seeds for potential disruption. Rather than fixed instances of going through the motions to support institutional order, these organizational routines exist as fluid moments full of change in the interplay of habit, thought, and emotion (Simpson & den Hond, 2022). Faculty

meetings represent moments where dominant institutional forces can pull our attention to things like competing for funding, meeting enrollment objectives, or defining measurable outcomes. At the same time, they hold opportunities for bringing other things into the mix: concerns for each other, for our place, and those who reside there with us. As a step toward supporting pluriversality we notice how, within our existing efforts at Planning, there are spaces for relating otherwise, which may be strengthened through the materials, tools, arrangements, etc. at play in our matters of care (de la Bellacasa, 2011).

> ***Knowing***
>
> *As educators, we work with knowledge. Over the years, we learn through making, reading, modeling, imitating, and discussing various aspects of designing. We leverage that expertise in our classes. During these interactions, it's easy to slip into a sense that we are guides: we have the knowledge of how to design and we lead students to it. In such cases, we adopt a position and attitude that perpetuates certain expectations of design education, many of which promote a narrow range of ways to know, be, and make worlds.*
>
> *An Exercise to Notice Knowing: The Project*
>
> *When was the last time you didn't structure a design studio around projects? We often default to the project as our go-to format for teaching design. But how does engaging with the world through a project lens influence what students learn? Look carefully at the tools and approaches that emerge alongside projects. How do these frame possible ways of knowing compared to times when you didn't work with a project? What do the artifacts that are produced from projects say about the student's relationship with different worlds?*
>
> *The "project" is one of the defining characteristics of design education. Wrapped up in institutional life, we find ourselves shaping design education around predetermined quantities of time (semesters, credit hours, four-year degrees). To fit these constraints, we also begin packaging knowledge. The objectives of this project are to deliver X, Y, and Z. The project format also nudges us toward a problem-solving approach. We ask students to identify user pain points to address or to design an objective that is effective. The project is just one way of organizing design. Things move in and out of projects, extending before, during and after. Take time to notice these flows and you might also find ways of knowing that projects obscure or render insignificant.*

In this example, noticing "The Project" is a way to explore how design education knows and relates to issues that are complex and evolving. Design is infused with social, technological, political, and environmental factors that projects need to "freeze" in order to manage. This freezing-based approach lends itself to conceptualizing knowledge as something out there that we can gather, compartmentalize, and bestow (Freire, 2000). Common design tools and activities also contribute to this understanding. Problem statements, system maps, user personas are inherently reductive. And while we might recognize their limitations and myths, their connection with other institutional forces often lends itself to educational practices that privilege rational, exclusionary engagement with worlds. The power in taking notice of Knowing lies in our orientation to change. By attending to those moments when our programs support knowing as open-ended, emergent, and embodied, we might find how they relate to our attachments or commitments to each other and the local sites where we practice design education.

5. Conclusion and Invitation

Today, most formal design education happens in programs of higher education. Whether private or public universities, the dominant model of design education—faculty, organized by discipline, teaching cohorts of students according to explicitly defined curricula—is entangled in all manner of systems that influence what counts as knowledge, quality, and impact for students and faculty. It is also in these contexts that many design educators find themselves striving to respond to theoretical developments that emphasize

the importance of diverse ways of knowing and being for design. Indeed, design education must confront the "information revolution," and adjust perspective from a focus on discrete artifacts to complex evolving, interconnected systems (Davis & Dubberly, 2023).

Unfortunately, shifting vantage points can reveal things you might rather not see. Looking at design in relation to systems highlights the dangerous relationship that our practices have with unsustainable and unjust economic and ontological models. In response, scholars have recommended the development of curricula to move design education "toward a relational, ontological, and pluralistic perspective" (Noel et al., 2023, p. 182). Despite the orientation toward systems in the development of curricula and pedagogies, design educators have little to go on if they want to act on the implications of pluriversality, especially when it comes to the ways we organize and manage our programs. With this initial sketch of The Field Guide for Noticing Institutional Life, we hope to prompt more engagement and experimentation with the practices of organizing our design programs in specific, and design education at large.

Is it reasonable to expect design educators to engage with noticing institutional life? After all, many of us are experts in our discipline, not management or organizational studies. And as practice theorist Andreas Reckwitz reminds us, there may be little affective motivation to dedicate attention to areas outside our cultivated interests and skills (Reckwitz, 2016). Facing this situation, we have modest aspirations for the Field Guide. We do not expect the guide to unleash a sea change in the practice of design education. Rather, we see the guide as a prompt—or perhaps a probe—to generate critical discussion and reflection about the forces that shape design education and how we might find ways to start shaping it otherwise. It is our small effort to invite exploration of tools, interactions, contexts, and languages to change "the ways in which we deal with ourselves and things so that futuring is enabled" (Escobar, 2018, p. 168).

In no small part, this effort departs from our own moments feeling trapped and helpless in the face of institutional bureaucracy. At times it can feel like there are only two paths ahead: accept the institution or leave it. Indeed, we are keenly aware that the most popular tools for managing organizations evolved within a paradigm we seek to disrupt. Our aim, therefore, is to support design educators by developing alternatives to "the master's tools" (Lorde, 2003). Yet, in confronting our entanglements with established institutions, we recognize that we need to find ways to work with new tools in relation to our everyday realities. Therefore, we close our call to notice with a reminder from Paolo Freire that education is constantly remade in praxis: "in order to be, it must become" (Freire, 2000, p. 84).

KEYWORDS | PRODUCT DESIGN, MADE IN ITALY, CULTURAL VALUE CHAIN, CIRCULAR SUPPLY CHAIN, LOCAL PRODUCTION DISTRICTS

ABSTRACT | This paper proposal, which is part of a wider interdisciplinary research called MICS (Circular and Sustainable Made in Italy), intends to reflect on the new contours of the contemporary idea of 'Made in Italy', exploring its cultural value chain and the user engagement's new paradigms as well as the companies' current narrative strategies and the role played by the product-service systems within the Italian production framework.

The paper will focus on the new and consumer-driven business models for resilient and circular supply chains analyzing how Italian design supply companies today address the public (visitors, buyers, customers, users, etc.) in the framework of an approach in which the ethical components prevail over the aesthetic ones.

Furthermore, the research will study the narrative forms, both physical and virtual, through which companies present, to an increasingly sensitive and attentive audience to environmental issues, not their products but their strategies related to sustainability, inclusion, respect for the environment, and control of their products' life cycle, as well as how they pursue the objectives of product, process and social innovation.

1. Introduction

The paper represents a reflection on the contemporary contours of the Made in Italy design production in its relationship with the new social requirements, to lay a groundwork for further research steps aimed at defining and experimenting with a new country of origin effect based on circularity and sustainability, models and methods for technology-based branding, communication, customer engagement and experience.

As a first step of the research (view the acknowledgments below), the paper has the form of an essay rather than a traditional paper because due to the complexity and the multiple directions that a topic like this can take, in this phase the investigation needs to be anticipated by the definition of a general framework in which to move.

Considering the definition of a new competitive paradigm for the companies in the Made in Italy sectors and the development of models, approaches, methods and tools for design as main final objectives of the research, the paper is based on a methodology structured in three parts: in the first one (chapters 2 and 3) the text offers an overview on the contemporary interpretation of the concept of Made in Italy, underlying the relationship with its historical identity and actual external references and interpretations; in the second part (chapter 4) the essay moves from this relationship towards the detection of the main specific elements which characterizes the new Italian production showing their ethical, sustainable and innovative components; in the third part (chapter 5 and 6) the paper uses these elements to draw the contours of the contemporary Made in Italy paradigm, its strengths and its possible future implementations in cultural terms.

The conclusions, far from being final, try to get out from the complexity of the argumentations through the definition of some simple questions to whom it tries to give a first system of answers in the mark of starting building a bridge between design and consumer-driven business models for resilient and circular supply chains.

2. The Concept of Made in Italy

Italy has a long history of excellence in design, which ranges from ‘anonymous’ objects of its historical material culture to innovative products born in various historical periods, especially between the 1950s and the 1980s. The concept of Made in Italy traditionally evokes images of high-quality craftsmanship, sophisticated style and innovation in continuity with cultural tradition and, in more recent years, it has continued to evolve by adapting its productions to the global cultural, technological and economic changes which have led to a significant transformation in the so-called ‘Made in Italy’ design paradigm. Amongst other things, an aspect that characterizes this paradigm shift is certainly linked to environmental and social sustainability: Italian companies and designers are increasingly trying to integrate eco-friendly practices into their production processes, using recycled or recyclable materials and adopting design solutions to reduce environmental impact; moreover, sustainability itself acquires a social dimension through processes of ‘democratization’ which aim to improve people's lives through conditions that become inclusive and accessible to all.

A second important aspect of the contemporary Made in Italy is represented by the renewed dialogue between design and technology: being Italy renowned for its artisanal and manufacturing heritage, the access to information and digital technologies (Internet of Things, Artificial Intelligence, 3D printing systems, etc.), if at first it seemed to be a threat to its identity and productive culture’s authenticity, today it seems to reveal itself as a precious ally precisely because it defenses the small productive realities offering them fundamental tools to enhance and innovate their productions, remaining competitive on the global market.

Thirdly, another aspect is represented by the ability of the new Made in Italy to adapt to changes in the needs and expectations of global consumers: Italian companies are increasingly looking beyond national borders and trying to meet the needs of an increasingly diversified international market and this means not only offering products and services that reflect universal values of civilization but also and above all demonstrating sensitivity and responsibility towards major environmental, social and economic issues.

3. Made in Italy Between Local Tradition and Global Future

In a condition of liquidity such as that of our contemporary age, uncertain instead of certain, temporary instead of definitive, flexible instead of solid (Bauman, 2000), it's not easy, and perhaps it doesn't make reasonably much sense, to establish a universal definition of 'Made in Italy', at least for a couple of reasons: first of all because it's original meaning was defined ex-post, that is only after having observed the results of a very complex process in which creativity, social sensibility, artisan know-how and industrial technologies built an unrepeatable historic conjuncture which produced design artifacts with a very high (aesthetical and ethical) quality level (Fortis, 2005). Secondly, because it's evidently anachronistic to refer to a national context intended as a closed territorial unit in a moment in which the match is played between the local context (sub-national dimension) and the global market (trans-national dimension).

What can today probably have an interest, beyond the speculations about the origin of this phenomenon, is considering the Made in Italy in terms of a more general idea of excellence, in which the objects always have not only a function but also a 'soul' (Branzi, 2004), transferable to other cultural contexts, filtered through the actual contemporary social and economic situation; on the other hand, the importance of reaffirming the Made in Italy brand can be seen as the possibility to detect the cultural elements that it produced (also independently from the original socio-economic framework) anticipating the times and the forms through which it now flows into the idea of sustainability first and of 'country of origin effect' then (Pellegrini, 2016).

With the aim of making a new reading matrix, considering 'traditional' the idea of Made in Italy as a complex and heterogeneous industrial archipelago of local clusters with deep roots in artisan tradition, human capital and territorial culture able to produce always new high-quality objects within strong physical interactions and interpersonal relationships (Becattini, 1998; Sennett, 2008), the detailed analysis of this complexity leads us to detect some elements that, without claiming to be exhaustive, can be summarized as follow: Synthesis between art, tradition and material culture; Unicity in the product's character and identity; Strong relationship between row materials, transformation techniques and supply chain; Propensity for innovation in the mark of a historically sedimented know-how; Capacity of finding out solution using the latest technologies, always seen as a means and not as end; Confluence of the artisanal manufacturing production into high quality design objects through industrial productive processes; Social attention, communication and interaction with the final users' needs and requirements, those intended both as individuals and as members of cultural communities; Production based on cooperation, intercultural dialogue and sharing; Aesthetical aspects based on semantic and semiotic elements. Even if these elements, still visible today, shall be considered as constant and temporally stable characteristics of Made in Italy, their relationship with the global scenario in which they are inserted has significantly changed: this means that the traditional dynamism of the Made in Italy system turns it into a constantly evolving paradigm in which it rediscovers and reinvents itself aiming at building a new system of values in the framework of the so-called 'New Normal', starting from the valorization of the local production districts so to give a contribution in creating a new country of origin effect extendable at international level (Lotti et al., 2015).

Starting from the valorization of the local production districts, what is happening is that the (so-called) Made in Italy tends to build a new system of values to produce a new country of origin effect extendable at the international level: beyond the 'traditional' 4A (*Alimentari, Abbigliamento, Arredo, Automazione*), in all the sector in which is nowadays possible to recognize the abovementioned characters of the new Made in Italy brand (automotive, fashion, craftmanship, furniture, graphics-communication, urban spaces,

enhancement of cultural heritage, new digital technology) the companies that mainly belong to small local productive context with little chance of emerging in the global market, are increasingly moving towards the definition of social innovation strategies, sustainability and customization as well as on the offered user experience possibilities and usability.

In Europe, the relationship between local traditions and global future is nowadays crucial in design's field of action because the necessity of defining new ethical values that follow the contemporary social senses and sensibilities of each local community has become fundamental to reach the objectives defined by the New European Bauhaus initiative, as promoted by the many platforms created for the cooperation of art, architecture, design, science, circular economy and AI, to build a sustainable, inclusive and innovative future (i.e. the Triennale of Milan in 2021, the MAXXI in Rome in 2022 and the *Biennale di Venezia* in 2023); otherwise, the challenges coming from the global dimension of things cannot be tackled any more by deleting or restricting the local traditions and this is true both in the dimension of production processes and consumer awareness (Ceconello, 2022). Furthermore, sustainability, innovation and identity as never before are now parts of a more general 'cultural dimension' which can be considered as a bridge between different backgrounds and as a *fil rouge* connecting all the local contexts with their specific relationships between industrial design and manufacturing knowledge (Dellapiana, 2022).

While the European Union identifies the productive factor of the manufacturing sector as fundamental for future sustainable economic development, in 2017 the Italian Government promoted and presented the Industry Plan 4.0 (*Piano Industria 4.0*) aimed at improving the digital innovation for the manufacturing sector (advanced craftsmanship), but the crisis has slowed down in approaching the new possibilities offered by the latest technologies.

In 2015 the Italian Government answered to the European guidelines also in terms of sustainability when, following the goals of the Agenda 2030 for sustainable development, it arranged the national scheme called 'Made Green in Italy' to integrate the Made in Italy brand with the dimension of sustainability: this led to a very positive outcome in terms of product's environmental sustainability (as evidenced by the report '*Italia Sostenibile*' by Cerved Italy), even if to yet excellent under the social and economic point of view. Nevertheless, all the sectors are now showing signs of recovery both at the productive and management level: which is leading to an important contribution, as we have seen, to the construction of a new paradigm of Made in Italy, made of the innovative supply chain, technology transfer, preservation of the artisanal dimension besides the acquisition of computer tools (hardware and software), clear traceability and authenticity of products, equilibrium between productive responsibility and necessity of quickly placing on the market, new ethical relationship between specific user requirements and mass customization (Goretti et al., 2019).

As a consequence, downstream of these processes, after the global transition to industry 4.0 with its four components (cyber-physical production system, internet of things, smart factory and internet of service), it's now that Made in Italy is trying to re-invent its identity updating its historical relationship between technology and craftsmanship, overcoming stereotypes and misrepresentations on behalf of its real social, economic and cultural characteristics, reconstructing the relationship between 'image' and 'information on it', taking advantage of the opportunities offered by the new digital technologies (Bettiol, 2015).

The companies are now asked to design their products differently, better explaining their philosophy, integrating sustainable strategies, strengthening customer services to be close to buyers as consultants and assistants; furthermore, the 'content' becomes fundamental for the future production in the local contexts: with which to communicate, inspire and bring the target audience closer by creating suggestions of living lifestyles through the product, as well as sustainability and circular economy are increasingly concrete resources and challenges for all the actors involved in the design processes.

4. Sustainability and Innovation of the Italian Production

Sense and aesthetical sensibility, empathy and adaptive flexibility, humanistic mode, meticulousness and attention to detail, thinkering, and enjoyable modernity (Amatulli et al., 2017) are keywords related to the concept of Made in Italy that can help us to reach the specific dimension of sustainability of its brand: an ante-litteram social and environmental sustainability strongly connected to a cultural context, with a central role of design that becomes an active subject in managing innovation processes, communication systems, cultural meaning of the functional solutions.

Furthermore, this extended interpretative perspective of the concept of sustainability is a key to changing our point of view on the actual idea of 'consumption' which tends to become a critical action done by the users/buyers that, without passively suffering choices 'from above', on one hand actively ask the company to demonstrate them their strategies in terms of environmental respect and resource-saving, on the other hand, claim to 'communicate' with products that recognize their values and their identity instead of (only) that of the productive company (Micelli, 2017). As already underlined, this is certainly a form of sustainability, on one hand considered in its social aspects, on the other hand as a fundamental ingredient in the search for innovation: the increase in the number of actors involved, the extension to the intangible dimension of things and the open character of the manufacturing processes create the conditions for maintaining a constant updating independent from the companies' push and more and more related to the encounter of a large number of contributions at any level.

In the ambit of this new sustainability paradigm, the Italian design supply companies have accepted new consumer-driven business models, welcoming the opportunities offered by the new information technologies and systems of interaction that allow buyers and users to participate in the design decisions through individual experiences, collective interpretations and definition of new meanings, symbols and rituals: new narrative approaches that make possible to share knowledge and offer to the public the possibility to become active creators, co-designing and sometimes co-producing, starting the product development process from the bottom and not anymore from above (Micelli & Di Maria, 2000); but also living real experiences in specific real contexts or virtual spaces as a sublimation of the sharing of cultural meanings and ethical values with the companies, in a socially and economically sustainable way.
In other words, through the new models of interactions, consumers have now tools to get out from individuality and build social relationships with companies and with other consumers, so that the manufacturing systems, in this case of Made in Italy, cannot live anymore on the old image of its brand, but it's now asked to redesign not only its productive framework but also its context of consumption to allow participation and definition of new significances.
In terms of innovation, as already mentioned, the Made in Italy design tradition has always been characterized by a condition of flexibility, mutability, creativity and intuition: then, not products intended as reiterations of static and dogmatic aspects, but future-oriented solutions open to a multitude of productive outputs (Mancini, 2018). Now, the evolution of this concept can be the idea of innovation as an expression of an equilibrium between art, technology and the human factor, based on relentless experimentation which always starts from the reinvention of the past and never by its denial, also in absence of the highest technological tools (Dellapiana, 2022). Moreover, an innovation that is not radical but 'incremental', produced by a sequence of small contributions that can be added over time, from generation to generation, without an explicit boost but, in a way, spontaneously, as a natural consequence of a working methodology and ritual.

5. New Paradigms of the Made in Italy Design

Currently, the narrative dimension of Made in Italy in the international context is characterized by some shortcomings which are mainly attributable to the following aspects: absence of a common strategy for the entire industrial network; not always clear definition of the common values that link the specificities of the different local production contexts beyond their differences (among themselves and with those of other countries); a certain reticence of the small companies to make their know-how available; confusion between the

communicative dimension and that of marketing, that is, between narration and marketing of products; limited acceptance of the information and digital technology contributions, including those relating to online sales (Micelli, 2018).

This situation clashes with the increasingly active role required by users who focus less and less on the products' functional aspects and more and more on the symbolic and cultural ones, attributing to the concept of 'quality' a connotation more in line with an idea of continuity with history, identity of the cultural contexts and authenticity of the production processes.

It is therefore clear that in Made in Italy, the relationship between production, storytelling and user experience must necessarily be generated starting from the ethical comparison with the material culture and cultural heritage of the territorial contexts, with their tangible and intangible elements, and must also be freed from traditional marketing mechanisms aimed at mere commercialization and move closer to build open, participatory and ultimately 'cultural' dialogue with users.

Therefore, the possibilities offered by the new business models and their relationship with the Made in Italy brand, as well as the necessity now socially shared to build a condition of circular economy, brings us to overcome the concept of 'made in' and arrive, as anticipated by the previous reflections, at that of 'country of origin' (Lotti & Trivellin, 2017).

The country-of-origin effect is the impact of the idea of quality associated to a specific cultural context on the users/buyers' purchasing processes. In the case of the Made in Italy products, the COOE can be defined as the trust people place on the objects whose design and production have been developed in Italy, due to the positive image they have of this country, with its abilities, experiences, knowledge and capacities (Bertoli & Resciniti, 2013; Bettiol & Micelli, 2005).

Being related to the buyers' perception and behavior (especially foreigners), downstream of the processes of market integration, standardization and trend for delocalization, the COOE is now taken into account by the companies through strategic systems of communication, interaction and participation, to rebuild their identity. Hence, the companies start addressing the shopping experiences of their clients but, as we have said before, is not possible anymore to consider the users/buyers as passive consumers, so becomes important the respect their consciousness and awareness about the products' cultural values.
But actually, the problem is that, due to the difficulty of a product to be designed, manufactured and assembled in one unique country, the COOE has become fragmented at least into three main constitutive elements: the overall image of a country, the image of a country and its products, images of products from a country (Bertoli & Resciniti, 2013).

Considering the stark imbalance in company size, typical of the contemporary Made in Italy productive system, it should be considered that the fragmentation which characterizes it very often tends to becomes an opportunity to transform the signs of recognition into a system of socio-cultural distinctive values; when these values take on a certain strength, they are intercepted by the contemporary scenario that, once accepted, it translate them into possible directions for design, productive and marketing strategies with a greater awareness. With no ambitions of being exhaustive, these directions can be: interoperability between objects, machines and people; virtualization as a function of the productive, economic, environmental and social sustainability; modularity of adaptable and open products, services and processes; decentralization as organizational form of the processes (Celaschi et al., 2017).
As a consequence, the user experience is therefore fundamental in the dialogue between companies and buyers, but it must be intended not as something added to the ordinary objects with the mere objective of selling a product, but, on the contrary, as an occasion made of specific spatiality, temporalities and rituals when companies and buyers can share a common ground of iconographic repertories, ethical values, bonds with tradition, socially eligible degrees of innovation, forms of customization (Rinaldi, 2015).

Today, communicating one's impact and sustainability by informing the consumer about the creation of green products, use of natural and recycled materials, etc., is a fundamental competitiveness factor for local companies: the attention to quality of life becomes an issue to be addressed through the new business strategies to make people understand the new directions that the more careful design actions are going to take, rediscovering an approach that in our modernity has as a founder in the person of Adriano Olivetti which, ahead of his time, investigated the problem of interaction already between the Fifties and the beginning of the Sixties working with designers like Sottsass and Maldonado (Riccini, 2010).

6. Towards a New Cultural System of Values

The new contours of the contemporary Made in Italy, its cultural value chain and the user engagement's new paradigms of the companies, as we have seen, are nowadays interested in a process of transformation in which a fundamental role is represented by the strategies used by the product-service systems and by the new consumer-driven business models. The resilient and circular supply chain is now fully recognized as a necessary condition, as well as the fact that the ethical components of products and processes prevail over the aesthetic ones is not an option anymore but a widely recognized fact.

The way Italian design supply companies today address the public (visitors, buyers, customers, users, etc.) and the narrative forms, both physical and virtual, through which companies present, to an increasingly sensitive and attentive audience to environmental issues, not their products but their strategies related to sustainability, inclusion, respect for the environment and control of their product's life cycle, as well as how they pursue the objectives of product, process and social innovation, are all elements that the new design approach must consider in its background research (Dalla Mura, 2015).

Although the level of awareness, as often pointed out, is higher than in the recent past both in companies and consumers, what seems to be by no means certain is first of all the fact that the Made in Italy design with its many local cultures could build automatically a relationship with the global design landscape; secondly, that the entity of the social and emotional level of communication, its natural modalities, as well as the dimension of time (temporality of experience) defines always compatibility with the physical context, its social acceptance and its eco-sustainability (Giovannella, 2008); thirdly, the fact that all the forces involved in the new product development process (designers, engineers, marketing experts, etc.) easily reach a balance between them without cultural coordination (Bettiol & Micelli, 2005).

This is the reason why the designer is still fundamental in its capacity to mediate between different knowledge, activate interdisciplinary contributions, give sense to innovation, improve the cultural dimension of objects, humanize technology, promoting eco-efficient behaviors (Lotti & Trivellin, 2017). Furthermore, as well as we put the word 'new' beside the concept of Made in Italy and that of country-of-origin effect, the same should be done for the idea of 'authenticity': also, in this case, design can be a privileged actor in detecting and managing the forms of expression of all the possible new authenticities which can come out from any local context, productive territory, social community and innovative reality at a different scale. Thus, to link them together in a unique (even if diversified) cultural common ground within a new multiverse geography of productive systems able to improve, through good objects and services, the environment and the people's everyday lives (Norman, 2013; Scalera, 2020).

More specifically, the power of cultural renewal that the Made in Italy design is interested in, belongs to its narrative power and the possibilities offered by the digital and/or virtual storytelling, whose impact is not measured on a generic final user but on a 'social capital' made of people belonging to a specific cultural context with strong and dynamic relationships between them, sharing a common system of ethical and aesthetical values, rituals and behaviors and open to the global world (Bertola & Colombi, 2014).

This aspect has a deep impact on the conception of the new products because changes, on one hand, the ways of consumption and customer expectations, on the other hand, the companies' approach to production which becomes more and more customized and personalized: this encounter produces a

dimension called ‘cultural manufacturing’, that in the cases of territories characterized by strong cultural roots, such as Italy, is transformed into a cultural experience closely linked to a specific physical and social context of use (Ceconello, 2022).

Regarding the relationship with digital technology, if Stefano Micelli, paraphrasing the work of Maholo Uchida, says that empathy is the key through which design can make the digital world acceptable, preventing technology from reducing the role of human dimension and, in the meanwhile, building new forms of co-habitation for reality and virtuality based on innovative aesthetics and new forms of interaction (Micelli, 2018), trusting technology seems to be now a more easily accessible street.

In the case of the Made in Italy districts, this change of behavior undoubtedly leads to a real and diffused cultural change, as well as to a concrete opportunity to raise and increase competitiveness in the global market. Certainly, but not only that, because this perspective re-activates an artisanal dimension made of small productive archipelagos, auto-production systems, etc., in those territories in which the big industry is physically too far away: economy, simplicity, clarity and beauty but also awareness, privacy, context, experience, synergy, emotions, participation, identity and cultural meaning are the main ingredients for the cultural framework of the new relationship between digital technologies, design and Made in Italy brand. But the very big power of this new dialogue goes at least in four main directions: the possibility for products to be manufactured locally; the facility in preserving over time the cultural manufacturing know-how; the capacity of joining together the humanistic aspects of production with the technologic-scientific ones; sensibility in combining virtuality and reality in the user’s interaction and participation processes.
On a productive level, the new possibilities offered by the dialogue between Made in Italy design and digital technologies improve the potentialities of the products in terms of customization and non-standardization through the sharing of information and participation in making decisions, as well as expand the design freedom of movement already in the concept phase where many possible final product proposals can be created in a digital environment. This means that design and production build an innovative relationship that is very similar to that of a traditional craftsmanship activity: what happens, then, is first of all that design and production are not sequential steps anymore but become synchronic and simultaneous activities, secondly, that artisanal creativity and rational management of the processes are no longer in opposition, thirdly that self-manufacturing becomes increasingly available (Ramoglu & Coskun, 2017).

As already happened in the past, also in this case the technological innovation flows into a radical social and economic innovation, thanks to the strong union between products (with its components of design, production, and put on market), productive systems, territories, natural environment and people, so that the digital transition is accepted for its power to produce democratic and socially virtuous processes that can be returned to the creative dimension of the craftmanship (Sbordone & Turrini, 2020).

7. Conclusions

This paper, which aims to be an essay, must be considered as a starting point of an investigation which, more in detail, in the next step of the research will focus on specific local contexts within the Made in Italy productive system, to analyze the impact of the aspects above illustrated and regarding their matching with the contemporary paradigm, in its evolution to the cultural country-of-origin effect.

In any case, as a conclusion, we can try to answer the following questions, according to the general objective of exploring the future perspectives of the Made in Italy design culture within the global design landscape: How do customers and users attribute value and significance to the products? How do companies manage the relationship between brand identity and (mass) customization? How do companies declare and show their way of being inclusive, sustainable, and innovative? Which is in general the relationship between cultural dimension and marketing?

First of all, we can say that customers and users can give value and significance to the products considering a variety of factors, which depend on individual expectations, needs and personal social background, as well as criteria that come from their relationship with one or more cultural contexts. Besides the traditional evaluation elements like quality, functionality, aesthetics, durability, prize, etc., the main aspects that now seem to be fundamental are the emotional factors (aspiration, references to individual memories, social identity, etc.), the active involvement in the user experience, the reference to cultural and social factors and the forms of flexibility in terms of customization.

As a consequence, companies are now asked to manage the relationship between brand identity and customization first of all building an identity that must be shared with the clients and not imposed from above: is not possible anymore to speak of 'company's identity', against which the users don't feel like sharing it, but, on the contrary, the identity becomes a value with many different interpretative declinations with a unique cultural common ground. Even the word 'mass' is going to disappear, not in favor of extreme individualism, but for a more human material culture open to diversity and contrary to the cultural leveling.

Then, companies are nowadays obliged to declare and show their way of being exclusive, sustainable and innovative: this happens in all contexts, physical and virtual, such as shops, temporary expositions, fairs, museums, online platforms, etc. The traditional distribution ways, selling and commercialization are outdated, as well as the products (or the services) cannot be sold if they don't show their 'ethics' in terms of environmental respect, resource-saving, and productive sustainability.

Last but not least, the relationship between cultural dimension and marketing appears now profound and multifaceted. The cultural dimension of products and services provides insights into the values and priorities of a target market; therefore, marketing efforts must align with these cultural values to resonate with users and we must consider that the cultural dimension has an influence also on language, communication, symbols that are meaningful to the users (semantic and semiotic dimension of things), hence, companies must take into account the necessity to be always dialogic in their marketing strategies, building trust and credibility, not only in the small contexts but also in the global market. No doubt, these first general answers to the questions above detected, have many possible declinations according to the specificities of each local social context. But as another fact to be highlighted, each productive context is ultimately a social entity and it relates to the market (local or global) always in social terms, and this awareness constitutes the quintessence of the renewal of the Made in Italy circular and sustainable contemporary brand.

KEYWORDS | FASHION RESEARCH, FASHION LIBRARY, FASHION PRINTED MATTER, LIMINALITY, THRESHOLD

ABSTRACT | The academic field of Fashion Studies is a relatively new one and has been traditionally defined by its scholars as a mixed, hybrid and layered area of study. Merging various and sometimes unexpected disciplines, methods, and approaches; Fashion Studies have therefore been the protagonist of a long-lasting debate on their positioning within academia. With this paper, I argue that the state of in-between-ness which distinguishes this area of study permeates not only its identity as a discipline, but also as a research practice, ultimately characterizing the spaces in which it is carried out as well. The contribution employs key concepts such as liminality and thresholding to investigate the spatial qualities of fashion research and of the fashion library, with the objective of defining them as fundamentally intermediary, 'entre-deux' and transgressive. These theoretical premises find their actualization in the analysis of International Library of Fashion Research (ILFR), a public library dedicated to fashion printed matter founded in 2020 by editor and curator Elise By Olsen and hosted since November 2022 by the National Museum of Art, Architecture and Design of Oslo (NAM). Observing the intertwining of the digital ramifications of the project and its physical space, the peculiar positioning in fashion's geographies and the proximity to an established cultural institution, as well as the heterogeneity of the collection and the multidisciplinary team that guides it; ILFR can be identified as inherently decentralized, capillary and in-becoming, and therefore the ideal site-of-passage for fashion research.

1. Introduction

The research intends to contribute to a recent momentum of interest towards fashion archives and repositories, and their role within the study of fashion cultures. This study investigates the practice of fashion research and the space in which it is conducted, namely the fashion library, through the theoretical framework of liminality. The aim is to uncover the spatial, symbolical and practical qualities that, I argue, facilitate and inspire the use of multimethodological approaches and decentralized perspectives on fashion research.

In the first chapter, I will focus on the definition of liminality by engaging with a solid theoretical framework, with the scope of applying this notion to the context of fashion research. To do so, I will start by tracing an overview of Fashion Studies to sketch a portrait of its disseminated and cross-disciplinary positioning within the academic disciplines' landscape. From these theoretical premises, it will then be possible to investigate the practice of fashion research and the space of the fashion library as composite, capillary, and liminal thresholds.

The second part of the paper will apply the theoretical web introduced in the first chapter to a specific case study, that of International Library of Fashion Research, a repository for fashion printed matter founded in 2020 by editor and curator Elise By Olsen and open to the public since November 2022. The features of this specific library, I claim, encapsulate at best the state of becoming and in-between-ness shared by Fashion Studies, fashion research and the fashion library, establishing itself as an ideal space for research in the field.

What I offer here is by no means an exhaustive or complete investigation on the topic, but a mere introduction which I hope can inspire further explorations on fashion repositories and their role on fashion research.

2. Liminality and Fashion

2.1 Fashion Studies: A Decentralized Discipline

In 1991 fashion historian and curator Valerie Steele famously published an article titled "The F Word" on the American magazine *Lingua Franca*, highlighting the status that fashion had among the academic lineages at that moment in time. Nameless and utterly unmentionable, fashion as a discipline for critical reasoning made its debut on a media outlet officially dedicated to intellectual discourse in the form of a cut-off word, a highly symbolical letter which ironically played with the concepts of censorship and academic propriety. More than twenty years later, scholars operating in the field still participate in a heated debate on the positioning of fashion within the realm of research, successfully unveiling both the criticalities of imposing fixed categories in academia and the struggle of navigating this landscape to gain proper recognition.

Foremothers of the discipline are figures such as independent researcher Elizabeth Wilson, who through her seminal book *Adorned in Dreams* (1985) gave a first contextualization of fashion within theoretical frameworks; or cultural studies scholar Agnès Rocamora and visual culture theorist Anneke Smelik, whose anthology *Thinking Through Fashion: A Guide to Key Theorists* (2016) offers a compendium of theoretical interventions on the concept of fashion. In the introduction to the book, the editors define Fashion Studies as "an interdisciplinary field that refers to the understanding of fashion in its broad meaning, including influences from history, philosophy, sociology, anthropology," (Rocamora & Smelik, 2016, p.3) a view also shared by art historian Christopher Breward (1995), cultural theorist Efrat Tseëlon (2001), and cultural anthropologist Heike Jenss (2016). The names here cited are just a few of the personalities who feed the discussion around the topic, nevertheless, they effectively demonstrate the heterogenous plethora of backgrounds that forged leading voices of the field before the advent of specialized educational career paths, which are also a relatively recent phenomenon.

The diverse scenario of fashion researchers is well exemplified in “A Fashion Studies Manifesto: Toward an (Inter)disciplinary Field” (2023), a contribution signed by Dean of Fashion at Parsons School of Design in New York Ben Barry and Graduate Program Director of the School of Fashion at Metropolitan University of Toronto Alison Matthews David. In the paper, the academic duo employs an autoethnographical methodology to comment on the state of the art of Fashion Studies, recounting their personal parabola towards fashion as former PhD students in Management and Art History. In their recounts, both strongly agree that the mixed methodologies applied to their work as researchers, theorists, and educators of Fashion Studies "opened up new possibilities of research” (Barry & Matthews David, 2023, p.11) and stimulated a productive dialogue between seemingly antipodal specialisations. Directly quoting the words of authors Eugenia Paulicelli, Veronica Manlow, and Elizabeth Wissinger (2021), Barry and Matthews David concur that “if ever a subject both called for inquiry and resisted classification in a single field or method of inquiry, fashion would be it,” (Barry & Matthews David, 2023, p. 2) concluding that the study of fashion should not be a prerogative of few experts. Distancing from a sectorial and fixed division of specialties, the authors therefore identify Fashion Studies as an ideal arena for academic convergence and overlapping: “Fashion Studies is about fostering community, collaboration, and inclusion, not about disciplinary boundaries.” (Barry & Matthews David, 2023, p.17).

Another example that clearly highlights the composite nature of this field is the investigation conducted in 2012 by author and Associate Professor of Fashion Studies Francesca Granata, which unravels the methodology adopted for her Doctorate thesis. Her project, which applied Bakhtin’s theories of the Grotesque within the framework of fashion practices, “needed a range of methodological approaches, poached from a variety of fields and disciplines, including material culture, visual culture, as well as performance and film studies” (Granata, 2012, p. 68). Expanding Rocamora and Smelik’s definition of fashion from interdisciplinary to “multi-methodological” and “inter-media” (Granata, 2012, p.75), Granata reasserts the state of in-between-ness of Fashion Studies within the realm of research. From an object-based approach to qualitative research, passing through philosophy, cultural memory, and ethnography; the author unpacks the complexities of conducting research in this area and concludes that a mixed-method approach is beneficial to the study of fashion due to its natural hybrid identity.

From this brief introduction to Fashion Studies, it is clear how this discipline is fundamentally decentralized, and privileges contamination, if not a total hybridization, between areas of specialization. Moreover, it is significant to underline how both the “Fashion Studies Manifesto” and Granata’s investigation make use of a specific terminology, that of spatiality. In the first reference, the writers define Fashion Studies as “both bordered and borderless in practice,” (Barry & Matthews David, 2023, p. 3) introducing the words ‘in’ and ‘out’ to communicate their fluctuating posture within the academic sectors and the propensity to blend areas of study by activating different disciplines and practices. Granata, instead, traces conceptual parallels between the theories applied for her research and fashion practices in general, finding a common ground in the idea of liminality and threshold. By acknowledging the heterogeneity of Bakhtin’s theories, which supported her Doctoral thesis, she concludes that this mixture of references and backgrounds “remains particularly apt for a study of a ‘discipline’ (such as fashion) that exists itself at the borders.” (Granata, 2012, p. 79).

2.2 Fashion Research as a Liminal Practice

To better understand the spatial features that denote Fashion Studies and apply them to fashion research at large, it is fundamental to define the concept of liminality. One of the seminal publications that contextualized this notion in the realm of research is *Landscapes of Liminality: Between Space and Place* edited by Dara Downey, Ian Kinane, and Elizabeth Parker; a compendium of articles that present possible implementations of the concept within Humanities. In the introduction to the book, the editors retrace the history of the term starting from the Latin etymology *limen*, which suggests “a ‘harbor’, […] a ‘threshold’ or ‘passage’ to be crossed.” (Downey et al., p. 10).

The volume then cites anthropologist Arnold van Gennep as the first figure to use liminality as a concept, applied to the process of becoming that every individual experience while participating in sacred rites of passage. But it was Victor W. Turner, through his cultural studies approach, that popularized the term

within the academic sphere, speaking of the spatio-temporal, symbolic and transformational passages of becoming that distinguish the process of community-formation. Since the 70s, the concept of liminality has been a constant presence in theoretical experimentations, to the point that the authors criticize the widespread misuse of the concept yet embrace the fact that the term cherishes a natural "malleability," as well as the "ability to signify in multiple, even contradictory ways" (Downey et al., p. 4). These elements are ultimately the features that make this specific notion so pervasive and appliable to any study subject.

In the volume, professor of English Robert T. Tally Jr quotes German philosopher Martin Heidegger through the association of liminality to the concept of the uncanny and their intrinsic "sense of homelessness" (Downey et al., p. x), while the editors echo Eric Prieto by stating that liminality can be referred to as "the 'entre-deux', or the 'in-between' that occurs between certain 'established categories' (Downey et al., p. 5). The spatial and metaphorical imagery of liminality could therefore easily be associated that of Fashion Studies, whose positioning in the academic realm is essentially 'entre-more-than-deux', simultaneously implying "some sense of boundaries, borders, or limits" (Downey et al., p. xi) and a fluid transgression of such. Moreover, the image of the "anteroom" (Downey et al., p. xii), of a cushion-space between a 'here' and a 'there' clearly resonates with the situation of being both 'in' and 'out' described by Berry and Matthews David in reviewing the background of fashion scholars.

I argue that if Fashion Studies share fundamental features with the concept of liminality, fashion research should undoubtedly be considered a liminal practice too, as it implies that fashion is itself a terrain for fluid hybridizations. In her review of the seminal book *Fashion Studies. Research Methods, Sites and Practices* (2016) by Heike Jenss, Anneke Smelik frames fashion research as a necessarily open and layered practice based on a multiplicity of perspectives.

> "As fashion is made of both material things and symbolic signs, produced by individual and collective agents, which all merge through practices of production, consumption, distribution and representation, the study of dress and fashion necessarily covers a wide range of research issues." (Smelik, 2017, p. 618)

Thus, whether for academic purposes, design processes or marketing manoeuvres; researching fashion necessarily implies the merging of disciplines, themes, methodologies, and approaches; taking into consideration both theoretical reasoning and practice-based attitudes. The fashion researcher could therefore be considered a transgressive figure, one who recalls "the form of the Deleuzian nomad, living in the intermezzo, ever deterritorialising without reterritorialisation, occupying smooth spaces subject to intense striation, over and over again." (Downey et al., p. xi). Porous and decentralized, the fashion researcher therefore moves in a flux between structures and categories and occupies a space where "a boundary or border might become a threshold, but only when it is transgressed" (Downey et al., p. xi). In tracing the portrait of the fashion researcher, it could be remiss not to mention once again Granata, who in her article aptly quotes Mitchell's definition of inter-disciplinarity: a practice which "causes moments of 'rupture' and/or 'turbulence' within established disciplines" (Granata, 2012, p. 79).

Furthermore, directly quoting fashion theorist Susan Kaiser, professor of Integrated Design Otto von Busch claims that "studying fashion is a both/and, rather than either/or" activity, as "fashion thrives on contradiction (conflicting truth claims) and ambivalence (conflicting emotions)" (Jenss, 2016, p.181). It is then clear how the inclusive and contradicting nature of fashion naturally guides its research methods too, which abandon all hierarchies or divisions in the process of acquiring references and sources. Von Busch then offers a visual representation of fashion research applied to the context of design, taking inspiration from Donna Haraway's theory of diffraction based on an "approach to complex fields, which include both/and perspectives and contradictions" (Jenss, 2016, p.185).

Dwelling in the interstices between disciplines and methods, thriving in an abundance of sources and inputs; the fashion researcher can therefore employ diffractive modes of observation to stimulate intermediate, comprehensive, cross-cultural, and decentralized studies. If liminality "is itself an in-between space of potentiality," (Downey et al., p. xi) researching fashion then mirrors this state of becoming by

edging the borders of the disciplines it encounters. In the next chapter, I will argue that since the practice of fashion research shares qualities with the concept of liminality, then the spaces in which it is conducted are ever more effective if they feature liminal qualities as well.

2.3 Thresholding the Fashion Library

From study collections to museums, from the ateliers to university workrooms, the spaces in which fashion research is conducted are varied and not standardized. For the purpose of this article, I will focus on the space of the library, as I argue it tunes in with the state of in-between-ness and the definition of liminality sketched in the previous chapters. Going back to Granata's contribution, the author traces a revealing outline of the difficulties faced when researching fashion by recounting her experience of the library.

> "[…] one of the easiest ways for me to visualize the difference in disciplinary status between film and fashion studies was by observing how works on film studies were spatially self-contained within large research libraries compared with those on fashion studies. […] retrieving books on fashion had me scouring between floors and wings, which gave a more exploratory dimension to the physical act of research, but it certainly made it more time-consuming!"
> (Granata, 2012, p. 75)

Not only this image is exemplary in portraying the positioning of Fashion Studies within academia, but it also effectively illustrates the idea of 'passage' that fashion research implies, as well as expressing the urgency of creating spaces which could enhance—yet facilitate—this liminal practice. A specialized library of fashion therefore faces a crucial contradiction: it should unify its collection under the umbrella-term of fashion, yet it must also be broad enough to stimulate cross-disciplinary encounters.

In her MA thesis *Beyond the Library: A Study of Fashion Documents' Archival Spaces,* fashion scholar Ilaria Trame unpacks the terminological and phenomenological complexities of the fashion library, disclosing the state of in-between-ness proper of this institution. In particular, the author acknowledges that the identity of a fashion library necessarily flirts with that of other existing repositories such as centers of documentation and archives, especially for what it concerns the contents of its collection. The fashion library, in fact, can host multiple forms of materials: magazines, fanzines, exhibition catalogues, books, documents, photographs; but could also expand its collection to ephemera—a concept I will analyze more in detail in the next chapters—or textile samples. To define a library of fashion therefore means to evermore engage with a liminal perspective, starting from its positioning at the borders of established centers of conservation and authentication.

> "The margins of the term 'library' need to be broadened in order to become a comprehensive device to gather these variety of identities. I argue that its identity is strictly related to the types of materials that it preserves, and to the ways in which these objects are stored and put in communication with one another. It is specifically for this reason that the definition of a fashion library is still so blurred and multifaceted: there is an urge to acknowledge this heterogeneity and the multiple singularities in order to be able to define the main features and characteristics that compose a library of fashion." (Trame, 2022, p. 8)

Similarly to documentation centers, the fashion library can host materials (such as ephemera) which are not canonically fostered by traditional libraries. It also mirrors the objectives of the archive by becoming a repository of objects and participate in what French philosopher Michel Foucault names "the creation of a system of statements" (Foucault, 1969, p. 34) by actively legitimizing its collection. Nevertheless, the fashion library differentiates from the museums' documentation centers for the materials included in its physical as well as digital walls are not apt merely to sustain a collection of artworks or garments. Simultaneously, it challenges the institutionalized heritage-making of the archive as its collection can be contaminated with unofficial knowledge as well, that is materials which stem from the everyday, the under-represented and the personal spheres.

The broadness of the term is evermore enhanced by its digital iterations, which continuously challenge the definition of what a fashion library should or could be. Trame mentions for instance the phenomenon of university libraries' Instagram accounts such as @bibliotecaiuav—the official social media of IUAV University of Venice's library—which display their collection echoing hyper-popular profiles dedicated to sharing images or videos related to fashion printed matter—which not coincidentally use the word 'library' and 'archive' interchangeably. It is also noteworthy to mention the proliferation of online guerrilla libraries, which offer complete scans of rare materials without considering copyright or distribution policies and regulations. From these examples it is clear how the concept of fashion library itself, as well as its actual collection, is then subject to multiple mutations and transformations. In Trame's words:

> "The library can be seen as a device to reorient an understanding of fashion beyond the garment itself […] and to redefine certain hierarchies of material typologies […] that can speak for another, additional and parallel history of fashion, oftentimes complementary to the one written by the study of garments." (Trame, 2022, p. 12)

Another feature proper of the library, is that it "demands a daily relation with the system of fashion in order to keep being relevant in contemporary times," (Trame, 2022, p. 10) something that, I argue, is not necessarily required by documentation centers and archives. Emblems of this permanent dialogue between the library and the outer world are two specific genres of materials: ephemera and magazines. If the second object is quite self-explanatory, the first can be described in the context of fashion as "all those objects, documents, invitations, press releases, catalogues, lookbooks and flimsy materials that survive their original function" (Trame, 2022, p. 10). These objects are highly reactive to the cultural zeitgeist, as their production by the fast-paced industry of fashion grows steadily and consistently. Through their presence, both magazines and ephemera expand the idea of the library and are manifestation of the multiple identities, definitions and practices proper of the institution. Ultimately, the fashion library could be seen as an intermediate space of constant negotiation between the fashion industry and fashion research; an ever-changing threshold charged of interpretative possibilities.

Based on these premises, it is interesting to analyze the act of researching within the fashion library through the practice of thresholding as described by artist and lecturer Ally Bisshop. In her Doctorate thesis, based on practice-based research and sustained by Henri Bergson's theories of the threshold, Bisshop coins this term to describe a set of techniques that stimulate more-than-human relationships between artist and art. Without getting into the specifics of the single techniques, it is interesting to notice a resonance between her definition of thresholding and the act of researching within the fashion library.

> "In its openness to indeterminacy, thresholding puts into question what we think we already know […] when we enter into compositional relation with material. Instead, it provides the conditions for new knowledge and new techniques to emerge in the making, in the process of engaging and attuning to material forces." (Bisshop, 2018, p. 9)

If we were to apply Bisshop's definition to the fashion library, thresholding the library would mean to engage in a relational and open-ended process of questioning with the objects of the collection, a dialogue which aim is to produce new knowledge and stimulate new kinds of research. I argue that this practice is innate to the fashion researcher when in dialogue with the library, as they are both rooted in the concept of liminality. As a practice of rupture and creative invention, states Bisshop (2018, p. 54-55), thresholding aligns both with the transgressive nature of the fashion researcher and of the fashion library. To conclude, it is clear how Fashion Studies, fashion research and the space where both meet—the fashion library—all share liminal qualities and are instances of decentralized practices, methods and spaces which stimulate a constant thresholding of their specific relations.

3. International Library of Fashion Research (ILFR)

3.1 The Foundation Process

The primordial state of International Library of Fashion Research can be pinpointed at the moment of encounter between Norwegian editor and curator Elise By Olsen and New Yorker cultural theorist Steven Mark Klein. In 2015, By Olsen's work as editor and curator was already well-renowned in the European publishing industry and overseas. One day, Klein contacted By Olsen through a three-word email that recited: "who are you?" (By Olsen, 2022, p. 58). Curious to meet the person that started her first blog at eight years old and founded her first magazine *Recens Paper* at thirteen, Klein initiated an epistolary exchange with By Olsen, which led to multiple encounters, conversations and exchanges of ideas and perspectives. Sharing a profound appreciation of printed culture, the duo found a common ground in discussing practices of publishing, collecting, and archiving fashion printed matter. In the 80s, 90s and 00s, Klein had in fact been a hungry hoarder of anything that was fashion-print-related and fed his personal archive accumulating brands' in-store catalogues, stealing discarded weeklies from his neighbor's doorstep (By Olsen, 2023, p.37), and acquiring now rare fashion publications and ephemera. In three decades, Klein generated a collection of more than 5000 objects, crammed in his Lower East Side apartment. Then, in 2020, during a call between the two, Klein nonchalantly asked By Olsen if she would have been interested in inheriting his whole collection.

In a matter of just few months, the collection was shipped, relocated, and established in the renovated building and former train station opposite the brand-new National Museum of Art, Architecture and Design of Oslo (NAM), the Stasjonsmesterboligen (Fig. 1 & 2), which agreed to host the library-to-be on its premises. This passage of the baton couldn't have been more symbolical: an entire collection was quite literally navigating across the ocean to become the foundation of an international institution. Going back to the theories on liminality, the repositioning of the collection could be associated to what Van Gennep identified as "preliminal rites," that is the ceremonial passage "that incorporates the individual(s) within the new symbolic-spatial state." (Downey et al., 2016, p. 7). I argue that Walter Benjamin's essay "Unpacking My Library" (1931) could be a suitable reference for this process. In the text, in fact, Benjamin describes the state of in-between-ness of his library, at a time in which it found itself amid a relocation in his new house. Evoked by the author's words are in fact a precise sense of transition, as well as the tactile-like notion of presence and persistence.

> "Inheritance is the soundest way of acquiring a collection. […] the attitude of an heir, and the most distinguished trait of a collection will always be its transmissibility." (Benjamin, p. 66)

The threshold that a book trespasses in the moment of acquisition, when it ultimately becomes part of one's possessions, is emulated in that of the inheritance process, which is described as the natural course of a collection: being passed on to other possessors. For Benjamin, "ownership is the most intimate relationship that one can have to objects," (Benjamin, p.67) and the materials purchased become secretly bounded to the acquiree, and vice versa. In his conclusion, the author offers an image which symbolizes the total union of object and collector, when he states that the collector 'disappears' inside the library. For the author, the presence of the original collector isn't lost in the process, it is hosted instead by the objects of the collection. This process, which lays in the foundation of a library, triggers questions related to the concepts of memory, identity, and temporality within the space, charging these concepts with a sense of becomingness and transition.

Shortly after the donation, in the fall of 2021, Steven Mark Klein ended his life. After learning the news, By Olsen stopped the process of relocation before slowly re-introducing her presence and that of her collaborators in Spring 2022. The library finally opened its doors in November 2022, and has since grown steadily gathering many private collections through donation process only. By Olsen not only considers the library as the physical and spiritual legacy of her mentor, but also as an entity in constant transformation, a malleable body that reacts through the contact of those who touch it, though "memory, symbiosis, sharing

and conversation." (By Olsen, 2023, p.38). It is evident how the process of foundation and the subsequent establishing of ILFR is embedded in a state of liminality, it is the incarnation of a threshold in constant negotiation between the boundaries of "privacy, autonomy, and public access." (By Olsen, 2023, p.38); as well as of memory, history, and heritage.

3.2 From Digital to Physical, and Back

Before its physical opening in 2022, ILFR had already launched in 2020 as an Instagram profile and website, which became the first visual manifestations of the project. Alongside the fundamental information of the project—such as the mission, the team and board members, and the history of the library—the website hosts the collection's catalogue, which is constantly updated through the process of classification and indexing of donations. The front and back cover, as well as a spread of every object of the collection are also photographed and uploaded to the site, supported by essential data such as material typology, location of production, names of practitioners and date of publishing. This process aligns with the investigation conducted by fashion scholar and curator Marta Franceschini in her 2019 paper "Navigating fashion: On the role of digital fashion archives in the preservation, classification and dissemination of fashion heritage." In the contribution, the author stresses that, when digitalized, the materiality of the fashion object is lost and is replaced instead by its data.

> "Digitizing museum objects means reproducing them as a set of information that defines them. Information can be easily isolated, perhaps shaping research paths and establishing commonalities that different objects may, or may not, have." (Franceschini, 2019, p.72)

A point that Franceschini makes in her contribution is that the data stored in digital archives can offer "the opportunity for researchers and enthusiasts to widen their knowledge and wander into an incredible number of items from different disciplines," (Franceschini, 2019, p.72) especially through the implementation of thematic pathways or curated selections of materials that gather seemingly unrelated objects under shared data. In the case of the ILFR, this is achieved on the website through the aforementioned sets of information—Brand, Publisher, Year, Location, Language, Material, Category, Practitioners, Collection—that can be filled and accessed transversally for each object. The library's site also offers a series of curated pathways, such as the Homage to Donors series—which gathers the materials of a specific donation—, selections compiled by guest practitioners, groupings of the objects displayed in in-house exhibitions, and general thematic collections on designers, art directors or photographers. These thematic compositions offer additional object-led tracks, inspiring the act of 'wandering' throughout the digital platform and the subsequent trespassing of the same data sets that define each object. In this sense, the library's website acts as a liminal terrain of dialogue between the physical boundaries of the objects and the openness of their metadata. Especially for what concerns the curating the digital space, the processes implemented by ILFR seem to tackle the theories introduced by professor Yrjö Engeström, which pinpoint in the object the node of interpersonal communication, unveiling new perspectives on the digital ramifications of such shared relations and shifting them from the canonical 'object' of fashion—the clothing or textiles—to other objects such as printed matter and their digital doppelgängers.

The Instagram page of ILFR, @fashionresearchlibrary, is also an interesting incarnation of the liminal properties of the project. In particular, the digital debut of the project—a post of the animated acronym ILFR—encapsulates the identity and essence of the whole project. The name itself name of "International Library of Fashion Research represents an incredibly broad definition that opens to multiple interpretations," (Trame, p. 130) observes Trame in her research. The name in fact implies and suggests the natural state if in-between-ness of the project, which stems from a collection originally based in the United States, but which is now hosted in Oslo and is fueled by a network of international and multidisciplinary practitioners. The Library's collection grows steadily as is the repository of world-wide donations. Antecedent to the physical space of the library, the digital tentacles of the project can therefore be interpreted as its visual manifesto, informing and subsequently representing the physicality of the space (Fig. 3 & 4).

3.3 Between Location, Site, Place and Metaspace

Even if the site for the library had been allocated by NAM in 2020 and its digital iterations had been up and running since 2021, the library officially opened its doors only on 29th November 2022, occupying the mezzanine and top floor of Stasjonsmesterboligen. For an analysis of the physical space of the library, it is crucial to apply the definitions of 'location,' 'site,' 'place,' and 'metaspace,' theorized and contextualized to the realm of fashion by professor and architect Vésma Kontere McQuillan, which in fall 2021 was also appointed as Head of Spatial Design of ILFR. In the volume *Fashion Spaces: A Theoretical View* (2020), the author addresses in fact these definitions from a theoretical and fashion-focused perspective. Through these concepts, I argue it is possible to unpack the decentralist stance and the liminal posture of the physical library.

The location of the library would be its "coordinates of a real-worlds geographic position," (McQuillan, 2020, p.22) therefore its position in the urban landscape of Oslo and outside of the canonical European fashion epicenters. The site is instead the Stasjonsmesterboligen building, an ex-train station which is now part of NAM. Defined as "both the context for the object to be designed, and also the design of that object," (McQuillan, 2020, p. 24) I claim that the site could also be interpreted as the context for fashion printed matter, collecting and ultimately fashion research. Finally, the place can be defined as the ultimate thresholding status of the library, as it embodies the proximity to the NAM's archive and library and the fact itself of being hosted by a cultural institution—a feature that plays a central role in influencing continuous responses and dialogues between the collections of both the ILFR and the museum. This fluid relationship is also fed by shared experiences, such as the Fashion Research Symposium, a conference and cultural gathering organized by ILFR and hosted in the NAM's conference rooms every year in September since 2022. The first edition of the symposium was fittingly centered on the topic of *Decentralizing Fashion* (2022).

This brief introduction to the physical features of ILFR highlight even more the in-between-ness of this institution, which finds itself between the borders and boundaries of fashion geographies, cultural landscapes and institutional collections. Moreover, the concept of 'metaspace' becomes relevant to this analysis as it had played an instrumental role in the design process of the library's physical space. Inspired by cultural theorist Alicia Kühl, who defines the metaspace as an "imagined space," one which "cannot be localized, as it is abstract," (McQuillan, 2020, p. 25) McQuillan pinpoints fashion's current metaspaces in the digital realm. This concept was therefore crucial for the design process of ILFR, as at that point the only manifestation of the project was solely digital. Through an act of translation, McQuillan and her students of the Brandscapes courses she holds at Kristiania University of Oslo created the interior design of the library effectively blurring the boundaries between its site, place, location and metaspace (Fig. 5 & 6).

3.4 A Mediatic Collection

Focused on fashion printed matter and ephemera, the composition of ILFR's collection is undoubtedly a fundamental interpretative key to disclose other liminal qualities of the institution. In By Olsen's words, the library "aims to mediate the gap between the academic world and the spectators of fashion" by fostering objects which are "framed around the whole system of mediation and communication of fashion." (Trame, 2021, p. 125) If fashion communication and promotion are fundamentally mediational disciplines of the fashion system, occupying the interstices between clothing and its cultural impact, designers and their buyers, crafts and their visual manifestations; then the objects resulting from this process can be considered inherently liminal.

Thus, magazines, lookbooks, exhibition catalogues, fanzines and publications of all sorts can be seen as highly relational materials, establishing thresholds between the players and spectators of the fashion's industry, system and culture. As mentioned, the library finds itself in constant conversation with the

external world of fashion, endlessly updating its collection to host the products of these mediational dialogues. The collection therefore seems to resonate with the interests of design director of ILFR and multidisciplinary designer Morteza Vaseghi, who pinpoints his focus on "everything that comes before and after clothes" (Vaseghi, 2023) offering an effective definition of the liminal features of fashion research, repositioning again the gaze of the researcher towards non-textile-based objects.

Introduced previously, the concept itself of ephemera is also deeply rooted in a state of in-between-ness. In the words of fashion scholar and Director of the MA Fashion Studies at Parsons Paris Marco Pecorari, who dedicated its Doctoral thesis and subsequent book *Fashion Remains: Rethinking Ephemera in the Archive* (2020) to the phenomenology and ontology of ephemera within the context of fashion museums and repositories, this term describes "flimsy, printed artefacts produced not intended to survive beyond their initial purpose," namely, in fashion, "fashion plates, commercial receipts, invitations, fanzines, commercial photographs, gadgets, catalogues, posters and much more" (Pecorari, 2020, p.4). Living in a paradoxical state of subversion of their temporality and value, ephemera are in a way the incarnation of a threshold between their original function and their current place within a collection (Fig. 7 & 8).

An interesting and extremely rare example of the role of ephemera within ILFR is the case of calendars, usually created by brands as New-Year's gifts for clients. A calendar, of course, expires the 31st of December of that specific year. But what happens when time passes, and the current year shares the same weeks and dates of a previous calendar? This is what happened for instance with the 16th issue of the experimental fashion publication VISIONAIRE, which took the form of a calendar of the year 1996. Sharing 1996 and 2024 the same dates, that issue of VISIONAIRE could be reactivated as a functioning calendar for the library guests and team. Sometimes, then, the ILFR also becomes a space of liminality for ephemera and publications, in a limbo between intermittent reenactments of their original purpose.

3.5 An “Indisciplinary” Team

The last feature of ILFR I intend to analyze to unveil the liminal properties of the institution, is its team and board members. The board is constituted by 24 members from different nationalities and backgrounds, a compound of expertise and knowledge that includes art critics and creative consultants, publishers and editors, curators and entrepreneurs, designers and photographers, professors, and graphic designers, as well as some of the most prominent figures of the fashion landscape. Moreover, the network of the library expands beyond the board into the Director’s Circle, a web of some of the leading names of the fashion’s system, industry and academia which actively participate in the growth and evolution of the project. Cross-generational, decentralized, inclusive, hybrid and global, the ILFR’s network tackles all aspects of fashion, celebrating its interstices, layerings, and margins.

Finally, I argue that the portrait of the fashion researcher sketched beforehand, characterized by transgressive approach to research and an anti-heirarchical scouting of sources, can be effectively associated with that of the team members of ILFR. Originating from disparate backgrounds and bringing each a specific expertise on fashion, the collective fuels the space of vivacious interpretations of fashion printed matter and its cultural and practical implications. Aforementioned Elise By Olsen, founder of ILFR, is an editor and curator; Else Skålvoll Thorenfeldt, co-founder and head of communications of ILFR, which is a former member of the original team at Maison Martin Margiela; Morteza Vaseghi, director of design of ILFR and multidisciplinary designer; Vésma Kontere McQuillan, head of spatial design of ILFR and architect and interior designer; and Ilaria Trame, head librarian of ILFR who is also a fashion researcher and scholar. Ultimately, one could define the ILFR (Fig. 9) as a co-design-driven project led by the collective work of various fashion practitioners, which paradoxically are often seen as ancillary figures (or the subject matter) to the field of fashion research, and less as its key agents and promoters.

4. Conclusions

This paper defined Fashion Studies as an inherently decentralized and liminal discipline, characterized by a state of in-between-ness and 'entre-deux'. Then, it made use of the definition of liminality and thresholding to investigate the spatial qualities of the practice of fashion research and that of the space in which it is conducted: the fashion library. These theoretical premises found their application in the case study of International Library of Fashion Research, whose spatial, conceptual and constituent properties express the fundamentally intermediary, interstitial and transgressive nature of the project. In conclusion, ILFR can be identified as inherently center-less, capillary and in-becoming, and therefore the ideal site-of-passage for fashion research.

KEYWORDS | DIGITAL DESIGN HISTORY, INTERFACE DESIGN, WORLD WIDE WEB, ITALY

ABSTRACT | When we think of the third industrial revolution, namely the digital one, we have Silicon Valley in mind. The southern area of the San Francisco Bay is where, back in 1969, Stanford University launched the ARPANET, the first seed of the Internet revolution, and many of the pioneering and contemporary companies driving the digital turn, as well as most of the innovation in the field comes from California. Nevertheless, the WWW backbone and the globalisation brought up by the Internet have declined in the different regions according to a glocal perspective, creating a relationship between the centre and the peripheries that should be critically investigated.

Although in a borderline position, Italy was among the "early adopters" thanks to a technological infrastructure that created favourable conditions to establish a context for the flourishing of website design communities of practitioners and experimentation in the field. Besides, some of the Italian protagonists of the 90s and early 2000s gained visibility on the international scene and established original trends in the Italian community.

The paper proposes, drafts, and discusses a possible Italian historiography of the last 30 years, treating web interface design as a contemporary digital artefact at the crossroads of transdisciplinary approaches: graphic design, computer science, and Human-Computer Interaction. In doing that, it also faces aspects of research in the fields of contemporary design history able to propose different perspectives and trace down different stories compared to the "official" mythology of the Information Age. The historical approach, in fact, questions the relationship between global and local actors, decolonising the "vulgate" in order to include decentralised experiences enriching with points of view a complex, articulated, interconnected, but not monolithic evolutionary process as narrated so far.

1. Centre and Peripheries: Different Perspectives

It has been thirty years since the web protocol created by Berners-Lee was made available royalty-free and led to the birth of the World Wide Web as a (future) mass medium that we are all familiar with today. Although in a peripheral position, Italy was among the "early adopters" of the digital revolution thanks to a strong infrastructure innovation creating favourable conditions to establish a technological context for the flourishing of websites as communication artefacts and an intriguing experimental field of design. Besides, some of the Italian protagonists in the 90s and early 2000s gained visibility on the international scene. It is helpful to name some of them, such as Mirko Pasqualini, an Italian 'enfant-prodige' of web design based in New York and co-founder of WXO, who tragically passed away in 2020; Luigi De Aloisio, currently working on the 'nostatic' explorations; Simone Legno, mentioned in New Masters of Flash (Baumann et al., 2003); SuperTotto.com aka Totto Renna. In the late 1990s and early 2000s, several local community events and awards also created leadership in terms of languages and approaches intimately connected with the rest of the Italian design scene.

More recently, others have set specific trends in the Italian digital design community, such as Claudia Molinari, internationally awarded narrative-game designer of the duo WeAreMüesli.

By opening the perspective to experimentation beyond the bi-dimensionality of a display, Studio Azzurro and its intellectual offspring represented a turning point towards a more transversal way of conceiving and conceptualising communication and experience projects mediated, enabled or augmented by digital technologies. If, in the latter case, the architectural and exhibition scale, as well as the intellectual presence of the late Paolo Rosa (Balzola & Rosa, 2019), have made it possible to trace these design experiences in a structured manner, vice versa in the case of what has populated the web and the digital world over the past 30 years, it hardly leaves footprints and traceable paths. Therefore, reconstructing and telling a coherent, documented and articulated story of ephemeral, emerging and complex phenomena seems to be the real challenge in terms of methods rather than content.

The historiographical issue becomes all the more necessary and urgent for those phenomena that belong to the contemporaneity and to contexts that are eccentric with respect to the disciplinary centre of innovation and experimentation in terms of geographical and cultural spaces.

It is indeed paradoxical that a global phenomenon such as the advent of the World Wide Web, in terms of its revolutionary scope and planetary pervasiveness, should be perceived in terms of approaches, models, aesthetics and stylistic features as a single, unifying and unified corpus. The role played by the big players in the digital information market, the "four horsemen of the [digital] apocalypse" (Galloway, 2015) is undeniably homologating, as in the case, for example, of the aesthetics of Apple's products and interfaces or the design system (material design) of Google/Android, which impose patterns and guidelines that are universally received and adopted, just to name two of the leaders in the hardware/software/cloud/service sector.

Even within equally international phenomena, in fact, as in the case of rationalism and modernist architecture, it was possible to identify local schools, currents, interpretations, as in the case of the Bauhaus or Scandinavian interpretation or individual personalities active between and after the two world wars. This was also the case in the field of visual communication and graphic design, where the variations of the Swiss style or of the so-called 'Milanese School' or, within the same tradition, the more recent Dutch "wave", have been contrasted with a modern language, it seems more difficult to define as many variations, paths and personalities in the field of digital design.

The relationship between the epicentre of emerging phenomena and the successive waves that spread from it to more distant territories often defines a leadership role and a subordinate terrain. If this progression is particularly visible in certain historical processes, the time lag becomes the space for mediation with local material culture, taste and aesthetics or for original elaboration.

In their emergence and evolution, innovations often transcend the context and purpose for which they were conceived to spill over into other domains and respond to other needs implicit in the social fabric. However, this dynamic relationship moves asynchronously. Technology dictates the rules by making itself accepted, indeed often becoming indispensable (Bucchi, 2020).

However, recent and contemporary phenomena, such as the electronic and then digital revolution, show a rapidity in which these different planes collapse. The web has become a worldwide mass communication platform in less than a decade. Although it is a polycentric phenomenon that sees the American way (first the military and then the Silicon Valley) and the European communities (from the academic-scientific spheres to the open source model) converge, the Bay Area soon takes over thanks to the concentration of entrepreneurial realities that manage to ride the "momentum" in commercial terms gaining the leadership. The United States, specifically California, formulates the rules governing innovation and design processes in political, financial and commercial terms. These are rules to which the rest of the world has inevitably adhered because of the monopolies that have been created, i.e., the dominant role of platforms such as Amazon or Meta or software such as Adobe or Microsoft. As Gui Bonsiepe (1993) already pointed out,

> "the imbalance in international trade relations [...] may represent a type of power that should supersede traditional forms of 'making history'. [...] without lapsing into the idea that the industrial design of the periphery is merely a belated and shoddy repetition of the process through which the industrialised countries have gone through in the last ninety years when the d.i. was transformed into a social reality." (Bonsiepe, 1993, pp.78-79)

In particular, in some of the essays dating from 1987, Bonsiepe analyses and discusses the ambiguity of this relationship in industrial design in the broadest sense, but especially in the transition to the electronic and then digital world in which design itself becomes an interface and interpretative model of asymmetrical social, economic and political relations. Among the themes that emerge as characterising this relationship between centre and periphery, Bonsiepe identifies the question of autonomy and a partially hetero-directed development of the processes of adoption and acquisition of innovation and its languages with respect to internal capacities, i.e. the production of a "material" culture with its own identity with respect to the external culture and the world trade scene.

At the basis of these processes, design didactics, not only professional practice or critical-academic reflection, play a significant role, especially in a tradition of teaching design culture still deeply rooted in the unifying lesson of the Bauhaus first and the Hochschule für Gestaltung in Ulm later. In the former case, the reference is to the model of basic design, the Grundkurs and the philosophical, conceptual and language-based founding elements of rationalism and modernity, and in the latter to the interdisciplinary approach of the post-World War II period, which is on the way to the crisis of this 'fideistic' vision of the rational and progressive and to the post-whatever. The shift from industrial design to a society of image (Sinclair, 1988) and communication (McLuhan, 1989) and web 2.0 and social platforms (DiNucci, 1999) that dematerialises production and fruition processes and practices in favour of a continuous flux – infinite, like the scroll of social media walls – further collapses and flattens identities, aesthetics and languages on the epi-centres.

2. Mapping the Italian Scenario: for a Research Methodology

The research project presented is in its preliminary phase. It deals with the research of recent history in the field of web design, i.e. that part of digital design predominantly oriented towards interface design of interactive artefacts and websites between 1993 and 2023.

The project has been divided into several concentric waves covering different sources to map and create a puzzle of fragments able to recreate a bigger picture of the phenomenon investigated, the last 30 years of (Italian) web design history.

1) The first of the five planned waves aims to explore and scan printed documentation – i.e. a) theory and statement books; b) edited books and curated projects' catalogues; c) journals and professional magazines; d) indexes and annuals; and e) publishers, which we could call the "cold" sources (for a more in-depth discussion on "cold" and "hot" sources compare Gunetti, 2017). Documents that can reflect crystallised knowledge or image of a specific period often limited and partial but stable and fixed.
Even if working with analog materials, it seems counter-intuitive when it comes to the history of digital design. However, these primary sources show us a precise picture of a given period. Their potential is also their limit: much of the information presented is not valid anymore (URLs of websites, emails and other references), making it very difficult to trace back presences, styles, and phenomena though presented and secured in time.

The first recognition, partially presented but discussed in this paper, maps the aforementioned categories of direct sources.

2) The second wave, on the other hand, explores digital references as primary documentation, e.g. a) websites; b) the Internet Archive; and c) directories, databases and repositories. We can label those "hot" sources because they are still evolving and producing entropic energy and dissipation. Accessing URLs, in fact, often implies finding new versions of a website, updated information and news, partially or completely shadowing and erasing previous releases (Bollini & Guida, 2022; Bollini & Guida, 2023)

3) Moving from the more stable to the living sources, the scope of the third wave is to explore oral documentation and first-hand memories, for instance, thanks to oral stories, interviews, personal archives and so on. This wave embraces the micro-historical approach (Ginzburg, 2023; Parikka, 2011) in order to gather documents, traces, and glimpses from the protagonists, fixing the memories in possible further sources documenting the past in the future, scraping and digging archive primary and secondary sources, preserving existing and otherwise perishable testimonies and legacies. It is also the context in which historical research tools, methods and practices face the need to rethink the idea of documentation, access and sources.

4) The fourth one investigates live documentation, i.e. a) awards such as the Bardi Web Award, Italian Web Award, DonnaèWeb, AWDA (the AIAP Women in Design Award) and/or awards with a digital section like Media Key Awards, already partially mapped, presented and discussed in this essay; b) associations' activities, community meetings as in the case of Architecta, Web Master Italia, International Web Association (IWA) Italy, the Italian Association of Visual Communication Design (AIAP), AccentiRosa, the Ux Book Club, Ux/UI Designer Italia; c) professional conferences and events, for instance: the Kerning Conference, ePublisign Rimini, Webbit, Ux Book Clubs, Italian Information Architecture Summit, WUD (World Usability Days), WIAD (World Information Architecture Days), Pane, Web & Salame, Accessibility Days, that is periodical as well as 'una tantum' events; and d) more ephemeral experiences often taking place thanks to people gathering together. In this case, we can include several categories and sub-events.

5) Finally, the last wave is mainly focused on digital design education, i.e. mapping the a) Universities, private schools and academies, and courses teaching web/UX/UI design; b) the profile of professors and lecturers, their academic background and scientific sectors; c) the disciplinary areas of Bachelor and Major Degrees and of the courses.

The research approaches the investigation by adopting complementary and convergent strategies. The common ground of the first wave has been to map through "cold" sources the existing printed documentation about the last 30 years of web design, namely digital, interface, experience design and information architecture.

In order to do that, the publishers specialised in the digital technologies, design and user research disciplines have been listed, and the catalogues analysed.

Reilly, New Riders, Peachpit Press, A Book Apart, Rosenfeld Media, and Friends Of have been catalogued on

the international scene. The following have been considered significant at a national level: Hops Libri, Tecniche Nuove, Hoepli, Pearsons, and Apogeo, together with Happy Books and Logos. Other players such as A Book Apart, Peachpit Press, O'Reilly, Rosenfeld Media, Taschen, Rockport, AVA, and Pepin Press, for instance, have been included as significant references, although not expressly specialists in the field but covering the project's culture macro-area (architecture, product/industrial design, graphic design, illustration and so on).

If the publisher and consequently the monographs or edited books, catalogues, annuals and indexes have been considered at the international level because of the presence of Italian protagonists in the World Wide Web scene, in the case of journals and magazines, the spectrum has been restricted to the national one. In particular, LineaGrafica e Progetto Grafico, i.e. two communication/visual/graphic design periodicals linked to the academic scenario and professional magazines such as Internet News, Neural, Wired Italia, and Jump.

Looking at the Italian scenario, it is possible to trace down a local historiography of the last 30 years when treating web (interface) design as a contemporary digital artefact at the crossroads of transdisciplinary approaches between communication and graphic design, computer science and Human-Computer Interaction. Doing that also means facing aspects of research in the fields of contemporary design history. It questions from a methodological perspective the difficulties in researching digital sources in an ongoing environment and proposes a systematisation and critical mapping derived from the analysis of publications, curated books, international indexes and annuals published between the mid-90s and the 2010s, scientific journals and digital archives and repositories. Furthermore, it aims to discuss the consequences of switching from the canonical approach to historical research – based on archives, primary sources and documentation mainly in the form of written, printed, and sketched materials – to digitised, digitalised or digital-native sources. For their very nature, the latest ones appear to be subject to obsolescence, manipulation and disappearance, forcing researchers to interpret and write design history based on non-traditional sources and approaches.

Another issue to discuss is the supposed peripheral role of Italy in the evolution of digital visual languages and its participation in the international scene. In communication design, the presence of Italian designers in the global discussion and discipline advancements is underestimated. The research project aims to establish the dignity of some protagonists to be mentioned in the still-to-be-written histories of digital design.

3. Italian Historiography: A Tentative Summary

"By the end of 1993, there were still fewer than 650 websites online" (Ford & Wiedemann, 2019, p. 22). One of the first was Italian: the CRS4, a research centre based in Cagliari (Sardinia) and effectively an extension of CERN. Its website was published in August 1993. The opportunity came from a late 1992 meeting that Maurizio Davini, from the University of Pisa, had with Berners-Lee, who shared a copy of the source code of the web (UniPiNews, 2023). The CRS4 Research Centre was directed in a couple of periods by Nobel Physician Carlo Rubbia: first in 1990-1999 and then in 2003-2006.

In its history, CRS4 has distinguished itself for some milestones related to the development and dissemination of the Internet, not only in Italy: as already mentioned, it created the first Italian website in 1993 (www.crs4.it), contributed to the creation of the first European web-based newspaper in March 1994 (L'Unione Sarda) (Bettini, 2006), and to one of the first Internet Service Providers (Video On Line, December 1994). These milestones also suggest that in the early 1990s, there was a growing need for technicians and designers not only of protocols but also of the first interfaces.

Figure 1. a) “Il progetto delle interfacce” book cover, 1993; b) “Web Design in Italy 01” book cover, 2004; c) LineaGrafica, n. 299, 1995.

3.1 Theory and Manuals

In 1993, Giovanni Anceschi, the most important Italian theorist in the fields of graphic and communication design at the time, published “Il Progetto delle interfacce” (Interfaces Design) (Figure 1a). At that time, he was the scientific coordinator of the Special Course in “Interface Design: Interactive Communication Design” at Domus Academy in Milan. In his seminal volume, Anceschi defines the roles and competencies of the interface designer, consciously not confined to the fields of the then-emerging web design.

In particular, in the essay “The Domain of Interaction. Protheses and Anaphora for Interface Design”, Anceschi (1993, pp. 9-41) discusses the disciplinary approaches to interface design, dividing them into theoretical, analytical and descriptive, on the one hand, and pragmatic operational disciplines on the other. He opened the perspective of a transdisciplinary approach to digital design, including ergonomics and cognitive psychology, information theory, and theories of notation and graphic notation, to name but a few. The book itself represents the variety of disciplinary contributions thanks to the participation of authors – scholars, practitioners and researchers – such as Daniele Marini (professor in the Information Science department at the University of Milan and founder of the Eidomatic Laboratory), Sebastiano Bagnara (full professor in ergonomics and psychology at the University of Siena), Marco Susani (an architect who has been collaborating with Olivetti and Sottsass Associati), Roberto Polillo (founder of the company Etnoteam, specialised in software engineering, author of several publications in the field of usability and design and then professor of Computer Science), Gui Bonsiepe, previously mentioned, and Stefana Broadbent (research fellow at the Centre de Recherche en Epistémologie Appliquée de l’Ecole Polytechnique in Paris). The list demonstrates the variety of contributions converging in interface design and interaction.

In 2006, Anceschi will also edit, with Massimo Botta and Maria Amata Garito, the book “L’ambiente dell’apprendimento. Web Design e processi cognitivi” (The Learning Environment. Web Design and Cognitive Processes). The collective volume provides an insight into the experience of one of the first Master’s courses delivered online in Web Design, which proposed a cross-disciplinary approach based on the expertise and experience of academics and professionals. Some of the authors were the above-mentioned Roberto Polillo and Daniele Marini. With them, Anceschi involved Giovanni Lussu (one of the most relevant theorists in graphic design), Carlo Branzaglia (theorist and teacher), Dina Riccò who wrote: “Sinestesie per il design” (1999) (associate professor at Politecnico di Milano), Letizia Bollini (2004), Maurizio Gnot (at that time at Politecnico di Milano), and others.

Among the various contributions, Anceschi specifies in his introductory essay that the book was conceived mainly by designers. Asserting a fundamental role for designers, in terms of skills and sensitivity, in the project of web interfaces. He proposed a map organising the knowledge of web design and then the figure of the web designer (Anceschi, 2006, pp. 29–39). He organised the knowledge map into two main layers: Methodologies and Artefacts. The design methodologies are articulated in 'instances' (indispensable operations: data collection, analysis, solution research and development, executive design, ...), 'notation systems' (all those methods useful for representing the new objects of the web, which are kinetic and temporal objects), and 'semi-finished products' (i.e., the elements that will constitute the website: typographic text, images, icons, ...).

The second layer, the one of the Artefacts, is divided into two main categories: Tool Sites (those websites that allow for concrete activities) and Database Sites (websites that allow access to a variety of sources of information). This synthesis is useful to support one of the hypotheses of the present research. Namely, the contributions of Italian design culture fully deserve reappraisal at a level that is not solely local. Indeed, some of these references have contributed to the institutionalisation of Communication Design disciplines and the training of digital design professionals.

3.2 Magazines: LineaGrafica

In the early 90s in Italy, only a few magazines were dedicated to graphic design. Alongside them, the Italian publishing market offered various opportunities such as publications, some of which were more oriented towards the technical and design aspects of the web, e.g. Internet News, Wired Italia, and others towards artistic developments and the search for new aesthetics and language, like Neural.

LineaGrafica, founded in 1946, was the main one specifically dedicated to graphic and communication design in all its aspects, reserving its pages to theory and technical aspects and showing case studies. Giovanni Baule (already a full professor at Politecnico di Milano) directed it from 1980 until it ended in 2007. The magazine published during the 80s some articles on digital arts, movie design, and computer arts, and it was an obvious consequence of giving exposure to the first interesting cases of web interface design in the early 90s. It is of some interest that one of the first editorials dedicated to the Digital Revolution was published in 1993, and it was a sort of warning about the changes that it was bringing in the professional world:

> "The computer revolution has already changed the manner in which printed graphic artefacts are produced and is beginning to create its own where electronic graphics are inside the writing and reading mechanism itself. The extension of the graphic design project from desktop publishing to all forms of electronic media brings into question the already debatable confines of an area that had precise limits within the typographical sector but one that was able to extend its vision beyond the world.
>
> The fact that a profound transformation is already taking place is evident. An unequivocal disorientation has hit the culture of graphic design [...]. It is necessary to renew, as soon as possible, the awareness of historical background, capable, as always, of articulate direction, new forms, intelligent products and balanced formal solutions." (Baule, 1993a)

In essence, with his words, Baule emphasises the need for a culture of design and its centrality. It should be noted that just a few years earlier, in 1989, Baule, Anceschi and Torri drafted the "Carta del Progetto Grafico" (Charter of Graphic Design). This was a sort of manifesto in which the centrality of communication design in contemporary systems was advocated (Baule, 2015).

In one of the subsequent issues of the magazine, he identifies an initial response regarding the role of the visual communication designer and its needs:

> "Faced with these new technologies, graphic design finds itself less "armed" with a design theory and guide-less. [...] However, if graphic design is also able to propose itself as a construction of the new media, where each writing and compositional operation of the "new page-settings" can be relocated, where the graphical form of the interaction is invented, it will then discover a precise task. One that will also involve the design of new systems, typologies and formats. One that will encourage, as a first act, a move towards the verification of traditional methods." (Baule, 1993b)

It is of particular interest to revisit some of these editorials that, on one hand, accompany the developments of the web and, more broadly, the digital domains and, on the other hand, those of the profession. Especially how, particularly in Italy, professionals were adapting to them. The editorial titled "Routes", from 1995 (Figure 1c), is probably more optimistic in tone as it begins to clarify the tasks of the graphic designer:

> "The communication visual project has always been designed as a way to accompany and take in hand the message receiver. If we consider graphic design [...] [as] a general project of information system, indicating different routes, even the most complicated.
> This continuous project of route tracing, map drawing and verifications is applied in various fields. [...]
>
> In the net of the hypertexts or, more generally, in the digital systems of writings, graphic design is not any different: controls – cursors and buttons – although metaphorically illustrated as electromechanical, are actually symbols, writings, operative signs: all graphic systems for active directions.
>
> In a virtual library, the system connecting the texts, which can be immediately consulted, is organised on a communicative level. Today, interconnected computer systems are metaphorically called the information superhighway because they are true international communication routes, the faster they advance and broaden through new links and nodes, the more they need adequate sign systems, maps and faster ways to identify directions." (Baule, 1995)

In essence, within the Italian disciplinary literature, there was a need to emphasise the role of the graphic designer on one hand and to build a more solid and updated theoretical foundation on the other. Baule's reflections and considerations indeed find a perfect counterpart in the publication of the first reference texts from a theoretical perspective, as mentioned in the previous paragraph. Also, the first repertories with collections of case studies emerged, which were useful for mapping and monitoring production.

3.3 Repertories: The First Collections of Case Studies

"NewMedia Italian Design" (Bergamini, 1997) was the first book that aimed to give an overview of the production of websites and multimedia products in Italy, as affirmed by Anceschi (in Bergamini, 1997, pp. 8-9). The first impression was that online and offline digital production in Italy was at the international level. Referring to the evolution of web design and to the role of the visual designer, Anceschi states:

> "Perhaps the most pioneering phase is coming to an end when there is already a lot to do. Now begins the phase of focusing on how to do it. [...] we are perhaps moving from a phase of technical naivety to a phase of rhetorical awareness or rather [...] direction. So it once again claims for the designer the ability to govern the limits and potential of hardware and software and to know how to exploit them in the function of an effective and efficient visual translation. [...] the designer, the web-designer, must know how to be a designer of the invisible, or rather of hypostructures, i.e. info-designer and service-designer, but must also be a designer of the visible, i.e. of the graphosphere, and of the video-sphere [...], i.e. graphic- and visual-designer. He must be a logistical planner, a director and choreographer of interaction, but also a tactician and strategist of communication."

Commenting on the collected case studies in the book, Anceschi defines Italy's pioneering web production as free-range in its adaptation to the hard constraints of technology and what Daniele Marini called eidomatic friction, i.e. the excessive number of clicks needed to reach a destination. He also notes how the phenomenon of website production has already taken on a sociological dimension by involving all spheres of life on the web. The book thus provides an important overview of the sectors and realities active at the time.

It is also to note that in the same year, in September 1997, the first website of the Presidency of the Council was presented to the public for the first time. It was the first online presence of the Italian government. It was configured as the typical showcase site, with the images mounted on the classic grey background of the early days of HTML. It is a bit poor, considering that in 1998, Macromedia Flash went mainstream, but it certainly testifies to how the presence of institutions on the web would have constituted another area of application (Ruggeri & Sinni, 2022).

In 2004, another collection of case studies was published: "Web Design in Italy 01" (Galli & Nannini, 2004) (Figure 1b). The intention was to introduce the first book series specifically dedicated to web design in Italy. The initiative was launched through a call on the web magazine yo-yoll.net, which was dedicated to graphic design initiatives and news.

Although the project did not continue, it also represents an interesting case for some of the considerations that the curators report in the introductory text. One initial issue emerged, linked to the transience of the web and the need to document its transformations:

It might apparently seem a contradiction to presenting websites in print, therefore, losing those multimedia and non-linear characteristics offered in websites. When this book is published, several of the websites will have already undergone modifications or will be restyling. This is why paper allows for the permanency of the projects involved, which would, on the other hand, become lost.

In offering a useful instrument of consultation and inspiration for those who worked in this field, it collected websites created on assignment:

> "[...] which affront problems related to communications and positioning, usability and accessibility, supported by an overall project of great dimensions.
>
> From the beginning, the idea was not only to present several frames taken from the web but to, above all, highlight the planning elements that define each specific website.
>
> The creators of the website selected were asked for information regarding the project and the material used, which led to their final creation. Reading through this volume, one can find work drafts, logos, flow charts, photos, and illustrations so that it seems more similar to a book on graphics than a simple home page catalogue.
>
> The presentation structure of the websites, along with the URL and the frames copied from the web, provide several notes relating to the project, information on the author and on the structure that followed the planning and programming stages, and, if available, iconographic project material. At the end of each page, a summary was added that lists the technology and software used, excluding the obvious." (Galli & Nannini, 2004, p.5)

So, there was a clear intention to present at least some case studies in a documented manner, complete with the process or information that could account for the 'instances' and 'notation systems' adopted. The selection of case studies was based on four evaluative parameters: 1) graphic design; 2) Contents and communication capability; 3) Usability and navigability; 4) Accessibility (this parameter was only applied to Public Administration websites or to those with public interest).

The two editors conclude their introduction, affirming that, a few years after the publication of the first repertoire (Bergamini, 1997), “the web has definitely left behind the pioneering phase ever more to become an instrument of daily use for those who work or require information, using the world wide web” (Galli & Nannini, 2004, p. 5).

3.4 Awards

Awards are possibly another source, although most of them disappeared over time, and nowadays, it is difficult to reconstruct the rankings, being most of them promoted online starting from the early 2000s. The only exceptions are the Compasso d’Oro and the EDAwards (the European Design Awards).

Established in 1954 and promoted by ADI, the Italian Industrial Design Association, the Compasso d’Oro is renowned as Italy’s oldest and most prestigious design award. Over sixty years, the award has recognised more than 350 projects, with nearly two thousand receiving Honorable Mention archived in the Historical Collection, established in 2001. The award selection process involves a pre-selection conducted by ADI’s Permanent Design Observatory and then published in the ADI Design Index yearbooks. Starting from the 2007 edition, all selected projects have been collected online and are free to access. As in the EDAwards case, all awarded projects among the various categories are published online.
Among the awards specifically dedicated to web design and related activities, it is necessary to briefly mention the Premio Web Italia (PWI), which ran from 2002 until 2012 and expanded to encompass all digital products, including apps, games, and social media channels. In addition to the Best Project of the Year category, awards were also given for Professional of the Year and Web Agency of the Year. Another referenced award was the Bardi Web Award, run from 2000 until 2008.

Of the main mentioned Italian awards, none have an active website, and there are no circulating yearbooks. This makes it difficult to reconstruct the Hall of Fame and identify any individuals or organisations that have particularly distinguished themselves.

Although awards have played a significant role in the construction of a culture and community within the Italian scene, they seem to go into a crisis from a certain point onwards. Some well-established and prestigious experiences seem to fade away and then close down for good gradually, others continue if they are more grafted into the broader sphere of communication and marketing by updating, adding or renewing specific categories in the digital sphere. A number of hypotheses can be advanced in this regard. In some cases, this is a physiological conclusion due to the waning energy, commitment and presence of the original organisers and the subsequent lack of new protagonists capable of taking up this legacy and renewing it as the digital project context rapidly changes. On the other hand, the renewal of the professional world made up of new generations of digital natives for whom certain areas, practices and processes were much more taken for granted and metabolised than for previous generations who had experienced the emergence of the internet and the web.

Lastly, it can be assumed that the visibility given by collective platforms - as in the case of Behance - and by social media, the possibility of direct contact, exposure and self-promotion, has partly diminished the ‘showcase’ role originally offered by awards in the face of new dynamics and interaction between people and peers enabled by Web 2.0 onwards.

The limited presence of web design in the various award categories, particularly in the area of communication design, represents a significant change in the sector. It is partly a sign of a structural transformation of design in the digital sphere: static pages, corporate sites and customised solutions are being replaced by platforms that have standardised various processes. New blogging frameworks – e.g. WordPress or Drupal – complemented by add-ons and plug-ins offer a solution for most communication strategies and, in a serialisation context, interface design is sacrificed in favour of commercial or slightly customisable visual templates.

A second critical aspect is represented by the relationship between the traditional world of graphic design and the emerging sector of interface and digital artefact projects. The first seems to be less keen to recognise the latter as part of the same design culture mainly for the strong interdisciplinarity of the digital world and for the hybrid profiles – (user) researchers and experience designers, cognitive psychologists or computer scientists and developers – involved in the design practices.

4. Conclusions

As partially illustrated by this initial phase of research, here presented and discussed, the world of Italian web design has been extremely vibrant and diverse since its inception, at least in terms of quantitative production. The local project culture and research environment have expressed theoretical reflections and contributions, unfortunately, marginalised compared to the main trends at the international level, often due to the language gap. In fact, many of them have been published in Italian or have been translated only recently, losing the sense of originality brought by their first edition and within the then-contemporary debate. In this sense, the relationship between centre and periphery, between languages and mainstream modes of dissemination, seems to penalise original local productions in a (post)colonialist perspective, effectively weakening the broader debate or making it a solo rather than a choral one. As prosecutions of the research plan and as a possible further development of the whole project, the qualitative production needs to be reassessed in light of a more comprehensive mapping and compared with contemporary productions from other geographic areas. The critical issues and difficulties already highlighted in the preceding paragraphs are just the main ones that have emerged in the initial stages of this research. Others may arise.

Further reflection on the relationship between the centre and periphery should be made on the Italian territory and experience precisely because of the specificity that the research is bringing out. Referring above all to events, communities and awards, a specific and original distribution is, in fact, noted. The Italian panorama, in fact, as emerges from this initial mapping, is studded with polycentric and eccentric presences with respect to the large urban reference poles where most of the international web agencies or the big players in the sector are (have been) concentrated. Provincial towns, peripheral with respect to poles such as Milan or Rome, but central in their turn with respect to territories with specific productive, entrepreneurial, and cultural vocations that should be further investigated. In addition, some of the communities of practice and cultural reference have, in turn, fostered a great territorial connection between these different centres by organising events, conferences or meetings in different cities precisely to meet and contaminate local realities and contexts.

In this perspective the research highlights alternative point of view to the American West-Coast centric narrative proposed as the only possible interpretative approach to the digitalish storytelling. Besides, the exploration to be further expanded, faces the role and the contribution of women protagonists according to a decolonising (Lupton, 2021) and feminist discourse (Bollini, 2020).

In its future developments, the research intends to investigate and deepen precisely these peculiar and original aspects of the Italian experience, of an epi-centre, peripheral, but not marginal to the broader international debate.

KEYWORDS | OBELISKS, DECOLONIAL APPROACH, GLOBAL CULTURAL TRANSMISSION, COSMOPOLITAN STRUCTURES, MONUMENT DESIGN

ABSTRACT | This paper examines the global transmission of obelisks from ancient Egypt to contemporary societies, employing a decolonial approach. While existing research has primarily focused on the Western reception of obelisks, this study highlights the dynamism of obelisk traditions in East and Southeast Asia, revealing a convergence of knowledge and aesthetics between East and West. The paper incorporates case studies from urban and rural Afro-Euroasia (China, India, Southeast Asia, West Africa) to illustrate the variety of designs and meanings associated with obelisks outside the Western context. It argues that modern obelisks are cosmopolitan structures but also symbols of Westernization and sources of tension in decolonization efforts. The paper emphasizes the importance of raising awareness of the spatiotemporal context of obelisks and encourages designers to reflect on their choices in monument design. However, it acknowledges the potential perpetuation of colonial narratives in futuristic obelisk designs and questions the feasibility of achieving a decolonial obelisk. The study concludes by considering the future evolution of obelisks and the challenges of disentangling them from colonial paradigms.

1. Introduction

The study of obelisks holds a significant place within the realm of Egyptology and, occasionally, Cultural Studies, drawing attention from various disciplines including architectural history, epigraphy, political history, religious studies as well as scholars interested in the reception and cultural influence of ancient Egypt up to contemporary times. This paper seeks to bring attention to obelisks as a constant in global memorial design and as a traditional structure between archaism and futurism. Enhanced by a decolonial approach, it also aims to use the opportunity to reflect on the future of obelisk design based on its historical trajectory presented in the form of regional case studies, thereby inviting designers and other practitioners to become involved. The selected case studies showcase the Egyptian origins of the obelisk followed by a discussion of the imperial Roman and subsequent early modern European and modern Western appropriations of the concept. With the latter being arguably instrumental in the global spread of the obelisk, case studies from the global South – here China, Southeast Asia, the Indian subcontinent, and West Africa – illustrate the transformation of form and function through local adaptations. This then leads to a discussion of obelisks as cosmopolitan and politicized architecture. The case studies raise the problem of whether it is possible to disentangle the concept and design of the obelisk from its conflicted history, and whether its design can become decolonial to overcome the imperial/colonial paradigm.

Existing research on obelisks can be categorized into several focal points, each shedding light on different aspects of their history and cultural significance as outlined further below. With the exception of studies focusing on the original Egyptian obelisks, most research areas collectively fall within the broader context of Egypt's reception, encompassing various forms of cultural appropriation of obelisks spanning the past two millennia. These investigations predominantly center on reception hubs in the Western world. This geographic concentration can be attributed to the proximity of these regions to global centers of Egyptology and knowledge production (Langer and Matić, 2023, pp. 4–7), as well as to the ideological association of Egyptology with the construct of the West. Egyptology has historically played a significant role in shaping the perception of Egypt as a precursor to so-called Western civilization (Winter, 2019, pp. 60–62). Given this context, it is understandable that scholarly attention has primarily been directed towards Western receptions of obelisks. However, there is a growing recognition of the need to globalize obelisk research in order to advance theoretical understandings of these monuments (Langer, 2021).

Modern obelisks serve primarily in administrative and commemorative capacities and as mere embellishments, for instance, of bridges and squares. Administratively, they often function as waypoints and boundary markers, facilitating navigation and demarcating territorial limits. However, the more extensive and research-intensive aspect lies in their commemorative function, which can be further classified into collective and individual commemoration. Collective commemoration encompasses events of suffering and triumph, including successful wars, periods of (imperial) rule, liberation from oppression, and broader societal achievements. Meanwhile, individual commemoration occurs through burials or memorials honoring specific achievements or individuals. Notably, war cemeteries often blend collective and individual commemorative aspects, marking both victories and sacrifices on both collective and individual levels, thereby illustrating the multifaceted nature of obelisks in memorialization.

2. Obelisks Around the World Through Space and Time: Mapping and Overcoming the Rift Between Spatial Foci and Reality

This section provides a concise overview of the transmission of the obelisk from ancient Egypt to the modern global South beyond the traditional research foci of Egyptology and obelisk-related scholarship. While not exhaustive, the selected case studies provide the reader with an impression of adaptability of the obelisk depending on regional contexts.

2.1 Ancient Egypt and Rome

Obelisks, originating from ancient Egypt (Egyptian sg. *tḏn*), are narrow, four-sided tapering pillars with a pyramid-shaped top, known as the pyramidion. Initially associated with solar cults, the first obelisks were placed in Egyptian sun temples during the Old Kingdom around 2500-2400 BCE. During later periods, such as the New Kingdom in the Late Bronze Age (ca. 1550–1069 BCE), pairs of obelisks became common in Egyptian temples, often inscribed with praises of the king's power and conquests. The term obelisk itself is derived from the Greek term *ὀβελίσκος* 'little skewer', which relates only to appearance but conveys nothing about the function of obelisks. Studies focusing on original ancient Egyptian obelisks delve into various facets such as their construction history, symbolic meanings, current locations, and preservation states. Scholars like Labib Habachi (1977), Fekri Hassan (2003), and Bob Brier (2016) have contributed significantly to this area, with particular emphasis on the latter aspects.

After the Roman conquest of Egypt in 30 BCE, the Roman emperor Augustus began the practice of relocating obelisks from Egyptian sites to Rome, transforming them into symbols of imperial authority. This practice was later adopted by European powers during the Renaissance, leading to the revival of Classical architecture and thought in Western Europe, further solidifying the obelisk's association with imperial power. This line of inquiry explores the transport of obelisks to Rome, the construction of new specimens, and their embellishment with hieroglyphic inscriptions, all within the context of the ideological legitimization of Roman authority over Egypt. Roullet (1972), Curl (2005) and Sorek (2010), for instance, have explored the Roman appropriation of obelisks and other Egyptian motifs extensively. Essentially, the European appropriations of the obelisk since the Renaissance are appropriations of the earlier Roman adoption of Egyptian motifs that facilitated the integration of ancient Egypt with a European identity (Langer, 2023, p. 48). The next section introduces some results of the developments set in motion during the Renaissance.

2.2 Modern West

There is a continuum from ancient to modern obelisks, with European constructions representing a further stage in the appropriation of this architectural form. Among modern obelisks in the Western context, the Washington Monument stands as the most extensively studied and recognized. Erected in Washington D.C. between 1848 and 1884, it comemmorates George Washington, the first President of the United States. Torres (1985), Fazzini and McKercher (2003), Curran et al. (2009), and Gordon (2016) have examined its significance within the political and aesthetic landscape of the United States. Its design reflects a strong affinity with the Roman Republic, underscoring broader cultural connections.

Similarly, the Mussolini Obelisk commissioned in Fascist Italy symbolizes the regime's aspirations to revive the grandeur of the Roman Empire under Benito Mussolini's leadership. Other lesser-discussed obelisks in the western hemisphere include the Obelisk of Buenos Aires (1936) and the Trujillo Obelisk (1936) in Santo Domingo, commemorating historical events and figures. However, not all obelisks erected or planned in the West have received scholarly attention. For instance, obelisks planned in Nazi Germany and the Soviet Union represent intriguing yet understudied phenomena. In Nazi Germany, ambitious plans included obelisks in Berlin and Munich, reflecting Hitler's vision of connecting with ancient civilizations to underline dominance over contemporary powers (Langer, 2021; Spotts 2009: 21–22, 122). Soviet obelisks, on the other hand, were realized, serving as memorials to victory over fascism in World War II and as tombstones in military cemeteries (Langer, 2021). Despite their prevalence, research on Soviet obelisks remains sparse, necessitating further exploration into their cultural and ideological significance. Crucially, even within the West, research on obelisks is patchy and focuses on specific nodes, which are primarily concentrated around the North Atlantic.

Additionally, obelisks have become ubiquitous in pop culture due to Egypt's enduring influence on Western thought and Egyptomania. They feature prominently in various forms of media, including science fiction, serving as symbols of Egyptian mystique or futuristic architecture. While they are integral to studies on

Egypt's influence on pop culture, obelisks have yet to emerge as a distinct research focus independent of broader ancient Egyptian tropes.

In conclusion, the study of modern obelisks in the West offers insights into the complex intersections of politics, ideology, and cultural memory, highlighting the enduring legacy of ancient Egyptian symbolism in contemporary contexts. For a more representative picture, research should aim to broaden the scope of inquiry, encompassing obelisks beyond the Western hemisphere and examining their designs and multifaceted roles in shaping collective memory and identity. To this end, the following section shifts the perspective to cases in the global South of Afro-Eurasia: Southeast Asia, China, India, and West Africa.

2.3 Southeast Asia

In the 1940s, Thailand and Myanmar saw the construction of obelisks as national monuments, albeit with differing levels of scholarly attention. The Victory Monument in Bangkok, Thailand, has received more extensive discussion compared to the Independence Monument in Yangon, Myanmar (Wong, 2005; Noobanjang, 2011). Both monuments, however, are deeply intertwined with the political history of Southeast Asia during the 1930s and 1940s.

Thailand, known as Siam until 1939, underwent significant political transformations following the abolition of absolute monarchy in 1932, transitioning to a Western-style constitutional monarchy under Prime Minister Plaek Phibunsongkhram (Noobanjang, 2011, p. 58; Baker and Phongpaichit, 2022, pp. 128–139). Thailand's involvement in World War II was marked by territorial ambitions, aligning with Japan's regional agenda (Baker and Phongpaichit. 2022, pp. 149–152). The Victory Monument, erected in Bangkok in the spring of 1941, symbolized Thailand's perceived victory and served as a demonstration of power, echoing the urban restructuring efforts of Mussolini and Hitler. Designed by architect Pum Malakul, the monument featured a 50-meter obelisk adorned with five bayonets atop a pentagonal pedestal containing the ashes of fallen soldiers (Noobanjang, 2011, pp. 58–60). The monument represented a departure from traditional Thai values towards a modern, Western-style nation-state, encapsulating a new essence of Thai identity (Wong, 2005, p. 63; Noobanjang, 2011, pp. 61–63). In the post-war era, it became a focal point for nationalist discourse, reflecting on the trauma of colonial territorial loss and the futility of fascist expansion (Noobanjang, 2011, pp. 57, 66–68).

In contrast, Myanmar's path to independence was shaped by its colonial history under British rule. Independence movements gained momentum during World War II, leading to Myanmar's treaty-granted independence in 1948 (Charney, 2009, pp. 46–71). The Independence Monument, erected in Yangon in the same year, replaced a statue of British Queen Victoria and commemorated Myanmar's struggle for self-determination against British colonialism (Seekins, 2011, p. 83). Standing at 50 meters tall, the monument symbolized Burmese resistance and sovereignty, particularly through its association with Burmese general Maha Bandula, who fought against British expansion in the First Anglo-Burmese War (Myint-U, 2001, pp. 12–15). Thus, while the obelisks in Bangkok and Yangon both serve as national monuments, they convey starkly contrasting narratives—one of aggressive expansion and the other of anti-colonialism,

In the Philippines, the presence of at least two distinct obelisk traditions reflects the nation's intricate colonial past. From 1565 to 1898, the archipelago was under Spanish rule, during which the capital, Manila, faced occupation by British forces from 1762 to 1764. Spanish-Filipino resistance led to the establishment of two sun-crowned obelisks in Manila and Bacolor, commemorating the Spanish defence of the Philippines (Langer, 2021). Following the Spanish-American War in 1898, the United States assumed control of the Philippines, introducing a new chapter in the nation's history and further emphasizing the obelisk as a prominent monument form. Notably, the Rizal Monument was erected in Manila in 1913 in honor of Filipino writer José Rizal (Craig, 1913), who was executed as a revolutionary in 1896 (Kissling, 1916). While the reasons for selecting an obelisk remain unclear, this monument stands as a testament to Filipino nationalism and resistance against colonial oppression.

In the early 21st century, obelisks continue to serve as common monuments in the independent Philippines, often commemorating events from the colonial era. One significant example is the collective of obelisks memorializing the Bataan Death March, a tragic event during World War II. The march, which resulted in the deaths of thousands of Allied prisoners, predominantly Filipinos (Lansford, 2001), prompted the erection of approximately 100 obelisks along the march routes (Murphy, 2014, pp. 6–8). These obelisks, featuring representations of US soldiers assisting fallen Filipino comrades, were largely funded and donated by Americans, underscoring the enduring significance of the Bataan Death March in US-Philippine relations. Despite the bilateral appearance of these memorials, the dominance of American contributions suggests a prioritization of US perspectives in commemorating shared historical experiences (Langer, 2021).

2.4 China

The Chinese obelisk tradition is slightly older than those of Thailand and Myanmar, yet roughly as old as the Philippine tradition. Since the abolition of the monarchy in China and the creation of the Republic in 1912, Chinese memorial culture has revolved around so-called martyrs (烈士) monuments (usually 纪念碑 or 纪念塔; the former denoting a stone tablet, the latter a tower/pagoda) (Hung, 2008, p. 280; van de Ven, 2003, p. 100). Initially, those who died in uprisings against Qing rule were revered as revolutionary examples. Since the mid-1940s, the Communist Party of China has promoted a martyrs cult to commemorate those who died in wars against the Guomindang (GMD) and Japan. This cult, linked with the Qingming Festival, focuses on monuments, often obelisks, erected at cemeteries where war dead are buried. These monuments serve as sites for collective remembrance. By the 1990s, China had over 5,000 martyrs cemeteries and memorials (Hung, 2008, pp. 281–284, 302), though the exact number of obelisks remains unknown. Ongoing work (Xie Zilong Image Art Museum, 2023) argues that obelisks were seen as symbols of revolutions after Chinese travellers first visited Place de la Concorde in Paris with the famous obelisk of Ramesses II from Luxor. Yet little did these Chinese travellers apparently know that the obelisk came to Paris as a gift from the Egyptian ruler to the French king 40 years after the French Revolution in 1830, and that it came to stand at the site of the guillotine and revolutionary justice was mere coincidence; if anything, the obelisk at Place de la Concorde is rather a symbol of monarchy than one of bourgeois revolution.

The most important monument of the Republic of China is located in Huanghuagang Park in Guangzhou, Guangdong (Figure 1). Initially established in May 1911, following the Second Guangzhou Uprising against Qing rule, the site houses the tomb of 72 martyrs. It grew into a complex tomb structure aligned with traditional geomantic beliefs through various construction phases between 1918 and 1935. This complex became a symbol of revolutionary fervor and resilience, hosting annual rites as part of a martyrs cult (Ho, 2004, pp. 101–104). The central feature of the tomb complex is an inscribed obelisk, positioned beneath a pavilion at the cult axis center, signifying the modernization and westernization of Republican memorial culture. This integration of a Western/Egyptian architectural form into local geomancy highlights the complexity of cultural influences. Furthermore, the park contains graves of individuals seeking to benefit from the *qi* (life energy) of the 72 Martyrs Mausoleum (Ho, 2004, pp. 105–107). This interplay between secular commemoration, spiritual beliefs, and architectural symbolism underscores the multifaceted nature of memorialization in Guangzhou.

Figure 1. The obelisk atop the 72 Martyrs Mausoleum at Huanghuagang Park, Guangzhou. Source: C. Langer, April 2023.

Today, the Monument to the People's Heroes in the center of Tiananmen Square, Beijing is the central and single most important monument of the People's Republic (Figure 2). It resembles an obelisk with traditional Chinese architectural elements, thus essentially merging Chinese and Western architectural traditions while the Egyptian roots are concealed. The location at the former site of imperial power and its height of 38 meters – taller than the old imperial palace – also signified that the people in the guise of the CPC had ultimately won and a new era was beckoning (Hung, 2001, pp. 459, 463). Designed by the architect-couple Liang Sicheng and Lin Huiyin, the monument was supposedly inspired by an ancient Chinese stone tablet, yet the literature (e.g., Hung, 2001; p. 462; Wu, 2005, 24–36) refers to it as an obelisk as well; interestingly, Liang and Lin travelled extensively in Europe and North America at young age (having studied at the University of Pennsylvania) (Hung, 2001, pp. 459–460), where they would have encountered modern obelisks beyond any shadow of a doubt. The obelisk commemorates Chinese who died in conflicts starting with the First Opium War of the mid-nineteenth century, and since its construction in the 1950s has served as a standard blueprint for martyrs monuments across China (Hung 2001, p. 472). The design frequently appears in connection with martyrs monuments in provincial capitals, which symbolically refer to the Tiananmen obelisk as the spiritual 'superior'.

Yet in recent decades, architects and policymakers have, at times, developed the design further, toward the direction of postmodernism or futuristic designs. A fitting example is the Yunnan Monument to the People's Heroes in Kunming, capital of Yunnan province (Figure 3). Completed in 1995, it was built in the political and economic center of the city and its commemorative scope reflects that of the 'inspiration' from Beijing. Yet unlike the monument in Beijing, the design has departed the traditional appearance. While the basic appearance is recognizably inspired by the Monument to the People's Heroes in Beijing, and thus the Republican tradition and the Egyptian obelisk, its individual design elements have been greatly abstracted.

Figure 2. The Monument to the People's Heroes at Tiananmen Square, Beijing. Note the presence of a Chinese-style curved roof instead of a traditional pyramidion. Source: C. Langer, January 2019.

Figure 3. The Yunnan Monument to the People's Heroes in Kunming, Yunnan. Note the postmodern appearance and reduced elements vis-à-vis the Beijing obelisk. Source: C. Langer, August 2022.

These examples give a spectrum along which modern Chinese obelisks are situated in terms of design: from the design akin to Egyptian obelisks to the communist design incorporating traditional Chinese elements and postmodern variations thereof. In this context, local adaptations are noteworthy. The Chinese population consists of 56 'nationalities', or ethnic groups. Next to their own language, these often come with their own architectural designs somewhat distinct from the Han majority. The province of Yunnan,

China's most diverse region, on the border with Myanmar, Laos and Vietnam, shows that obelisks reflect subtle differences as well. The far north of Yunnan boasts a majority Tibetan population. The martyrs monument in Shangri-La/Xianggelila (Figure 4) reflects that in that it not only combines the monument form with Tibetan elements but the memorial inscription is in both Chinese and Tibetan. In turn, the far south of Yunnan on the Myanma border is inhabited by a Dai majority. The martyrs monument in Jinghong, Xishuangbanna, incorporates local Dai architecture and language (Figure 5).

Figure 4. Dedicated to Tibetan revolutionary martyrs, the monument in Shangri-La/Xianggelila, Deqing, Yunnan combines Tibetan architectural design with Chinese characters on the front and Tibetan characters on the back (depicted here). Source: C. Langer, August 2022.

Figure 5. The martyrs monument in Jinghong, Xishuangbanna, Yunnan incorporates a Dai-style roof and combines alternating Chinese and Dai-Lü inscriptions. Note the postmodern appearance and reduced elements vis-à-vis the Beijing obelisk. Source: C. Langer, August 2022.

The Chinese obelisks showcase the, ultimately, modular character of modern obelisks and their adaptability to local conditions, in a way that Western obelisks cannot, for they adhere to the same design canon. Since first obelisks were taken out of Egypt, the shape has developed a design dynamic that would remain hidden if we only looked at Western specimens. This dynamic comes to the fore once we leave the traditional purview of research. The transmission and evolution of obelisk symbolism in China present intriguing avenues for further exploration, given the abundance of material and potential complexities in their meanings and historical trajectories. China thus presents an ideal case study to illuminate the non-Western history of obelisks, offering insights into their adaptation and significance beyond Western contexts.

2.5 India

If we talk about China, we also have to talk about India. Similarly populous as China, India is also a BRICS member and an economy very much on the rise, and thus worthy of scholarly attention. Like China with the obelisk at Tiananmen Square, India boasts an obelisk as a central national monument to commemorate military personnel killed in armed conflicts since Indian independence from Britain in 1947. Commissioned by the Modi administration and unveiled in 2019, the National War Memorial features a stone obelisk as the centerpiece of concentric rings; the base houses an eternal flame while the top is rather a bronze statue of three lions than a pyramidion (Baruah, 2019). An example more in line with Egyptian design is the Batasia

Loop War Memorial in Sikkim in the triangle between the Nepalese, Chinese, and Bhutanese borders. This obelisk commemorates the Gurkha soldiers who have died in service since 1947 (Khan, 2022). Other monuments in a clear obelisk shape that commemorate the military service of individual units are distributed all over India (Chhina, 2014, 172–202).

In the case of India, the line of transmission seems to be clear since it was a British colony. British obelisks on Indian soil are the 1911 Coronation Obelisk in New Delhi (Datta, 2022) or the 1907 Obelisk Monument in Srirangapatna (Polash, 2019), the former in classical Egyptian appearance and the former with a sphere on top instead of a pyramidion. While both the British obelisks are a testament and celebration of the British domination of India, the recent war memorial refers to independent India only. Due to a lack of research, it has to remain unclear for now whether the Indian government went with the form of the obelisk as a reaction to British obelisks or whether the shape had been normalized as a monument form in the minds of decision-makers and architects. The absence of any discussion of the presence of obelisks in the available literature suggests that they are seen as given. These circumstances illustrate the need for research into obelisks on the Indian subcontinent.

2.6 West Africa

Similarly un(der)-researched are apparently modern obelisks in Africa outside Egypt. Despite the apparent absence of literature, one modern African obelisk has to be mentioned here, not least because of the importance of African decolonization movements. Place de la Nation in Dakar, Senegal, is home to a white obelisk as its central feature. The Roman numerals MCMLX on its side betray what it commemorates: the independence of Senegal from France in 1960 coming on the back of anti-colonial struggle (Ollivier, 2021). Besides a lion as the national emblem on the base, the shape is akin to the original Egyptian obelisks. This example concludes the survey of obelisks.

2.7 Obelisks as Cosmopolitan and Politicized Architecture

It has become clear from the case studies presented here that obelisks have transformed considerably in appearance and meaning ever since they first left Egypt as their place of origin. At the same time, obelisks as public monuments are highly politicized. This goes back to ancient Egypt. There, obelisks were religiously and ideologically charged, embodying and expressing the Egyptian king's and the Egyptian state's nominal rule over the world and foreign people as bestowed by the Egyptian pantheon. Since Roman times, there is arguably an inherent connection between obelisks and armed conflict, whether that is the celebration of conquest or the liberation from domination.

The analysis contrasts commemorative narratives of domination and liberation, highlighting two distinct ideological traditions. The commemoration of imperial or colonial rule, influenced by practices observed in the Roman Empire and pharaonic Egypt, emphasizes the use of obelisks to assert power. The opposite tradition celebrates resistance or liberation from imperial or colonial rule. This dichotomy suggests regional and ideological divides in obelisk symbolism (Langer, 2021). Further investigation is needed to validate this hypothesis through comprehensive data analysis. In these instances, obelisks not only convey messages but embody historical narratives of domination and liberation.

Yet, despite all the focus on conflict, obelisks are ultimately cosmopolitan architecture as well. This becomes apparent once research leaves the traditional spatial confines of the North Atlantic and incorporates other regions in the analysis. Especially the Chinese obelisks with their modularity and adaptability to local conditions embody a conversation between China and ancient Egypt via the West, but also among the diverse Chinese nationalities, linking the majority Han traditions with minority cultures.

Such a cosmopolitan reading may be in line with one contemporary obelisk in Central Europe. The Nigerian-born American concept artist Olu Oguibe developed a contemporary concrete-and-metal obelisk for *documenta 14* in 2017. The Monument to Strangers and Refugees is inscribed with a Christian Bible verse ("I was a stranger and you took me in") that appeals to hospitality given to strangers (Kassel, 2024). Oguibe (2017) related the shape of the obelisk to timelessness and universality of African origin. Ironically, the artwork became the site of conflict between the artist and local right-wing groups who were against the subsequent purchase of the monument by the city of Kassel. Nonetheless, conflict surrounding obelisks deemed controversial for whatever reason should not detract from the hopeful moment that, ultimately, they represent intercultural dialogue and cultural compatibility despite any nationalist messages of individual obelisks.

3. The Future of Obelisks in Architectural Practice: A Speculation

3.1 Awareness of Practitioners

A recurring problem among the case studies discussed here is the why: why did architects choose the particular shape of the obelisk for their monument? Whereas in many cases there is no answer in the literature or archival material, in the cases where we can tell, it was usually a reference to an already existing monument; in other words, designs were simply copied, obelisks erected for monuments simply because

someone else had done the same earlier. This generally raises the issue to what extent practitioners, i.e., architects, designers and those who commission public monuments, are aware of the meanings and histories behind design choices. Oguibe's choice to construct a contemporary obelisk due to its African origin and global relevance suggests that he was aware; yet the case studies suggest that same cannot be said for many. That means that this paper and related research can also serve as invitation to designers to reflect on their choices and raise their awareness of the spatiotemporal intricacies of the obelisk.

3.2 Designing for/in the Future: Toward a Decolonial Obelisk?

It has become clear that the global presence of obelisks alone is the outcome of colonialism that may go back two millennia. The bulk of existing monuments either commemorate domination or liberation from colonial-imperial domination. Colonial and anti-colonial obelisks are thus part of the same conversation since they negotiate the relationship between colonizer and (formerly) colonized. Speaking with decolonial thought of the South American school (e.g., Mignolo, 2021; Mignolo and Walsh, 2018), even anti-colonial obelisks are still colonial obelisks since they pertain to the same logic as the monuments placed by colonizers. The question is if we can break out of this colonial logic. What would a decolonial obelisk look like? What would a decolonial obelisk even be? The obelisk's track record of over four millennia and its global variability suggests that the concept is here to stay for the foreseeable future; hence, these questions are worth pondering, or generally what an obelisk of the future may look like.

First of all, decoloniality is an option to bring about a world where colonial relationships are entirely absent. As already mentioned above, the obelisk is spread around the world in large part thanks to European colonialism and because local elites intended to westernize their memorial culture, as in the Chinese case. An alternative may be an obelisk that represents potentially everything. The Chinese obelisks highlight the modularity of obelisks. That means in theory it should be possible to combine several traditions in the same monument (Figure 7). Yet this would then raise the question which traditions to choose to represent various local identities to create a truly cosmopolitan obelisk. Depending on the choices, these may entail the danger of essentializing representations ("this is Chinese, this West African") and thus reproducing colonial attitudes toward aesthetics.

Figure 7. Obelisk design combining several traditions (Prompt: an obelisk with a pointy top and West African and Asian design elements on the body). Source: Midjourney.

A possible alternative may be an obelisk that adheres to no recognizable traditions, one abstracted so much and stripped of any elements that are easily relatable (Figure 8). Incidentally, this may point toward the path China has already undertaken with its postmodern monuments. Yet a monument that is recognizable as an

obelisk by the shape may still be primarily linked to Egypt; the absence of any inscription may be enough to detach it enough from Egypt so as to render it suitable for more widespread use. Then again, if there cannot be any markings, what is the appeal for any local iterations to emerge

Figure 8. Futuristic/minimalistic obelisk design avoiding any recognizable tradition (Prompt: an obelisk in style of a space rocket with smooth undecorated sides and a metallic look). Source: Midjourney.

Perhaps a decolonial obelisk would be an obelisk that does not exist, in the sense of the cessation of the construction of obelisks altogether. Note the somewhat circular argument by Leo Name (2021, p. 8) in this context, "There is no decolonial architecture because there is no teaching of decolonial architecture because there is no decolonial architecture". He further asserts that architecture that maintains the link with its design roots in the Renaissance had been used by bourgeois white Europeans to conquer territories (Name, 2021, p.8). It is fair to say that obelisks satisfy these criteria, a decolonial obelisk is thus hardly possible.

Decolonial thought sets the bar admittedly high for decolonization, demanding no less than a wholesale departure from colonial structures, including modes of knowing. For the future of the obelisk, that may well mean that it would have no future outside Egypt, especially as its global transmission has been crucially facilitated by European colonialisms. Yet even within Egypt, one may wonder if modern iterations are not expressions of colonial mindsets and policies (Langer, 2017; Jurman, 2022, pp. 20–22); note that a glass obelisk is planned to become the tallest building on earth as part of Egypt's new administrative capital (Jungfleisch and Reali, 2023, 33). This may render the modern obelisk colonial architecture by default, in line with Name's intervention.

Yet per Mohamed Elshahed (2023), the bar may be lower when it comes to *moving toward* decolonization. He proposes the following five points in asking what it took "to decolonize architecture in contemporary practice and in history":

1. Recognize that history is never a linear progression of figures, events, buildings, or styles.
2. Recognize the impact of colonialism in its past and present forms on architectural production, on the fate of architectural heritage, on the fate or archives, and on the capacity to write architectural history, both in the colony and in the metropole.
3. "The only primitivism is Eurocentrism"
4. Decenter architectural knowledge production, support the building of independent architectural institutions in former and present colonies.
5. In a global economy, "meaning" and "value" in postcolonial contexts are often assigned from the

colonial center, maintaining a center-periphery dynamic. Restore the production of "meaning" and "value" to local communities.

This paper relates to Elshahed's points in the following ways:

1. We acknowledge that the transmission of the obelisk was likely a complex entanglement of agencies rather than a one-sided affair, and that the form and meaning of the obelisks around the world are fluid and subject to change.
2. We have acknowledged the Eurocentric/Western bias in scholarship on ancient and modern obelisks as well as the role of colonialism in the role of their transmission around the globe.
3. An outcome of this paper and related research is the overcoming of Eurocentrism by bringing into focus the under-researched regions and traditions outside the traditional Western focus.
4. We are moving toward the decentering knowledge production by adopting a global perspective that brings attention to local adaptions in former and present (semi-)colonies and those areas never formally colonized.
5. In turn, especially opening the research question toward a genuinely global perspective can allow local communities' input into the 'meaning' of their obelisks and engender further reflection. The global perspective allows for a shift of what appears peripheral at best in the literature, i.e., regions beyond the North Atlantic, to the center of attention, which may also reflect the fact that more innovation in the design of obelisks has happened there over the past century than in the West.

In this sense, local adaptions of obelisks could satisfy the criteria of a decolonized obelisk. Yet the ultimate issue remains that an obelisk at present cannot be decolonial in the way decolonial thought would have it. Irrespective of that problem, the quest to decolonize should leave enough room for artistic creativity and experimentation.

4. Conclusion

The paper has revealed the spatial focus in obelisk-related scholarship on obelisks in the West. It has also shown the feasibility to incorporate obelisk traditions from the global South to devise a truly global history of the obelisk, to fully grasp its transformative potential in design and function. The case studies ranging from ancient Egyptian to contemporary Afro-Eurasian obelisks reveal the evolving appearance and significance of obelisks outside of Egypt, emphasizing their politicization as public monuments, a tradition dating back to ancient Egypt. Obelisks historically symbolized imperial domination or liberation from it, reflecting contrasting commemorative narratives. One tradition – what can be considered the Western tradition – celebrates domination, influenced by Roman and Egyptian practices, while the other commemorates resistance or liberation – perhaps to be called the global South or anti-colonial tradition. This dichotomy suggests regional and ideological divisions in obelisk symbolism, warranting further investigation for validation. Despite their association with conflict, obelisks also embody cosmopolitan architecture, seen in Chinese adaptations and contemporary artworks like Olu Oguibe's Monument to Strangers and Refugees. Such instances highlight the potential for intercultural dialogue and compatibility amid nationalist tensions surrounding obelisks.

The global presence of obelisks is a legacy of colonialism. This poses questions about the potential for decolonial obelisks. The paper has explored the possibility of obelisks that transcend recognizable traditions, abstracting their form, or ceasing their construction altogether as a decolonial gesture. However, decolonial thought presents challenges that ultimately question the feasibility of a truly decolonial obelisk given its historical entanglement with colonialism. Existing propositions for decolonizing architecture offer insights applicable to obelisks, emphasizing the need to recognize colonial legacies and restore agency to local communities. While local adaptations of obelisks may align with decolonial principles, the inherent ties to colonialism pose barriers to achieving decoloniality in obelisk construction. Nonetheless, the pursuit of decolonization should accommodate artistic innovation and experimentation within the realm of obelisk design, which – as this paper has shown – is a highly dynamic field worthy of

further reflection by scholars and designers alike. Next to design experimentation, that may include careful theoretical deliberations over the nature of decolonial architecture to delineate the feasibility of decolonial obelisk designs.

KEYWORDS | DECOLONIAL DESIGN, FEMINIST DESIGN, CRAFTS, TEXTIL DESIGN, STENCIL

ABSTRACT | The evolution of design in Chile has come about through the amalgamation of knowledge that fuses the practices of local artisans and craftsmen with the economic and cultural influence coming from the United States and Europe - the global North. This mix impacts a society marked by profound social inequalities, where design sometimes finds itself in an uncomfortable position of challenging the universal norms imposed by the North. Beyond questioning colonial models, Chilean design currently finds itself in a unique socio-political context by integrating intersectional gender perspectives and reflecting on diverse and distinct Latin American cultures. Challenging the central structures that govern economic development, design takes a different perspective by embracing local visions, the anonymous voices of indigenous peoples, and intangible cultural richness. Silently, craftswomen, caregivers, artists, and those who confront precarity with their skills nurture design and, at the same time, empower people, understandings that give non-neutral agency to design to transform reality in the remoteness of large dominant centers.

“De otro modo” is an integral perspective derived from decolonial perspectives and intersectional feminisms, which aims to bring together the knowledge and doings of the narrow and long Chilean territory from its idiosyncrasies marked by inequalities, disasters, and natural riches. A territory in which designers look between the Andes Mountains and the Pacific Ocean for the well-being of life in the future. The paper describes three case studies based on the authors’ research work, which weave together historical-political contexts and socio-cultural representation to understand the current dimensions of local design.

The first case reviews the significance and resignification of women’s popular-local culture in ‘Feminist May’ (Chile, 2018). The second case analyses the aesthetic and conceptual renovation undergone by both textiles and clothing during the 1970s due to the professionalization of design in the country. In this sense, it explores the influence of the discipline on the cultural transformations of the time, highlighting the role of women designers who integrated iconographic elements of popular and indigenous culture into mass-produced objects. The third case, from a critical-decolonial perspective - informed by ethnographic and anthropological design fieldwork - reviews the discourse of representation around the link between the traditional knowledge of local crafts and the aesthetic bases of contemporary Chilean export design..

1. Introduction

Chile, located in the south of the Americas, is distinguished by its peculiar territorial configuration: an extensive and narrow strip of more than four thousand kilometres between the imposing Andes Mountain range and the vast Pacific Ocean. A recognisably seismic country, Chile's landscape ranges from deserts to glacial regions. As a Spanish-speaking nation, Chilean culture shares common colonial traits with the rest of the Americas while exhibiting unique characteristics derived from miscegenation. In contemporary times, following the period of military dictatorship (1973-1990), Chile adopted a neoliberal economic model that has been a regional standout in terms of macroeconomics. However, growing social inequalities, the extractivist approach, political tensions and other complex challenges have become more prominent in the last decade, reflecting ongoing socio-political changes. Significant social milestones have strongly influenced design studies in recent years. Notable among these events are the feminist movement of May 2018, the Social Outburst of 2019, the coronavirus pandemic of 2020, and the coming to power of the first government with a feminist agenda on its political agenda in 2022.

This context places the study of design in front of critical cultural questions that influence its practice. These questions include the consideration of maintaining classical modern design guidelines, following northern hemisphere trends, or identifying critical territories to propose transformative knowledge and practices.

Design activity and reflection in the South America do not differ significantly from what the Northern hemisphere dictates, as the idea that the practices of the developed world are always "better" than those of the underdeveloped, colonial heritage has been "normalised". Whether true or not, it is undeniable that the application of "imported" knowledge and practices inevitably takes on the influence, emphasis and values of the local context. That suggests that subjective aspects, which are constantly evolving in terms of location and form, are relevant to considering different perspectives (Flesler et al., 2018). Moreover, to see things in an 'other way, other manner'.

In this approach, as pointed out by Yuderkys Espinosa (2014), ‘de otro modo’ relates to the commitment to the decolonial feminist perspective, which questions the explanations developed by white-bourgeois Western theory and radically redefines the concept of 'woman', making it impossible to reconstruct it. Moreover, in collaboration with the decolonial approach, feminism is committed to reinterpreting history from a critical perspective towards modernity, not only because of its androcentrism and misogyny, as classical feminist epistemology has done but also because of its intrinsically racist and Eurocentric character.

Feminist perspectives contribute to the visualisation of the contributions of women and dissenting people, as well as the recognition of situated knowledge. This integration reflects Haraway's proposal for "an embodied objectivity that is compatible with paradoxical and critical feminist science projects: feminist objectivity simply involves the consideration of situated knowledge" (Haraway, D; 1995, p. 324). Adopting this 'embodied', affected view of design allows us to highlight pieces of knowledge and practices that enrich understanding and engagement in the field of design.

In the context of the Chilean territory, design faces economic and social challenges, often accentuating its voices to solve problems within the limits of inequitable economic development. Situating ourselves from the creation of design education, whose vanguard was the women of textile design at the University of Chile in the 1970s, as well as the reflection of industrial design when observing local crafts or the use of global DIY aesthetics to leave traces on the walls of the Chilean capital of the rage and weariness of its communities, serves the recognition of three different scenarios for a situated view of Chilean design, of a critical look at what we do and think in this territory.

1.1 Questions and Objectives

In light of the above, the question arises: How has design, both in its theoretical approach and practical application, acted as an active cultural agent that promotes an "other way" perspective in its work? Through three cases linked to a decolonial-feminist perspective, the study aims to recognise the possibilities of an "other way" of looking that can shape transformative alternatives.

1.2 Methodology

The cases studied belong to the recording of information on three spaces of Chilean culture: women in the beginnings of the formation of design in Chile, the traditions of artisan communities and the design and graphic testimony of a Chilean social landmark (October 2019).
These three cases approach from:

Case 1: The methodology used in the first case involved the historical reconstruction of an object of study, the Textile Design career at the University of Chile, through a qualitative approach and with a gender perspective. The object was determined by conducting interviews and collecting personal objects, which became the primary source of information.

Case 2: For this case, theoretical information was collected and complemented with on-site observation and personal interviews to analyse the relationship between crafts and design critically.

Case 3: A theoretical review links the graphic testimonies of the streets to the slogans inherited from the 'feminist May' of 2018, specifically the stencils produced during the 2019 social outburst in Chile.

All of them compose an interweaving of historical-political contexts and socio-cultural representation to understand the current dimensions of local design. They respond to the need to establish ways of understanding design culture as an articulating axis of new perspectives for society as a whole.

2. 'De Otro Modo' Perspective

The feminist perspective of situated knowledge enriches the (design) project and, at the same time, decolonial; as Dori Tunstall says, "decolonising design requires us to break down our basic assumptions about what design is and what it has been" (Tunstall, 2023, p.6). Enrichment grows from considering women in an active role in the weight of history and attributes related to the 'feminine' that aim to tread a new path for the study - not always comfortable (Ahmed, 2018) - of communities and their doings.

Ibarra (2023), from her studies in Brazilian territory, proposes in the case of textile processes that "they offer a means to explore themes, communicate with interdisciplinary teams and advance in the knowledge of different areas of thought. Textile language impregns metaphors of collaboration and joint work, and the act of making transforms the metaphor into the potential for transdisciplinary practice" (p. 332); this understanding of craft activity proposes a disciplinary articulation that is no longer merely rational and or functional, objective, but adds a subjective and affective component that reflects in the work of the communities. This thinking is in line with what Escobar (2018) has proposed to define what is "appropriate" for the design of the South, where the cosmovisions (in the case of the original peoples) and appropriate modern visions of feeling and living the South American landscape, offer a particular view that, even under heteropatriarchal and Eurocentric structures, offers a becoming of its own.

Flesler (2018), on the other hand, from Argentina, was able to verify through the experience of design workshops in the classroom that from a gender perspective, "differences and inequalities can be considered in the processes of planning and design of urban spaces, objects and communicational statements" (p.45).

In the Chilean case, whose history and landscape are often convoluted, the wide range of feminism has tried to appear in areas on different axes of inequality, feminism being "not only an egalitarian movement in general but also a radical and transformative decolonial struggle for the positive affirmation of differences between marginalised people and peoples. These differences in material positioning manifest distinct life experiences and diverse forms of knowledge" (Braidotti, 2022, p.32). Thus, the historical events that occurred during the Feminist May 2018 and the Social Outburst of 2019 concur in a precedent in the meanings in which actors considered outside of structural power (women, dissidents and others), which allows studies within culture to draw on the phenomenon to re-signify their own methodological or critical components.

Maya Ober (2023), a decolonial, depatriarchal feminist design activist, invites us to understand that design can be "a critical, situated, reflexive and socially transformative practice, engaging in struggles and developing practice on the ground" (p. 4). Different voices and ways of doing weave a broader, more diverse, and more affluent way for design and culture and fostering transformations for the well-being of communities and territories.

2.1 The Vanguard of Textile Design in Chile: A Journey to the Aesthetic and Conceptual Revolution of the 1970s by women

In a historical scenario, the evolution of design education originates from women's work in a progressive socio-political context, leaving the legacy of a "struggle" that will later be recognised by the discipline of design and the history of Chilean design.

This history took place when the first university programme in Textile Design in Chile was born in 1970, during the socialist government of Salvador Allende Gossens, under the protection of one of the oldest public institutions in the country -the University of Chile-. In this context, and over almost a decade, a team comprised almost entirely of women developed innovative weaving, printing, and clothing projects with a strong national identity, rescuing symbols and modes of production typical of peasants and indigenous Latin American culture. The latter materialises by applying these elements in textiles and garments originating within the industry.

Between 1960 and 1970, most Latin American countries, regardless of their type of government, intensified their industrialisation policies with the intention of moving from an 'easy import substitution' to a 'difficult substitution' model. Thus, efforts were concentrated on making the objects produced in the continent more complex, which implied strengthening domestic markets.

In the Chilean case, the belief that only industrialisation would make it possible to leave underdevelopment behind led to the creation or restructuring of institutions dedicated to technological research, industrial innovation and product development. Consequently, design discipline progressively integrates into the state apparatus and the discourse of modernity, considered an instrument for updating local industry. Parallel to and derived from the same belief system, the first schools of modern design emerged in the country, promoted by left-wing youth as part of a profound restructuring of higher education.

At this point, it is essential to note that the notion of design import into the country during this period came mainly from the ideas of the HfG Ulm. This German school sought to provide a rational response to technological development and its influence on everyday life that "would forge over fifteen years a project methodology that was especially important for the consolidation of design as an autonomous activity, interdisciplinary in nature" (Castillo, 2010, p. 222). In this sense, the presence in the country of the German academic Gui Bonsiepe was relevant, who, in addition to working for the International Labour Office (ILO) and the Technological Research Committee (INTEC), gave some courses at the Pontificia Universidad Católica (PUC) and worked with some students at the Universidad de Chile (UCh).

Figure 1. Printmaking Workshop Class of the Textile Design course at the University of Chile, 1971. Personal archive of Ana María Hidalgo. All rights reserved, reproduced by permission of the author.

On 26 August 1970, by decree N°10.032 issued by the Rector's Office of the University of Chile, the Textile Design course was officially created, making official a discipline practised for decades by granting a professional title to future graduates. Initially, the course had two specialisations: Weaving and Printing (Figure 1), each with a specialised workshop. Later 1974, the Costume major was added, and a typical first year was created to promote interdisciplinary work. This educational project had a curriculum that sought to promote interaction between artistic education, trades and national industry in the context of an inward-looking development model in the first stage and a socialist one in the second. In this way, and following the technological guidelines mentioned above, although the university's aspiration was for designers to join the industry in order to modernise it, they "were also interested in generating a new, different productive space that conceived of creativity and manual work" (Montalva, 2015, p.85).

Like the rest of the mentions, the curriculum (Figure 2) focused on teaching industrial procedures complemented with humanities and science subjects—the latter, in order to distance the degree from the artistic field. However, as a differentiating element in Textile Design, learning about craft trades was maintained, incorporating technical knowledge and iconographic elements of the popular and indigenous Latin American imagination into the products designed. This approach, far from being an isolated event, was part of a general phenomenon in the Santiago fashion circuit, whereby many designers sought their language through the conceptually Chilean. This movement was called Moda Autóctona and, according to the historian Pía Montalva (2015, p.85): "It rescues the Latin American as a source of inspiration or cultural and visual reference, but always assumes the mediation that brings the own of the time, the contemporary elements. The designer's task [...] is to resignify these contents". The task was to reinterpret these contents, resulting in a unique proposal.

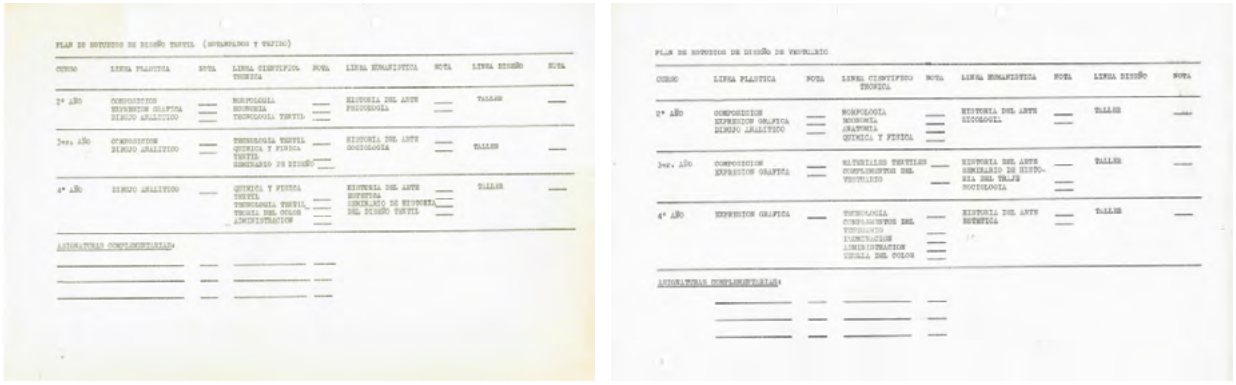

Figure 2. Syllabus of the mentions Prints and Textiles of the Textile Design Degree of the University of Chile. Faculty of Architecture and Urbanism of the University of Chile.

'Moda Autóctona' [Native Fashion], whose period of greatest apogee was between 1969 and 1973, prospered because it was supported and encouraged by the governments in power, mainly: "because the discourse that sustains it coincides with the Latin Americanist approaches that cross the public and cultural space of the period" (Montalva, 2015, p.84).

Regarding the latter, it is essential to note that textiles acquired a central role in the economy during the Popular Unity government. On the one hand, because of its status as an essential good, and on the other, because of its capacity to generate jobs. In particular, a relevant milestone was the nationalisation of 1971 of the prominent textile companies in the Metropolitan Region, which turned the sector into a fundamental pillar of economic nationalisation and workers' participation (Echeverría et al., 1987).

Seeing an opportunity to enrich local production in this economic growth, the University of Chile tried to incorporate its Applied Arts graduates in the factories by changing its curricula. The latter led to the creation of the Department of Design, which used professional internships to insert students into industry. In the particular case of the weaving and printing courses, this was almost exclusively thanks to two teachers: Margarita Johow, who had direct contact with important entrepreneurs in the area, and Ana María Hidalgo, who worked in Alejandro Stuven's printing factory. At the same time, students with family connections needed to be in the course. Such was the case of Ingrid Pollak, who obtained internships for her classmates.

On the other hand, thanks to the links between Johow herself and Paulina Brugnoli, a teacher specialising in gobelin weaving, with archaeologists, researchers and government institutions, some students could carry out research with state funding. One of the most emblematic cases was the CONICYT project 207 Pre-Inca Chilean Textiles (0 to 1350 AD), awarded by both in 1970, which incorporated a group of four students: Carmen Gloria Gajardo, Liliana Prado, Gioconda Pamparana and Liliana Ulloa, who developed the thesis Industrial textile creations based on a formal selection of pre-Inca textiles researched in the museums of the Norte Grande. The project consisted of selecting, studying and recording sixty-five pieces from four national museums, on which they studied weaving techniques, types of fibre, colours and dyeing plants. With this, they designed textiles based on the reinterpretation of the archaeological pieces produced and marketed by three textile factories.

Although this project can be considered the largest due to its funding and state technical support, 10 of the 28 undergraduate theses completed by the students of the degree course had the country's indigenous and/or popular culture as a central theme, giving rise to diverse proposals for prints, fabrics and clothing. However, although the degree course was created to introduce designers to the local industry, the efforts to build a bridge between the students and the factories were mediated by specific subjects. In this sense, it was a group of female professors who organised, independently and without the university's financial support, a series of events that brought the students closer to the national reality and allowed them to develop professionally.

However, it is crucial to acknowledge that, despite the efforts of artists, designers, and the backing of the Frei Montalva and Allende administrations, the textile industry showed little interest in creating fabrics featuring indigenous motifs because of the preference among women for foreign fabrics, aiming for dresses resembling original French, Italian, German, or English designs (Montalva, 2015, p.86). Consequently, native fashion only gained traction due to its smaller-scale production and artisanal methods.

Despite this and the brevity of its existence, this educational project trained many professionals who, faced with the collapse of the textile industry, the repression of the dictatorship, or simply out of personal interest, oriented their careers towards other ways of doing the discipline. In this sense, to date, an essential group of former students has been identified within the group of graduates who have continued to develop in the textile scene until the present day, achieving great notoriety.

2.2 Exploring the Local Identity of Contemporary Design Through Crafts

Object-oriented design situates the work at a critical crossroads regarding the recognition of the locals, the colonialisms in the work, and the dialogues between designers and artisans in the space of regional Chile beyond the capital. This recognition can be seen in how artisans have incarnated their habitat in crafts, adopting materials and forms, which has directly inspired designers to recognise in it a way of doing that has been very valuable, and at the same time, in tension with the need for co-creation beyond cultural appropriation.

Crafts can be understood as an expression of the cultural landscape of their makers. They are the material representation of community narratives and singular realities, witnesses and containers of long and dynamic processes of evolution and historical-cultural phenomena, objects where the dialogues between humans and nature embody, building a deep sense of local identity (Mier y Terán 2013; Sepulveda, 2003; Turok, 1988).

Figure 3. Three generations of craftsmanship. Betancourt family’s work with ox horns. Left: traditional ox horn (Achurra, 2018); Right: Necklace by Walka (Klunes, 2016).

In the case of Chile, the diversity of the landscape, with desert, ice, mountains and ocean, is rich in raw materials from north to south. The transformation of these materials into functional objects reveals a deep connection between people and territory as an essential characteristic of Chilean craftsmanship; the piece is recognised first by its material and then by the technique. Most craft traditions in Chile are rooted in local communities, where knowledge of materials and techniques is transmitted from generation to generation through practice and observation. Artisans dynamically integrate elements of their environment into their creative work, continually enriching what understood local identity - a process in constant change as cultural contexts evolve.

This notion of local identity has also influenced wider creative and Design fields. Materials, technologies and aesthetics that were once associated only with craft traditions now constitute the foundations for constructing a notion of identity unique to contemporary Chilean Design. The current generations of creators have adapted and transformed traditional practices, creating pieces that resonate in spaces of cultural exchange different from those of traditional craftsmanship. One example is the creative work of the Betancourt family, who, over three generations, have worked with ox horns, evolving from traditional use as wine glasses to the exploration of contemporary jewellery (Figure 3).

According to the Consejo Nacional de las Culturas, las Artes y el Patrimonio (2017), the relationship between artisans and designers in Chile began approximately in 1990, along with the return of democracy, when independent designers seeking to differentiate their proposals and broaden their academic bases began to investigate expressions of widespread and informal knowledge that were not accessible in formal educational spaces (CNCA, 2017). The interest of designers has evolved in recent decades, mainly due to Chile's participation in European design fairs. In 2011, state agencies ProChile and DIRAC selected a group of emerging designers to represent Chile at the 100 Design London exhibition, part of the London Design Festival. Under the curatorial leadership of Luz Méndez, products with a cohesive identity were brought together, highlighting pieces made with local materials. The final selection included objects that combined traditional carpentry skills with digital fabrication. The exhibition was entitled "Southwest View: Contemporary Design from Chile" (Figure 4). After that first experience, the presence of Chilean Design at these fairs has continued to be characterised by objects that represent a connection with local techniques and materials over other options. According to Francesca Bucci, DIRAC coordinator, Chilean materials translate a narrative connotation that materials can help characterise these creations as "Chilean", thus fostering their internationalisation (Guzmán in INE, 2018), as crafts are the creative industry that produces the highest percentage of foreign exports of cultural goods (CNCA, 2014).

Figure 4. Screenshot of 'Southwest view' catalogue, for the participation of Chile in the exhibition 100 Design London in 2011. Retrieved from PROCHILE, 2011.

Since participating in these events, the notion of Chilean Design has become associated with a distinctive aesthetic that reflects the characteristics of traditional crafts. A recent newspaper article entitled "Mapping National Design" in 2020 presents examples of artefacts where craft practices inspire the technique or materials or involve the direct participation of artisans in the manufacturing processes (Figure 5). In one example (LUP), the design team produced a recycled plastic fibre that was provided to a group of traditional basket weavers to weave baskets in combination with natural fibres. Another example (Prima) integrates traditional material, technique, and production with wicker fibres from Chimbarongo as a distinctive aesthetic feature in the cabinet design (Figure 6).

These examples show that contemporary Chilean Design has found in crafts a deep-rooted connection, a source of inspiration and knowledge guided by practice, consolidating a distinctive aesthetic, using the notion of local identity emanating from the territory to its advantage. It makes sense because crafts are the

sector most valued by the population because they are associated with a notion of "national identity" and a "sense of belonging" and represent the labour of Chilean workers, while their products are evidence of territorial diversity (País, 2016, p.47).

However, although there is a shared value base centred on highlighting the nobility of local materials and celebrating diverse 'ways of making', even when techniques, technologies and aesthetics differ, the problem lies in the fact that this model tends to view crafts as a fragmented activity, separating the value of the object-product, the artisan's expert knowledge (technical, experiential and bodily) and the narratives contained in the practice. Moreover, artisans are not included as expert creative partners but rather as providers of manufacturing services (Mier & Teran, 2013; Parada en Cattan, 2019).

Figure 5, 6. Examples of current Chilean design where the influence of artisanal techniques is visible. Left: LUP Design; Right: Prima furniture; MasDeco, 2020.

Unfortunately, despite the visibility granted by the showcase of foreign design fairs, the craft sector continues to be perceived by audiences as a "minor art" and artisans as "technical workers" having a subsidiary position compared to Design and other areas of the cultural production milieu (Pais, 2016). In this sense, cultural policy researcher Beatriz Navarrete reflects:

> "Beyond the harsh survival under a model that ignores and marginalises them, the trades and productions grouped under this denomination -that of Popular Art and Crafts- have survived in a world that does not recognise and marginalise them. -(Popular Art and Crafts) have suffered a harsh effect of transculturation due to state policies that have tried to retranslate them to the new imperatives of globalisation". (Navarrete, 2017)

The paternalistic protective role of institutions and the market, installed through heritage preservation and promotion policies, can have a negative impact to the extent that dichotomies installs turn crafts into a representation of the past (Navarrete. 2017), while Chilean Design would be the image of the present. Thus, artisans cannot imagine a future, limiting themselves to repetition to safeguard the intangible heritage.

Thus, although the linking and referencing of contemporary Chilean Design with traditional crafts would be expected to be beneficial for both sectors, it is argued that, as a result of the lack of critical reflection by the creative sector of Design, it unintentionally reinforces the subsidiary position of artisans in the local cultural milieu (Noronha, 2018). There is a great contradiction in trying to protect and promote the local - as ways of making and thinking - through its alienation and subjugation to global regulations, being, in a way, a way back to colonialism (Navarrete, 2017).

2.3 The Explosion of Feelings: Walls as a Testimony of Rage and Resistance

Figure 7. Stencil records during the 2019 social outburst in Santiago de Chile. Iconographic representations of women. Reproduced from Iconografía del Despertar: esténcil [Iconography of Awakening: stencil], by Ch. Soto, 2022, Impuro ediciones. All rights reserved [2022], reproduced by permission of the author.

The urban scene of the Chilean capital has been fertile territory for the graphic expression of the population's social struggles, with its most relevant moment in recent years, in which politics and activism have gained relevance.

Preceded by large student demonstrations (2006, the “Revolución pingüina” [penguin revolution], allusive to the uniform worn by secondary school students; 2011, the largest student demonstration in the return of democracy of students of all levels), in 2018, students mobilised in the so-called "Feminist May", leaving a deep mark that prepared the ground for the "Estallido Social" [Social Explosion] that began on 18 October 2019. High school students refused to pay the metro fare, triggering an unprecedented escalation of mobilisations across the country, which led the conservative government of the time to decree a state of emergency. The demonstrations ceased with the arrival of the COVID-19 pandemic in 2020, but a process of constitutional change was agreed upon, which ultimately failed to materialise in 2023. For the inhabitants of Santiago, these experiences represented, in the words of one woman interviewed on the street, "living several Chiles".

The street was the canvas for expressing the slogans and symbols of these demonstrations. Urban Iconography (Figure 7) emerges from the movement of people agitated by the protests—the language of the street in performances, posters and on walls. Various designers and other professionals took it upon

themselves to compile these icons. The hybridisation of languages emerges by using DIY techniques, stencils, collages and others. In these expressions, the imprint of the 'Feminist May' is visible in slogans such as 'No is no. No more abuse. No more abuse. Girlfriend, realise. Fight Like a Girl’ indicates youth culture influenced by slogans on screens and digital platforms that repeat the same things ad infinitum. However, the appearance of these images in this context aims to challenge the social power relation (Hollows, 2001), more so because of their intensive reproduction that occupies all the walls of the city centre—resignifying the non-'gendered' citizen space (Flesler et al., 2018), as an empowered space, with the right to be inhabited even with discomfort.

On the other hand, the slogans 'Ni tuya ni yuta. Los pacos son inflamables. 1312. ACAB, All Cops Are Bastards' (Figure 8), emerges as a sign of global rage, of voices revolutionising social justice. The Chilean 'cops' are the 'pacos', the 'yuta', and occupy a large part of the messages on the stencils of the explosion, with the ferocity of a rage that no longer distinguishes the symbol from the living signifier. The violence unleashed in the streets remained in the voices of written hatred. Matapacos, the dog ‘companion’ of the student protests, by then already dead, emerges as one of the most recurrent symbols in the visuality and performances of the outburst. The carabineros are reflected as the ‘oppressive male’, in the words of Las Tesis' performance "Un violador en tu camino" (Colectivo Registro Callejero, 2019), alluding to Carabineros de Chile's advertising slogan in the 1980s: "Un amigo en tu camino"; the unbridled repression corresponds to the vicious circle (Cárdenas, & Ceballos, 2021) that perpetuates violence towards women and LGBTQ+ communities.

The stencils of the outburst (Soto, 2023) represent a discovery in popular graphics that reflects the sentiments of society in a simple and often precarious way. They are the voice of an affected culture, using what they have to complement the more enormous graphic slogans of the time. Rage manifests itself as an expression of hidden fear or sadness. It confronts the forces of desire and needs in a culture that prioritises economic growth and the value of money over other human qualities, such as affective and creative ones. This global culture adopts the Chilean accent in the metaphors created through the stencil technique and famous sayings.

Figure 8. Stencil records during the 2019 social outburst in Santiago de Chile. Slogans left: "Against patriarchy and capital I*G Women and Dissidence", right: "It wasn't my fault, where I was or how I was dressed". Reproduced from Iconografía del Despertar: esténcil [Iconography of Awakening: stencil], by Ch. Soto, 2022, Impuro ediciones. All rights reserved [2022], reproduced by permission of the author.

The stencils of the explosion represent the cultural heritage of a society that shared common feelings, fears and sadness, expressed through aggressive slogans, visual ironies and punk aesthetics that reflect a unique Latin American sentiment. These messages were made visible and joined the chorus of other citizen demonstrations. Women, intersectional feminists and LGBTQ+ communities vindicate in messages that relate to the experiences of what it is to be a woman in a hetero-patriarchal society. Visuality from the graphic becomes an archaeological object for the writing of a testimonial history (Carson & Pajaczkowska, 2000) about the problems of economic abuse and violence.

Although they contradict the culture of urban beautification and the academic canon, these stencils sincerely cooperate with the aesthetics of our culture based on feelings (Gatica, 2018, 2021, 2023). What is considered countercultural in the voices depicted on the walls of the capital gives form and image to popular sentiment, being an essential part of the cultural testimony and history of the country.

2.4 Recognizing Women's Contributions, Challenges, and Resistance

Due to political-social connotations, the professional practice of design in Chile is subject to the economic framework, which places it as an actor that must "give value" to consumer products and services. In this respect, the professional activity produces global pieces mediated by intermediaries who create strategies to improve sales. This economic context influences the dynamics of contemporary design, conditioning its processes and results.

From the situated, critical perspective seen in the three cases presented, we can point out that a relevant aspect to consider is the fundamental role played by women in the development and promotion of textile design - and its teaching - in Chile. It stands out how a team made up almost entirely of women carried out innovative projects, rescuing symbols and modes of production typical of popular, peasant and indigenous Latin American culture. Furthermore, despite the efforts to insert the designers into the local industry, these were mediated by female teachers who organised independent instances to bring the students closer to the national reality and allow them to develop professionally. This historical experience highlights the importance of recognising women's work in the field of design and their contribution to the cultural and economic development of the country.

On the other hand, the valuation and relationship between contemporary design and traditional crafts in Chile, valued by the population for their association with national identity and sense of belonging, and which represent the labour of Chilean workers, both men and women, is relevant. However, despite this valuation, artisans are perceived as technical workers and have a subsidiary position compared to design and other areas of the cultural production environment. This perception reflects entrenched gender dynamics in which manual work, mainly associated with women, is less valued than design, which has historically been dominated by men. Furthermore, it notes that cultural policies have contributed to the transculturation of crafts, limiting the capacity of artisans to imagine a future and relegating them to repetition to preserve intangible heritage.

Finally, the centrality of demonstrations led by women and feminists in events such as the "feminist May" and the "social outburst" provided a platform for expressing anger and discontent at patriarchy, police violence and social injustices. The slogans and symbols created at these protests reflect the struggle for gender justice, as well as resistance to male chauvinist and heteropatriarchal oppression. In this case, the stencils become a form of visual expression that makes visible the experiences of women and LGBTQ+ communities, challenging the dominant culture and contributing to the writing of a testimonial history of issues of gender-based abuse and violence. These manifestations highlight the importance of including feminist perspectives in Chile's analysis and practice of design, recognising the impact of feminist struggles in shaping contemporary society and culture.

3. Conclusions

Reflections on design and its culture from a situated and critical perspective, which seeks more significant equity and inclusion, lead us to recognise and value the work of women and dissidents. This alternative view promotes gender justice in all dimensions, advocating for a more egalitarian and diverse society.

From this perspective, which includes gender and decolonial perspectives, we seek to enrich design practice in the global south and everywhere where communities require transformations to promote their well-being and empowerment.

The particularities of Chile's territory and history have given design a character that, from a situated perspective, allows it to reflect on its work. This history and work are at the forefront of the norms that the North "dictates." However, they include local voices that may be invisible or non-existent in the economic dictates that usually govern the discipline.

Adopting an "other way" view implies a commitment to constructive critique of design, especially when it appropriates the landscape, the territories and the communities that inhabit them. In South America and beyond, this perspective allows us to recognise and address the inequities present in our societies and the urgent need for social justice.

KEYWORDS | URBAN RESIDENTIAL SPACE, FAMILY DAILY LIFE, REFORM AND OPENING-UP, INTERIOR DESIGN

ABSTRACT | This study is an interdisciplinary qualitative research on the history of interior design and the history of everyday life. It examines the evolution of living spaces, interior design, and family daily life in Beijing since the reform and opening-up. The research adopts anthropological ethnography as its method, exploring materials related to design and daily life from a micro-historical perspective. Through in-depth interviews with four different types of Beijing families, it investigates their living changes and daily experiences before and after the reform and opening-up. The study finds that there has been a spatial transformation in Beijing residences from “sleep-oriented” to “multi-functional” spaces after the reform and opening-up. This transformation was due to the increase in living space and the division of spatial functions. In terms of family daily life, there emerged a “visual-audio” lifestyle centered around the living room, along with the convenience brought by the popularization and smartening of appliances. In terms of home decoration, the pursuit of personalized and holistic spatial aesthetics gradually became the mainstream.

1. Introduction

Family life practices in the process of spatial production are both the result and the material for development, mapping the macro-level social, economic, and cultural developments from the micro-level of everyday life. The reform and opening-up, as the starting point of China's modernization efforts, not only achieved leapfrog growth in the country's economic growth and urban construction but also brought unprecedented changes to the daily lives of Chinese people, especially in living spaces and family life. Zou Qichang and others have linked China's design with social changes, believing that "design is closely related to socio-economic activities, and a certain economic base determines certain design concepts and behaviors. A history of design is a history of socio-economic changes." (Zou Qichang, 2021) This reflects the marketization introduced after the reform and opening-up and the promotion of design development through the improvement of industrial production levels. In terms of housing, the reform and opening-up changed the ownership of living spaces, transitioning from state-owned and planned allocation to commodities that individuals could possess. This changed people's understanding of space, rapidly initiated the production of space, and brought changes to living spaces and family daily life. Chinese sociologist Wang Min'an believes that since the 1980s, the space and family ethical structure have been inverted: spatial relationships have replaced ethical relationships, becoming the primary concern of home management and life. In a sense, the family is the effect of spatial production (Wang minan, 2006). Past research on interior design, especially the history of interior design, mostly follows the research methods of art history, focusing mainly on representative works of interior design styles and styles (Tang xingrong, 2015). This traditional historical research method overlooks the actual feelings and life experiences of "people" as subjects in space, leading to interior design research that "sees objects but not people," lacking mutual corroboration between macro-historical materials and micro-materials.

Therefore, this article takes Beijing as an example, based on in-depth research and interviews with more than a hundred families living in Beijing for over 40 years, and selects four families with typical characteristics for analysis. The study observes the changes in family living spaces after China's reform and opening-up from a micro-perspective, based on the living experiences and oral history narrations of the interviewees, as well as spatial information and photographs of family living spaces from various periods.

As the capital, Beijing's living conditions and personnel present very distinct characteristics, namely, communities centered around work unit compounds. According to the nature of work, these compounds can be divided into residences for research institutions and colleges represented by intellectuals, government agencies represented by civil servants, military units represented by military personnel, and factory units represented by workers. Families represented by these four types of personnel occupy over 75% of Beijing's permanent households, demonstrating strong typicality (Figure1).

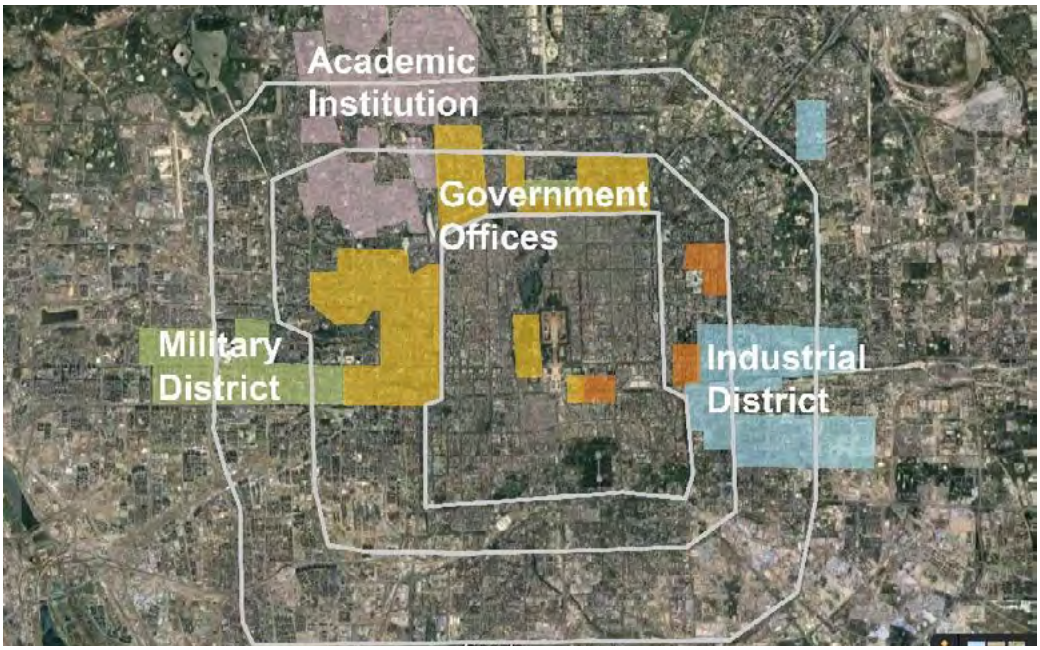

Figure 1. The four main types of work units in Beijing City. (The people working in these units constitute the majority of the population in Beijing City. They are mostly individuals who came to Beijing for study, work, and settlement after the founding of the People's Republic of China in 1949 and after the reform and opening-up in 1978.).

Therefore, this study selects families from these four types of personnel as the subjects of research. The research subject A is a retired university professor (71 years old) who came to Beijing to attend university in the 1970s, and stayed after graduation to become a university professor. Notably, he is among the first batch of university graduates in interior design after China's reform and opening-up. Over 40 years, he has not only engaged in design education but also personally led numerous interior design projects and developed a series of curriculum systems and training objectives for the interior design profession in China. Research subject B (62 years old) grew up in a military compound, joined the army in his youth, and entered a corporation after discharge. Research subject C (52 years old) is a local resident of Beijing for multiple generations, who went to work in the Capital Iron and Steel Factory after high school graduation. Research subject D (56 years old) is also a local resident of Beijing, who became a grassroots government official after high school graduation.

2. Egalitarianism and Collective Living: Residential Spaces and Family Life Before the Reform and Opening-Up

In the early years of the People's Republic of China, under the guiding principle of "production before living," housing construction was severely lagging. In 1949, the national per capita living space was 4.5 square meters. With population growth after the founding of the PRC, industrial backwardness led to a lack of infrastructure, and residential construction developed slowly, resulting in very low levels of urban family living standards. By 1956, the per capita living space of urban residents had not increased but decreased to 4.3 square meters. During the Cultural Revolution from 1966 to 1976, economic and urban construction was essentially at a standstill, and by 1978, per capita living space had further decreased to 3.6 square meters (Lv junhua, 2003). From 1949 to 1978, China's population growth rate far exceeded the rate of housing construction. After 1978, the state changed its closed population policy, adopting a relatively open policy of population mobility. As the capital, Beijing became one of the cities with the largest scale of population inflow, including people who left Beijing during the Cultural Revolution for the "Up to the Mountains and Down to the Countryside" campaign, and those who came to Beijing for higher education through the national college entrance examination after the reform and opening-up and stayed to work. The rapid population growth further exacerbated the pressing situation of housing issues, making solving the housing "debt" an urgent issue of the time. Corresponding to the severity of the housing issue, the 1950s-

1970s saw relatively monotonous residential interiors and family life: on one hand, the newly established PRC, just out of modern turmoil, was scarce in materials and lagging in industrial development. During this period, the state planned to invest heavily in the development of heavy industry, with slow development in light industry related to daily life; on the other hand, the planned economy system shifted people's focus from the nuclear family to the "collective" large family. The ideological socialist construction ideal replaced personal life's attention, and the planned distribution system for housing allocation, and furniture rationing, along with the political equality thoughts of "egalitarianism" and "decoration is a crime" meant that people did not pursue much in terms of interior decoration and daily life. In 1978, two years after the end of the Cultural Revolution, China initiated reform and opening-up, shifting the central task to economic and modernization construction. The state launched a series of economic reform measures to promote modernization and improve people's lives. The "housing problem," as the most pressing social issue, was given attention, and the state began to try reforms transitioning from welfare housing to commodity housing. To achieve the reform's goals of "affordable housing, separation of functions, and stable living," in addition to improving architectural design, the exploration of interior design also became an indispensable important part.

3. The Transformation of Family Space Structure: From Sleep-Oriented to Multifunctional

3.1 The Family Space Structure Before the Reform and Opening-Up

Before the reform and opening-up, China operated under a planned economy system, implementing a housing allocation system also referred to as “welfare housing.” With the state prioritizing the development of heavy industry and adhering to the “production before living” policy, urban living standards were maintained at relatively low levels. In terms of residential design, the main reference was the Soviet standard housing, aimed primarily at controlling the cost of housing construction. Between 1949 and 1978, although the standards for housing construction and types of residential designs varied at different stages, the distribution was based on the principle of equality, not considering the rationality of family living, described as “rational design, irrational use.” A typical example was the tube-shaped building, also known as barracks-style housing, characterized by narrow corridors connecting equally sized single rooms on either side, each about ten square meters, with communal kitchens and bathrooms on each floor (Figure 2). Before the reform and opening-up, a large number of work unit compounds, primarily consisting of tube-shaped buildings, were constructed in Beijing, with each compound inhabited by groups of people working in the same unit (Figure 3). Nearly all interviewees or their parents from the 70s and 80s shared similar living experiences in such housing, which became a memory of their childhood or youth.

Figure 2. The floor plan of the tube-shaped building. (The building is generally 1-3 floors, and the maximum is not more than 5 floors. The floor plan is generally rectangular or L-shaped.)

Figure 3. The tube-shaped residential buildings in Beijing during the 1950s-60s.

The allocation of tube-shaped buildings did not consider the functional needs of families but was purely based on per capita quota area, typically 4-5 square meters per person (Li dexin, 2014). The first housing of research subject A after graduating and working at the university in 1979 was in a standard tube-shaped building, measuring 12 square meters, housing the spouse, child, and nanny. Living, sleeping, storage, and dining activities were all forcibly integrated into one room, and the contradiction of small living spaces with multiple cohabitants revealed a reluctant complexity and ambiguity in the function of interior spaces. In such spaces, ensuring each person's "sleeping area" became the most important task (Yu aokun, 2022). A, leveraging his professional skills as a designer, designed and constructed a bunk bed himself: a large double bed for the couple to use, with a baby crib and ladder on the side of the double bed, and a single bed on the second level for the nanny, thus essentially resolving the living issue for a family of four (Figure 4).

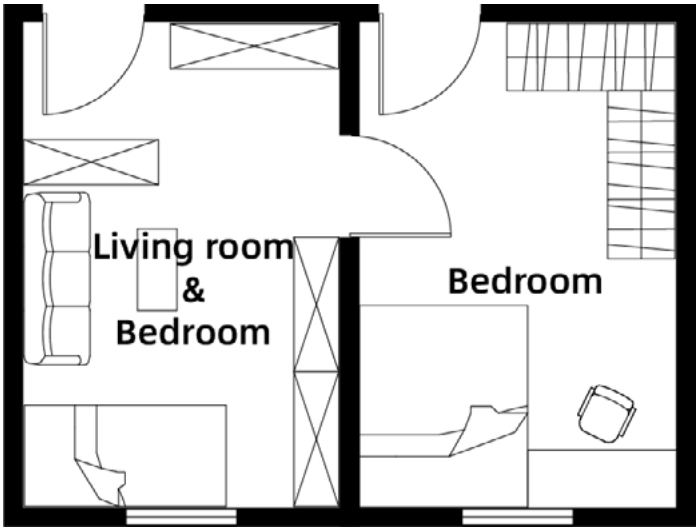

Figure 4. The floor plan of the residence where research subject A's family lives. (Research subject A is a university professor and designer who teaches interior design. The image is personally designed and hand-drawn by him.)

A described this living experience as "living in a can, suffocating." Similar examples of room functionality combinations were common among various types of families surveyed. Family B, consisting of parents and a younger brother, thus four people in total, were allocated adjacent two rooms, allowing them to open a door on the wall between the rooms, connecting them into a two-bedroom unit and further dividing the crowded space for different functions (Figure 5).

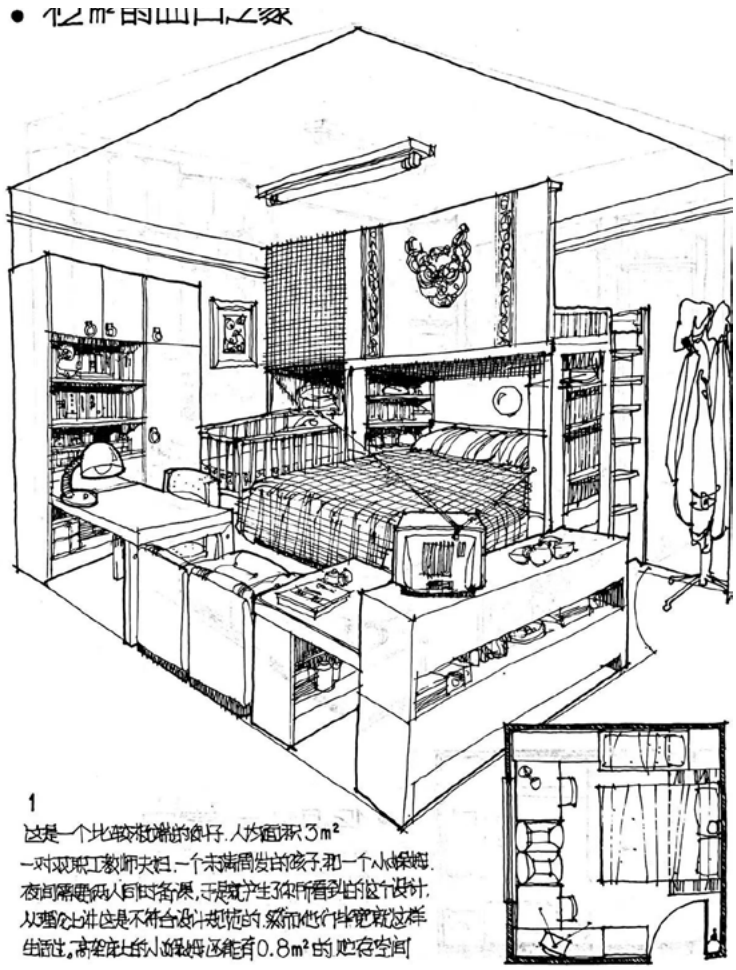

Figure 5. The floor plan of the residence where research subject A's family lives.

This separation allowed parents and children to have their private spaces, yet sleep still occupied the most significant portion of both rooms. When guests arrive, the outer room could serve as a living room, separating public and private activities. However, in tube-shaped building residences, regardless of how many rooms a family was allocated, kitchens and bathrooms were communal spaces shared by all families on the same floor, making shuttling between rooms, kitchens, and bathrooms a frequent and fixed activity route. Since residents in the same building were often colleagues from the same unit and familiar with each other, the blurring between private and public boundaries was further intensified. Although this spatial model brought some privacy concerns to each family, it unexpectedly created a tight-knit neighborhood relationship. In the oral history of research subject B, he recalled his childhood home rarely closed the door, always leaving it open or ajar, especially during cooking times at noon and evening when households would keep their doors open for easy access between the kitchen and bedroom; it allowed adults and children to freely visit familiar neighbors for dining or inviting neighbors to taste their own meals. Only at night, when it was time to sleep, would doors be closed, entering real private life. B mentioned, “At that time (70s-80s), despite poor housing conditions, there was an extraordinary neighborhood relationship. Although there was no blood relation with neighbors, it felt no different from relatives. Sometimes, when adults in the family couldn't come home on time due to work, children could naturally go to a familiar neighbor's home to do homework, play, and have dinner. In contrast, now, as living areas continually expand, the relationship between neighbors has become distant, closing one's door means entering one's own space, even neighbors across the hall would only nod in passing in the elevator, without more conversation or contact.” This situation, unthinkable in today’s urban life as an invasion of private space, was considered reasonable behavior in housing before the 80s due to the ambiguity brought by cramped spaces, shaping the public nature and special atmosphere of neighborhood living space (Figure 6).

Figure 6. The corridors within tube-shaped buildings and the communal living atmosphere. (Due to the limited space of each household, the corridor has become a communal space for children's activities. During the day, children play in the corridors. In real life, because the communal kitchen is too small, some families often set up simple kitchens at their own doorsteps for cooking and storing food.)

Aside from tube-shaped buildings, this period also saw a large number of relatively independent, complete set of multiunit housing, typically with two to three households per floor. "Multiunit housing" is a term unique to China, commonly referred to as "apartments" in English, and is a type of collective housing (Wang junjie, 2017). Multiunit housings are one-bedroom or two-bedroom units, each with its own toilet and kitchen. The "Baiwan Zhuang" residential area in Beijing, constructed in 1953, is a large housing complex assembled from standard units (Li hongduo, 1956). The families of research subjects C and D live in such residences. Although such housing offered more complete spatial functions compared to tube-shaped buildings, due to the design still following the area quota system and focusing primarily on meeting sleep needs, space remained limited. In actual family life, larger rooms still assumed multiple functions such as bedroom, living room, and dining room, sometimes also serving as the master's study or children's playroom, with the family's daily life largely centered in this room. The added joy brought by this composite function and uncertain spatial division is that families would periodically change the room's layout, utilizing movable furniture like sofas, cabinets, and beds to divide the room's space, meeting the family's needs at different stages or seasons, or adding freshness to family life. For instance, when A's family's child reached the age to attend kindergarten, requiring more space for activities and play, and no longer needed a nanny during the parents' work hours, the family reverted to a three-person state. At this time, A dismantled the original bunk bed and redesigned and made a low, floor-level large bed (Figure 7).

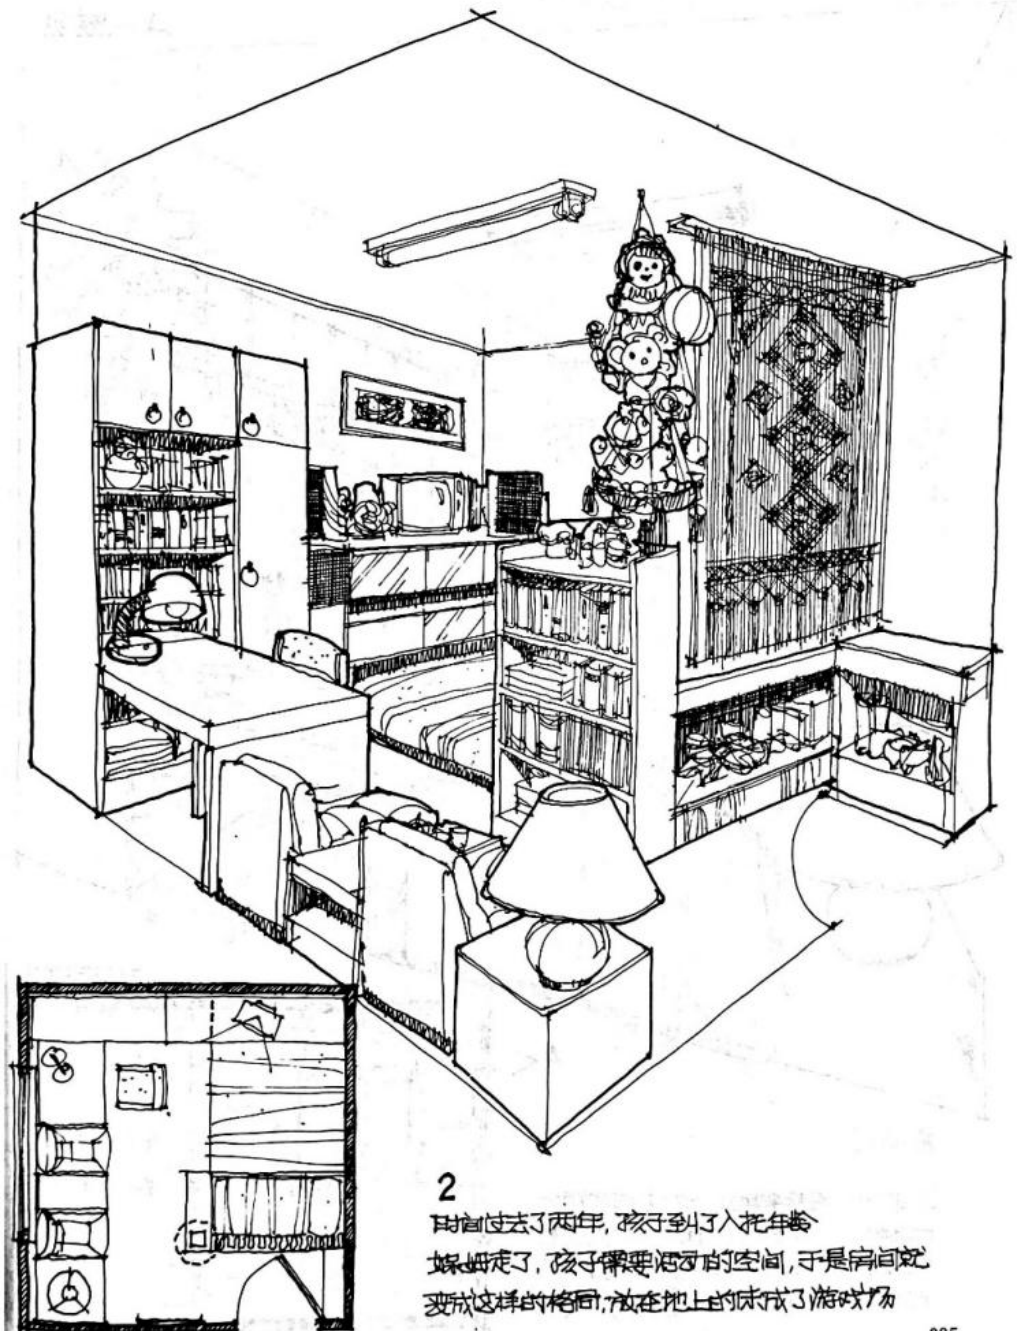

Figure 7. The arrangement of research subject A's family space after the nanny moved out.

When the child needed to play, the bed, serving as a sleeping space, formed an unobstructed connection with the floor, allowing the child to freely climb up and down, facilitating better interaction between parents and child. Family D would move the sofa to the south side of the room near the window for better living room lighting in winter, and make different adjustments in summer. As D grew older and needed to sleep in a separate room from the parents, a space was partitioned in the living room with a bookcase for a single bed, and a curtain was hung at the end of the bed. He mentioned, “When guests visit or my parents rest or read in the living room, the bookshelf and curtain isolate me in a relatively private space to do my own things without disturbing each other. The bookshelf was made by my dad, who later added a board in the middle, dividing the bookshelf into two parts, one side towards my bed where I could place my books and decorations, and the other side for their stuff (Figure 8).” This entirely “functionalist” design and home layout, autonomously designing living space according to life needs, reflected the design intelligence and daily life joy of families during that period. This type of small area, multifunctional, sleep-oriented housing, and family daily life was widespread before the reform and opening-up and continued until the late 1980s.

Figure 8. The floor plan of the residence where research subject D's family live.

3.2 The Family Space Structure Before the Reform and Opening-Up

After the reform and opening-up, the state began to improve people's living conditions. From a temporal perspective, the improvement of housing includes two phases: the first phase from 1978 to 1998, still adopting the welfare housing distribution model; the second phase from 1998 to the present, entering the era of commercialized housing. Specifically, regarding improvements in residential design, this can be summarized in two aspects: increasing space and rational room division. Regarding these two aspects, the 1980s was a critical period for residential development in China. Through reviewing literature related to housing, the author discovered that the 1980s experienced dense changes in housing policies, housing layout, spatial patterns, and interior design. In terms of increasing space: in the 1980s, to save land and increase residential density, Beijing began developing high-rise residences and accordingly relaxed the standards for residential space, significantly increasing the living area for families. In terms of functional division of housing, in 1985, the “suite concept” was proposed in the “China Technical Policy Blue Book” issued by the state, promoting residences composed of living rooms, bedrooms, kitchens, toilets, corridors, or living rooms for single-family use, equipped with corresponding facilities such as showers, gas, and heating (Lv junhua, 2001). The promotion of the suite concept led to homes built in the late 1980s gradually having complete and mature daily living functions (Zhao guanqian, 1999). In "The Discovery of Dwelling," the Japanese housing scholar Ryue Yosizaka proposes the "three types of living," categorizing human dwelling behaviors into three classes. "First living" involves actions to sustain physiological and vital needs; "Second living" covers activities such as production and consumption that support the first living; "Third living" encompasses art, entertainment, and intellectual activities (Zhang hong, 2002). It is precisely because of the increase in residential areas and the rationalization of spatial functions that family living has been able to move towards completeness. The four families surveyed in this article also moved into

residences with larger areas and more rational functional zoning in the late 1980s to the mid-1990s: a single room no longer needed to serve as both a bedroom and a living and dining room, members of different generations had their own private rooms, and kitchens and bathrooms no longer needed to be shared among several families. The separate kitchen and bathroom are integrated into the household, encompassing the basic aspects of family life (Zhang Qinyi, 1995). In the mid to late 1980s, kitchens and bathrooms in residential layouts were no longer bundled together but were adjusted based on functional needs. The number of appliances inside kitchens and bathrooms increased, and their layouts became more detailed. The usable area of the kitchen was increased to 5-7 square meters (Lao Yuanyou,1983), and storage space also began to expand: overhead cabinets made of concrete slabs were installed on kitchen doors, niches for storage were set up on the side walls, cabinets were mounted above the stove, and storage space was also created under the countertop (Bai naipeng, 1985). During the same period, the functionality and space of bathrooms in residences were also improved: to reduce interference between different functions, separations between areas such as the sink, bathtub, and toilet began to appear. Family life is clearly separated from communal living by the threshold of the door, with domestic functions becoming gradually more refined. Research subject C recalled moving in 1994, saying, “At that time, feeling that we could live in a house that was all our own, without having to share kitchen and bathroom facilities with neighbors or go to a public bathhouse for showers, felt incredibly blissful. It was like moving into our own happy paradise” (Figure 9).

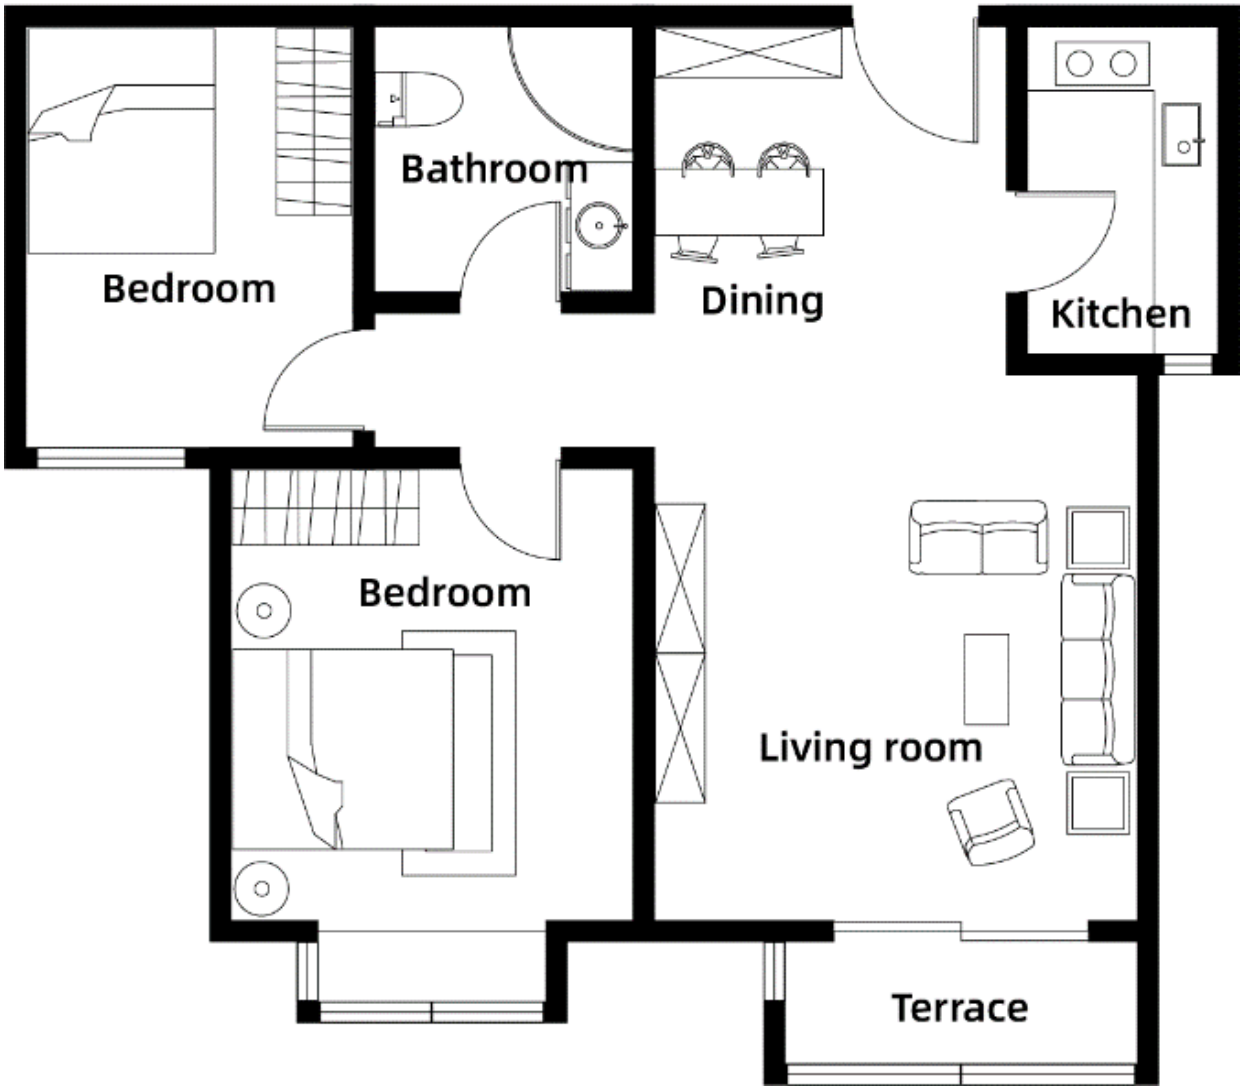

Figure 9. The floor plan of research subject C's family residence in 1994.

Research subject A moved into a two-bedroom apartment, allowing the couple and their growing child to have their own independent rooms. The increase in space and separation of functions also impacted family life: A could continue working at home after work without worrying about disturbing others. After some time, A used a modular cabinet to divide the bedroom space into a work area and a rest area, making the room more suited to actual needs (Figure 10). A mentioned, “Being able to work from home, I could spend more time at home instead of having to finish my design drawings before returning. I also had more time and space to spend with my daughter. She always watched me finish my design drawings when I wasn’t busy and asked me to teach her how to draw. It was then that she developed an interest in art and decided to become a designer when she grew up.”

Figure 10. The housing of research subject C's family in the 1990s(The photo shows the workspace separated by cabinets in A's bedroom, used for drawing design plans and preparing lessons.).

By 1998, China officially ceased the welfare housing distribution system, advocating for housing purchases through loans, with houses being fully introduced to the market as commodities. As products designed to meet people's purchasing needs, residential spaces began to be designed larger, with further rationalization of functional zoning to meet the area and usage needs of different families. Segmented spaces such as studies and bedrooms equipped with private toilets began to emerge. The average living space per capita for urban residents in China increased from less than 4 square meters in 1978 to about 9 square meters in 1997. In Beijing, a first-tier city, the average living space per capita reached 14.36 square meters (Li Yan, 2009). According to the author's research, from this time on, the majority of the research subjects' families no longer only owned one set of housing but began purchasing additional properties to acquire higher quality living spaces and family life. Research subject D mentioned, “Our family's living no longer needs to be cramped together, and as family members age, each member has more space needs.

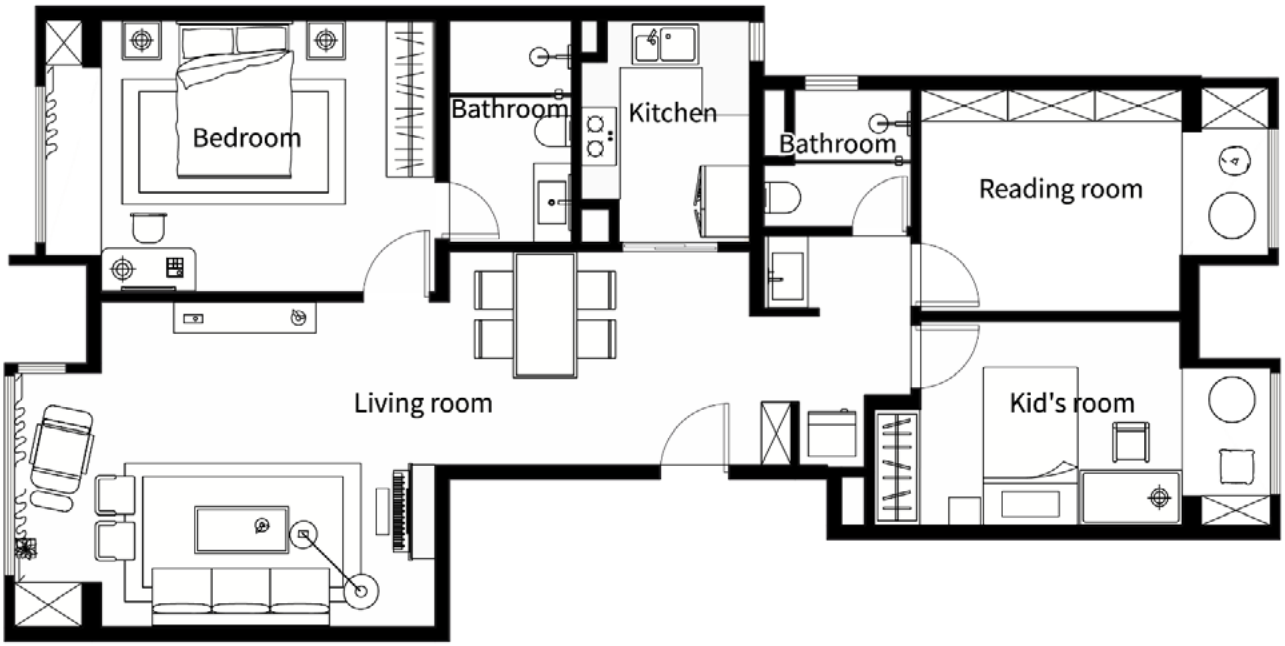

Figure 11. The housing of research subject D's family in the 2000s. (This housing unit is 128 square meters in size, which is twice as large as the previous residence of the D family.).

When we didn't have a living room, we wanted a house with one; after getting a living room, I started to want my own study to read and work at home; and as my child grew older, she also needed a larger and more independent personal space. Such changing needs prompted us to keep thinking about buying more houses (Figure 11)." Compared to the 80s and 90s, the increase in space not only satisfies the functions of living and daily life but has also become a property that adds value to the family. According to the research summary, starting from 2000, most of the Beijing families researched would purchase a set of housing within 5-10 years to improve their family housing conditions. As of 2020, the per capita housing area in Beijing reached 33.7 square meters, a tenfold increase from 1978.

4. The Changes in Family Living Spaces Brought about by Household Appliances and Home Facilities

4.1 The Family Public Life Centered around the Television and Living Room

After the reform and opening-up, the legitimacy of modernization was initially established within people's physical sensations. According to Zhang Xudong, at that time, Chinese people had many doubts about whether China was considered a modern country and whether they were considered modern individuals, which were actually rooted in these physical sensations. Inherently, there was a collective historical impulse to embrace, possess, and create a truly modern life as quickly as possible (Zhang Xudong, 2014). For families, objects, especially household appliances, were at the core of this modern life imagination. In the 1980s, China's economy saw a significant uplift, and the reform and opening-up led to a leap in family consumption. From the 1950s to the 1970s, the "Four Big Items" were the dream of many families, symbolizing the standard of living for families. The "Four Big Items" were "sewing machine, bicycle, watch, radio," colloquially known as "three rounds and a sound." By the 1980s, the new Three Big Items were "black and white TV, single-tub washing machine, single-door refrigerator"; by the late 80s, they became "color TV, twin-tub washing machine, double-door refrigerator." Before the reform and opening-up, due to China's limited industrial production capacity, televisions needed to be supplied by plan and ticket, and only families with purchase tickets could buy televisions from state-owned stores. Research subjects A and C's families each purchased a 14-inch black and white television in the late 1970s. According to C's

description, "At that time, families owning a television were very rare. Although it was just a black-and-white TV, the screen was very small, and the TV programs were very limited, it was more like a decorative piece in the house. But every time it was turned on, the house would be filled with neighbors, and several households would bring their children to watch TV. In summer, the TV would simply be moved to the corridor for everyone to watch together." Although the primary function of family residences at that time was for sleeping, the emergence of audio-visual household appliances like the television began to change the family's space and way of life—the audio-visual centered family life became an important feature of residential interior spaces after the reform and opening-up. As the national economy began to marketize, household appliances like televisions rapidly became popular in families. According to statistical data, in 1978, the number of televisions per hundred urban households in Beijing was 1.3, increasing to 24.3 by 1985, and rapidly to 145.5 by 2000 (Figure 12).

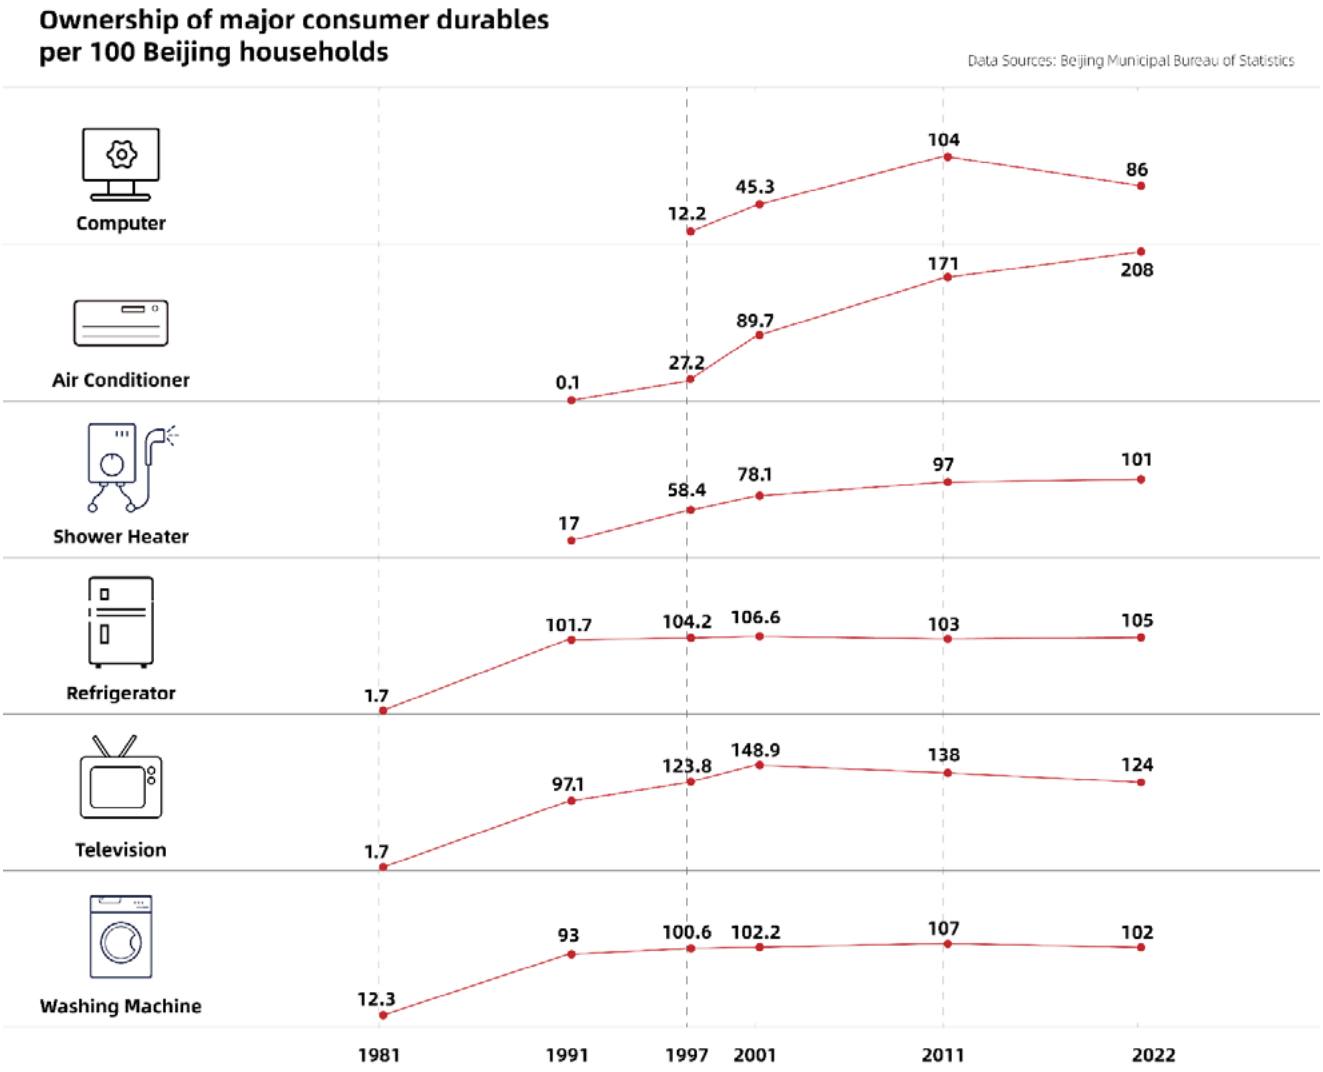

Figure 12. The changes in the number of major electrical appliances owned per hundred households in Beijing families from the 1980s to the present.

The proliferation of televisions made the "large living room" and "small bedroom" a trend in family spaces. When describing their living conditions around the year 2000, all four sample families mentioned "living room size" as an important standard by which they measured satisfaction with their housing. Research subject A mentioned, "At that time, every family wanted an independent living room, because the living room was not only the public space for family members but also a place for receiving friends and connecting with the outside world, like a front stage that could be seen by anyone who came to the house." The living room, as a public space within the family and a transitional space to the social space outside the family, became the center of the entire residence. The television and corresponding audio-visual equipment became the focus of this center, with every family beginning to consider the placement of

audio-visual equipment. As the audio-visual equipment itself has a high degree of technical beauty and a sense of the times in terms of shape, size, color, and texture, apart from achieving the best audio-visual effects, it also has a display and decorative function. The style and personality of the living room became the visual center of the entire family and the display stage to the outside (Figure 13).

Figure 13. The living rooms of research subjects C and A's families in the 1990s and the 2010s.

As a place for rest, entertainment, and conversation, family life centered around the television and the living room also unfolded here. In interviews about the living room, it was found that almost all public affairs related to the family occurred in the living room, especially during TV watching, discussions, and resolutions; the family's emotions were also enhanced in the coexistence of living room audio-visual life. For example, after dinner, when the whole family watched TV, the living room often served as a space for internal family meetings to discuss family expenses, children's education and interest development, family outings, etc.; at the same time, when watching TV programs of mutual interest, exchanges would start, and personal views and opinions would be shared. Parents' understanding and discipline of children were also generated here, making the living room a place that accommodates the commonality of family members.

4.2 The Convenience Brought to Family Life by Electrification and Smart Home Appliances

Consistent with the television, from the mid-1980s, white goods such as washing machines, refrigerators, and air conditioners gradually became popular in urban residences, ushering in an era of electrification in family life. The increase in household appliances led to an expansion in the usable area of residences, making an increase in auxiliary space inevitable. Correspondingly, the use of auxiliary home appliances also provided convenience for family life, changing family habits. Taking the kitchen and refrigerator as examples, in the author's interviews, all four respondents unanimously chose the refrigerator as the appliance that has had the greatest impact on family life since the 1980s. The refrigerator not only changed the way food was stored but also affected eating habits, kitchen space design, and usage. Research subject B emphasized the impact of the refrigerator on family life, especially in terms of food storage and preservation: "My family bought a refrigerator in 1987. The biggest change after having the refrigerator was that we could buy more meat in the summer. Because my home and workplace were far from the market, it was troublesome to go there, and in the summer heat, the meat bought back would spoil quickly if left outside. With the refrigerator, we no longer had to worry about meat spoiling if we bought too much." Research subject C mentioned: "My father and I are both sports fans. In 1990, when we got a refrigerator, it was the year of the Asian Games in Beijing. That summer, my father bought a lot of beer, and after dinner, we'd start watching the Chinese team's games with chilled beer and snacks from the refrigerator. I was just 18 then, and it was the first time he allowed me to drink. I remember many nights we'd drink and talk about the games, and life. It was the happiest summer I had with my father."

Interestingly, initially, the refrigerator in Chinese homes was not placed in the kitchen but in the dining room. One reason was the small size of family kitchens in the 80s and 90s, only enough to accommodate a sink, countertop, and stove; the second reason was that the refrigerator, as a relatively high-end household appliance at the time, had a certain display function and was thus often placed in a more conspicuous position in the home. After 2000, the electrification of kitchens further increased: microwaves, rice cookers, exhaust hoods, induction cookers, ovens, and other small kitchen appliances and equipment gradually became popular, making cooking behaviors and procedures more complex, and allowing for larger and expanded kitchen spaces. To make the cooking process smoother, some families with large kitchens began to place refrigerators in the kitchen, considering the refrigerator and cabinets as a whole in the design and layout of kitchen space, to balance convenience and aesthetics (Figure 14).

Figure 14. The kitchen arrangement of research subject A. (The left image shows a refrigerator from the 80s-90s, which can be seen placed outside the kitchen, serving a certain display function. Nowadays, refrigerators are more often placed in the kitchen, forming a kitchen layout closely linked to cooking activities.)

In recent years, with the emergence of small smart home appliances with more refined functional divisions, thanks to the development of mobile internet and smart IoT, these smart home appliances have begun to more deeply integrate into daily family life. The interconnectivity of home appliances facilitated by IoT technology and smartphones further brings convenience to family life, while also effectively reducing the energy consumption of appliances (Figure 15). For example, research subject B purchased a smart air conditioner and humidifier for the family, which can set the ideal temperature and humidity on a smartphone. When the temperature and humidity are not within the ideal range, the air conditioner and humidifier will automatically start working and stop after adjusting. Additionally, the use of smart vacuum robots and dishwashers significantly reduces the cleaning tasks for family members, especially the elderly, allowing them more time for rest or leisure activities.

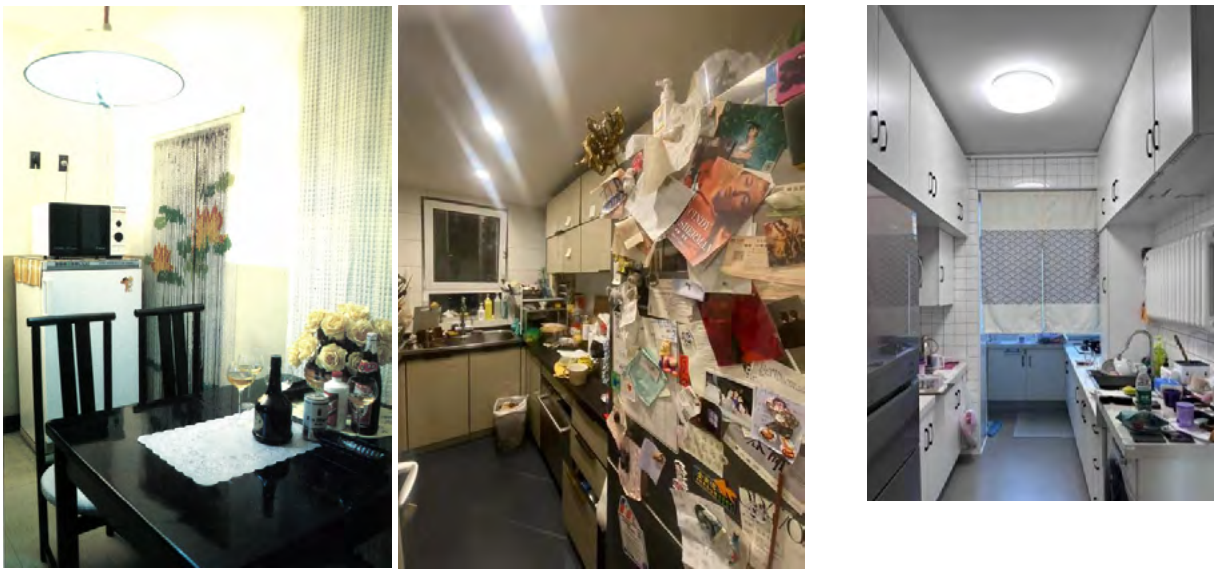

Figure 15. The types of smart appliances currently owned by the four surveyed households.

5. Characteristics of Changes in Home Decoration

5.1 From Standardization to Personalization

During the planned economy period, urban residents' home decoration tended toward standardization. This design approach was partly to save economic costs and, on the other hand, to reflect the equality of people's social status through standard home decoration. The arrangement of facilities within the room could also collectively display the socialist political characteristics of the space. From the 50s to the 70s, the interior furnishings of ordinary families were very simple, consisting only of essential furniture for daily life such as beds, chairs, tables, and cabinets. As for decorations, walls in the rooms were usually adorned with portraits of Chairman Mao. After the reform and opening-up, the concept of the family as an "individual" rather than a "collective" began to emerge. Marketization, bringing a rich variety of products, made people not only pay more attention to the practicality of home layout but also break away from standardized interior furnishings to show individuality, creating a family living atmosphere became the need for most families. Design scholar Hang Jian, based on the overall social situation in China and the general level of design awareness, argued that China's "modern design" began in 1978, pointing out that only a society that realizes the best development of industrial civilization is through design to improve life, can echo the spirit of design at all levels, and by choosing design through consumption, thereby achieving the highest good of mass behavior (Hang Jian, 2018). In terms of home layout, in the 80s and 90s, there were no professional interior design companies and designers in Beijing yet. Many families' walls, floors, and ceilings were treated very simply, mainly using combination furniture of different shapes and sizes to divide and plan family space. This furniture was usually made based on the ideas and needs provided by the family, asking furniture makers to produce them. Research subject A mentioned, "At that time, all the furniture in the

house, from cabinets and tables to sofas, were created based on my design drawings, and then I had a carpenter make them for me, and most families did the same. If you had no ideas, the carpenter would offer suggestions based on their own experience." After the new century, with the furniture market maturing, people could choose ready-made furniture or customized furniture according to their aesthetic preferences. In recent years, the concept of "minimalist decoration, emphasis on adornment" has gained popularity, with simple interior decorations filled with personalized home decor becoming the choice for many families when doing interior design. In the current home of research subject A, one can see the display space specially designed for his favorite ornaments, showcasing his personalized collection of hobbies and aesthetic taste.

5.2 From Intricate Decorativeness to the Integrity of Space

After 2000, professional interior designers and construction personnel began to be active in the market, and home decoration tended more towards personalization: walls, floors, ceilings, and other interior space interfaces were decorated and processed, and people paid more attention to the coordination of lighting, furniture, and furnishings. Interestingly, between 2000 and 2010, some families were keen to imitate and draw inspiration from the decoration style of hotel rooms: wooden wainscoting, multi-layered ceilings, and patterned wallpaper became the main elements of the space. Unfortunately, in terms of furniture and furnishings coordination, most families lacked an overall aesthetic awareness, leading to discordant home spaces, such as "Baroque" style wallpaper matched with Chinese-style furniture. After 2010, under the influence of internet media, the Scandinavian minimalist style of "IKEA," the modern design concepts from Italy focusing on wholeness and materials, and the impact of "environmental consciousness," led to a home interior design philosophy that began to emphasize the integrity of space: simple spatial interfaces, harmonious color atmospheres, unified style furniture, personality-showcasing furnishings, and decoratively functional fresh green plants became the aesthetically pleasing decoration choices favored by families (Figure16).

Figure 16. The current interior appearance of the homes of research subjects A and B.

6. Conclusion

This study aims to showcase and reveal the changes in interior spaces and family life of urban households in Beijing since China's reform and opening-up. Utilizing methods of literature analysis and anthropological ethnography, this research combines historical documents as objective materials with oral facts from family surveys. Based on interview data from four types of families, it outlines the changes in Beijing's family interior spaces over the past 40 years. Accordingly, the conclusion of this paper is that after the reform and opening-up, the spatial structure of households has transitioned from sleep-oriented to multifunctional: the increase in area and the rational division of spatial functions are the main reasons for this change. In terms of family life, the prevalence of televisions has shaped an "audio-visual" life centered around the living room; the popularization of household appliances, electrification, and smart technologies

have made modern family life more convenient. In terms of interior decoration, there has been a shift from standardization before the reform and opening-up to showcasing the personalization of family life; from focusing on intricate decorativeness to emphasizing the aesthetic integrity of space.

ABSTRACT | Peripheria x Cor (Agency of Amber) is a research project that delves into the intricate dynamics of global structures, focusing on the historical impact of binary thinking, particularly within colonialist systems. Rooted in the concept introduced by Jane Schneider, the project distinguishes between a core of urban consumers, a periphery altered by its role as a raw material supplier, and an outer margin indirectly influenced by innovations. Exploring the post-pandemic world, the study seeks a paradigm shift away from binary perspectives. The investigation delves into the historical role of dichotomy in geographical, economic, and political structures, with a particular emphasis on the 'amber route' as a precursor to European polities. Challenging established perceptions, Peripheria x Cor adopts a post-humanistic phenomenological approach, rejecting human ontological primacy over material reality. The project engages artistic research methodologies, providing a structured and critical inquiry framework for artists to explore concepts and perspectives and foster innovation. The study focuses on amber as a foundation for interrogatory design research, aligning with the theory of material engagement, asserting the agency of inanimate objects. It argues that objects like amber possess a distinct agency, shaping human intentions, interactions, and cultural systems. Historical contexts, such as Lithuania's peripheral location on major trade routes and its evolution from Soviet occupation to colonial rule, are examined to understand the complexities of power dynamics and economic integration. As the research progresses, the project contends that the Global East occupies a unique position, being too rich to be part of the South yet too weak to be the center. The periphery, in this context, extends beyond geography to represent a space in history and culture. Addressing the colonial wound, the study emphasizes the need to consider colonial and imperial differences in global knowledge production and circulation, emphasizing the intertwining of the geopolitics of knowledge with the geopolitics of knowing. The creation of a new virtual earth serves as a symbolic space where global networks and local environments intersect, offering potential for new grounding. The study advocates for recognizing multiple virtual earths as sites for political alternatives, extra-earthly findings, and journeys into cores and cosmos.

While previous studies on amber often focus on symbolic analysis and historical contexts, Peripheria x Cor takes a unique approach by exploring the material itself and its motivations. Departing from conventional auto-ethnographic practices, the study utilizes creative production to showcase design's transformative impact on understanding the world.

The project acknowledges the challenge of conveying accumulated knowledge transparently in artistic studies, emphasizing that the artwork itself becomes a tangible representation of the research. The study aligns with postmodern critiques of traditional linear models of progress, acknowledging the importance of small narratives or micronarratives in understanding fragmented histories, especially within the context of amber material.

The narrative transcends individual experiences to describe collective culture, employing autoethnography as a method to access nuanced and specific knowledge. The significance of historical figures like Feliksas Daukantas and Hermann Brachert in shaping perceptions of amber is explored, emphasizing the need for small narratives to avoid ideologized histories.

In conclusion, Peripheria x Cor represents a multifaceted exploration of binary thinking's impact on global structures, leveraging creative production, autoethnography, and a post-humanistic phenomenological approach. The study challenges conventional perspectives on amber, advocating for a deeper understanding of material agency and its role in shaping cultural systems. Through an interdisciplinary lens, the project seeks to contribute to a broader discourse on post-pandemic shifts, colonial legacies, and the transformative potential of design research.

Research Focus: Exploring the Potential Shift from Binary Thinking in a Post-Pandemic World
Peripheria x Cor investigates the historical impact of binary thinking on global structures, particularly in colonialist systems where power dynamics were determined by relationships with the center.
Objectives:
• Analysing the influence of binary thinking on societal constructs.
• Examining the post-pandemic scenario as an opportunity for a paradigm shift.
• Investigating the historical role of dichotomy in geographical, economic, and political structures.
• Tracing the historical significance of the 'amber route' in shaping European polities and its influence on later developments.
Following a suggestion by Jane Schneider, a distinction is drawn between a core area of urban consumers, a periphery that is actively altered by its role as a supplier of raw materials to the core, and an outer margin that is indirectly affected through the spread of innovations.
The 'amber route' was an important precursor of the structures underlying the later development of European polities.

My design research project, Peripheria x Cor, challenges established perceptions about the emotional impact of specific materials by adopting a post-humanistic phenomenological approach.
I reject the notion of ontological primacy of humans over material reality, proposing instead that both are part of the same "ecology of representations."
Employing interrogational techniques in artistic research, this approach provides me with a structured and critical inquiry framework. This enables me to refine concepts, engage with diverse perspectives, facilitate dialogues, and stimulate innovation. The methodology goes beyond surface-level understanding, fostering profound and meaningful artistic expressions.

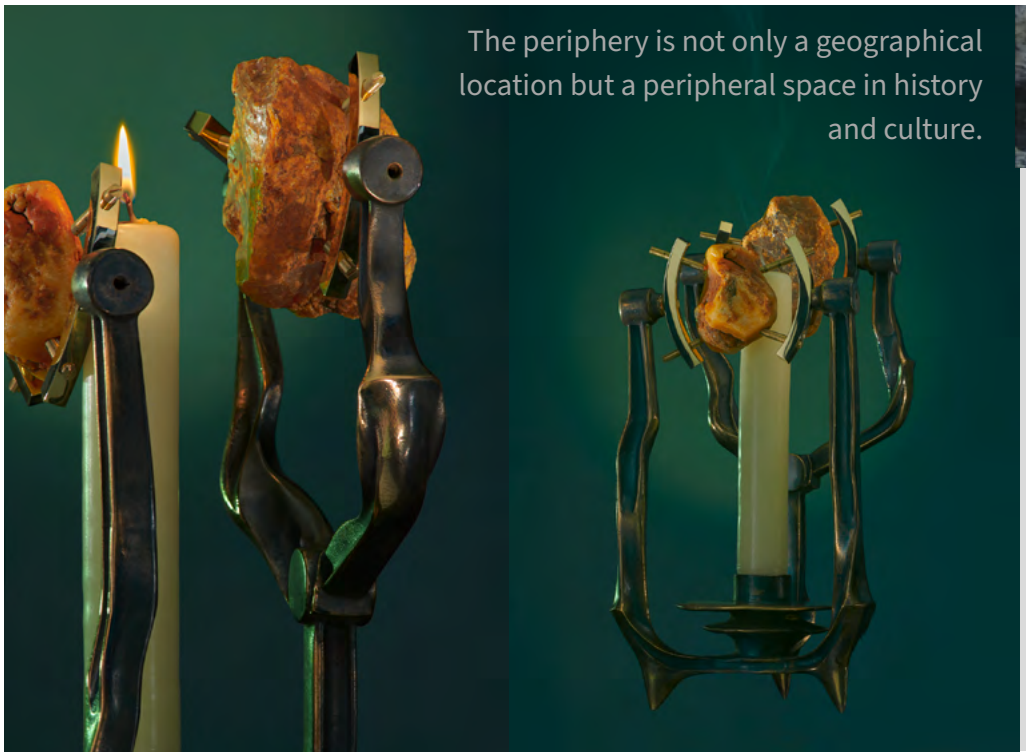
Peri-phe-ria x Cor

The current research phase centers on utilizing amber as the foundation for interrogatory design investigation.

Grounded in the theory asserting the agency of inanimate objects, this study explores the potential impact of such materials.

According to Renfrew's theory of material engagement, it is the experiences of things that make them come alive to the people engaging with them.

Renfrew uses gold as an example and claims that gold has a potent agency which is obvious because of all the trouble we go through to mine it. This means that people do not always choose to pursue ownership of things, sometimes things demand to be owned.The same could be said about amber.



Lithuania has historically been located on the periphery of major trade routes and markets, limiting its influence and potential economic integration.

According to Epp Annus, initially, communist Russia did not seek to colonise the Baltic States but rather 'occupied' them. However, this initial period of occupation later evolved into a phase of colonial rule.

Today the Global East is too rich to be a proper part of the South, but too poor to be a part of the North. It is too powerful to be periphery, but too weak to be the centre.

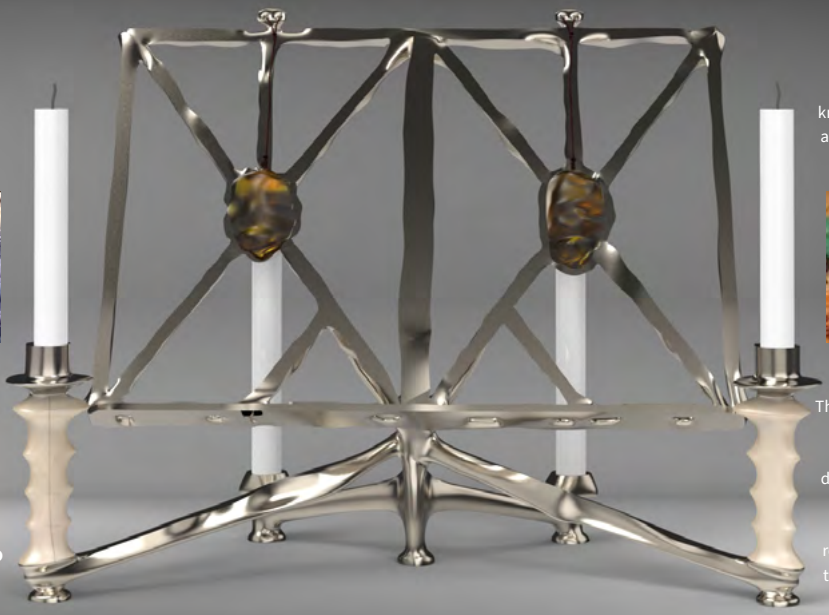
The periphery is not only a geographical location but a peripheral space in history and culture.

The de-colonial path has one thing in common: the **colonial wound**, the fact that regions and people around the world have been classified as **underdeveloped** economically and mentally.

Ian Hodder posits that our perception of an object is influenced not only by its inherent qualities but also by our knowledge about it.

By recognising the agency of objects, we gain a deeper understanding of how they contribute to the shaping of human intentions, interactions, and cultural systems.

Departing from conventional auto-ethnographic practices in anthropology, my project goes beyond mere reporting. Instead, it embraces creative production to showcase how design can have a transformative impact on the world we seek to understand.



It calls for the necessity of considering colonial and imperial differences in discussing global knowledge production and circulation.

Geo-politics of knowledge goes hand in hand with geo-politics of knowing.

Cultural semiotician Yuri Lotman, who studied various cultural practices, argued in his theory of center and periphery meaning-making that it is precisely on the

periphery, i.e., at the edge of the dominant culture, where new meanings are most intensively generated, supporting (and sometimes overtaking) the relevance of the center. According to him, it is not the center, not the canon, but specifically the periphery that is the condition for cultural renewal.

The *crisis of representation* motivates researchers to recognize the limits of the knowledge claims they make about the contexts, subjects, and findings of their research.

The crisis considers the limits of *scientific* knowledge, particularly what can be discovered, understood, and explained about identities, lives, beliefs, feelings, relationships, and behaviors through the use of empirical or experimental methods;

Material kinship can illuminate the violent logics of history-making narratives.

If extraction means to draw forth by force, then something becomes 'material' or 'matter' - object not subject -through sheer will, force or domination.

Extraction is what fuels the engine of colonial-capitalism.

Through domination and oppression, colonialism named most life, land, people and waterways as 'material' or 'property' that can then be converted into capital.

New virtual earth in this map is used as the site where an interconnection lies between global networks and local environment, where potential to form new grounding exists: where power-seeping wires become a site for diffusion towards peripheries and overlooked actors.

CONTEMPORARY ART PRACTICES IN REVIVING FOLK ART / INDONESIAN - HUNGARIAN CASE STUDY.

Luca Petrányi*[a]

a Moholy-Nagy University of Art and Design, Budapest, Hungary
* lucapetranyi@gmail.com

DOI: 10.63442/ROCI1938

KEYWORDS | DECOLONIALITY, TRAVEL DIARIES, FOLK ART, HANDCRAFT TRADITIONS, CONTEMPORARY ETHNOGRAPHY

ABSTRACT | Global tendencies in the aesthetics of art and design are led by the interests of capitalism. Globalisation expects mainstream aesthetics to be new and different, even (to use a controversial expression) we could say exotic, often borrowing motifs from local, traditional cultures. This cycle does not result in recognising and reviving certain folk arts but the opposite: positioning folk art for consumption through fast, market-based circulation. Contemporary artists, on the other hand, often face criticism when using folk art or traditional styles of handcraft techniques. The importance of local forms of knowledge represented in handcraft traditions and folk art is undeniable. However, the ways artists can use, reuse, interpret, redefine, transform, or distort such cultural heritage are unclear.

As a fine artist, I work with Indonesian wax resist batik dying. I find it a personal responsibility to question how I position myself in this highly critical Western discourse. I am committed to the revival of local folk art and believe that artists need to reconsider how we can approach folk art and what kind of relationships should and can be built with local communities. Artistic attitudes can be very different: from exploitative re-exoticising to traditionalist or sensitive. I seek to explore future-oriented artistic attitudes that are free from the colonialist narratives of West-East dynamics that continue to divide us today.

In the research methodology, I explore the questions of colonial heritage, focusing on Hungarian travelers of the 19th and 20th centuries whose ethnographic collections form a large part of the Ethnographic Museum in Budapest. Since the three travelers' personalities had different social backgrounds and personal motivations for traveling to the Dutch-East Indies, these case studies can provide an accurate picture of the semi-peripheral conditions of the period in Hungary. Intersections can be found when describing their attitude to "exotic cultures" compared with the relation to their "own" Hungarian folklore. Studying past narratives and understanding historical complexity can help shape our contemporary approaches.

My network in Indonesia allows me to explore the context of the theme among local artists whose practices involve handcraft techniques and make use of cultural references or who take up the topic of contemporary exoticness. The research touches on the issues and lessons of Documenta15, curated by an Indonesian collective, ruangrupa, in 2022. I discuss questions about the traditional authenticity in the framework of folk art, which often resists concepts of individual ownership or creativity. Folk art practices have a lot to teach us about community-based practices, sustainability, and the potential of learning slow processes, patience, and humility that offer counterpoints to the current trend of global aesthetics.

LONGING TO THE "OTHER" (?) IN THE 21TH CENTURY

Why should we talk about it?

Maori trading a crayfish with Joseph Banks, by Tupaia, 1769. © British Library

Is it a tendency?

In what kind of manner should we relate?

„Then, strip the word exoticism of its exclusively tropical, exclusively geographic meaning. Exoticism does not only exist in space, but is equally dependent on time. From there, move rapidly to the task of defining and laying out the sensation of Exoticism, which is nothing other than the notion of difference, the perception of Diversity, the knowledge that something is other than one's self; and Exoticism's power is nothing other than the ability to conceive otherwise." (Segalen, 2002, p. 18-19)

artists' responsibility,
reactions of the West

2022 Documenta15 organised by Indonesian curator-collective ruangrupa led to a long-lasting debate about what art should mean in the Western context. Ruangrupa's aim was to dismantle the fixed structure of the biennales and to rebuild a functional and appliable model for an alternative way of presenting "art" by destroying decentralising curatorial position and showing anti-art projects (Marchart, 2022). The issue of Documenta15 clearly shows how stuck is the debate of the West and the Other and how irreconcilable questions can come in front when talking about art in general.

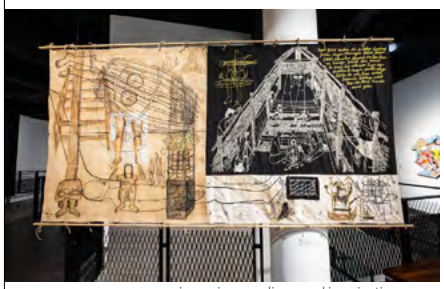
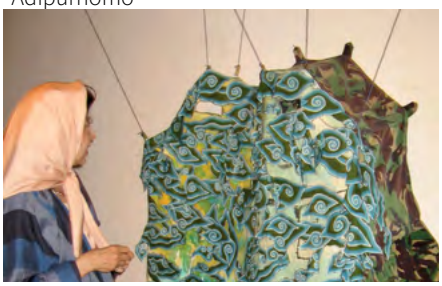
What can folk art practices teach us? How can we implement them in contemporary art practices?

Contemporary artist examples in Indonesia, whose practices involve handcraft techniques, artisan work, who apply cultural references or who thematise the topic of colonial heritage.



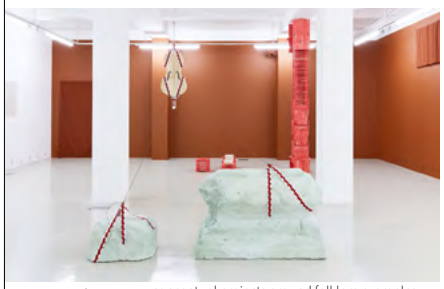
Citra Sasmita — re-creating traditional Balinese kamasan paintings into female dominated pictures



Nindityo Adipurnomo — using various mediums and imaginative narratives, conceptual crafts

Jompet Kuswidananto — Conceptual artist working with the questions of culture and identity

Ipeh Nur — using various mediums and imaginative narratives, conceptual crafts



Mella Jaarsma — Dutch artist living in Java, working with traditional techniques

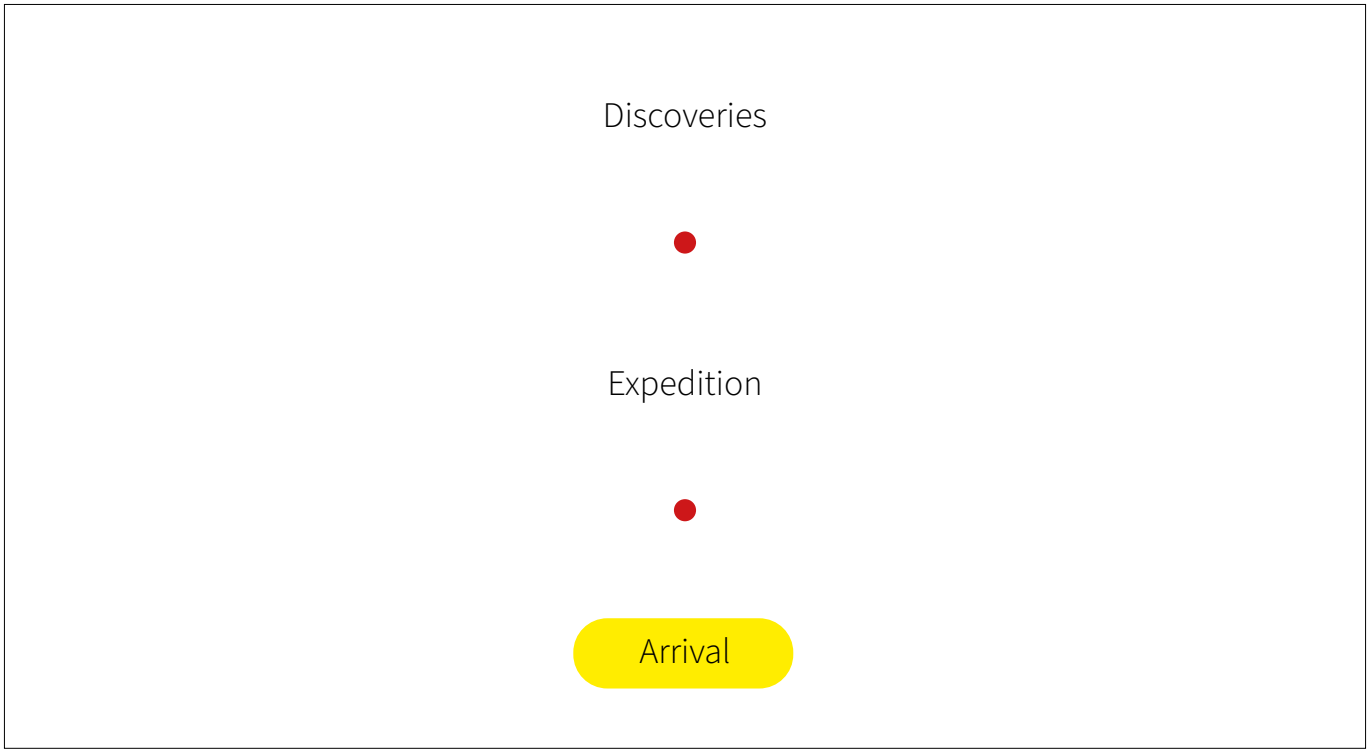
Gabber Modus Operandi — musical duo whose visual conept includes cultural motifs

Contemporary artist examples in Hungary, whose practices involve folklore as a theme or practice, or who thematise cultural topics as artistic-projects.

Dominika Trapp — conceptual projects around folklore examples, microhistories

Bence Pálinkás & Kitti Gosztola — a collecive working with stories from folklore mainly connected to nature

Eszter Ágnes Szabó — often working with traditional crafts and collective activities



OMARA — Roma self-taught artist, often thematising her identity

Krisztián Kristóf — conceptual projects framing anthropology, human glaze

AU Workshop — architecture duo who work with rural practices in their process from Hungarian folklore

DOI: 10.63442/NVSZ6999

For a reminder, in our call, we wrote:
"Today, the necessity of taking joint action in the face of global challenges could not be more evident, yet the political economy is tacitly propagating and pressing for increased specialisation as a key to progress. The idea of converging bodies of knowledge cries for theoretical and practical support. The insights art and design education can provide might be instrumental here, as the conflicts underlying the separation between 'hard' and 'soft' sciences have been played out – in vitro – within their fields of expertise, between design and art. What then are the challenges and potentials of art and design education in integrating different modes of knowledge production? How can the often-opposing interests and assumptions of a variety of stakeholders be reflected through the diverging insights of design and art practitioners? How to address wicked problems, and propose new – whether feasible or utopian – ways of convergence?"

The urgency of the call stemmed on the one hand from the anxieties felt globally in the current multicrisis, and on the other, from the situation all of us – practitioners, theoreticians, researchers or educators of art and design – experience firsthand daily, since the introduction of a market-driven focus in higher education, potentially undermining the breadth and depth of creative and intellectual exploration. The neoliberal pursuit of knowledge production creates its unavoidable pressures for immediate impact and siloed approaches, however, it can also present opportunities for art and design to engage in co-creative, trans- and interdisciplinary collaborations with other domains within and outside of academia, capitalising on the holistic nature of creativity that makes art and design an ideal means of outreach and communication towards society.

Surprisingly, our track ended up competing for the highest number of abstracts for papers, workshops, slide decks and posters received, summing far over 100, from the most divergent research and educational backgrounds. This obviously created a difficult situation for the selection as most of the proposals, among which highly valuable ones, had to be declined or redirected to other tracks where they seemed to fit more properly, to remain within the limits established for the conference. In the end, three workshops, two posters, and a total of 24 paper and slide deck presentations were accepted. Considering shared themes and possible synergies, we configured the presentations into 6 sections that all went by a specific title.

Section 1. Self-reflexivity in Art and Design Education focused on the persona of the artist/designer (practitioners or students) and examined subjects spanning from agnotology, that is, the role of doubt and ignorance in education and design conversations through feminist epistemologies and the application of the concept of situatedness to the exploration of the designer's values and internal processes in critical design methodologies.

Section 2. New Disciplinary Domains and Frontiers: The three scholarly articles and a comprehensive slide presentation of this section presented bold endeavours to introduce new models, metaphors and practices in art and design education covering various areas of research, from endosymbiosis to ancestral practices and to the role of human and non-human agents, challenging the preliminaries of traditional design.

Section 3. Design Education for Children and Young Adults considered practical contributions to social innovation of design as a powerful pedagogical means of empowerment. The case studies presented in this section provided examples of how to improve early childhood development, address educational and material poverty, and facilitate therapies for children with disabilities through design methodologies, using participatory design, rapid prototyping, AI technology, or coding.

Section 4. Inside the Academia The contributions examined the curricula of a variety of HEI from specific points of view and proposed changes to conform them to the new market and societal circumstances. Besides presenting the current collaborative effort FAST UK ('Future Art School trends') by British educators, student collectives and third-sector partners, particular attention was paid to the development of the soft skills of design students under innovative concepts as Equality, Diversity and Inclusion (EDI), the Creative Thinking Style Index (CTSI) enhancing student's creative and collaborative skills, as well as the role of signature pedagogies.

Section 5. Case Studies: Practice-Based Teaching and Industrial Design discussed practices, new methodologies and models from the fields of industrial design with a perspective of potential applicability in "real life" situations. These included accounts on creativity enhancing practices for product design students, inclusive approaches to fashion design, the questions of 'material agency' in book design, as well as an innovative university mentorship and trainee program facilitating students' integration in the job market.

Section 6. Transformative Practices listed contributions with a stronger interest in introducing new pedagogical approaches, with references to the experiential turn in knowledge production and the role performative design can play in it; the transformative power of immersive storytelling design; practices directly addressing the climate crisis and the decolonial issues; as well as the case study of an international workshop where the exploration of the transformation of a specific urban milieu was at stake.

Due to their special relevance to the overall theme of the Conference, Section 1 and 2 were invited to the main Auditorium of MOME, while the others were presented in the convivial atmosphere provided by the Space Experiments Lab, facilitating more in-person discussions. We would like to thank all our contributors for their engagement, intriguing accounts and highly professional presentations, in the hope that their experience was as positive as ours as organizers and members of the audience.

NATURA ARTIS MAGISTRA: THE ENDOSYMBIOTIC DEVELOPMENT MODEL IN THE FUTURE ART ACADEMY.

Dr. Marc Boumeester*[a], Bob Verheijden FRSA[a]

a ArtEZ University of the Arts, Netherlands
* m.boumeester@artez.nl

DOI: 10.63442/LSCH8781

KEYWORDS | ENDOSYMBIOTIC DESIGN, EDUCATION DEVELOPMENT, SOMAESTHETICS, CREATIVITY

ABSTRACT | This paper focuses on the transformative potential of the Endosymbiotic Development Model in the context of evolving art and design education. Against a backdrop of a rapidly changing geopolitical, technological, social, and environmental landscape (and the increasing societal awareness thereof), this text critically examines current paradigms within the author's own (art-) academic structure and substance. The urgency for art academies to align with the dynamic terrain beyond traditional boundaries prompts the exploration of educational models that bridge disciplinary gaps yet do not discard the expertise that comes with the terrain, advocating for innovative educational approaches based on smooth but radical symbiotic inclusion rather than on striated fractionality and reactionary replacement. The authors introduce a bachelor program named "Try Out," which is in development at the "ArtEZ Academy for Art and Design Zwolle," as an application of the Endosymbiotic Development Model in art education, emphasizing social engagement, creative thinking, and question-making. The curriculum prioritizes students' motivation and urgency, fostering a diverse and inclusive learning environment. The program's structure emphasizes ongoing 'exhibition performances,' minors focusing on specific issues, and real-world applications in the form of field projects or social internships, all based on the urgencies and social engagement of the students themselves.

1. Introduction

Against a backdrop of a rapidly changing geopolitical, technological, social, and environmental landscape—and the increasing societal awareness thereof—we have started to critically examine the current paradigms within our own art-academic structure and substance. Underneath this movement, a few assumptions have come to the forefront, some of which are not necessarily innovative but have been overruled by others or reduced to the status of a “paper tiger,” meaning that the basic idea is still there, yet in execution, it lacks the strength to make an impact.

One assumption is that there is an urgency for art academies to align with the dynamic terrain beyond traditional boundaries, prompting the exploration of educational models that bridge disciplinary gaps yet do not discard the expertise that comes with the terrain. Sadly, many reactions in academia to the fading boundaries of disciplines (and their historical professional hinterlands) have allowed a particular neo-liberalist agenda to enter the premises of the art school without much resistance. Many responses to the question of how to react to the excavation of vocational prerogatives have focused on filling supposed gaps rather than reframing the paradigm of education itself. We have witnessed waves of transformations in art education based on a supposed lack of theoretical components in the program, a lack of collaborative skills, a lack of social relevance, or a lack of generalist communication and presentation skills, and so on. Rather than succumbing to reactionary responses to the exigencies of the present, especially within the realm of art and design education, it is prudent to uphold certain traditional values. This does not imply an inherent value in tradition as a tool; on the contrary, change within the academic sphere is imperative to prevent a loss of relevance in ethical and political dialogues. Some traditions, which have long obscured our vision and hold no relevance to the contemporary, must inevitably fade away, including our submissive behavior vis-à-vis societal and political critique. In Holland, less than 4% of all bachelor education at this level is somehow related to the arts and design, and yet it is the segment that has been most scrutinized by political polemic and populist opinion-making. This will not cease by adapting to an agenda that is not part of our main purpose of existence. Moreover, the awareness that this world urgently needs a completely new agenda to somehow salvage what is left of it forces us to act in a far more radical and oppositional way.

A second assumption underlying all of this is the need to grapple with our ‘being in the world’ in a way that cannot be abstracted accountably. Similar to how major industries have escaped accountability for significant disruptions in our ecosystems due to intricate webs of legislation, economic priorities, and the availability of undervalued commodities, we – art and design educators ourselves – seek refuge in the proverbial ‘institutional curriculum’ to alleviate our burden of accountability. The institutional curriculum serves as shorthand for the entire complex of practicalities, legal and administrative demands, habits, automations, etc., that exert influence on us daily within the confines of the school system, resulting in the 'unavoidable average.' In other words, even when there is a specific desire for change, such as revolutionizing an educational program, accounting for all institutional values (work hours, study load, square meters, facilities, salaries, legal accreditation, company culture, etc.) leaves very few variables that can actually undergo substantial change. We colloquially refer to this as the 2% rule: irrespective of the starting point or the initiative, at most, only about 2% can be changed. Yet, the only constant is the expanding perspective of each generation, enabling a broader view of the world and thus heightening individual responsibilities. In this context, the contemporary is marked by perpetual change. The unceasing flux of today intensifies this dynamic; we possess the capacity to perceive more of the world and extend our gaze further into the future. However, the ability to see more does not necessarily equate to heightened insight. Changing the future is impossible as it has not been made yet; shaping it differently than its designated course directs requires drawing lessons from the past and opening ourselves to a radical review of all that we have been doing. This includes questioning the exchange of our individual accountability for institutional responsibility while simultaneously recognizing that some elements are unavoidable and contribute to the need for rethinking this equation. Therefore, the contrast with the old is perhaps not something new but something much older.

The third assumption forming the foundation of our development efforts is to prioritize the logic of embracing the inevitable rather than resisting its consequences. For many decades, we have witnessed a rapidly changing professional field, and yet we have been expected to produce alumni capable of operating at the forefront of these changes. Given that the 'incubation time' of major changes in curricula—apart from the constraints of the institutional curriculum—is about seven years (one year for development, one year for accreditation, one year for implementation, and four years for the first students to graduate under this altered curriculum), this seems like an impossible task. On top of this comes the inevitability of reduction: there is no sustainable agenda that can mitigate the exploitation of our biosphere based on any existing economic model of growth. Less is not only more but also crucial and inevitable. So, the question becomes one of larger contrasts: how can we deliver more with far less, in a changing world that is hard, if not impossible, to keep pace with given the constraints induced by our own systems?

To find an answer, we have started advocating innovative educational approaches based on smooth but radical symbiotic inclusion rather than on striated fractionality and reactionary replacement. To this end, we are working on the development of a bachelor program named "Try Out" at the "ArtEZ Academy for Art and Design Zwolle" which can be seen as an application of the Endosymbiotic Development Model in art education, emphasizing social engagement, creative thinking, and question-making. This program will center Joseph Beuys's credo: "Our true capital is our creativity," at the core of its curriculum and engages with the existing academic structure in an endosymbiotic way. The curriculum prioritizes students' motivation and urgency, fostering a diverse and inclusive learning environment. The program's structure emphasizes ongoing 'exhibition performances,' minors focusing on specific issues, and real-world applications in the form of field projects or social internships, all based on the urgencies and social engagement of the students themselves.

The reviews of this paper, while expressing enthusiasm and appreciation for the work presented, also noted that outlining "a concrete curricular path, as a pilot exercise, duly evaluated, could facilitate the understanding of this new training proposal". We fully acknowledge this suggestion; however, as of the time of writing, this development is still very much in progress. Our goal is to launch the new program in September 2025 for students, and the content presented here represents the foundational elements from which we will build a coherent holistic system. Your feedback is invaluable to us, and therefore we invite you to be a part of this journey. In the next paragraphs, we will conceptualize the workings of endosymbiotics, forefront somaesthetics as a baseline for an unmediated and non-abstractable way of relating to the world, and finally, present our first draft of a curriculum that aspires to address our concerns, by exceeding disciplines and replace paradigms.

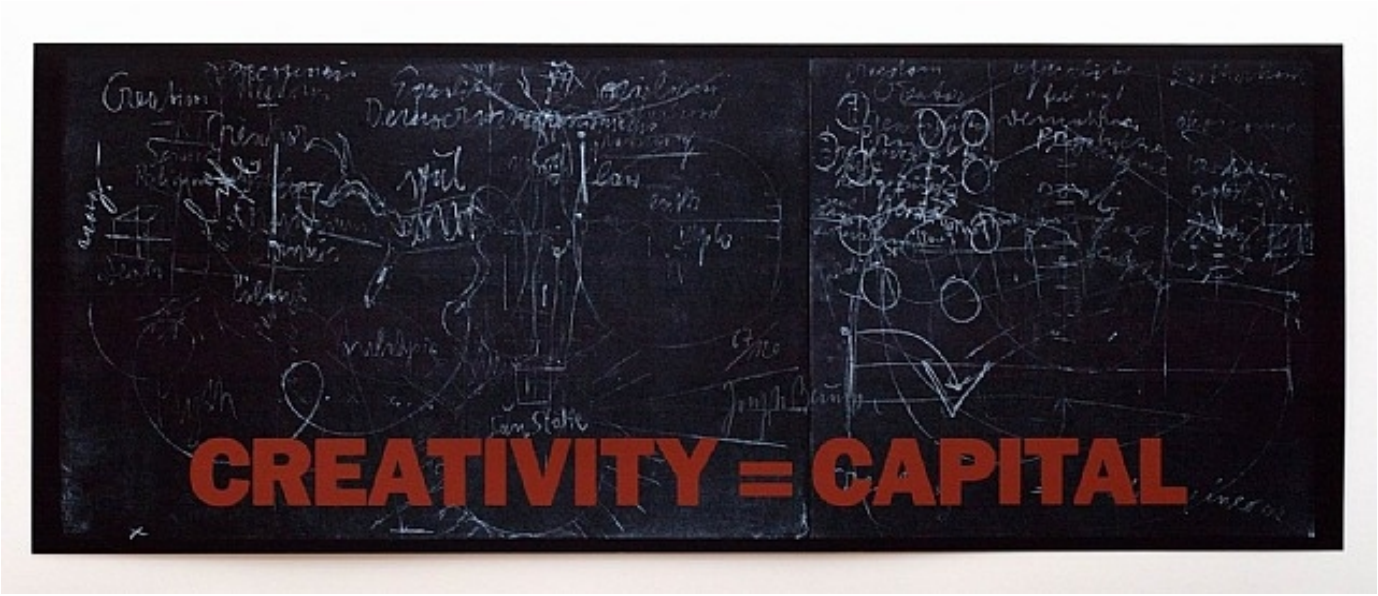

Figure 1. Joseph Beuys, New York Subway Poster "Creativity = Capital" (1983), Lithograph, edition of 120. This image of the work is used here under the fair use policy as stated in Section 107 of the U.S. Copyright Act of 1976 for academic purposes.

2. Endosymbiotics

2.1 In Biology

The Endosymbiotic Development Model is a scientific hypothesis derived from biology, proposing an evolutionary mechanism for the origin of eukaryotic cells. Eukaryotic cells, characterized by a nucleus as a central control center containing genetic material, possess various organelles such as the endoplasmic reticulum and mitochondria, each with specific roles. Surrounded by a membrane that regulates the passage of substances, these cells are present in plants, animals, fungi, and other complex organisms, distinguishing them from simpler prokaryotic cells. An endosymbiont, or endobiont, refers to an organism that resides within the body or cells of another organism, often in a mutually beneficial relationship known as endosymbiosis. The term is derived from the Greek words meaning “within,” “together,” and “living”. Examples include bacteria aiding plants (like legumes) in obtaining nitrogen, single-cell algae living in corals, and bacteria providing essential nutrients to insects. The concept of endosymbiosis is articulated in the endosymbiotic theory, chiefly developed by Neo-Darwinist biologist Lynn Margulis. This theory suggests that certain bacteria began living inside other organisms after being engulfed by them. According to the Endosymbiotic Development Model, ancestral eukaryotic cells emerged through the engulfment and subsequent integration of free-living bacteria by a host archaeal or bacterial cell. This integration is believed to have established a mutually beneficial relationship between the host cell and the engulfed bacteria, leading to the formation of organelles within the eukaryotic cell, such as mitochondria for energy generation and chloroplasts for photosynthesis.

We find inspiration in this model, as it effectively describes several key elements that we are incorporating into our curriculum development and the development of our new academy building. It is crucial for us to view this model in its most abstract form yet retaining its literal concept. Abstract, because we are applying it outside its original context and transposing it to another domain, and literal because we are extrapolating several elements that function similarly in our educational development. Similar to the visual metaphor employed by evolutionary biologist and philosopher Conrad Waddington to depict his view on epigenetics, we use endosymbiosis as the metaphorical embodiment of our development. Waddington posited that the outcome of (evolutionary) *becoming* is not the product of logical necessity but contingently obligatory, which refers to something that is not necessarily predetermined or logically necessary but becomes obligatory or necessary based on certain circumstances or conditions. It implies that an outcome or requirement is not inherently dictated by a fixed rule or necessity but is instead contingent on specific factors or situations. This concept acknowledges the role of chance, context, and the dynamic nature of biological processes in shaping outcomes. This allows for the existence of 'multiple optima,' signifying the possibility of different yet equally important outcomes. Moreover, any outcome can only be established after its formation, never as a result of a predefined procedure.

Waddington's metaphorical landscape, termed the ‘epigenetic landscape’, illustrates how evolution progresses and ‘takes turns’. It portrays marbles rolling down a hill, each representing a mutation in time, competing for grooves on the slope, and eventually settling at the lowest point. The marbles denote the options available in the progress of evolution, with their competition affecting the distribution and the landscape itself. Waddington used the term “creode” to describe the pathway of the marbles, embodying the 'contingently obligatory' argument. In a manner as abstract *and* literal as Waddington's, we apply the major premises of the endosymbiotic model as well as the contingently obligatory argument to the foundation of our future art school.

2.2 As Basis of Our Development

The Endosymbiotic Development Model is proposed here as a transformative approach in the context of evolving art and design education. It envisions a symbiotic relationship between diverse artistic disciplines, fostering collaboration, interconnected learning, and a holistic understanding of the broader societal potential of arts education. Challenging dualities such as 'specialization versus generalization' and 'theory versus practice', the model encourages a multidisciplinary learning environment where students from diverse backgrounds collaborate, disconnecting the building of creativity from artistic development per se.

The main 'learning' that we draw from this model has three components. Firstly, the model doesn't propose a complete renewal as a characteristic element in development. Rather, the developing structure absorbs other bodies for the mutual benefit of both elements. This gives right and tribute to the existing, as opposed to an idea of demolition and starting from scratch. Secondly, the absorbed entity retains a certain level of sovereignty; it is only assimilated to the extent that it becomes part of a larger system, with the added benefit of protection by the bigger body. Its functions are kept operational, as they are the main reason for the collaboration to begin with. Thirdly, it demonstrates the conditionality of use and perception. Many endobionts are classified as bacteria, which can do great good or harm to others, depending on the conditions (contingently obligatory). Yet when encapsulated, symbiosis regulates these effects and produces only positive qualities. In fact, the qualities of the endobiont can start to steer and determine the functioning of the entire cell. The consequent engulfment of new elements builds a holistic outlook on the concept of development itself; it fosters and shelters older developments and insights without being rigid or dogmatic.

A holistic approach as a pedagogical concept is not a new idea. A well-known example is the Humboldtian model, named after philosopher and linguist Wilhelm von Humboldt, which advocates for an education

system that fosters individuality, critical thinking, and the integration of research and teaching. It emphasizes the idea that education should not only impart knowledge and skills but also cultivate students' intellectual and moral character. The model promotes the notion that education should encourage students to become autonomous thinkers and lifelong learners rather than mere recipients of information. In a Humboldtian education system, there is an emphasis on academic freedom, the unity of research and teaching, and the belief that education should contribute to the development of well-rounded individuals capable of meaningfully contributing to society. It centers around the German term “Bildung” (Von Humboldt, 1794), encompassing the concept of self-cultivation, education, and personal development. Bildung is a complex and multifaceted idea that goes beyond the mere acquisition of knowledge and skills, akin to what any good school system should aspire to be. It is often associated with the holistic development of an individual's intellectual, moral, and aesthetic capacities. The term implies a lifelong process of self-formation and self-realization, emphasizing not only cognitive aspects but also personal growth and ethical considerations.

While valuable, we acknowledge that “Bildung” as a verb can act as “condescending and demanding,” as pointed out by Varkøy (2015, p.20). It favors a particular outlook rooted in the Humanistic paradigm, prompting us to question its validity in times that necessitate decentralizing the human in favor of sustainable placement in an ecology that includes the rights and urgencies of all things, not just human. Furthermore, its major premise underlines the necessity of contributing to society, at a time when there is growing unrest about what this society has produced in areas such as equity, inclusion, social injustice, imperialism, environmental and human exploitation, and more. For us, fitting into society is not enough; we need to change it. Hence, we have been exploring radically different ways of thinking about education. We feel the need to challenge the 2% rule and still build on the strengths of what we have. Instead of assimilating different entities into one (purposely constructed and monitored) holistic learning environment, the Endosymbiotic Development Model ensures the sovereignty of its participants in an environment that reciprocally depends on those very autonomies, again a contingently obligatory relationship. For us, this is an intriguing definition of inclusion. The engulfed becomes the *engulfer*, forming new alliances time and time again that are always to the mutual benefit of all involved.

3. Curriculum

3.1 Structure

Our overarching objective is the individual development and cultivation of the capacity for creativity, emphasizing its unrestrained and freely applicable nature as a key competency. The topic of their learning program will be based on the urgencies that students (V/X/M) themselves bring to the table. Therefore, a subsidiary aim is to equip students for sustainable income opportunities within the dynamic realm of supply and demand for creativity and imagination by addressing issues they care about. The program's structure is built on three major focal points.

Firstly, direct participation through individual thematic minors and the “free” selection of domains, meaning that from the first day, students will work on real projects and with real concerns rather than engaging in “sandboxed learning”. Secondly, students will produce a permanent output through the exhibition performance and the field projects, ensuring that their messages will be heard from the beginning and will only increase in strength throughout the years. Thirdly, diversification by stepping away from the traditional entrance exam. The program's structure is designed to attract students with diverse backgrounds. Many potential students have a gift for creation, but not all have had the opportunity to develop specific proficiencies in the arts. Therefore, in contrast to the typical entrance exam, candidates undergo an interview where their motivation and urgency take center stage, rather than an assessment of previous work or proof of artistic talent. These three structural pillars of the program will help shorten the time of addressing the urgencies considerably compared to more traditional structures.

The first year of the program revolves around a continuous “exhibition performance”, allowing students to choose a curriculum based on their passion and expressive abilities, spanning various disciplines from theater and music to graphic design and philosophy, and everything in between. Consistently working on their “exhibition performance” throughout the first year helps clarify which creative processes students need for further development. The classes are organized in several domains from which a selection can be made (more about the domains in the next section). In the second year, students choose so-called “minors,” engaging in intensive individual and collective work on specific issues. This promotes their collective problem-solving skills and individual capacity to ask questions. By the end of the second year, students have reached a conscious level of competence (according to Maslow's model), not primarily based on the use of specific media but rather on their creativity, analytical abilities, and reflective skills.

In the third year, students can apply these skills in their own “field project” or in a societal “internship” that aligns with their personal urgency and theme. Here, the focus shifts outward: the first two years are dedicated to self-development, while the last two years emphasize application and self-realization. This structure resembles the shape of a “diabolo,” setting itself apart from other art programs by not focusing on refining artistic skills but rather on broad societal engagement. During the final year, students create an intervention and regenerate their “exhibition performance” from the first year, this time incorporating all the experiences and knowledge gained during their studies as part of their graduation exam. This includes the applicability of what they have learned in the context of their societal engagement.

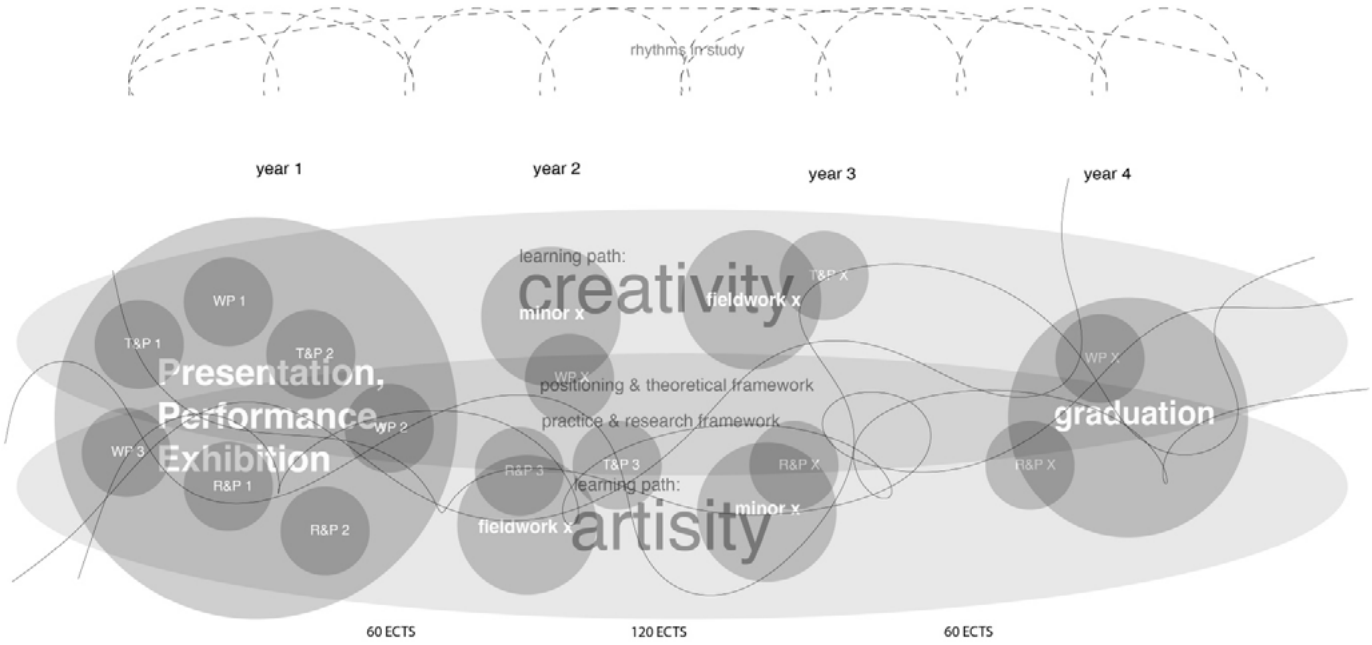

Figure 3. Organizational graph of the bachelor program “Try Out”.

3.2 Content Try Out

The development of the program was initially started by a team consisting of several heads of other departments, the director, and program manager of the “ArtEZ Academy for Art and Design” in Zwolle, The Netherlands. However, to ensure that we would not overlook any aspects (including our own perception biases), we implemented a structured development process with several phases or “Tiers”. Each Tier involves meetings with different groups of people, serving as temporary critics and advisors, ranging from external experts to students and everyone in between. After every session, the plan was elevated to a new level, a higher Tier, implying that the meetings were not inconsequential: every Tier has shaped the plan, incorporating and/or depending on the input provided by the participants.

The “Try Out” program is designed for students who want to express their commitment to social issues through creative thinking and practices. Throughout this program, students acquire valuable skills and insights that enable them to utilize their creative and artistic talents to contribute to addressing social inequality and complex problems in our society. They achieve this by continually developing their creative abilities and employing the creative production processes characteristic of art academies as methods to solve problems. The outcomes of their efforts are guided by the passion that both requires and inspires engagement. The program is committed to addressing the poly-crisis, which is producing pressing societal issues, such as the climate crisis, socioeconomic injustice, and the energy transition stagnation. Notably, our emphasis is on navigating transitions from profession to role, industry to movement, task to goal, ambition to urgency, method to serendipity, and identity to option. In pursuit of these goals, the department presents itself as a collective with an inquisitive spirit, eschewing a rigidly defined identity. It explicitly positions itself as inclusive, postcolonial, and pro-collectivist, evident even in its admission criteria.

At the start of this process, the fundamental question was whether we can continue to fulfill our mission within these premises by departing from media typologies and thinking in terms of disciplines. Even more important perhaps is the question of whether, in response, we should modify our existing departments to the point of diluting their character. We choose not to because we know that all our departments offer a high degree of specialization and high-quality, sought-after profiles that are crucial to the professional field. And still, there is a need for another. Thwartwise thinking is a valuable, unbounded competence that holds significant value across various market domains. By embracing these skills, this department distinguishes itself from others, partially entering a field predominantly served by non-art universities. The protective nature of art academies has allowed the emergence of a variety of programs in other types of universities and colleges operating under the banner of “creation,” even though the development of such competence is (or should be) a main prerogative of our sector.

Apart from the permanent “exhibition performance,” first-year students elect two of eight domains per semester to work in: ambiguity, scenario, dialogue, image, sound, craftsmanship, cartography, movement, and public space, all in the service of their function to address the specific urgency the student wants to tackle. Each domain has a designated ‘domain keeper’ who oversees providing a variety of learning prospects within their specific domain. In each domain there will be a variety of disciplines involved, coming for art, design, dance, music, and theater, which makes this program unique in its kind. By shifting to the level of domains, rather than disciplines, we render the discussion of inter, cross, or trans disciplinarity useless, as this is not adding anything to the development of the department. We actively promote a clear and integral combination of theory and praxis, a proper balance between conveyance and participation, and an unmediated learning environment, yet in terms of form, didactics and activities all is possible.

3.3 Somaesthetics

The new bachelor program will introduce several innovations, revisit older concepts, and incorporate foundational principles. One driving factor behind these choices stems from the observation that most prospective students have experienced a lifelong interconnectedness through the internet, particularly through the use of smartphones, significantly shaping their worldview. The continuous exposure to a stream of global issues can lead to information overload and, in some instances, desensitization. Students may find themselves overwhelmed by the volume and scale of problems portrayed in the media. Many “world problems” may seem insurmountable, potentially leading to a sense of helplessness or apathy. The resolution of the problem (how to stop climate change for instance), does not match the resolution of the student (I can take care of my plant) which leads to a level of abstraction that can be both paralyzing and useless. Additionally, media outlets may carry biases, influencing individual (and group) perception as they select and frame stories, thereby shaping the public's understanding of what constitutes a “world problem”. Without the ability to form a direct and unmediated opinion on the nature of the problem or its impact, one's thinking might shift to realms that are out of reach or non-sensible—for example, advocating to fix the rainforest while continuing to consume meat. To bridge this gap between feeling responsible for

certain world problems and the inability to address their sheer magnitude, an effective instrument involves scaling down the problem to the level of *direct* perception. Associating aesthetics with immediate perception requires finding a middle ground, specifically acknowledging the excluded middle – the inherent agency of the event itself, rather than the combined agency of interacting forces or any mediated extension thereof (Boumeester, 2022). This approach involves surpassing the individual level without reducing individuals to mere components of a group. The process encompasses a highly intertwined theoretical, analytical, and pragmatic aspect. We can only detect what is needed if we recognize the need to detect it, yet we cannot understand what is needed until we detect it. This necessitates engaging the entire spectrum of our bodily senses in the appreciation of our 'milieu.' Philosopher Richard Shusterman proposed somaesthetics as:

> "[T]he critical, meliorative study of the experience and the use of one's body as a locus of sensory-aesthetic appreciation (aisthesis) and creative self-fashioning [...], devoted [also] to the knowledge, discourses and disciplines that structure such somatic care or can improve it." (Shusterman, 2004, p.267)

This model expands the boundaries of "our reflective awareness and assessment of our own sensory appreciation" (Shusterman, 2004, p.268), also known as 'experimental somaesthetics', by extending the body to the level of a symbiotic whole. Sensory organs play a crucial role in sensing and converting stimuli, contributing to various human sensory systems such as vision, audition (hearing), tactition (touch), olfaction (smell), and gustation (taste). Interoception (internal sensations) involves detecting stimuli from internal organs and tissues, including systems like the vestibular system (balance and spatial awareness), proprioception (perception of position, movement, and orientation of the body parts in space), and nociception (perception of stimuli in the form of pain). Humans also experience internal chemoreception (perception of chemical changes) and osmoreception (perception of osmosis change) based sensory systems, influencing perceptions like hunger, thirst, suffocation, and nausea.

One goal of working with this approach is to (re)develop a sort of sense for one's own relation to the extended milieu, a type of "socioception" if you like, that registers and evaluates both the literal and metaphorical proximity and capacity of the mind/body and the socius/world. Essential to comprehending this approach is the perpetual preparedness to engage with any situation, whether actualized or virtual, *within its context*, including the context of one's own ability to engage. This involves approaching each scenario by considering its interrelations with others (its exteriority), rather than solely emphasizing its finite attributes. It fosters a continuous awareness of the assemblage in which one participates, explicitly acknowledging the role of the 'observer.' This entire constellation goes under the name intensive thinking and encompasses a broad spectrum of sensory information, facilitating heightened somaesthetic awareness (Boumeester, 2024).

Given that experiences reach us through various sensory channels, including those that are non-actualized, this comprehensive perspective is integral. This serves not only as a catalyst for innovative approaches in artistic and design processes but also as a potentially 'sterile' exercise where a tangible outcome is neither pursued nor essential. As all bodies behave distinctively in various assemblages, and these assemblages are in perpetual flux, the constancy of a body's capacity to interact with others yields varied effects contingent upon the specific assemblage. We posit that a genuine understanding of even the most elementary bodies necessitates an understanding of the entire universe.

Mastering the finer workings of somaesthetics can be achieved through exercises, while intensive thinking demands a theoretical and philosophical context to be efficacious. The designation of intensive thinking as a 'method' is inappropriate due to its inherent logic: every process constitutes a unique assemblage. Consequently, any observed linearity and causality in previous assemblages may or may not recur. Hence, we prefer to characterize it as a heuristic instrument rather than a method. The interconnected networks of capacities, actualizations, and flows link bodies across different strata and locations (non-local causality), and their precise mechanisms and effects remain inherently unpredictable (heuristics).

Despite its intricate meaning and background, the implementation of this concept in a classroom setting is straightforward. One example is of this is the “six-minute workshop”. The initial requirement is a reasonably sized space that accommodates all participants comfortably. Additionally, participants need some paper and a pencil for notetaking. In this environment, the exploration begins with an intensive approach, utilizing the “six-minute workshop” as a starting point. This involves physically investigating the site, focusing on one sense at a time for one minute each. Observations are recorded on paper and collectively discussed afterwards. The sixth sense is also explored literally, justifying the workshop's title. Though actions like literally licking, touching, and smelling the public space may attract attention, the valuable information gathered outweighs potential embarrassment.

Soma-aesthetic perception often yields entirely different insights than anticipated, proving crucial in subsequent design processes. Assumptions can subconsciously pre-format a solution, whereas affective empirical data raises different questions. This unique perception serves as a purification of general perception, unaffected by overflow and (mis)interpretation through sensory replacement. This refers to the tendency to extrapolate information gained from one sense to be universally valid for all senses. For instance, if something looks disgusting, there is an automatic assumption that it also smells or tastes unpleasant. The experience generates numerous new insights, importantly challenging existing assumptions held by both participants and tutors. The initial impressions based on soma-aesthetic cartography become the focal point of discussions.

4. Conclusion

The exploration into the Endosymbiotic Development Model has been a catalyst for transformative changes in the thinking about our education development, navigating through the complex terrain of redefining art education in response to the dynamic challenges posed by the contemporary world. By critically examining (our) existing paradigms and advocating for a departure from reactionary responses, we have proposed the Endosymbiotic Development Model as an innovative approach. Inspired by biological concepts, we envision a symbiotic relationship between diverse artistic disciplines, emphasizing collaboration, interconnected learning, and a holistic understanding of societal potential.

The “Try Out” program, born out of this model, prioritizes individual creativity, addresses urgent social issues, and fosters a diverse and inclusive learning environment. The incorporation of somaesthetics, emphasizing sensory appreciation and engagement with the environment, adds a unique dimension to the program, as it scales down global issues to the level of direct perception, the program aims to bridge the gap between responsibility and the seemingly overwhelming challenges of the world. Somaesthetics, as a key instrument in our pedagogical toolbox, will play a vital role in maintaining a connection to the self, amidst the complexities of the educational and worldly environment. This approach, characterized by continuous preparedness to engage with any situation, will enrich the understanding of the interplay between the mind/body and the socius/world as a powerful tool for students to engage with their urgencies in a way that is helpful and doable.

Drawing inspiration from the biological concepts of endosymbiosis and epigenetics, we have embarked on the journey of building a new curriculum that prioritizes the individual development of students while fostering a symbiotic relationship between diverse artistic disciplines, ensuring a mutual benefit for both the established and the innovative. This approach rejects the notion of complete renewal in favor of a continuous evolution that honors the sovereignty of each participant while contributing to a larger, interconnected system. The rejection of traditional entrance exams, inclusion of diverse domains, and a holistic approach to education challenge existing paradigms. The emphasis on creativity, urgency, societal engagement distinguishes the shift from discipline to domain, and the involvement of all arts (fine art, design, music and dance) in the formation of its content makes this program unique in its type. And we are happy to share our insights with you and expand our interconnectedness.

About the Authors:

Dr. Marc Boumeester, a scholar and education developer, has held leadership roles in cinema, television, and academia. His research focuses on non-anthropocentric desire, architectural conditions, and media, particularly cinema, emphasizing the concept of “Image by Proxy”. Boumeester's publications include “The Desire of the Medium”.

Bob Verheijden FRSA, Director at ArtEZ Zwolle, has held leadership roles at Minerva Art Academy and Coventry University. An artist and designer, he explores the performance of objects. Verheijden's works are exhibited globally, showcasing his artistic contributions to the field.

Acknowledgements: The development of the new program, Try Out, has been funded by the Quality Improvement Program (PKA) provided by the Ministry of Education, Culture, and Science (OCW) in The Netherlands, along with the enthusiastic participation of colleagues and students from our academy.

ABSTRACT | The objective of this project is to explore ways in which playful museum interventions can enhance and increase parent-child interactions to support early years development goals, including language/communication and self-regulation. This pilot study has been based out of The Fitzwilliam Museum, University of Cambridge in the United Kingdom during August and September 2023. The approach used is a participatory design methodology with an emphasis on co-design sessions and semi-structured interviews involving users and stakeholders. The target group of this investigation focuses on children between 0-5 years and their primary family members living in Cambridge City. This investigation consists of (1) co-design of a museum resource through active engagement and creative development with children and their families (2) design and execution of a physical multi-component toolkit through rapid prototyping using the Museum's existing resources and distribution channels to achieve the social impact pilot study objective. This investigation focuses on the creation of a physical prototype as opposed to a digital one based on initial conversations with parents about use, accessibility, preferences, and interest. Thus, it serves as a blueprint for how design research methods can be applied to fields of early childhood development and museum learning, exploring new multidisciplinary domains while integrating different modes of knowledge production.

1. Introduction and Literature Review

Family Museum Visits and Spatial Ethnography

Research shows that families are crucial stakeholders by means of which museums carry out their general missions along with generating sustainable income (Louisa Hood et al., 2021). Moreover, as per the UN Convention on the Rights of the Child, museums play a central role in their ability to support and encourage children to participate in cultural life (Wallis & Noble, 2022). A museum thus becomes a place beyond historical knowledge and starts to encapsulate active sensory, aesthetic and cognitive experiences in extraordinary surroundings (Wallis & Noble, 2022). To understand the nature of participation that the parent-child stakeholder can experience, it becomes imperative to conduct research studies that actively involves participation in generating data.

Designing for a Sense of Ownership and Belonging

Participatory design can be defined as an approach to support mutual learning through equitable partnerships of communities and experts through the design of an intervention (Cumbo & Selwyn, 2022). By actively involving all stakeholders in the design process, this approach aims to generate a result that meets stakeholder needs and is usable. The process of co-design, although in the same realm, takes this approach a step forward and deepens the level of engagement, input and decision-making power that stakeholders wield in the designed outcomes (Ashley, 2022). This project uses a co-design methodology carried out in the form of various creative activities and semi-structured interviews, placing the users at the centre of the opportunity space.

Incorporating Ways of Seeing and a Child's Perspective

Duncan and Wallach 1980; Sftinteş 2012 relied on the concept of liminality which looks at the interplay between people and the built environment in museum research (Louisa Hood et al., 2021). Inspired by the use-case of liminality in family life (Louisa Hood et al., 2021) and as researched by Isabelle, Dominique, and Statia (2019), this project references the magic of *nesting, investigating and stamping* through guided playful museum interactions. *The Museum and Me* is therefore a case study of the production of socially charged, contextually relevant and culturally sensitive physical tools aimed to materialise the intangibles of early childhood development.

The Significance of a Co-Design Approach in Early Years Pedagogical Development

Design thinking in a pedagogical context is viewed as a central pillar to promoting competencies such as social creativity, collaboration, and critical thinking while enhancing student-centred solutions (Aksela, 2019). A co-design approach in educational practice is known to design *with* students, not *for* them (Corio & Mengis, 2020) by viewing them as active participants who have the right to feel empowered in decisions regarding their own way of life. In recent years, using age-appropriate co-design methods to support children's participation has become one of the main focuses of early years pedagogy, challenging traditional cultures to rethink practices as to take children's agency into account (Brinck et al., 2022). These roles are dependent on the application of co-design and offer many roles to children such as those of co-designers, co-researchers, co-authors, informants, and testers (Brinck et al., 2022). For the purpose of this research study, the participating children have played the role of *co-researchers* in the *discover and develop phases* of the methodological approach.

2. Approach and Methodology

This research investigation has been generously supported through funding provided by Nesta, UK's innovation agency for social good and Art Fund, a UK national art charity. The research questions were co-created with museum researchers and the funding partners to be as follows:

1. What archetypal personas manifest among children aged 0-5 years during their engagement with museum environments alongside their primary caregivers, taking into account their developmental milestones and linguistic competencies?
2. Which sensory modalities predominate in children's exploration of their surroundings, and what attributes of museum spaces (including scale, proportion, materiality, color, and texture) resonate most profoundly with them?
3. Who are the principal stakeholders entrusted with guiding children through the museum experience, and what foundational competencies must be cultivated to foster their agency, autonomy, and penchant for play?
4. How can a multifaceted physical toolkit be conceived to stimulate playful interactions within the museum, informed by insights garnered from the preceding inquiries?

These research inquiries were further refined and operationalized into two distinct studies denoted as Study A and Study B, as delineated in subsequent sections. In alignment with the project's ethos of participatory engagement and innovative inquiry, the funders expressed a vested interest in promoting an approach steeped in participatory methodologies and innovation-centric paradigms. Thus, the project adopted the Double Diamond Approach (Figure 1), as elucidated by the UK Design Council, which systematically guided the project through divergent and convergent phases, underpinned by pertinent theoretical frameworks encompassing museum curatorship, pedagogical strategies for early childhood development, and principles of playful design. This methodological choice was predicated on its facilitation of exploratory and innovative exploration relevance to the project's overarching objectives.

The research and physical kit have been created in close collaboration with experts from early years education and museum learning through a process of co-design sessions and semi-structured interviews with users and stakeholders. These co-design sessions, integral to the project's iterative design process, were meticulously orchestrated over the course of a month, punctuated by visits to the museum at strategic junctures, spanning the phases of discovery, definition, development, and delivery. Employing a mixed-methods approach, the research amalgamated quantitative and qualitative data gleaned from co-design sessions and semi-structured interviews. Qualitative data, elicited through observations and insights recorded via camera and written documentation, were subjected to a nuanced adaptation of Braun and Clarke's Thematic Analysis, affording a comprehensive synthesis of emergent themes. It is imperative to note that all research activities and documentation were conducted in the English language, ensuring coherence and comprehensibility across all stages of the inquiry.

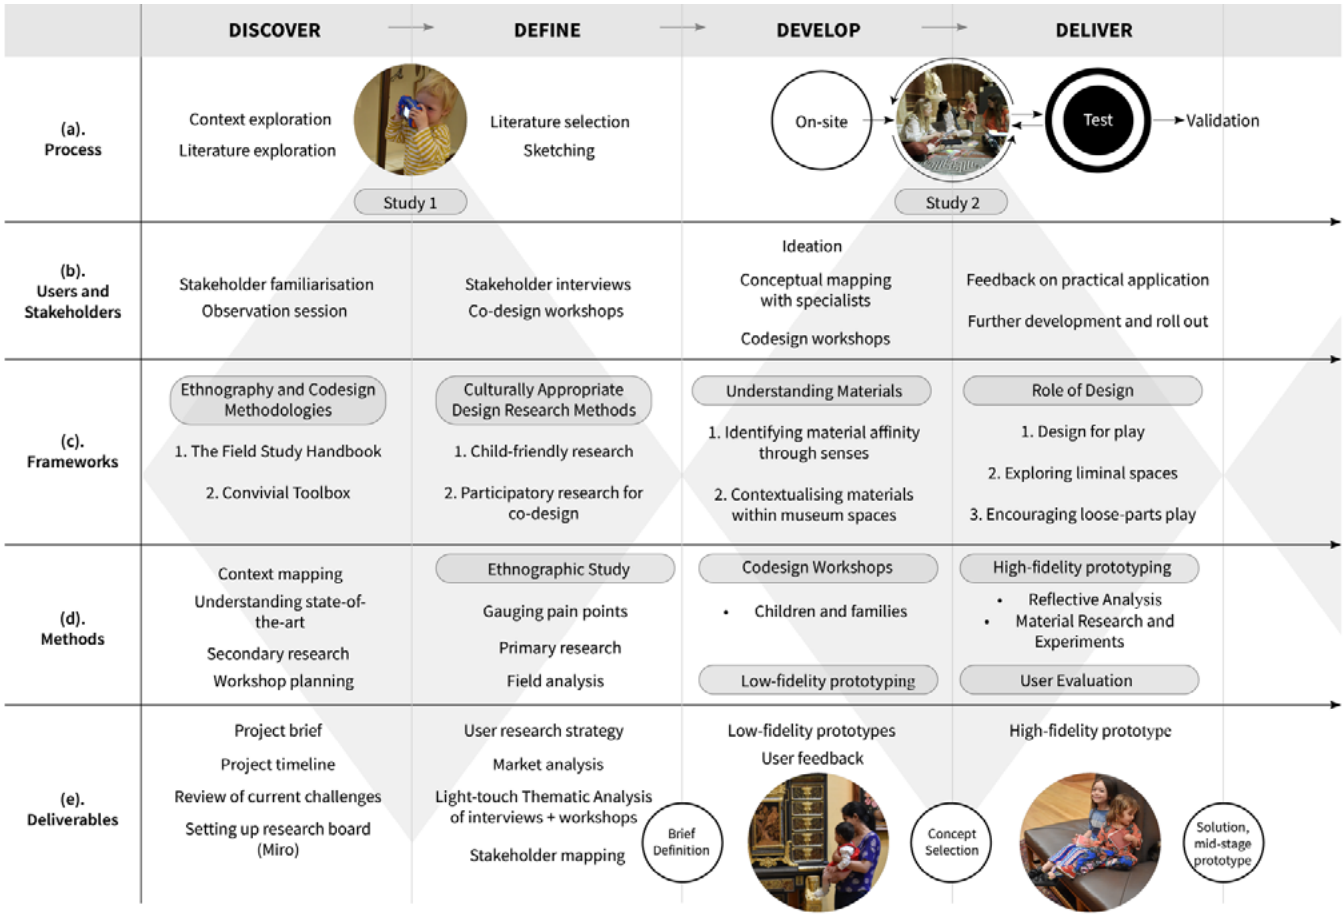

Figure 1. Methodology based on the Double Diamond Approach (full version in Appendix).

3. Study A: Co-design with Families

3.1 Aim

1. To understand the child's persona/s as identified by their parents.
2. To identify the primary sense that the child uses to explore the environment.
3. To understand the child's favourite object/area/destination in the museum to get a sense of the kind of spaces children have an affinity for.
4. To decipher a family's museum experience through parent-child interactions to identify the peak of both the most challenging and most rewarding experiences.

3.2 Study Protocol and Participants

All co-design sessions took place in the galleries of The Fitzwilliam Museum. Participants (N=10 families) were asked to choose an area/gallery they wanted to conduct the co-design activities in. Each session lasted for approximately 45 minutes, depending on the level of engagement per family. The sessions were

led by the designer along with support from a researcher at the Museum. The designer primarily engaged with the parent, while the researcher engaged with the child. However, due to the dynamic and co-dependent nature of parent-child interactions at that age, there was a fair amount of overlap in the interactions and the nature of the sessions was free-flowing.

Figure 2. Image from a Co-design Session with Remy and Leo.

3.3 Co-design Sessions

Each session was broken down into activities of material exploration (child), semi-structured interviews (parent) and storyline exercise (parent). The activities conducted are described below:

1. Gathering insights into material affinity (child)

Each child was shown a selection of different objects made from a range of materials that invoked responses from different senses. These included cloth, translucent and plastic frames, shakers, wooden blocks, etc. They were encouraged to interact with all/any of them as they preferred, and were asked to identify which their favourite object was. In situations where the child was too young to communicate using language, their actions for play and focus were keenly observed as guideposts. The researcher watched how they used/played with that object and took notes of any interesting actions and interactions.

2. Persona identification using the Blob Tree (parent)

Parents were shown the Blob Tree and asked to identify which blob/s best represented their child's exploratory nature when they came into the museum. To contextualise their blob selection, parents were additionally asked to give an example of this kind of interaction that they observed their child frequently displayed. This activity was conducted to identify core characteristics, behaviours and levels of engagement that a child showcased when in the museum space.

3. Persona identification using the Blob Tree (parent)

Using a multiple-choice question format, Parents were asked which sense (smell, taste, touch, sight, sound) or combination of senses their child was most keen to explore the environment through. They were additionally asked to give an example of this kind of interaction.

4. Storyline exercise (parent)

Adapted from the Convivial Toolbox, the storyline exercise helps design researchers understand how a particular user experiences a service, product, or environment. Parents were presented with an A4 sheet that had a line running through it. This line represented a linear timeline with the starting point on the left

being the time they entered the museum with their child, and the end point on the right being the time they exited the museum with their child.

a. On this timeline, they were asked to mark the most challenging moment they observed their child experience along with the most rewarding moment they observed their child experience.

b. Using post-it notes, they were asked to name an object/activity/toy/interaction that could make those respective moments easier or memorable respectively.

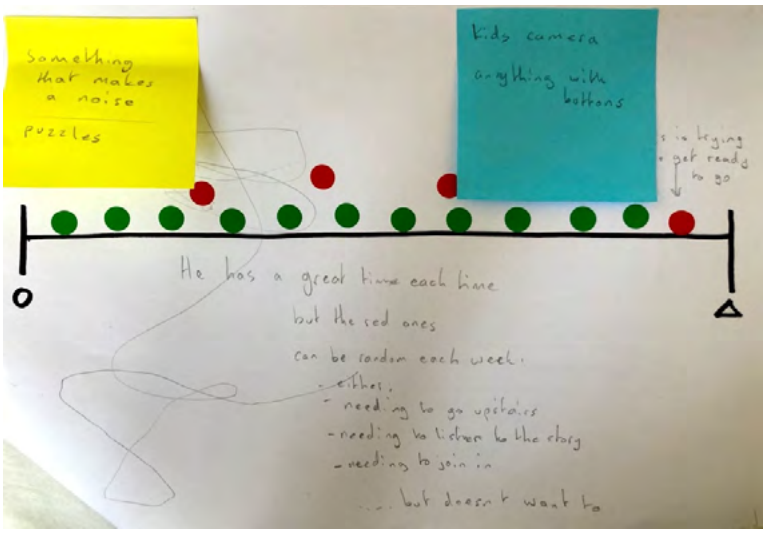

Figure 3. Image of the Storyline Exercise by Abigail.

To support these activities, parents were also asked questions like, “What would you want your child to take away from these museum visits?” and “Does your child ever talk about the museum when they are at home?” These semi-structured interviews provided details about the child’s experience of a new public environment and the types of things they remembered, were excited to share with others, were curious to come back for and were excited to experience again.

3.4 Findings

1. Children between the age group of 0-5 years are inclined to explore the museum as a physical space where the focus is not on the historical relevance (which comes at a later developmental stage), but rather the shapes, colours, sounds, scale and perspectives that they can play with. An example is shown below in Figure 4.

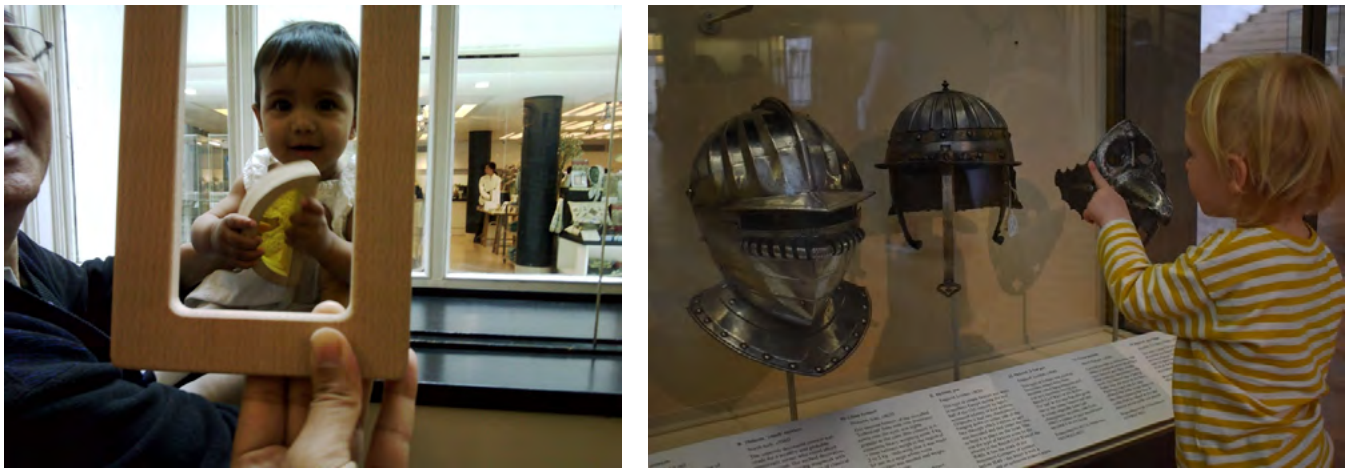

Figure 4. Image from co-design sessions with Tamana and Daniel.

2. Parents' answers to the Blob Tree helped identify the kind of child we were designing for. Descriptive words/phrases that came out of this exercise included *"loves being on the go," "making imaginary friends," "enjoys how much space there is"* and *"likes finding his favourite things"*. Looking at the trio of blobs 16, 17 and 18, Kamala exclaimed that *"these are just like us (the family), exploring the museum together!"*. An example of Lucy's answers about her child's persons as per the Blob Tree is shown below in Figure 5.

Figure 5. The Blob Tree as used by Lucy describing Lily's behaviour, interactions and energy in the Museum.

3. Most parents said that at this age their child relied on their sense of sight and touch to explore the environment as shown below in Figure 6.

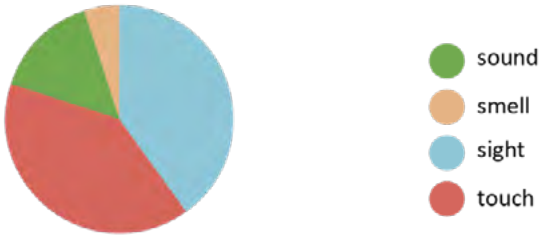

Figure 6. Graph representing parents' Answers for the question *"Which sense is your child most keen to explore their environment through?"*.

4. Majority of the parents marked a point roughly in the middle of their museum journey as the 'rewarding moment' where their child was in a complete moment of flow and absorption. While a point towards the end of their museum journey was the 'challenging moment,' where it was difficult for them to get their child to leave the museum space due to a range of personal, environmental and social factors.

Figure 7. The Average Data Gathered from Parents' Responses for the Storyline Exercise.

3.5 Results and Discussion

Table 1. Factors that emerged from co-design sessions and their thematic and design description.

Factors	Thematic and Design Description
(1). (a). Design interventions needed for the point of: Rewarding moment (experienced mid-way through)	(1). (a). Most parents indicated that their child enters a moment of flow and complete engagement at some point in the middle of their visit, where they are focused on enjoying themselves in the museum - be it by standing next to a statue, going up and down the stairs or crawling through the galleries. On further probing, parents described wanting a physical art book/magazine for their child to draw in to remember this moment.
(1). (b). Design interventions needed for the point of: Challenging moment (experienced towards the end)	(1). (b). Most parents described that their child would experience a challenging moment towards the end of their museum visit. They explained a multitude of factors for this - reluctance to leave a place that they're having fun in (environmental), exhaustion (physical) and agitation (mental). On further probing, parents described wanting a token that could be handed over to the child as a keepsake at the gate/desk as incentive to leave the museum as well as remember their time there.
(2). Parents' desire for their children to explore the museum in a safe way, without feeling like they are being judged for their child walking fast, singing, exclaiming loudly, asking questions, etc. (behaviour that typically goes against traditional expected norms of silent and watchful museum visits).	(2). All parents explained that they wanted their child to feel welcome in the museum space, and that it would benefit them in planning their visits if they discovered through the museum outreach and media channels that the museum was a child and family friendly space.
(3). Parent's desire for their children to learn about the museum as a place that's different from their home/other public spaces, to learn about the existence of an environment where things are preserved and about the ways that people lived in the past.	(3). This ties in with the need of a physical guidebook that illustrates how a museum can be explored through a child's perspective, taking into account their developmental stage and affinity for observing bright colours, exploring different heights and finding their own favourite markers that strengthen their sense of place.
(4). Parents' desire for their child to not feel scared or afraid of museum security staff.	(4). This ties in with training and capacity building that is needed to be delivered to museum staff, highlighting how charged representations of authority and uniforms can solidify fear and nervousness in a child. As at this age, it is important for a child to start being recognised as a developing individual, this can be supported by the museum staff handing out name tags for children to wear and write their names in. Subsequently, if a child is found running or touching something in the gallery, museum staff can thereby address the child directly with an ease and friendliness in their tone.

4. Study B: Design and Execution of a Physical Multi-component Kit through Rapid Prototyping

Figure 8. Work in Progress Image of the A3 Zine.

4.1 Aim

1. To develop a physical prototype that represented the participatory research insights garnered in Study A through playful interactions;
2. To identify areas of further development that go beyond the current form of the prototype.

Note: Outcomes that emerged from Study B of this project were low-fidelity prototypes documented in this paper and are currently being reviewed for further development.

4.2 Components

1. A3 Zine

To fulfil the identified need of *factor 3* from the *Results and Discussion* section in Study A, a low-cost and easily replicable A3 zine was developed. This zine title *'The Museum and Me'* is a visual guide to be used by parents and children (together or independently as preferred) to explore the physical museum space. The story of the zine is based on a child's perspective and use of their senses to explore a new environment (as represented in the empathy map in Appendix Figure 2). It makes use of a clay model developed by a family as the primary character that walks the parent-child through different spaces, objects and creative experiences.

This zine was prototyped in stages (refer Appendix Figures 3 and 4) and the low-fidelity version was tested with three families. Feedback was incorporated and elements modified, after which the high-fidelity zine was designed.

Figure 9. Digital File for the High-fidelity A3 Zine.

2. Acrylic Shapes

The co-design activities and semi-structured interviews reflected the importance of loose-parts play in supporting a child to explore the museum environment. Children between the ages of 0-5 years seemed to have an affinity for mirrors, cameras, and tinted translucent frames through which they could focus on and look through to surrounding objects, people, doorways and architecture. Based on this insight, a set of five tinted acrylic shapes were designed inspired by shapes found in the physical structure of the museum (as shown in Appendix Figure 5). They were subsequently developed by laser cutting blue and yellow acrylic sheets of 3 mm thickness.

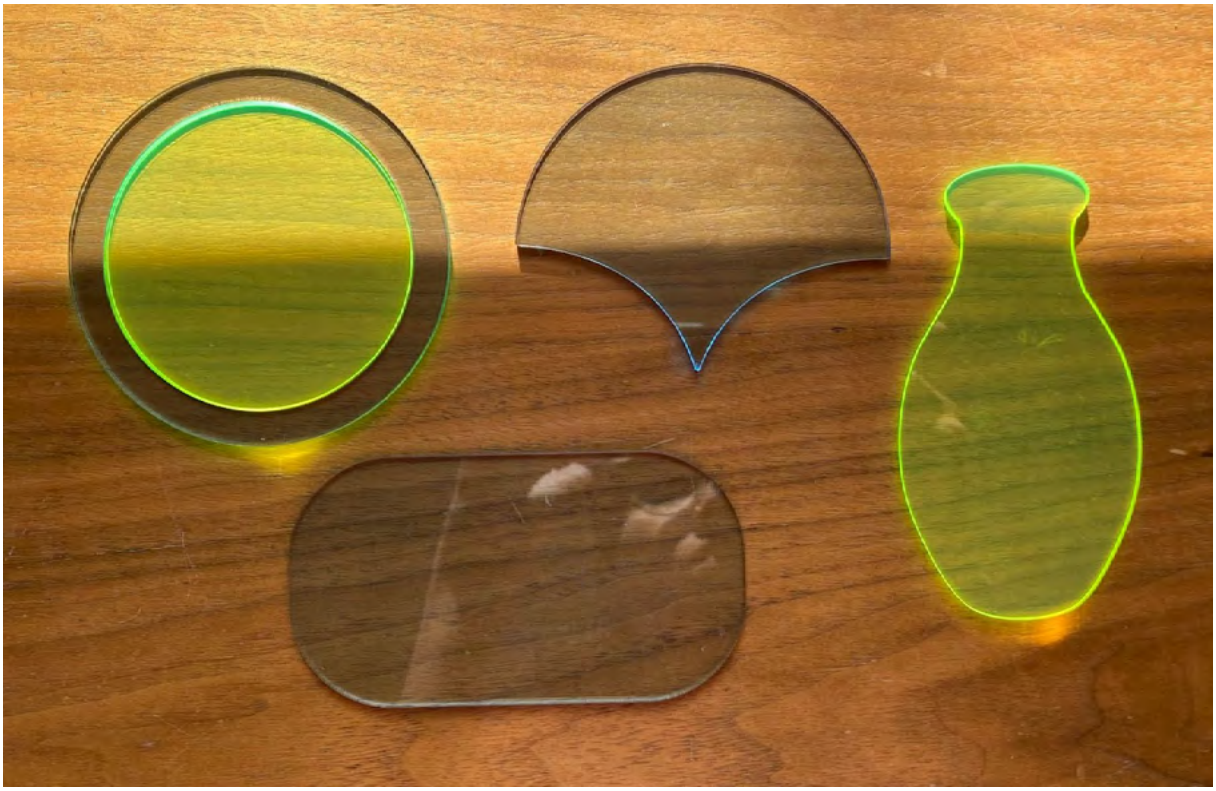

Figure 10. Image of Physical Prototypes of Acrylic Shapes.

Note: The poster in the above photographs is purely for representational purposes and not part of the display at The Fitzwilliam Museum.

3. Poster

To support the outreach and communication section of this project, two illustrations created for the A3 zine were turned into posters. Their intended use is for museum entrances, front desks and play corners which have resources and family learning material.

Figure 11. Digital Files of the Final A2 Posters.

4.3 Results and Discussion

The key contributions of this project lie in:

1. Achieving a practical, interdisciplinary collaboration between fields of participatory design, museum learning and early childhood education.
2. The use of a creative participatory design methodology - with a focus on co-design - from beginning to end, actively involving stakeholders in the design process to ensure their needs have been met.
3. The use of rapid prototyping to create a physical toolkit that is socio-culturally relevant, low-cost and easily replicable.
4. The creation of a physical multi-component prototype that can be rolled out in small groups for further user-testing and development.

5. Challenges Stemming from a Multidisciplinary Approach

This project adopted a design-led, multidisciplinary, and creative approach that allowed for the research to be crafted at the intersection of fields of early childhood education and museum learning. While such case studies are crucial to re-thinking traditional systemic modes of learning and promote inclusion, independence, and autonomy, they pose an array of challenges — ranging from maintaining a balance with stakeholders to divergent goals that are discussed below:

5.1 A Revolving Door for Stakeholders

A key challenge to a multidisciplinary approach is the frequent switching between individuals or entities involved in the flow of research. Recent literature underscores the necessity for a nuanced comprehension of 'good participation' in participatory educational contexts, emphasising socio-ethical principles such as agency and engagement (Cumbo & Selwyn, 2022). If such participatory research principles in education imply that research briefs and studies be set up in a space of earnest co-creation with students, members of educational committees and families, then the onus of maintaining the balance amongst stakeholders falls on the shoulders of the principal researcher, who in many situations may not be the expert authority on the subject matter, while remaining the expert on the nature of participatory engagement.

This provides a tricky situation for the principal researcher, as they must navigate the intricate landscape of diverse stakeholder interests, perspectives, and priorities while endeavouring to uphold the integrity and coherence of the research brief. In essence, the principal researcher assumes the role of a facilitator, orchestrating meaningful dialogue, fostering collaboration, and ensuring that the voices of all stakeholders are heard and valued. However, this task is inherently complex, particularly when stakeholders possess disparate levels of expertise, power dynamics, and vested interests.

5.2 Maintaining Educational Integrity Through a Design Lens

Participatory research is defined by socio-cultural principles that give stakeholders a say in the design of an intervention, while considering the benefits that emerge from stakeholder participation (Cumbo & Selwyn, 2022). Research indicates that participatory research in an educational context inherently aims to empower students by increasing their capacity for creative problem-solving across disciplines. While these skills are now starting to be recognised as core capabilities that support the navigation of systemic challenges, it becomes difficult to quantify and assess the nuanced impacts of participatory research initiatives within educational settings, particularly given the multifaceted nature of empowerment and the diverse array of factors that influence students' learning experiences and outcomes.

While this project emphasises learning through a design lens, the research insights acknowledge the difficulties of effectively integrating participatory methodologies into educational frameworks without compromising the integrity of the learning process. Thus, the exploration of participatory research within education requires careful consideration of how to balance innovation with fidelity to established educational standards and objectives. This endeavour necessitates ongoing dialogue, collaboration, and reflection among educators, researchers, and stakeholders to navigate the complexities of maintaining educational integrity while embracing participatory principles.

6. Future Needs and Opportunities

While the case-study has been successfully completed with key deliverables met, the majority of insights generated through this process currently remain in their early stages. This is due to a multitude of factors such as the short duration of the project, limited budget for physical prototyping and highly dynamic set-up of interactions with families. In order for the research to achieve its optimum potential in practical life, the following areas need to be considered:

6.1 Research and Development

Working with vulnerable groups requires flexibility in terms of stakeholder engagement, scheduling of sessions and the breadth of details that can be covered through interactions with the primary researcher/designer. While this project has taken these nuances into account, the depth of research could benefit with closer interactions with family groups. Areas that can be modified in the research design to achieve this include:

1. Ensuring that the structural integrity of interactions is maintained across all co-design sessions. For example, if planning for single family interactions while preparing co-design activities, it is important for all subsequent sessions to follow the same pattern. Otherwise, the risk of losing personal insights is enhanced in the face of group dynamics where people might be afraid, pressured or influenced by the other stakeholder's presence, opinions or answers.

2. To compare how families perceive museum learning and what they would want it to entail, it would be beneficial to supplement individual family sessions with focus groups for parents. This would allow stakeholders to have shared discussions about goals, ideals and value systems. It would also help in creating a network of family groups that feel connected about this topic, potentially leading to a strengthening of inter and intrapersonal relationships that could positively impact their visits to the museum. In order for parents to have such discussions with their full attention and without disruptions, it would be necessary for their children to be taken care of (if they are in a position where they lack child support) by museum/institutional staff.

6.2 User-Testing

In order to understand the effectiveness of the extent to which the current physical prototypes meet the needs identified, it is crucial for on-site user testing to be conducted. Given the contextual requirements of the project, the ideal test measures would follow a mixed-methods approach that would include the use of child-friendly likert scales, polling questions and journey maps. To gain a holistic evaluation at this stage, it would be beneficial to test the prototypes in individual families as well as in groups of families. The evaluation reached at the end would serve as a necessary blueprint for further iterations required, followed by mass development and roll-out phases.

6.3 Capacity Building for Key Museum Staff

The effectiveness of any tool, product or service depends on the openness, interest and curiosity of the stakeholders involved. In social innovation projects, this tends to involve more than the primary stakeholder as such environments flatten the curve between top-down and bottom-up structures. For children and parents to feel comfortable using the prototypes and guidelines provided, the supporting museum staff including the front desk, security team and museum curators need to be trained in the delivery of the toolkit. This would enable the use of the material in a safe, inclusive, positive and child-friendly environment.

6.4 Strengthening Foundations for Design Research in Pedagogy

Numerous research studies have consistently demonstrated the advantages of involving children in the co-design process during the initial stages of educational development. This approach not only enhances empathy but also encourages proactive problem-solving skills (Paracha et al., 2019). *The Museum and Me* delves into design research utilising creative methodologies, taking into account the specific needs of the environment, and employing readily available, cost-effective materials to facilitate inquiry. The results of this investigation highlight the significance of prioritising user input and providing the necessary tools for guiding their learning journey, thereby expanding the range of innovative outcomes.

A co-design lens diminishes the power gap between the adult researchers and children, establishing a conducive atmosphere for creative expression and affirming the belief that users are experts in their own domain. Viewing museums as learning environments unveils the multifaceted roles of museum curators, researchers, and childhood educators in shaping children's perspectives, communication skills, and overall development. Furthermore, adopting a multidisciplinary approach that integrates design research with early childhood development and museum education fosters new avenues for pedagogical advancements. This inclusive educational model, which emphasizes the active involvement of children, underscores the importance of community and peer engagement within the learning process (Brinck et al., 2022).

Co-design initiatives are able to specifically focus on children furthest from opportunity, help them explore their personal identities and engage in open-ended play within the museum environment. As we reflect on the convergence of various bodies of knowledge within educational research, the integration of co-design principles emerges as a powerful strategy for fostering collaboration and innovation. By bridging disciplines and perspectives, this approach enriches pedagogical practices and promotes a deeper understanding of child development within diverse contexts. This pilot study illuminates the transformative potential of co-design methodologies in shaping the future of education. Through similar collaborative efforts that unite theory and practice, researchers, educators, and practitioners can collectively strive towards creating more inclusive and impactful learning resources for children of all ages.

KEYWORDS | MATERIAL AGENCY, OBJECTS, MULTI-SENSORY DESIGN, SUSTAINABILITY, CONNECTION

ABSTRACT | As you take notes on this article in your black Moleskine, you are also connecting with it and with other objects. How might we explain this connection? How might we design it? This research is based on an exploratory analysis of the relationships designers establish with books, taken as examples of everyday artefacts. The hypothesis states that designed artefacts have an agency that affects designers in the more personal sphere. Initial research started a bibliographic review, after which a socio-material observation model of levels of agency was proposed. The model was validated by testing material objects in workshops that combined participation-action with observing relationships of agency. Finally, the results were read and expressed qualitatively. We have framed person-object relationships as a socio-material assemblage (Bill et al. 2015) in line with Lambros Malafouris's (2013) theory of material engagement, to reconsider the distributed agency of end objects as a shared characteristic, in the light of new materialism (Harman, 2010). The results from the two workshops conducted so far (with 4 and 13 participants, respectively) suggest that emotional involvement and the relationship between users and objects in the practical sphere is greater when participants are related professionally or academically to the design field. The initial interventions show that the number and types of users in the test need to be increased in order to compare data with non-expert users.

1. Introduction

When a person picks up a book, caresses the cover and inhales the scent of the paper, thousands of neurological reactions are taking place in their brain to produce an immersive sensory experience. How might we explain the connection we have with objects? How might this connection be designed?

In Stuart Walker's opinion, design is going through a critical phase of overproduction in the practical sphere (Walker, Stuart 2012). The maxim "form follows function" can be interpreted as an indicator of the value we assign to the practical side of things. In his critique of contemporary design, the author argues that the production of function-based artefacts acts to the detriment of social and personal function. Lack of meaning in the personal sphere is one of the reasons for rising consumerism. Hence the author considers that if designers were to emphasise the sphere of personal meaning, we would be able to generate more lasting relationships with objects.

Following Walker's point of view we understand that designing artefacts that affect us is relevant in establishing more lasting relationships with things. Designing artefacts that are meaningful in the personal sphere brings us closer to the goals of sustainability, reducing consumption and alignment with the needs of an environment suffering a climate emergency.

If we observe the relationship established between people and objects in the terms of New Materialism we can easily identify the problem as part of the living, changing mesh of these theoretical movement studies. As Bill et al. (based on Dolphijn & van der Tuin, 2012, p. 117) explain, this movement can be understood as part of the perpetual rewriting of modern philosophy. It aims to explain how matter imbricates our everyday processes of giving meaning to things (Bill et al. 2015, p. 12).

The authors explain that, despite the diversity of approaches to new materialism, they all share three common areas (Cudworth & Hobden, 2014). The first is that they are based on an object-oriented ontological model, as defined by Graham Harman, in which objects are things and all socio-material ideas, phenomena and constructs are also considered objects or things (2010). The second is that they see reality as an assemblage that is inseparable from human life and non-human processes. And the third is "the acknowledgement of the subjectivity of humanity in a world where the human isn't necessary" (Cudworth and Hobden, 2014, p. 3 in Bill et. al, 2015 p.12). Consideration of humanity's place in the cosmos also implies rethinking relations between what is human and a series of non-human processes "with a variable degrees of agency" (ibid. p. 400).

From this perspective, the end of the Anthropocene Epoch poses challenges to the study of the material relations and interactions established in the mesh of things. The study of connections established between people and objects needs updating in line with a model of variable agency, in which design is not human-centred but also includes xenodesign parameters (Shmeer, 2019), from the multiplicity of relations with non-human agents (Grove et al., 2019) to rethinking non-human-centred perceptive and interpretative processes.

To approach these issues systematically, three main objectives have been defined: (1) defining an experimental socio-material context to observe the designer's experience; (2) exploring material objects and their level of agency; and (3) displacing the point of view to the object.

2. Methodology

We developed a mixed methodology to achieve the objective of discovering the relationship established between objects and subjects, the former being printed books and the latter the participants in the workshop.

Initial research was based on a bibliographic review, which brought us closer to discovery rather than verification (Mejía, 1999), after which a social-semiotic model for observing levels of agency was proposed. This model is the central proposal in this paper and is inspired by the roles design prototypes acquire as sociotechnical entities, as defined in Amanda Guy, Bill Collier and Stephen Reay (2012). The data-collection instrument was constructed from the review, in the form of a printed qualitative survey (Bisquerra, 2004), which, along with the workshop dynamic, was tested with a small group of experts (four participants) in the first workshop.

The next step was to conduct the workshop, combining participation-action with observation of agency relations. The workshop involved participants who were experts in art and design teaching and were considered part of the same microculture. Galen Cranz introduces this concept in her book "Ethnography for designers" to describe specific cultural and social patterns that develop in local and particular contexts (Cranz, 2016).

The workshop was divided into four parts: 1) explanation of the concept of agency; 2) observation and participants' choice of material; 3) answering the questionnaire individually; and 4) discussion of each participant's experience with the chosen object.

During the workshop, the researchers carried out non-structured, exploratory observation (Campos and Lule, 2012), looking for variations in phenomena and behaviours that might be relevant to the purpose of the research.

Finally, a qualitative reading of the results was carried out, guided by the quantitative results from the relation assessment sheets.

3. State of the Art

By extending the definition of design, as proposed by Anna Calvera, we can go beyond the object to include human beings in the design concept. Designers and researchers refer to design as a process of defining an artefact, from its essence to the sensations, experiences, values and imaginary signs it activates in the user (Calvera, 2007).

By adopting an extended definition, we can, by way of reflection, trace how the designer's point of view has shifted throughout history. There are definitions that place the stress on the object, others that focus on the user and, looking further back, one can identify how the designer's point of view shifts in an action-reaction process, which for decades has reinforced the materiality of an essentially relational activity such as design.

Positioning design as a relational activity involves taking into consideration its context, as is the case with the designers and researchers Amanda Bill, Guy Collier and Steve Reay (2015). From their point of view, the designer and prototype are part of the same socio-material whole. They are inseparable from the very organisation, the very thing, and, furthermore, they extend this to users and all the animate and inanimate things that make up the socio-technological assemblage of design.

According to these authors, this point of view is part of the new materialism movement that arose at the end of the 20th century (Bill et al. 2015, p. 12), with the aim of creating a new conception of how matter imbricates our everyday processes in giving meaning to things. The production of meaning, extendable to scientific knowledge, is also one of the results of design, as we understand it in this paper.

The understanding between designer and object begins as soon as the designer and matter meet and extends to the materialisation of the product at the end of the process. It becomes a constant exploratory creation and evaluation process in which matter and its manipulation are considered through amusing, inventive and creative interaction, which can lead to innovation and originality in the design (Parisi, Rognoli and Sonneveld, 2017).

As Bedolla (2020) states, sensory processes play a relevant role in the design process and the resulting artefacts, leading to the search for benefits to skills and abilities at the cognitive and intellectual level, impacting significantly on people's emotional dimension. People's intrinsic nature demands constant multisensory stimulation, according to Bedolla, as we obtain all our information on the external world though our senses. According to Lefteri (2007), materials help us reach people's emotional level.

However, in recent times, the sense of sight has predominated over the others. Both designers and users of objects have neglected the possibilities offered by the other senses. Stressing the visual has left other possible perceptions by the wayside; for example, touch, is capable of producing different physiological and emotional-affective effects (Morales, 2015). Bruno Munari (2016) analyses how many designers adopt a distinctly visual approach to their work, with little interest in considering tactile qualities such as weight and temperature. If, as Munari continues, we consider all the senses when designing, people will gradually discover that we have many sensory receptors with which to discover the world in which we live.

One explanation of why designers (and many other humans) continue to love physical objects, their touch, and their smell, is the concept of the agency of objects. The archaeologist of knowledge Lambros Malafouris reconsidered the agency of objects and identified different coexisting levels of agency in what he calls "the theory of material engagement" (2013). According to the author, the agentic capacity of inanimate objects and animate beings is not the same:

> "(...) we distinguish between "agency", as in the agentic capacity of non-human animals or inanimate objects, and a distinctly human… "sense of agency" –that is, conscious agency" (Malafouris, 2013, p.214).

The distinction between the two provides a more inclusive and equal interpretation of the part of the socio-material whole consisting of people and their objects, as mentioned above. Lambros Malafouris does not consider agency a property of objects and humans; it is not a characteristic of the parts but of the relations established between them, through their shared material engagement.

In relation to the environment, there are different levels of agency with each artefact, a distributed agency. For example, a metro door button has a great deal of agency, even when it is deactivated.

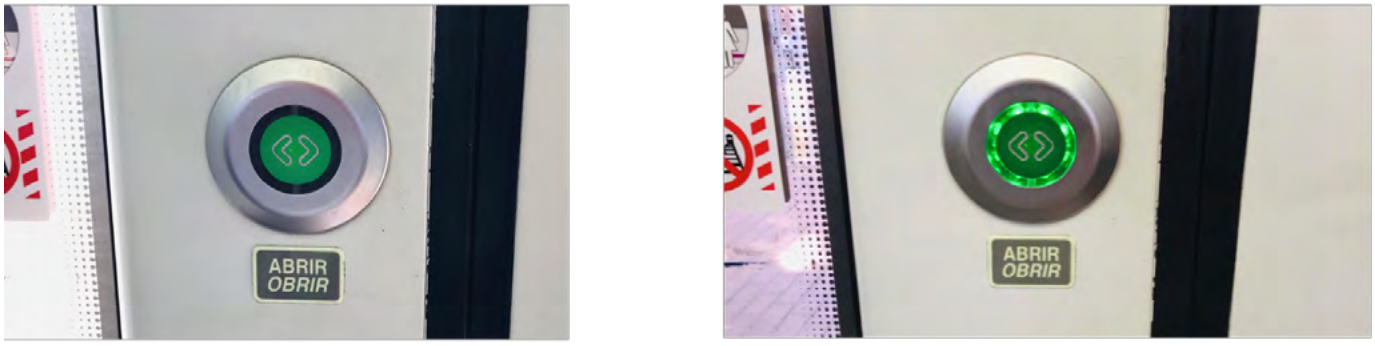

Figure 1. Door buttons on a Barcelona tram. Two levels of agency can be seen, where the one on the left has lesser agency than the one on the right. Photo: Elena Bartomeu.

If we see the design process as one of material engagement, we soon come to realise that designers do not really force their ideas on formats and, ultimately, matter. Rather than imposing their criteria on inert matter (Bill et al. 2015) they listen to the model, converse with it, enter into Malafouris's process of distributed agency, in which artefacts make us change our opinion and the two become a diverse socio-material whole, as explained above.

Material signs do not represent; they enact: They operate on the principle of participation rather than the principle of symbolic equivalency and substitution (Malafouris, 2013, p. 97).

This complements the initial definition of extended design, in which signs activate an environment that is already part of the design assemblage. As Amanda, Guy and Stephen explain, prototypes are not just evolving objects, or not just matter that will later become a final artefact. The processes in which ideas are defined, adjusted and tested through prototypes have more social significance, and more impact on the environment (Bill et al. 2015, 14). And this is even greater if we bear in mind that we have defined ourselves as a socio-material whole in which both human and non-human actors are united in the same organic whole. And even more so if we consider the amalgam of users, clients, partners and the whole network of agents that make up the design production assemblage.

But let us now focus on our interest in explaining the connection we feel with end objects, this connection that leads to personal enjoyment.

Stuart Walker, in The Object of Nightingales (2012), presents a vision of design in which the facet of personal meaning is in crisis. The author states that the designed object or artefact has three facets of meaning in which we may interpret it. All three originate in the anthropological principles of the human being, whereby we are individuals, each with our own body (personal facet), we live in groups of different sizes, be they family, friends, or the group of people with whom we share cultural or national characteristics (social fact), and we live in a natural physical world from which we obtain what we need in order to live (practical facet).

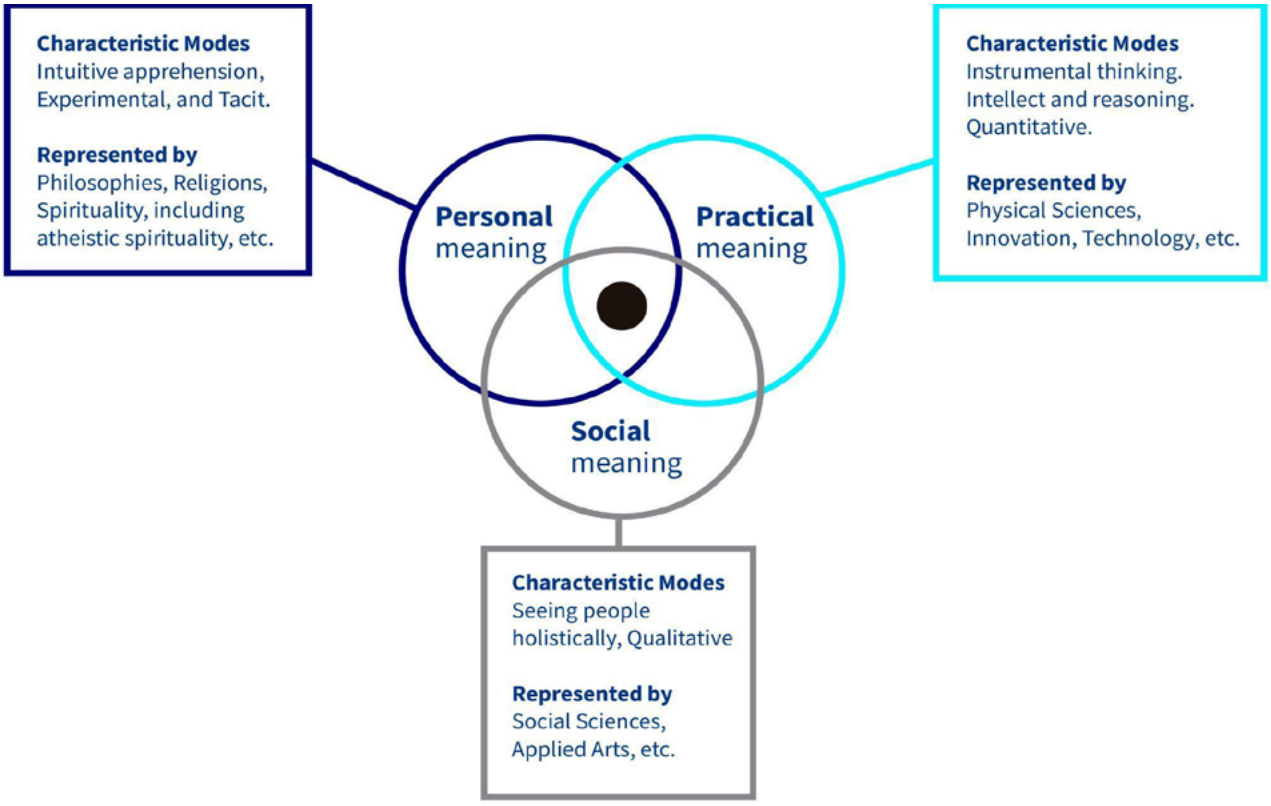

Figure 2: Authors' work, based on Three Facets of Human Meaning and their Interrelationships. Walker, 2012.

As explained in the introduction, the author argues that the production of function-based artefacts is detrimental to social and personal function. For this reason, Walker states that if designers were able to emphasise the sphere of personal meaning, they would be able to generate more lasting relationships with objects, they would place greater value on things and, returning to Bedolla (2020), they would feel more spoken to on the emotional level.

According to Rognoli and Ayala (2018), materials articulate emotions and provide much more than just form to objects; they can contribute significantly to the final perception of the artefact and the emotional

relationships they generate during their life cycle. Emotional relationships are activated when we interact with objects. Thus, a designer must be aware of these relationships to create more meaningful objects. According to Rognoli and Ayala, we do not realise the importance of the emotions produced by the objects around us, both when we interact with them and when we design them.

Thus, we see how sensory processes (Bedolla, 2020) have their own agency, which in turn activates the designers' sense of agency and affects them in the more personal sphere (Walker, 2012).

Karana, Pedgley and Rognolil (2015) refer to the concept of "materials experience" when they talk about the capacity of objects to activate emotions, suggesting that physical interaction with materials can positively influence the creative process. In this regard, the authors define three components: the aesthetic or sensory experience; the experience of meaning; and the emotional experience. Along the same lines, Maldonado (1993) proposes that designers should experience the "real" side of materials, and not just be familiar with the "virtual" details of materials.

If we integrate the main concepts into a model in which the points of view intersect, we can see how the authors understand design as a process or a result, or sometimes both, and also alternately assign the initiative of connection to the object or the subject.

The different arguments explored here permit us to map the design of socio-material assemblage with the following elements participating in the person-object relationship:

	Effect on the SUBJECT	Action with the OBJECT	Authorship	Focus DESIGN
Engagement	Distributed agency: listening to and dialoguing with the model		Bill, Cullier, Reay (2015)	Process
Material experience	· Sensorial · Emotional · Interpretative	Material The experience is activated by the material	Karana, Pedgley, Rognoli (2015)	Process
Interaction	Physical and emotional	To enact the relationship with the object	Rognoli, Ayala (2018)	Result
Meaning Sphere	Personal / Social / Practical		Walker (2012)	Result

Figure 3. Summary of the arguments on the person-designed object relationship in the design sociomaterial assemblage. Source: the authors.

When we integrate the arguments reviewed here, we see how proposals that place the point of view on the subject vary from those that place it on the object, although both work with similar ideas of interaction. We can see how the authors identify a directionality in the interaction that reflects their preferences regarding agency and the initiation of interaction. Sometimes it is the interface that initiates it, other times it is the user. Some concepts of design as process overlap with those of design as result. Nevertheless, by superimposing the contributions we can identify the common elements in the assemblage that enable us to design with a distributed agency, as shown in figure 4.

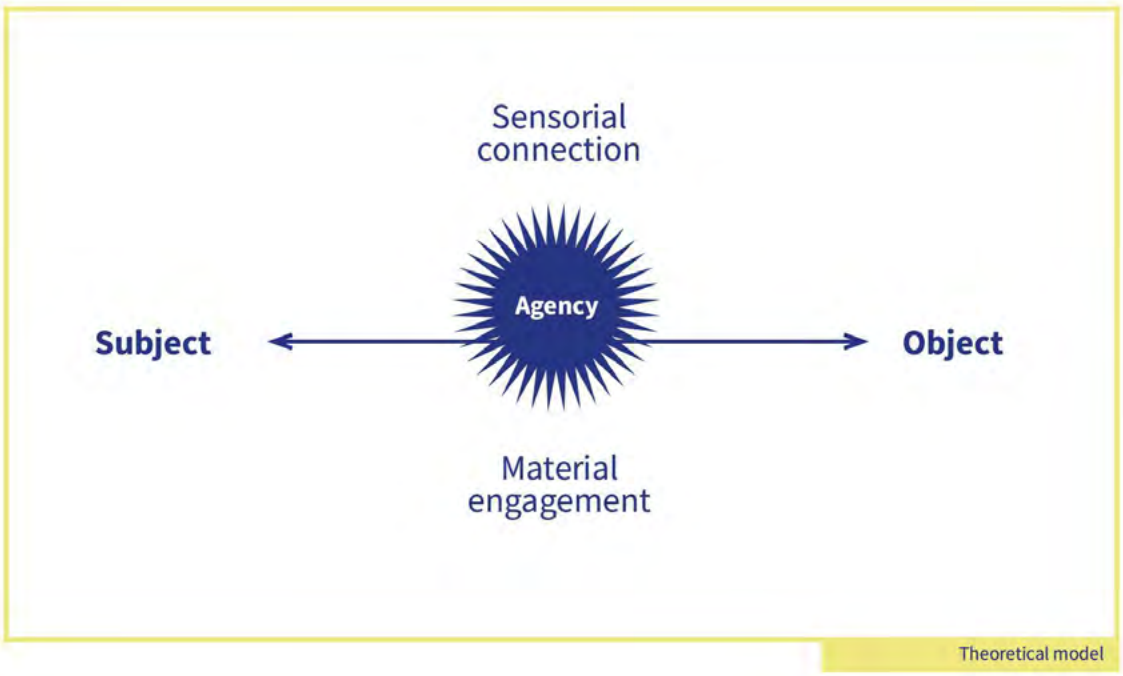

Figure 4. Theoretical model of the material agency of design. Source: the authors.

4. Development

To put into practice the model, we developed a relational practical activity in which we move the point of view to the object and observe the participants. This takes the form of a workshop titled “Is this print talking to me?”.

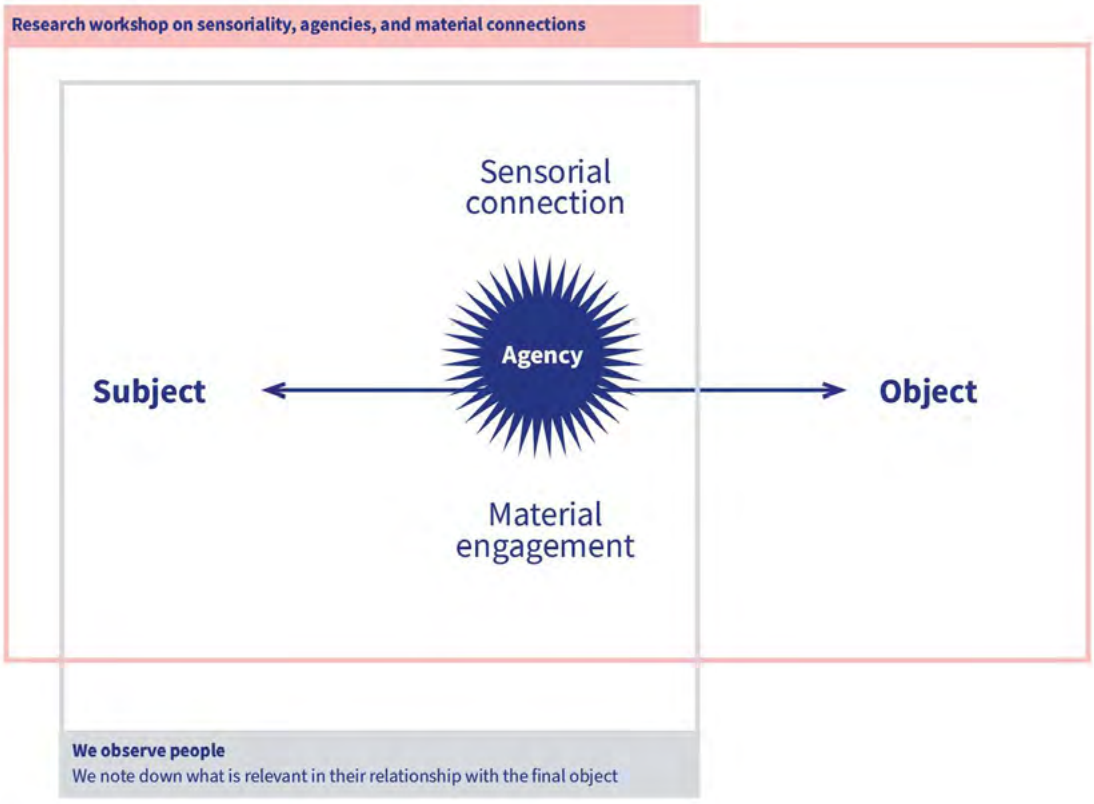

Figure 5. Relational observation of design material agency. Exploratory workshop. Source: the authors.

In the first part of the workshop, the authors/dynamizers present the basic information about the concept of material agency and the related key concepts so that participants understand the objective of the workshop and can develop it successfully.

In the second part, human participants are chosen by objects and the team of researchers observes and records the objects' level of agency, as shown in figure 5. At the same time, the participants reflect on and define the quality of the relationship they establish with their objects through a questionnaire handed out to them, whose purpose is to measure and describe the person-object sensory connection, agencies and material engagement.

Finally, participants, with the dynamization of authors, share their responses, sensations and aspects that have surprised them. They create a dialogue and come close to some first conclusions.

The questionnaire is used to collect information on how the end objects activate sensory processes (Bedolla, 2020), the level of agency participants recognise (Malafouris, 2013), and how the objects speak to the participants on the personal, social and practical levels (Walker, 2012). The participants share the experiences they have had with the object and with other human participants, and the collected data is used to validate the main hypothesis of the research, which states that end objects have an agency capable of affecting users in the more personal sphere.

The theoretical model and the questionnaire (research instrument) were improved and validated with feedback from previous workshops (a total of two).

The questionnaire is divided into four parts, which are ordered incrementally by the type of subject-object information exchange:

1. Level of agency (Malafouris, 2013; Harman, 2010, Bill et al., 2015)
- Origin
2. Material experience (Desmet, 2012; Dezcallar, 2012; Morales, 2015; Bedolla, 2020)
- Sensory
- Emotional
- Meaning
3. Interaction (Rognoli, 2018; Lefteri, 2007; Maldonado, 1993; Dezcallar, 2012)
- Physical
- Emotional
- In phases
4. Facets of human meaning (Walker, 2012)
- Personal
- Social
- Practical

The different sections are related in order to validate each part and help identify contradictory answers from participants. As this is an exploratory questionnaire with no extensive testing, no statistics have been used to measure the contradiction index; only a qualitative interpretation has been carried out.

The first part gathers information on the person-object relationship. Here, the object's level of agency is rated and a brief comment given on why the object chose the participant. If it is the participant who has chosen the object, a brief explanation must also be given. The premises on which the question is based are presented and discussed in the "State of the art" section.

The second part gathers data on the types of connection with the object and the qualities of this connection. Firstly, the intention is to ascertain the nature of the connection in terms of direct contact with the body, through three questions whose purpose is to explain sensations in order to identify the senses, locate the sensation in the body and provide details on the nature of the sensation generated by the object. Next, we ask about feelings through the emotions related to the sensations. In this stage, we use the list of emotions proposed by Pieter Desmet in “Faces of product pleasure: 25 positive emotions in human-product interactions” (2012). This list was developed and validated for designing positive experiences. To avoid bias in possible negative connections, the study was supplemented by the list of negative and ambivalent emotions identified by Desmet from Tomkins (1984) (ibid.). The emotional part concludes by asking participants whether they would add any other emotions, to facilitate open communication and collect off-the-record comments, on the understanding that the difference between sensation, emotion and interpretation is not intuitive.

With regard to the interpretative register, we ask participants about their memories, to relate the sensations and emotions of the object to the ideas that come to them when establishing the connection. As Juan Magariños de Morentin explains, the interpretative phase of the sign is fed by the subject’s knowledge, and thus can only be interpreted from memory (Morentin, 2001).

In the third part, the objective is to map the physical and emotional relationship arising from the connection. The questionnaire asks about the quantity of physical relationship established with the object (number of senses used) and the depth of the emotional connection. As emotions operate at the physiological, cognitive and behavioural levels (Dezcallar, 2012), if the object makes you smile or sweat you should indicate a high level of interaction . The questionnaire includes descriptive examples to help users rate their level of interaction. The premises for the third part are the physical and emotional dimensions (Ayala and Rognoli, 2018) and a third question is added to identify whether interaction occurs in different phases.

The information collected in the fourth part refers to how the object affects the participant, identifying whether this is on the personal, social or professional plane, on all of them, or at the intersections between the planes. This question is based on Stuart Walker’s model of spheres of meaning, as explained above.

The questionnaire concludes with an open question to make use of the participants’ knowledge and experience and gather suggestions for improvements and other connections.

Table 1. Workshop “Is this print talking to me?”. Questions for participants.

1. Level of agency	This section is aimed at studying the level of agency of the object.
	1.1. Indicate the level of agency you have perceived with the object, being 5 its maximum agency and -5 its minimum
	1.2. Why have you been chosen by this object? Briefly explain why you have been chosen, or why you have chosen it, if it has been you.
2. Material experience	Section aimed at collecting data on the type of connection with the object and the qualities of this connection.
	2.1. Sensorial experience. Questions aimed at collecting information related to the body.
	• Senses. With which senses has the object connected you? Sight / Touch / Hearing / Smell / Taste • Connection. Indicate with a cross where you have perceived the contact (includes a human body pict) • Sensations. Describe the sensations you have had, for example, cold, proximity, tension, etc. and the material part of the object that has activated it, if any.
	2.2. Emotional experience. Questions aimed at collecting information related to feelings.
	• With which other experiences have you associated the connection with the object? Briefly explain a maximum of three memories connected to the object.
3. Interaction	Section oriented to map the physical and emotional relationship arising from the connection.
	3.1. Level of physical interaction. Indicate the level of physical interaction with the object. The minimum level of interaction is understood as locating and grasping the object using the sense of sight and touch, and counts 1. The maximum level of interaction is understood as minimal sensory contact of four senses, sight, touch, hearing, and smell, and counts up to 5.
	3.2. Level of emotional interaction. Indicate the level of emotional interaction with the object, with 1 being the minimum level of interaction if your emotional state has not been affected by the object* and 5 being the maximum level, when you have thought about it again after ending the contact or have thought about taking notes of its references, or having the object.
	3.3. Interaction phases. Has your experience changed while interacting with the object? (Yes/No)
4. Spheres of meaning	Data we collect to know if the object appeals to you on a personal, professional, or social level.
	4.1. What is the impact of the object in each sphere of meaning? Indicate 1 when the object does not appeal to you and leaves you indifferent, and 5 when the object has connected with you to the maximum.
	• Personal: It has appealed to you as a person, connecting with your values as an individual, or with your beliefs, intuitively towards your inner world. • Social: It has appealed to you in your cultural context, you have shared it or want to share it with others, and it fits the social norms of your environment. • Practical: It has appealed to you at a professional, intellectual, technological level, it provides you with performance values in your environment.
5. Comments	Do you miss any relevant questions? Is there too much information? Tell us what you want to share: your help is valuable.

5. Results and Discussion

The results analysed below come from the survey completed during the workshop conducted at the ISEC Lisbon Centre for Studies Graphic Technologies, involving a total of 13 participants from the world of art and design teaching and research. Although we conducted a previous workshop in Barcelona with four participants from the field of teaching and research in communication studies, we decided to use this second source of results as comparative data, always bearing in mind they come from few participants and cannot be considered as a reference.

In the first question (1. Level of agency) we asked participants about the level of agency of the objects they chose and also their personal reasons for choosing them. With regard to the level of agency, the participants identified which object had chosen them with an intensity of 4.5 out of 5. In other words, they recognised the agency of the object without hesitation and required no further explanation.

With regard to why they chose the object, we analysed and classified the reasons using Stuart Walker's three spheres of meaning (2012). Personal reasons were mentioned in all cases, with participants using expressions such as "due to the cover with the lenticular image, which I've liked ever since I was a boy, seeing how the visual space is transformed" (L0302). Practical reasons were also included in all the answers, sometimes expressing highly technical details, such as "It shows that the same space (the cover), through a technical device (hologram), can be used for two different things" (L0303). However, social reasons did not appear in the answers from the workshop. Practical reasons were chosen in all cases and no social reasons were mentioned, although they rated this sphere when asked directly in the other sections.

The workshop called on participants to establish personal relationships with the objects, yet the participants rated the practical sphere higher than the personal, at 4.25 out of 5, compared to 3.8 out of 5 for the personal sphere.

Only in three cases did the reason for choosing the object given at the start of the questionnaire fully match the score for the spheres at the end. In eight cases (66%) participants did not mention the social sphere, but later gave it an equal or higher score than the practical and personal meanings. Finally only one case produced diametrically opposed scores, indicating that the participant had not understood the questionnaire (leaving some spaces blank, confirming the lack of understanding).

In the second part of the questionnaire (2. Material experience), which refers to the type and qualities of the connection with the object, we detected some confusion between "sensation" and "emotion" when participants were asked about the sensations conveyed by the object. The participants answered with emotions on nine occasions, an error which could be explained by the intensity of the emotional relationship established with the object, scored at 3.77 out of 5. We interpret this to mean there was an emotional impact resulting from using the object.

When answering about the participants' perceptive relationship with the object in their sensory experience, we identified an average of 2.5 senses. In the score for sensory interaction we identified 3.3 senses. As the questionnaire progressed, more senses were unexpectedly added to the perceptive relationship. This observation is analysed below. Nevertheless, it is interesting to note that in the third part (3. Interaction) participants scored the emotional interaction with the object higher than the physical interaction (3.77 vs 3.3).

Similarly, in the drawing where participants were asked to mark a cross on the part of the body where they had felt the connection with the object, parts such as the heart, head, feet and back were identified (figure 6). Even the whole body was circled in one case, suggesting more than a perceptive relationship focussed on the sensory organ, but rather a more holistic, interpretative relationship.

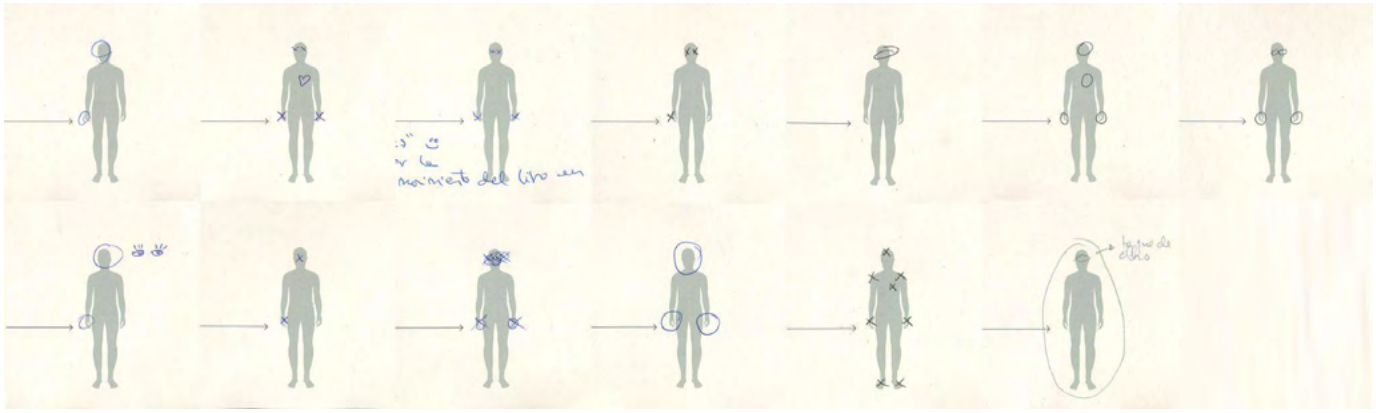

Figure 6. Sensory experience. Parts of the body in which the connection with the object was experienced.

In the emotional experience (see point 2 of the questionnaire), participants described positive and negative emotions. In the case of positive emotions (figure 7), those most frequently expressed were: surprise (10 out of 13 cases, 76.9%), fascination (9 out of 13 cases, 69.23%), inspiration (8 out of 13 cases, 61.54%), enchantment (7 out of 13 cases, 53.85%), and joy, love and satisfaction (5 out of 13 cases, 38.46%). None of the participants indicated emotions such as relief or compassion. Practically no negative emotions were indicated (figure 8). The only ones mentioned were surprise (2 out of 13 cases) and sadness (in 2 out of 13 cases). Only one person mentioned more than one negative emotion. In this case, they were anxiety, anger, sadness and aversion.

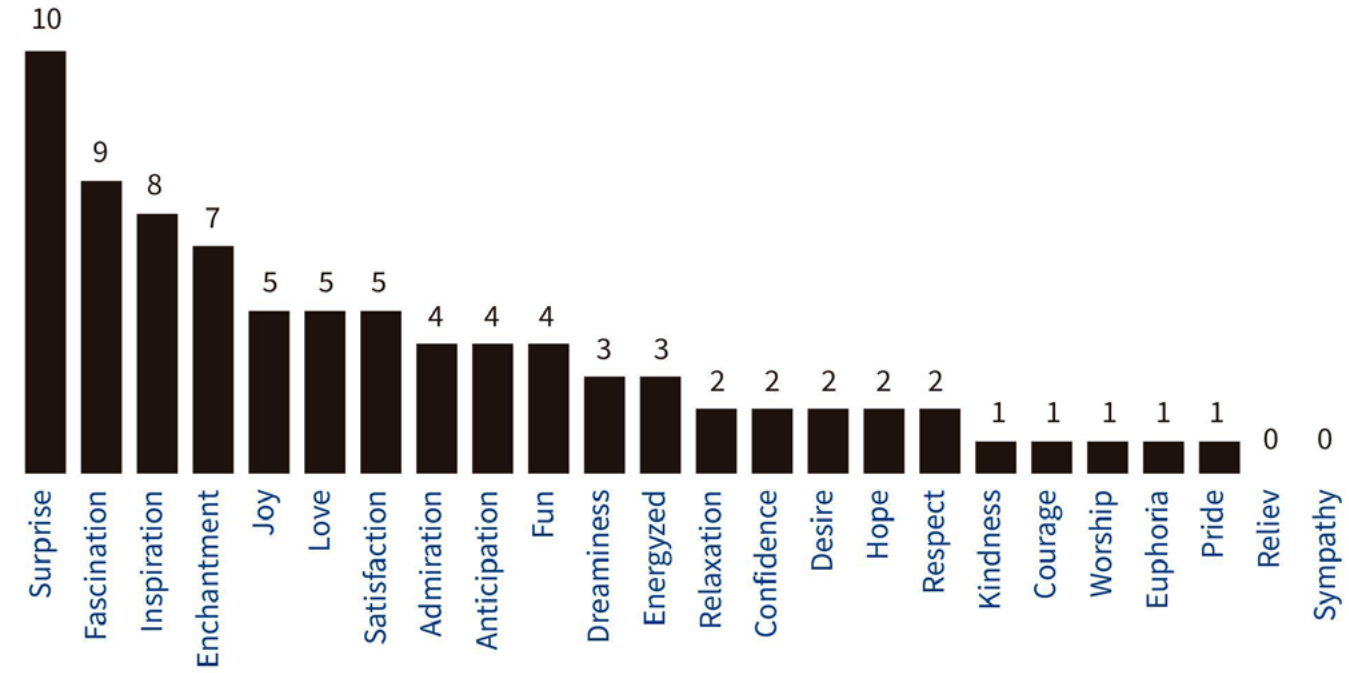

Figure 7. Positive and ambivalent emotions in the person-object interaction.

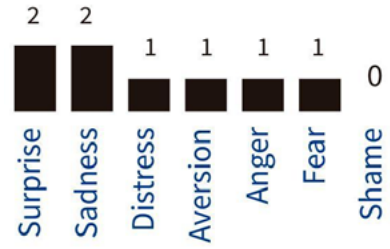

Figure 8. Negative and ambivalent emotions in the person-object interaction.

In the meaning experience (see point 2 of the questionnaire), which asks about other experiences (memories) associated with the connection to the object, most of the participants focused their narrative on personal experience (5.67 out of 10): “childhood games” (L0301); “new shoes” (L1002); or “wanting to keep the object, to run away and steal it” (L0101). Other participants related their experience to the practical sphere (5.33 out of 10): “playing when handling the object” (L0303); “typography, old-fashioned typography workshop” (L0702); “special effects used in graphic production” (L0501). Almost residually, only one person related the experience to the social sphere (0.33 out of 10): “relationships with significant people” (L0801).

6. Conclusions

Although there were a limited number of participants in this phase of the study, we have seen that the research-action works and the questionnaire permits data comparison and gathers relevant information. Various initial conclusions may be drawn with regard to the data obtained from the workshop and subsequently analysed.

Firstly, we see that there is an emotional impact after using the object. We also see that more senses are involved in the perceptive relation the more participants progress in the questionnaire. Practically no negative emotions were expressed in the questionnaire. In their observations, the researchers found that the workshop generated expectations that created an atmosphere of curiosity and a motivation to look, touch and feel the objects more actively than usual. Indeed, the first three positive emotions after surprise are those that make up the general typology of “interest”, as identified by Pieter Desmet.

With regard to spheres of meaning, it may also be stated that, after touching the objects aimed at stimulating the personal sphere, the practical sphere continues to receive higher scores. We think this is due to the profile of the participants (art and design teachers), who are used to coming into contact with printed products in their professional life. We venture to say that their ideas relate books and publications to their work environment, hence they score the objects in the practical sphere.

Finally, with regard to the level of agency, we note a striking difference between the Lisbon group of participants (13) and the Barcelona group (4). In the former group, they identified the object having chosen them at an intensity of 4.5 out of 5. In other words, they recognised the agency of the object without hesitation and required no further explanation. Despite their somewhat insignificant number, the Barcelona participants gave a very low score to the agency of the object, assigning the capacity for connection to the person. This difference may be due to the participants’ profile. In Lisbon, they had a specific academic profile in art and design, while in Barcelona they were academics, but from the general field of communication, not specifically art and design.

The low results in the sphere of social meaning seem to arise as a consequence of a bias in the analysis approach. By focusing on the object, we have neglected the social functions of objects and their effects. The entire realm of social meaning, including the staging of the workshop itself, has taken a back seat. A relevant question for the future will be how to approach the study of distributed agency while considering the social characteristics of humans without placing them at the centre.

We find several limitations about how the participant’s microculture was defined since we assumed there was a shared scheme of practices and social disposition among participants belonging to the group. But, observing how the social sphere emerged from results, we should consider habitus and cultural capital, as defined by Bordieu (2018) to gather the ideas, attitudes and other cultural attributes that impact a participant's behaviour. Our results suggest that there isn’t an homogeneous culture; instead, there are various subcultures and social microcosmos that influence practices and human interactions. Future work should gather data about participants’ specific cultural and social patterns that develop in local and particular contexts, such as design conferences where workshops have taken place.

Future lines for the study lie above all in testing the workshop in different cultural contexts with non-expert participants. Although there were few participants in Barcelona, their contributions were different to those from Lisbon, suggesting further testing among people with absolutely no connection to the field of design. On this basis, we would reformulate the hypothesis to: "Emotional involvement and relationship with the practical sphere increases when the participants are professionally or academically related to the design field".

Finally, we will apply the knowledge obtained here to improve the connection with objects, specifically, by providing an enriched description of elements in online materials libraries, thus seeking to overcome the distance between the library interface and the material.

KEYWORDS | SCHOLARSHIP OF TEACHING AND LEARNING, SIGNATURE PEDAGOGIES, DESIGN CULTURE, DISCIPLINARY AFFIRMATION, CROSS-SECTORAL INTEGRATION

ABSTRACT | In the range of theories and practices related to the field of design, several “designerly” ways of knowing (Cross, 2007) can be detected, in which the axioms inherently characterizing the discipline converge independently from the multiplicity of professional domains in which it branches out. From an educational point of view, such qualities are commonly geared to the arrangement of learning experiences aimed at facilitating students in developing the ability to manage from both cognitively and executively the procedures connecting the ideation of a product, a service, or a process to its actual concretization. Particularly relevant in this regard is the confrontation with a “design culture” (Julier, 2008) appearing to be constantly in search for a balance between identity and transversality, pointing out a juxtaposition in relation to which the educational system is faced with a twofold responsibility: on the one hand, that of transmitting to students an awareness about the existence of a professional and academic design community, endowed with a specific disciplinary status; on the other hand, that of fostering the acquisition of skills that will enable future designers to fruitfully integrate also within other knowledge areas. It is thus necessary to equip those working in the field of design education with both technical and intellectual tools that would empower them in addressing their teaching in order to appropriately interpret and enhance this polarity. On this basis, a particularly useful contribution is offered by the Scholarship of Teaching and Learning (SoTL), a current of post-secondary studies oriented toward the consideration of the educational approaches adopted in the context of individual disciplines as indispensable factors in the processes of knowledge formulation and transmission. Attributing to the dynamics associated with teaching and learning a pivotal role in constituting the perspectives underlying codified knowledge, SoTL interprets education itself as a further upstream discipline, within which expertise can be reflexively built up (Hutchings, 2000). One of the most significant contributions introduced by SoTL lies in the theory of “signature pedagogies” (Shulman, 2005), a conceptual construct aimed at delving into the fundamental criteria that shape, to an only partially conscious extent, the mindset of scholars, educators and professionals; in configuring a bridge between the theoretical and practical dimensions, these frameworks reflect the forma mentis shared by the members of individual disciplinary communities, expressing the main cognitions they possess regarding how it is most appropriate to act, think and know in order to operate appropriately in their respective fields. In the wake of various studies emerging in recent decades on the topic of the relationship between design and signature pedagogies, this essay identifies the concept as a notion of particular strategic interest in order to understand more deeply the “hybrid” disciplinary status of design, and consequently to orient its educational practices. In accordance with these premises, such a relationship will be first framed from an internalist perspective, reflecting a principle of disciplinary affirmation, and then explored from an externalist perspective, consistent with an assumption of cross-sectoral integration.

1. Design Pedagogy Between Identity and Transversality

In the range of theories and practices that can be associated with the domain of design, several "designerly ways of knowing" (Cross, 2007) can be detected, in which the axioms inherently characterising the discipline converge regardless of the multitude of professional domains in which it branches out. In fact, the inclusiveness of design discipline is indeed impressively wide, ranging from the ideation of industrial products to the development of communication artefacts or the fabrication of fashion items, with frequent contamination with the domains of art, architecture, science, engineering, and business management. The training of this particular profile presupposes the arrangement of learning experiences aimed at enabling students to acquire the ability to manage from both a cognitive and an operational point of view the methodologies connecting the conception of a product, a service, or a process to its actual concretization.

Recent developments in the social, technological, and economic landscape, however, highlight the need for a substantial revision of design pedagogy itself, from the structure of educational institutions to the relationship between students and teachers, involving also the context of professional practice (Pontis & van der Waarde, 2020). Particularly relevant, in this sense, is the inescapable confrontation with a "design culture," (Julier, 2008) that appears to be constantly in search of a balance between the level of identity and transversality, defining the extremes of a juxtaposition which faces the educational system to a twofold responsibility: on the one hand, that of transmitting to students an awareness about the existence of a professional and academic design community, endowed with a specific disciplinary status; on the other hand, that of fostering the development of skills that would enable future designers to fruitfully integrate also within other sectors.

In light of such premises, it is necessary to equip those working in the field of educational research related to the discipline of design with both technical and intellectual tools that can support them in arranging their teaching activities to effectively understand and address this polarity. In this perspective, a particularly significant contribution is offered by the Scholarship of Teaching and Learning, a current of post-secondary studies that began to spread since the early years of the new millennium in the international academic landscape, with particular reference to the Anglo-Saxon and North American scenario. At the heart of the Scholarship of Teaching and Learning lies the investigation around the so-called "disciplinary perspectives," understood as the specific point of view through which individual disciplines incorporate and implement their criteria for acquiring, formulating, and transmitting knowledge. Attributing to the dynamics associated with teaching and learning a pivotal role in shaping disciplinary perspectives, the Scholarship of Teaching and Learning interprets education as an additional upstream discipline, where sectoral experience can be reflexively developed (Hutchings, 2000).

One of the most significant contributions introduced by the Scholarship of Teaching and Learning resides in the theory of "signature pedagogies" (Shulman, 2005), a conceptual construct aimed at delving into the fundamental criteria that help to shape, to only a partially conscious extent, the mindset of scholars, educators and professionals. Providing a bridge between the theoretical and operational dimensions, such criteria reflect the *forma mentis* shared by the members of individual disciplinary communities, expressing the main cognitions they hold regarding how it is most appropriate to act, think and know in order to operate in their respective areas of expertise (Thomson & Hall, 2015).

Since its formulation, Lee S. Shulman's theory has been received with increasing interest in the international landscape of educational research, intercepting an increasingly broad and heterogeneous range of disciplines, from mathematics, physics and natural sciences to medicine, humanities, and social sciences up to psychology, art, music, and theatre. In its early beginnings, the concept has been mainly understood according to an internalist attitude, aimed at a stance of disciplinary affirmation; in more recent years, instead, the concept has been frequently inquired through perspectives connoted by a more pronounced interdisciplinary scope. As far as a field such as design, marked by an intrinsic propensity toward cross-sectorality, is concerned, this polarity takes on particularly emphasised traits, which resonate with a still unsolved tension between the affirmation of a disciplinary identity and, on the other hand, the propensity toward a transversal attitude.

With reference to an illustrative sample of studies corresponding to these two main strands of research, this essay identifies the concept of signature pedagogy as a notion of particular strategic interest in order to understand more deeply the "hybrid" disciplinary status of design, and consequently orient its educational practices. In light of these assumptions, the relationship between signature pedagogies and design is first framed from an internalist perspective, reflecting a principle of disciplinary affirmation, and then instead explored from an externalist perspective, which reflects an assumption of cross-sectoral integration.

2. The Concept of Signature Pedagogy

The research approaches developed by the Scholarship of Teaching and Learning involve a systematic study of the models underlying the transmission of disciplinary knowledge, starting from the detection and the in-depth analysis of the educational formats through which learners assimilate and put these models into practice (Shopkow, Díaz, Middendorf & Pace, 2013). In shifting the focus away from the strictly content-related plan on which individual curriculums are based, these approaches place emphasis on those educational formats that are able to encompass in an experiential way the set of job-specific competencies that students are about to learn (McKinney, 2007). In fact, each discipline refers to a specific pedagogical horizon expressing itself, on a case-by-case basis, in a well-defined system of theoretical and methodological coordinates, which support learners in developing the set of skills, cognitions and expertises that are necessary in order to practice the future profession.

Since its establishment the Scholarship of Teaching and Learning has developed a broad repertoire of investigative criteria aimed at supporting educational research in its sectoral multiplicity, in order to develop a deeper awareness on the most relevant disciplinary models that come into play in training to the various professions. Particularly interesting in this regard is the notion of signature pedagogy, a conceptual construct introduced in 2005 by the American psychologist and educator Lee S. Shulman with reference to the main formats, highly characterising in disciplinary terms, that underlie educational activity oriented toward the training of specific professional profiles. Specifically, the concept was introduced in the context of an interdisciplinary program inquiring the relationship between pedagogy and e professions promoted by the Carnegie Foundation for the Advancement of Teaching, an educational studies centre based in Stanford (CA) of which Shulman was president at the time.

According to Shulman, the notion of signature pedagogy identifies those particular educational modes that, in a recurrent and pervasive manner, prescribe what, in a given field, is considered as knowledge, and the criteria according to which this is systematically subjected to analysis, approval, critique, or denial. In their very implementation, signature pedagogies generate substantial repercussions within the fields from which they derive, designating their instances of scientific and deontological authority, and thus consolidating the institutional architecture that serves as a support for such paradigms, and which in turn works in perpetuating them.

With reference to the most literal, yet hermetic, meaning of the term "signature" – etymologically speaking, the term derives from the Latin verb *signare*, which can be translated as "marking", "imprinting," "designating" – the concept paves the way for acquiring a broader awareness about the central role that certain specific educational models have traditionally played, and still play, in shaping culture as we consider it today. While emphasising the existence of an indispensable bond connecting signature pedagogies with their own respective field — or fields — of reference, Shulman's theory remarks, at the same time, how all of them share a similar conceptual organisation, structured according to three main layers of meaning: a surface structure, concerning the visible operations of teaching and learning, and their corresponding outputs; a deep structure, referring to the universal and personal assumptions underpinning the teaching activity; and an implicit structure, embodying the moral values that legitimise a certain discipline in the wider system of knowledge.

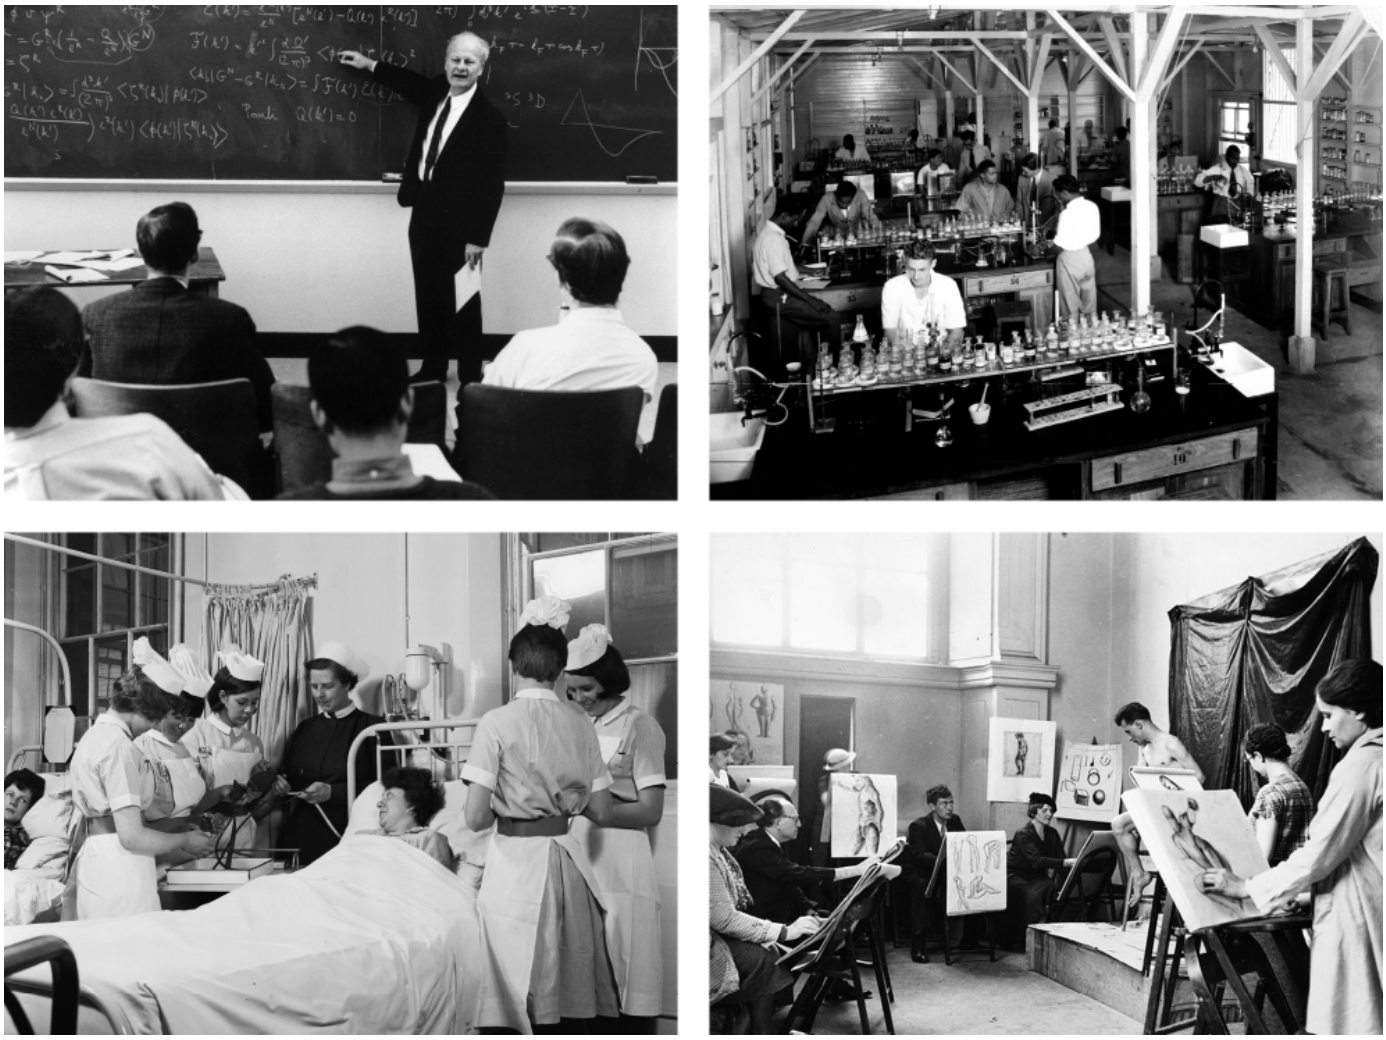

Figure 1. Examples of signature pedagogies in the context of different disciplinary fields: the frontal lecture in relation to disciplines with a theoretical stance, both scientific and humanistic; the laboratory in the field of natural sciences and, in general, applied research-oriented disciplines; clinical training in the field of medical and nursing sciences; the studio in reference to disciplines with an artistic and design orientation.

By simultaneously incorporating the epistemological and ontological roots inherent in the different branches of knowledge, the concept situates the relationship between learner and teacher within a state of mutual "interiorization" in which, according to Michael Polanyi (1966), the tacit components underlying any approach to knowledge reverberate.

Research about signature pedagogies can be give significant directions in order to build a deeper disciplinary awareness, that is functional, on the one hand, in conveying a condition of educational continuity in the different levels of individual curriculums and, on the other hand, in defining clear boundaries between different professional realms (Poole, 2010). However, this interpretation is not exclusive: the notion of signature pedagogy can also be framed following a cross-sectoral perspective, as a useful conceptual vehicle for encouraging the growth and consolidation of new communities of practice arising from the mutual interrelation between different disciplinary fields (Takayama, 2009).

Since its original formulation, the theory elaborated by Shulman has been received with growing interest and consensus by exponents of the Scholarship of Teaching and Learning and, more broadly, within the international educational research landscape, intercepting an increasingly broad and heterogeneous range of disciplines. Over the years, the design community has also begun to offer its scholarly input in this direction, and although the literature related to signature pedagogies is still rather fragmentary, a first core of research that confronts the topic from a disciplinary point of view is gradually being deposited. The following paragraphs will present two main strands of research detected within this body of literature:

a first attitude focuses on the detection of the signature pedagogies which specifically pertain to design; a second attitude, instead, is devoted to the interpretation of the design discipline itself as a signature pedagogy.

3. Signature Pedagogies in Design

As mentioned, a first strand of research carried out over the years within the Scholarship of Teaching and Learning on the topic of the relationship between design and signature pedagogies has been characterised by an interpretation of the concept tending toward a principle of disciplinary affirmation: in these cases, the inquiry has followed a predominantly internalist stance, which has expressed itself through research approaches aimed at classifying, and subjecting to critical analysis, the educational models through which individual disciplines have been, and still are, conventionally taught and learned (Ciccone, 2009).

Design pedagogy presupposes the arrangement of learning experiences aimed at enabling students in acquiring the ability to manage from both a cognitive and an operational point of view the methodologies connecting the conception of a product, a service, or a process to its actual concretization. The training of this particular profile presupposes an educational experience marked by a high degree of specificity, which is expressed according to approaches that are often very distant from the model of “formal education,” typically organised according to chronological and hierarchical criteria, commonly adopted in many other fields. This peculiarity can also be found in relation to fields bordering that of design, identifiable under the aegis of the so-called “creative disciplines,” in which the educational activity appears to be strongly characterised by the implementation of aspects related to instances of sociality, inclusiveness, permeability and flexibility (Thomson & Hall, 2014).

A first strand of research about the relationship between design and signature pedagogies has thus been oriented toward the identification and investigation of educational formats highly connoted in disciplinary terms, attributing to them an active role in shaping the identity of the field itself. Exemplifying this approach is a study on signature pedagogies in the disciplines of design and art originated in 2006 by the British scholar and educator Alison Shreeve as part of the Teaching Landscapes in the Creative Arts Subjects research program sponsored by of one of the United Kingdom's Centres for Excellence in Teaching and Learning, Shreeve returns the more strictly design-related outcomes of this experience in an essay published in 2016, in which the concept of signature pedagogies is introduced in relation to the design domain indicating those educational formats through which students learn to think and act as designers.

Within her contribution, precisely titled *Signature pedagogies in design*, Shreeve initiates a first, structured attempt to classify the most recurrent and significant formats that come into play in the context of design education, arriving at identifying a series of relevant signature pedagogies, of which we are going to look at some examples.

The studio, whose origins lie in the notion of “workshop apprenticeship” codified in the arts and crafts tradition, refers to the spatial context in which design education concretely takes place in its material and immaterial components, and where experience, both individual and shared, is placed at the centre of learning; the space of the studio determines educational conditions in reference to which the boundaries between the figure of the apprentice and that of the professional are often blurred, imprinting into design pedagogy a connotation that is, from the very beginning, strongly oriented toward professionalism.

The brief, referred to what is probably the most significant and recurrent formats employed in design pedagogy in order to progressively introduce learners to the cognition of the principles, methods and processes underlying design, namely through the execution of specifically formulated exercises; this approach reflects the project-based nature of most design pedagogy, where learners are expected to take an autonomous approach to finding their own way through the brief, and the finished design or artefact are open-ended and largely unknown to the tutor at the time of writing the guidelines.

Materiality, Identifying the experiential connotation that inherently qualifies design pedagogy, where the entire educational process should predominantly express in the form of physical objects, which prepares students to develop a certain know-how preluding the design profession; the focus on materiality reflects a paradigm where theoretical teaching is placed at the service of practical experimentation, and learning (in its performance, as well as in its assessment) is primarily based on the production of artefacts, expressing and revealing the accumulation of experience.

In its methodical and systematic attitude, Shreeve's inquiry of 2016 concerning signature pedagogies in design highlights a repertoire of paradigmatic approaches to disciplinary education, which paves the way for carrying out detailed investigations focusing more in depth on the singular ones. On these premises, a particularly topical horizon of inquiry lies in assessing the impact that the advent of digital technologies has generated, and will certainly continue to generate in the near future, in the reprocessing of these teaching models from both the cognitive and the structural point of view (Fleischmann, 2020).

4. Design as a Signature Pedagogy

In contrast to the previously outlined approach, a second strand of research carried out within the Scholarship of Teaching and Learning on the topic of the relationship between design and signature pedagogies has followed a diametrically opposite attitude, that is, interpreting the concept according to an externalist perspective. In agreement with this attitude, the notion is interpreted as a conceptual means for understanding how signature pedagogies can be employed across different disciplinary domains (Werder, 2013), and thus projecting the inquiry into a perspective with a more distinctly transversal scope. Rather than in a logic of disciplinary affirmation, this second strand of research interprets signature pedagogies as opportunities for sectoral hybridization, which can cross the boundaries that traditionally exist between individual knowledge domains, and which often tend to inhibit their mutual dialogue. In the specific case of design – which, as already mentioned, is itself characterised by an intrinsic propensity toward interdisciplinarity – the adoption of this perspective can open up particularly interesting insights of investigation, both from the field of design to the other sectors and *vice versa*; in fact, it provides an opportunity for scholars, teachers and educators to develop experimental approaches to teaching and learning that do not limit design to a merely instructional role, but methodologically seek to integrate it with other disciplines, fostering an effective knowledge exchange.

Even with the plurality of its potential applications and implications, such a purpose is consistent with the principle according to which it will not be possible to increase the quality of our educational systems until teachers begin to act as designers, and not simply as instructors (Spence, 2001).

Building on similar assumptions, this investigative attitude leads to questions about if, and how, it would be possible to borrow educational formats conventionally pertaining to the sphere of design in order to apply them as signature pedagogies within other disciplinary and professional fields. Exemplifying this approach is a study promoted by the Organisation for Economic Co-operation and Development (OECD), in which design is considered among the most relevant signature pedagogies to be involved in order to generate opportunities for enhancing creative skills and critical thinking in primary and secondary education. Carried out within the international project "Fostering and Assessing Creativity and Critical Thinking Skills in Education," the study was aimed at defining a set of rubrics on what it means to teach, learn and make progress in order to help students succeed in the context of contemporary, knowledge-based economies. With this goal in mind, between 2019 and 2022 the OECD worked with a network of schools in eleven countries, encouraging involved teachers in reviewing and improving their existing lesson plans according to a list of signature pedagogies useful for nurturing students' creativity and critical thinking. Encompassing approaches such as, for instance, metacognitive pedagogy, dialogic teaching, research-based learning, and the Montessori method, this list also includes design thinking, a procedure implying a systemic approach to problem solving based on the sequential conception, prototyping, testing, and iteration of new ideas.

In its narrowest sense, design thinking can be interpreted as the set of cognitive, strategic and practical methodologies used by designers while practising their profession; more broadly, it refers to the body of knowledge that has been developed about how people reason when engaging with design problems. Closely related to the realm of entrepreneurship, the design thinking method is now widely established also as a pedagogical approach in the context of "innovation courses" in both university and schooling, engaging students in learning experiences in which they are led to think and act like designers (Vincent-Lancrin et al., 2019).

The OECD rubrics thus interpret design thinking according to an understanding deprived of the more strictly business-oriented components, as a vehicle for providing educational experiences in which students are asked to inquire through different means to imagine innovative and multiple solutions. Potentially embeddable into all subjects in the primary and secondary school curriculum, the signature pedagogy of design thinking is meant to develop students' creative and critical skills in an applied way, emphasising their propensity toward exploration, openness, and sharing of knowledge (OECD, 2023).

Identifying design as a signature pedagogy can support learners in getting familiar with the phases that shape the design process in order to expand and consolidate their ideas, giving rise to educational formats that can be either implemented in short sessions in a specialised field or in longer interdisciplinary projects. In this sense, such identification may foster the development of "design literacy" strategies effectively capable of conveying the aptitude to relate creatively and critically to situations characterized by a high degree of complexity, ambiguity and ineffability (Christensen, Hjorth, Iversen & Smith, 2019).

5. Conclusions

In the totality of their disciplinary prerogatives, signature pedagogies contribute substantially to qualifying the designer's educational journey, supporting learners in developing the set of skills, cognitions and expertises

necessary to operate knowledgeably within the corresponding professional scenario. As seen, analysing the notion of signature pedagogy from an internalist perspective involves its acknowledgement in the role of a conceptual means which can be employed for understanding more deeply the system of disciplinary coordinates in which the design community recognizes and identifies itself. This perspective promotes an investigative approach aimed at decoding the linguistic and semantic paradigms through which, following Donald Schön (1983), designers describe and interpret the consequences of their actions, the implications of their discoveries, and the distinctive features characterising their acting in the world.

In turn, the interpretation of design in the role of a signature pedagogy corroborates the possibility of inquiring its potential role as a cultural substratum common to multiple fields of knowledge, not necessarily aimed at the development of a professionalism but, rather, at the acquisition of a mentality. A point of view, this one, that recalls the arguments expressed more than half a century ago by Herbert Simon (1969), according to whom design could constitute the core of any professional education with which schools of engineering, as well as those of architecture, economics, law and medicine, must inescapably deal.

Both perspectives pave the way for the development of structured approaches to research in the field of design pedagogy, and the production of further efforts in this direction would be definitively welcomed, detailing the investigation, when needed, at the level of the specific disciplinary branch. From this point of view, a promising field of application can be that of "basic design": this term designates a particular phase, placed at the beginning of the design curriculum, which promotes holistic and experimental methodologies aimed at supporting students in acquiring knowledge about the fundamental principles of the discipline. Such a stance may be corroborated in view of the high degree of pervasiveness by which basic design pedagogy spreads within both the curriculum — as its experience keeps echoing throughout the design training pathway — and the profession — as its principles recall those coming into play in everyday design

practice. In fact, working on this particular educational phase endorses the possibility to identify, and transmit through appropriately formulated exercises, the elementary grammar underlying the theory and the practice of design, providing students with a set of basic technical and intellectual skills preliminary to any further specialisation.

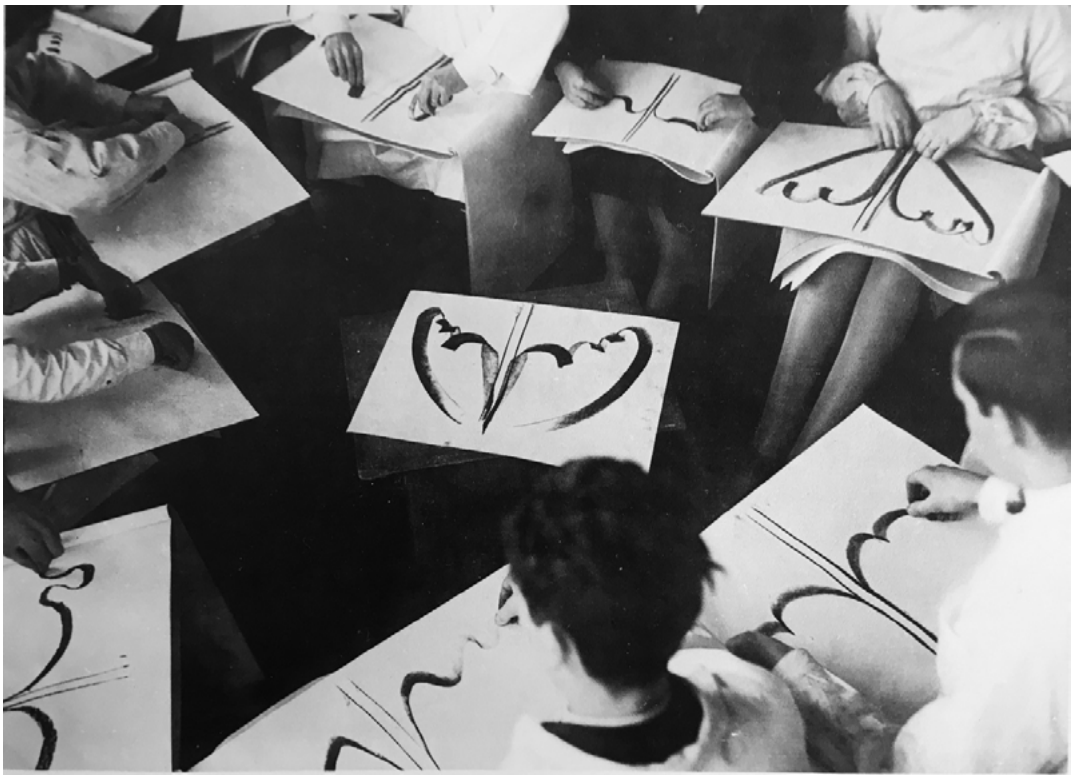

Figure 2. Johannes Itten: Basic design teaching class at the Staatliches Bauhaus of Weimar.

The impact of basic design reverberates not only upon the designer's intelligence of complex systems, but also upon the designer's professional responsibility (Findeli, 2001), and it is no coincidence that it has been interpreted as an essential educational phase by several of the most authoritative exponents of design pedagogy. By operating on the theoretical foundations of design practice, the dimension of basic design subjects the design discipline to a process of continuous revision and reprocessing, covering a function which in a certain sense, could be comparable to what in other sectors is defined as "basic research".

Weaving together preparatory training and disciplinary foundation (Anceschi, 2006), this model has traditionally played a crucial role in the history of design education, rooting on strong historical, theoretical, and methodological instances, and undertaking wide acknowledgement also within the contemporary disciplinary community: indeed, it is important to identify strategies for incorporating recent technological innovations into basic design pedagogy, focusing on the potential of digital tools from a critical point of view, in order to assess the value of this educational approach while adapting the course to a digital setting.

Figure 3. Josef Albers: Basic design teaching class at the Black Mountain College.

In light of the catalyst role it plays within the overall design curriculum, and the circularity it triggers in relation to the sphere of professional practice, basic design could even be considered and investigated in turn as a signature pedagogy in the general landscape of design education (Author, 2020): since basic design

represents one of the contexts where disciplinary statements are formulated more explicitly, such identification could provide a privileged point of view from which, on the one hand, address strategies for implementing this model in the contemporary context and, on the other hand, transpose it into other knowledge domains.

As a whole, the reasoning brought forward within this contribution corroborates the consideration of the concept of signature pedagogy as a useful interpretative lens through which it is possible to observe and

describe the phenomenology of design pedagogy in its varied expressions and manifestations. With the considerations here outlined, it is hoped to nurture a greater and more structured awareness about a conceptual construct that, bridging the level of theoretical speculation with that of professionalism, can provide useful insight in identifying and critically inquiring the processes involved in shaping the disciplinary status of design.

KEYWORDS | DESIGN EDUCATION, SITUATEDNESS, VISUAL REPRESENTATION, KNOWLEDGE, DESIGN THEORY, SOCIAL DESIGN

ABSTRACT | As a concept, situatedness has been influencing various disciplines, yet its potential in the practice and education of design in general and social design particularly has yet to be fully articulated. In this article, we will present a visual model of situatedness in social design education and practice meant to facilitate the communication of situated knowledges between various design partners. We do so through two main venues: first, from the student's point of view, we use our model to instigate and trigger a process of self-reflection and personal definition, on individual and professional levels. Conversely, this tool can help students in the classroom find suitable partners to work with for the duration of the course (either complimentary or similar potential partners). Second, from the teacher's point of view, we use our model for several goals: mapping the students in the classroom according to various attributes; managing the progress of the class in general, according to personal efficiencies; and using the mapping to generate richer and more diverse outcomes at the end of the course. We will also delve into the advantages of developing this type of knowledge through visual representation tools, triggered through visual communication and service design theory and practice. Finally, this approach will highly benefit designers embedded in working with communities through strategies of participatory design, due to its dialogue nature.

1. Introduction

> "Every experience is a moving force. Its value can be judged only on the ground of what it moves toward and into." (Dewey, 1997[1938]:38)

In the beginning, there was survival. In its early stages, design was focused on the primary mission of helping in the survival of individuals and communities through material objects. As surroundings and conditions changed, so did design shifted and evolved offering better solutions and influencing the ways we interacted with the world. The Industrial Revolution introduced deeply rooted changes that influenced not only the ways consumers interacted with designed products but also the ways designers influenced our daily lives. Mass production called for the annihilation of local differences and a direct connection of the craftsperson with their designed products, in favour of short-term profit (Heskett, 2016). Building on this overpowering capitalistic approach, the second half of the twentieth century added another dimension of marketing-oriented design to differentiate between competing manufacturers, vying for the consumers' attention.

However, since the late 1980s, socially-oriented design approaches surfaced, opting for a more ethical and people-centred practice. Instead of fighting for ever-growing consumption, social designers (although perhaps, not defining themselves as such) started tackling the "wicked problems of design" (Buchanan, 1992). These were identified as broad, deeply-rooted and global challenges that designers traditionally ignored either due to their professional irrelevance, or due to their seemingly insurmountable difficulties.

Due to the complex and varied nature of design practice, designers need a complimentary expansive body of knowledge. Famously noted by design thinkers and researchers (Simon, 1996; Cross, 2023, among others), this knowledge is situated between science, art and craft and between the humanities and social sciences. Famously, designers specialising in social design tackle "wicked problems", which not only lack a decisive or single solution but involve various points of view and a broad understanding of changing scenarios and situations. As a discipline (theoretical and practical) that presents a worldview rather than a specified subject matter, the knowledge designers need is even more complicated to define:

> "This is the creative or inventive activity that Herbert Simon has in mind when he speaks of design as the science of the artificial. What he means is 'devising artifacts to attain goals' or, more broadly, 'doctrine about the design process'. In this sense, Simon's Science of the Artificial is perhaps closer to what Dewey means by technology as a systematic discipline of experimental thinking." (Buchanan, 1992)

Alluding to both Simon and Dewey is extremely relevant to contemporary design education due to both the complex nature of design as a practice, and more so when dealing with social design education and working in a crisis-laden reality. Following this stream of thought, Suchman (2002) called on designers to acknowledge both the situated nature of our practice, as well as the intricate layers of this knowledge vis-a-vis working with and for communities. Naturally, this is even more relevant and important when working in the spheres of social and participatory design, in practice, as well as in education. Suchman continued to highlight two perceptions of designers' role in knowledge production. First, designers must pay attention and be aware of their own situated knowledge, values and rooted ideas they bring to each project (or to use another term, the so-called researchers' bias). This premise also holds significant political and sometimes critical aspects, as Haraway observed. Second, designers need to pay attention and highlight their positioned knowledge vis-a-vis other stakeholders in each project. Thus, their own set of values and attitudes need to be considered when presented with other, sometimes conflicting worldviews of community members, local government workers and other stakeholders.

Famously, Suchaman (1987) juxtaposes planned action and situated action, meaning that the latter is more relevant to designers who work in ever-changing and complex environments than the former. Conversely, she (ibid: 188) defines situated action as "actions taken in the context of particular, concrete

circumstances [...] the circumstances of our actions are never fully anticipated and are continuously changing around us… situated actions are essentially ad hoc [...] local interactions with our environment, more or less informed by reference to an abstract representation of situations and of actions." Conversely, Lave and Wenger (1991: 32-3) lament the extensive and somewhat over-used nature of the concept, claiming that "on some occasions 'situated' seemed to mean merely that some of people's thoughts and actions were located in space and time. On other occasions, it seemed to mean that thought and action were social [...] or that they were immediately dependent for meaning on the social setting that occasioned them." They add to Suchman's important account the concept of "situated processes", which allows for the integration of improvisation and bricolage as practices suitable for innovation in complex scenarios, which defines every act of design. While all these are true and have at least a layer of relevance to our research, we start our interpretation of situated practice in a political-critical stance, echoing the complex situation designers and educators find themselves in between students/novices, community members and other stakeholders in a social design setting. We can surmise then, that every practice of design, and especially so in social design, is an act of communication and an act of interpretation or translation. As in Clifford Geertz's classic depiction of interviewing as a double act of translation (from their mouth, through our understanding and then into a research-oriented depiction of their narrative), the fluid and complex flow of the design process passes through the various stakeholders, navigated by the designer, aiming for a clear narrative that considers every stakeholder relevant to the project. This process is even more important when applying participatory design practices in a social context. Indeed, as is the case in situated knowledge, design is also temporal in that its understanding, interpretation and movement towards a proposed solution changes continuously as it faces an unknown future. Returning to the classroom adds another layer of temporality since we aim to educate professionals who would influence the discipline in the short and long timeframes.

2. Situatedness and Social Design Education

> "Feminist objectivity means quite simply situated knowledges [...] Situated knowledges are about communities, not about isolated individuals. The only way to find a larger vision is to be somewhere in particular. The science question in feminism is about objectivity as positioned rationality." (Haraway, 1988: 581, 590)

Relevant as ever, Haraway identified the need for situated knowledges, a need further heightened when dealing with social design. Not only is this knowledge necessarily situated, but the designer's values, as well as the socio-cultural context of the community to whom they design, affect the design process and its outcome. As previously mentioned, design differs from other bodies of knowledge. As in anthropology, design is unique in its relative lack of specific subject matter in favour of broader worldviews or work methods. In other words, design is not about "what" but rather "how". However, when adding design theory to the mixture, and when focusing on social design we add other layers of "why" and "who" (or rather "with whom" or "for whom"). Contrary to other classic design venues, social design revolves around several key layers that are crucial in our focus. First, social design is heavily dependent on collaborative work (co- and participatory design); second, social design is very much dependent on a specified socio-cultural context, of both the designer and the design partners. As previously mentioned, Suchman (in Ciborra, 2005: 10) defines a situation as "being the full range of resources that the actor has available to convey the significance of his or her action and to interpret the actions of others. Concern for the situation denotes the material and social circumstances of every course of action". This definition is important in our context since it involves the resources available to the designer, an active act of interpreting others' actions, and finally setting a creative act into motion.

When reflecting on the fluid meaning of 'situated' knowledge in action', Gherardi (2008) offers several dimensions:

- Situated in the **body** - somatic materiality, gender-oriented design and general aspects of collaboration and ergonomics are all situated in the body.
- Situated in the **dynamics of interactions** - in social design, as in other broader venues of the discipline, communication is key, not only between the design partners but also with non-human partners (technological systems, environmental entities and more).
- Situated in **language** - 'discursive practices' are key in social design, as each design partner and stakeholder communicate with different discourse systems. Thus, when working with community members, the designer translates their knowledge and undergoes another stage of translation when communicating with other design partners.

These three dimensions are extremely important when conducting social design projects since the intricacies of a given socio-cultural context are embedded in somatic knowledge, interactions and used language frames. Rohlfig et al. (2003) propose looking at situatedness as a dialogue between context and situation. They continue to say that "a situation consists of the spatiotemporal ordering of objects and agents alongside physically given constraints or characteristics like gravitational force or light intensity […] in our view, situatedness refers to special situations in which actions take place." Indeed, this elaboration is interesting in our context for two main reasons. First, situatedness is a combination of space and time, as both influence it and second, it is a trigger for action, which is crucial in design as a practice. Moreover, the concept of context is rich and elaborate as well, including broad socio-cultural venues, such as language and narrower venues, such as local knowledge and norms. The importance of context, then, lies in the multitude of agents and stakeholders involved in social design projects, conducting multiple levels of interactions between themselves, and their individual situations.

Stoner and Cennamo (2018) describe situated learning as "learning theory and a model of instruction that focuses on learning through authentic learning environments in which students can immerse themselves in an academic domain and participate in authentic tasks." Indeed, when embedding situatedness approaches in higher education and pedagogy we can address situated learning, which can be viewed as learning through authentic learning environments. Social, cultural and later on ecological and ideological context will render learned knowledge relevant for students on all learning levels. Therefore, understanding social practices, real-life technological knowledge, as well as the cultural essence of language is critical for the acquisition of knowledge. However, as Contu and Willmott (2003: 283) suggest, we should "focus not just upon cultural and organisational artefacts, but upon the embeddedness of learning practices in power relations, rather than the cognitive contents of individuals' minds". As learning in general is located or situated within everyday practices, when dealing with design the issue is even more pertinent. Therefore, we can agree that "learning is conceived as an integral part of generative social practice in the lived-in world" (Lave and Wenger, 1991).

Moreover, design education is further unique in its ability and necessity to integrate situated knowledge aimed at various efficiencies. Aside from linking theory and practice, these situated knowledges are also stemming from a dialogue between 'knowing' and 'doing', in that design is based on understanding through dialogue and communication, but it is also judged by its ability to influence the visual materiality of our reality. Gheradi (2008: 519) traces the roots of this assertion to 1960s ethnomethodology and its ability to offer "understanding of how individuals successfully use indexical behaviours and expressions whose meanings are constantly negotiated and renegotiated in the course of interaction. One meaning of 'situated' regarding practices is that their performance depends on how indexicality is locally resolved." Two other important traits of situated action, according to Gherardi, are reflexivity and accountability, which are a crucial element both in PD (participatory design) and social design education.

Situated knowledges in social design is especially important when practising it through the lens of participatory design. Focusing on values, various social groups, and often also political issues, the socio-cultural dimension of design practice becomes even more pronounced. Agid (2016: 81) describes this important connection between PD and situated knowledge:

> "Here, I propose that a focus on designers' positions, and how we make the relationships through which infrastructuring takes place, helpfully complicates what is at stake in both building and engaging with various infrastructures. This includes learning to design together with others through collective engagement in the work itself. Additionally, I suggest that how we understand, contextualize, and articulate the aims of acting on infrastructures, especially those with uneven material consequences for people living with them, is critically important to what it means to do infrastructuring in different contexts, and with whom. How we infrastructure is a political concern for PD that includes both the structural and systemic contexts of that work and the people and relationships with and through which it happens."

Agid (ibid: 81, 87) continues to define infrastructures as "systems that are made up of continually renewing, complex socio-material relationships that form, inform, and shape their parameters and ways of working [...] infrastructuring helps to hold complex intersections between people, groups, technologies, systems, and ideologies in view as one means of seeing how they might work in and for designing". While differing from classic industrial design, these definitions illustrate a majority of design practices and fall well between the parameters of contemporary design education. In social design, practitioners and educators navigate and bridge between various worlds of situated knowledges (the designer's, technological attributes, and the community's, among others), thus rendering the importance of mapping and grounding these various micro-worlds.

The combination of situatedness approaches in the classroom and participatory design values led us to develop a visual model as a reflection medium for all relevant design partners. Aside from it being more intuitive for designers, we surmised that complex issues are best presented in a simplified manner, specifically when working with partners from differing areas of knowledge and understanding.

3. Visual Situatedness in the Classroom

The last few years presented various complex challenges (wicked problems if you will) to higher education in general and design educators in particular. Ranging from communication issues stemming from the COVID-19 pandemic, through wars and political strife, as well as coping with immigration flows, ever-growing social exclusion and segregation and more. These complex challenges echo the necessity to reframe and redefine the role of design educators in society. As these changes bring our personal beliefs, core values and priorities to the surface, they influence our professional sphere as well. They also demand a departure from traditional linear educational models towards a deeper integration of diverse modes of knowledge production throughout the design process.

Considering the classroom as a complex system composed of teachers, students, and design partners can deepen our understanding of the intricacies and power dynamics within the social systems where the educational, professional and personal intersect. To support this shift in perception, there is an emerging need for new tools in design education. These tools should be capable of visualising and comprehending the complexities of individuals, social groups, and communities, particularly in light of their often-conflicting interests, assumptions, and backgrounds. In response to this need, we propose the 'Situatedness Model' - a visual representation of situatedness in social design education. This model aims to represent both individual and collective situatednesses within the learning and designing processes. Our objective is to design tools (in line with Buchanan's concept of 'devising artifacts') that will cultivate a design approach that is sensitive to the diverse needs, perspectives, and knowledges in the classroom while seeking to foster a more inclusive, empathetic, and pluralistic perspective in social design education.

3.1 Developing the ‘Situatedness Model’

Mapping knowledge through visualisations is essentially a way of envisioning, interpreting, and spreading information. Tufte (1990) describes this process as a way of creating a multidimensional model of different worlds to better understand them. The primary value of visualisations is their ability to transform discrete sets of implicit knowledge into an explicit set of relational knowledge quickly and directly. Typically, designers tend to start using visualisations in an early phase of the design process. In this phase, visualisations are used either as tools for translating raw data into insights or as a way of communicating insights (Segelström, 2009). Yee (2012) categorises the use of visualisations in design into three purposes: “for reflection and exploration, as an analysis and knowledge generation tool and as a communication, facilitation and discussion tool”.

Indeed, reflection is a central activity in various creative practices. It is often viewed as a cognitive process that allows designers to develop new insights into their design, generate alternative solutions, reframe the design problem (Kinsella, 2007), as well as create a steppingstone for future projects. Reflection is also considered a form of design-embedded knowledge gained through practical experience which influences the creation of assumptions, methodologies, and decision-making. Schön & Wiggins characterise design activity as a “conversation with the materials” (Schön & Wiggins, 1992) associating the act of seeing with sense-making, sudden discoveries, and learning from the present situation. These activities are collectively referred to as “reflection-in-action” (Schön, 1983). In the classroom, as we shall see, reflection is doubly important, as both a professional way of navigating through the project, as well as an educational venue for self-understanding and situating one’s work in a broader community.

Using visualisations for analysis and knowledge generation represents a multifaceted approach; while words and numbers primarily cater to logical and sequential processing, visual representations engage the brain's capacity for quickly and intuitively perceiving patterns, relationships, and abstract concepts. This approach, which engages both analytical and visual-spatial intelligences, enhances comprehension, memory retention, and the ability to identify trends in data sets. This is extremely important vis-a-vis two key attributes of design practice - its temporal nature, previously discussed, and its tendency to work through iterative creativity, rather than linear reasoning. Creating visualisations from research material allows the integration of the material's heterogeneity into design decisions. In this context, visualisations are akin to what Geertz (1973) famously described as “thick descriptions”: the research phase focuses on (re)framing and understanding, necessitating clear articulation of assumptions and features, as noted by Segelström and Holmlid (2009). Thus, visualisations allow for interpretation and translation processes, necessary when shifting through various bodies of knowledge, typical to design practice.

Designers commonly use visualisations for communication and discussion, both within their teams and with external design partners or stakeholders, common in social or participatory design projects (Segelström, 2009). Visualisation of research materials facilitates designers in externalising their 'sensemaking' (Krippendorff, 1989), thereby fostering a shared understanding of the research insights. Yee (2012) describes the dual nature of visualisation in research, emphasising its role as a tool for internal cognitive processing by researchers and a medium for external communication and engagement with a broader audience. This dual functionality highlights the critical importance of visualisations in both the exploration and dissemination phases of design research (ibid).

The ‘Situatedness Model’ draws inspiration from visualisation methods commonly used in service and systemic design practices. These fields are highly visual, due to the intangible nature of services and systems, and the diverse types of data involved in their conception and construction (Diana et al., 2009). Research on service design visualisations spans both academic and professional literature. Segelström (2009) characterises the use of visualisations in service design for three main communication goals, each differentiated by the intended audience: articulating insights (“communication within the design team”), maintaining empathy (“communication with one’s memory”), and communicating insights (“communication with stakeholders outside the design team”). Segelström & Holmlid (2009) suggest that

the visualisation techniques proposed by designers are not merely tools for mapping and describing the existing situation, but rather aid in interpretation and understanding. The choice of visualisation character (the "how") helps to keep empathy with the user throughout the design process, particularly when engaging with different stakeholders who might not be familiar with the users' perspectives. Diana and colleagues (2009) classify the types of representations according to a matrix with two dimensions: iconicity (ranging from abstract to realistic) and time (synchronic versus diachronic).

Common and popular visualisation methods are widely and almost universally used to enhance empathy with users by visualising their experiences, including the potential of different interactions and choices. In this category, we find tools such as personas (Pruitt & Grudin, 2003), cultural probes (Gaver et al., 1999), design documentaries (Raijmakers et al., 2006), mood boards, empathy maps (Xplane, n.d.), and user journey mapping (Parker & Heapy, 2006). Later adaptations have led to different techniques that represent the irreducible complexity of service organisations and make them more tangible, such as service ecology maps (Polaine et al., 2013). The web resources *Service Design Tools* (Tassi, 2009) and *This is Service Design Doing* (Stickdorn et al., n.d) serve as practical, open resources for presenting the most common and popular tools. Akama (2012) cautions against the oversimplification in visualisations sometimes found in service design, as they often lack the representation of complex and messy realities and the contextual knowledge grounded in action. She argues that service design methods should "never be severed from their complex human and situational contexts. Design that is generalised, sanitised, and exported out of its applied contexts loses its power and agency for potential interventions and transformations."

As designers increasingly address complex and wicked problems, they are adopting new visualisation methods originally developed in systemic design (Besplemennova and Tassi, 2018), to convey complex ideas and solutions. Recent developments in systemic design emphasise generative and transformative values (Jones, 2014), stemming from the understanding that dynamic systems require equally dynamic tools for representation. Notable examples of these methods include Giga-Mapping (Sevaldson, 2011), Synthesis Maps (Jones & Bowes, 2017), Enhanced Service Design Tools (Tassi, n.d.), and Design Journeys Through Complex Systems (Jones and Van Ael, 2022). These tools prove valuable in highlighting intricate relationships and interactions among various actors, as well as the diverse ways they exchange values.

Building upon the foundation laid by a variety of visualisation methods in service and systemic design, our focus now shifts to social design education, specifically through the lens of situatedness. The 'Situatedness Model' draws inspiration from tools such as those found in the Enhanced Service Design Tools and aims to integrate the unique perspectives and experiences of teachers, students, and the community or design partners. It seeks to encompass the complex interplay of actors and values in socially oriented projects. In doing so, this approach extends the conversation beyond professional practices and into the educational domain, thereby enriching the learning process with a deeper understanding of real-world complexities. In this context, student situatedness emerges as a critical component of social design pedagogy, offering a more holistic and embodied educational experience that reflects the multifaceted nature of social design challenges.

3.2 Designing the 'Situatedness Model'

In the following section, we outline our interpretation of the 'Situatedness Model' in social design education, describing and illustrating its key principles and stages. We identify three correlating and entangled layers: the designer-educator's situatedness (who is both a practitioner and educator), and their own set of values, personal identity, and professional preferences. The student's, in turn, profess their own educational, professional and personal attributes as well as societal identities and expectations. Lastly, the community with whom we work in these projects, manifests their own identities, desired outcomes, and socio-cultural context and relations. Some facets of the model are shared across the three spheres and others are unique to each one.

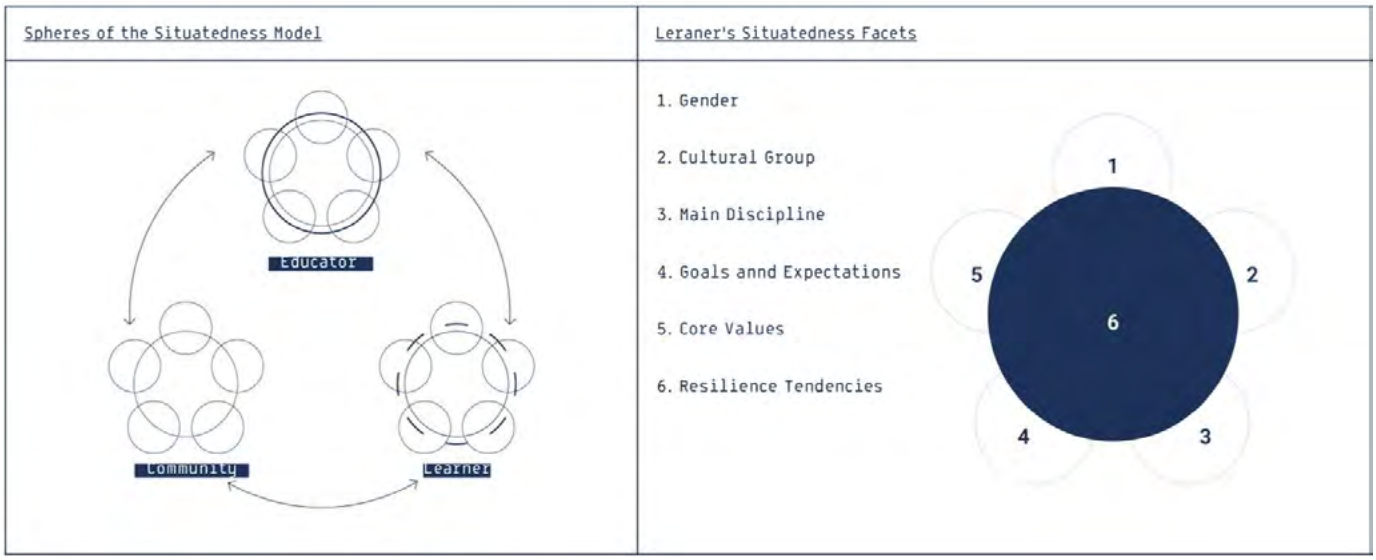

Figure 1. The three spheres of the Situatedness Model and the student's facet groups.

We based the design of the model on the geometric shape of a circle aiming to convey the continuity and relationality of the different attributes of situatedness to one another, as well as its a-hierarchical nature. We wanted to design a type of visualisation that serves as a symbolic representation of the interconnectedness of different perspectives and knowledges within individual and collective situatednesses. Our goal is to translate what is mostly perceived as abstract information within a class setting into visual representations that can be easily and meaningfully understood. We will demonstrate the different parts of the model by delving into the student's facet groups and attributes. This part of the model aims to describe the components that make up the student's situatedness at the beginning of a social design project. It does so by acknowledging the different facets that contribute to the knowledge, experience and expectations of each student. By doing so it places the design and learning processes in both the wider socio-cultural environment as well as the controlled design environment in which the project takes place.

Five outer circles represent the facet groups which are picked by the educator at the beginning of the course, in the current example - gender, cultural group, disciplinary background, goals and expectations, and core values. These may vary depending on the context of the course, student' background and project at hand. The inner circle represents resilience tendencies - it is the only constant facet. Each facet is categorized by a few attributes, and some may visually overlap.

The first three situatedness facets represent the student's background:

- **Gender:** Gender norms, roles and relations are powerful determinants of the health, social and economic well-being of individuals and communities around the world, as well as a central layer of our identity. In social design education, recognizing the student's gender perspectives can be pivotal; it can aid in integrating gender-based knowledge into the core of the design process, thereby facilitating the development of services and experiences that are more gender-aware and sensitive. In addition, when working with local communities, their perception of gender according to each socio-cultural context will dictate a different dialogue with the design team.
- **Cultural Group:** Typically, students' cultural backgrounds are not explicitly addressed in social design projects, with students more often integrating their cultural identities into personal or artistic briefs. By actively introducing cultural backgrounds into social design education, a more nuanced and context-sensitive understanding of design can be

fostered. This approach not only accommodates the specificities of different contexts but also helps in embracing diverse cultural identities and knowledge systems in design decisions. As social design deals in many cases with social justice, ethics and political issues, this is key to better defining the desired outcomes in each project. This aligns with Noel and colleagues' (2023) concept of a pluriversal design, where they advocate for a design environment where "multiple worldviews thrive and diverse lived experiences inform the entire field, as well as individual projects".

- **Main Discipline:** The complex nature of social design projects often requires collaborative and interdisciplinary work. Understanding each class member's disciplinary background can enhance the diversity of professional competencies within groups. Additionally, aligning students' design competencies with the specific needs of various projects can optimise project outcomes and learning experiences. The most advantageous aspect of social design is that it relies on cross-disciplinary skills, both inside the discipline (visual communication, urban design, inclusive design, service design and more), as well as outside its classic boundaries (social psychology, design anthropology and more).

The next two facets in the model are future-oriented and dedicated to the student's development goals through the upcoming project:

- **Goals and Expectations:** This facet draws on Richard Buchanan's four 'orders' of design, which categorise the outcomes of a design process on a scale from simple to complex: (1) symbolic and visual communications, (2) artefacts and material objects, (3) activities and organised services, and (4) complex systems and environments (Buchanan, 1992). This categorization encourages students to contextualise their current project within a chosen order as a strategic approach to their creative intervention.
- **Core Values:** We offer another name for social design - value-oriented design - to signify the importance of core values in socially-oriented projects from the project's starting point. We incorporate five values in the model: commercial, participatory, glocal (focusing on combining the global and the local), ecological, and critical/speculative. Students are encouraged to select one or more values to infuse into their project.

Mapping these values within the class serves dual purposes: to aid teachers in forming groups based on shared values, and to balance project expectations within each group.

The sixth facet in our model is **Resilience Tendencies**, placed at its core. The concept of resilience comes from the physical sciences, where it describes the ability of a system to create shapes, resist pressures, withstand challenges and return to its original form after a disturbance (Annarelli & Nonino, 2016). Resilience is manifested in times of change and crisis situations, denoting the capacity to remain in motion and to cope effectively. It is important to recognize that resilience is a dynamic and evolving attribute and can be strengthened through practice. In our 'Situatedness Model', we evaluate resilience, drawing on McGonigal (2015), within a holistic framework that encompasses four dimensions: physical, cognitive, emotional, and meaning-related tendencies.

We chose a visual code to highlight each of the facet groups in the model. Each facet varies by its colour, texture and size, as explained in Table 1:

Table 1. Visual Legend of the 'Situatedness Model'.

#	Facet	Attributes	Visual Language	Possible Interactions
1	Gender	Male		One option.
		Female		
		Non-binary		
		Fluid		
2	Cultural Background	Atheist		Students can change the size of the circle to mark their positionality between religious to secular.
		Jewish		
		Muslim		
		Christian		
		Undefined		
3	Main Discipline	Visual		Students were asked to choose one option.
		Product		
		Digital		
		Fashion		
		Other		
		Multi		
4	Goals and Expectations	Sign and Symbols		Students were asked to choose one option.
		Products		
		Services		
		Systems		
5	Core Values	Commercial		Students can choose a few values and arrange them by the degree of influence.
		Participatory		

		Glocal		
		Ecological		
		Critical/ Speculative		
6	Resilience Tendencies	Physical		The four tendencies are shaped as a compass, in the middle of the model. Each line is marked by the first letter for each tendency. Students can choose the length of each line to evaluate their resilience in each one of the attributes.
		Cognitive		
		Emotional		
		Meaning		

We used the MIRO collaborative online platform for the individual situatedness mapping activity of the model. This platform was selected for its user-friendly and collaborative features. On the MIRO board, a designated canvas (or 'frame') was provided for each student to construct their model. The board also includes an explanation of the model and a sample for reference. Following the mapping activity, students are required to complete a questionnaire to provide feedback for future iterations of the model. In some cases, this activity was supplemented with a group discussion to gather oral responses.

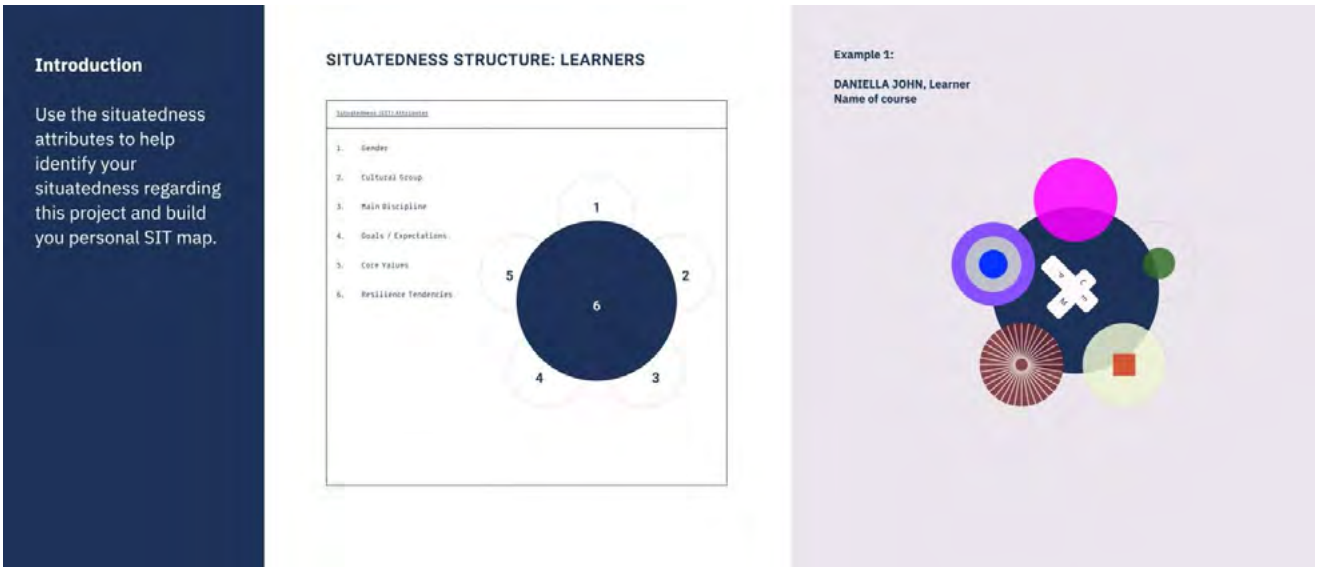

Figure 2. Details of the Miro board from the final project course (BDes) – HAC.

Figure 3. Details of the Miro board from the final project course (Mdes) – Shenkar.

The offered model is designed to work at two different levels. The first level focuses on the student's point of view - we use our model to instigate and trigger a process of self-reflection and personal definition, on personal and professional levels through a visual and conceptual model. Moreover, when introduced before choosing teams for a project the tool can help students in the classroom identify suitable partners to work with for the duration of the course (either complimentary or similar potential partners). The underpinning assumption is that there is an appreciation of expressed understanding through the visual model that triggers learning. Mapping, in this activity, serves as a platform for dialogue and reflection. This conversational approach plays a pivotal methodological role in enabling us to raise questions and address challenges that arise in the learning process. The second level focuses on the teacher's point of view - we use the model for mapping the students in the classroom according to various attributes; managing the progress of the class in general, according to personal efficiencies; and using the mapping to generate richer and more diverse outcomes at the end of the course.

To summarise the process of using the model we identify 6 main stages:

1. Identify the Individual situatedness of educators, students and community representatives, and highlight possible trigger points.
2. Harness empathy towards co-design and participatory design strategies.
3. Create a common denominator situatedness view for the collaborative project, defining boundaries and expectations.
4. Evaluate the design situation through sharing knowledge and applying co-design and participatory design strategies.
5. Define the type of design intervention needed, through innovation, improvement or non-design.
6. Choose the best possible outcomes that reflect the accumulated situatedness of the specific group, in this specific place and time.

As this is not a linear process, the last step is reflecting on possible changes in the actors' situatedness.

3.3 Teaching with the ‘Situatedness Model’

The first iteration of the model was held during a Health Design Lab course in the spring semester of 2023 at Shenkar, Israel. The second iteration was done within four design courses between December 2023 and January 2024 as represented in Table 2.

Table 2. Summary of Case Studies.

#	1	2	3	4	5
Date	May 2023	January 2024	January 2024	December 2023 /January 2024	January 2024
Location	Israel	Israel	Israel	Germany	Israel
Program	B.Des, Cross-Disciplinary Studies Shenkar	B.Des, The Department of Visual Communicatio n Shenkar	M.Des, Shenkar	MA Transformation Design, TH Augsburg	B.Des, Inclusive Design, HAC Jerusalem
Number of students	12	19	20	15	30

4. Interpretation and Conclusions

Visualising processes and interpretative knowledge through design is hardly a new concept. Immerging sub-disciplines of service design and visual communication use methods such as data visualisation to imbue raw data with emotions and create a deeper experience. However, we believe that visualising individual and communal situated knowledges will help designers and design teachers in facing present and upcoming wicked problems, especially when working on social design projects. Shifting perspectives and converging bodies of knowledge fall within an interesting change we have witnessed lately in design education. While the history of design education far surpasses the scope of this article, it has been widely accepted in the last several decades that the design teacher deals with the dissemination of knowledge or instruction of pedagogic processes. These approaches, rooted in traditional modernist paradigms, often portray the designer as a solitary master who analyses the design challenge from afar. This perspective neglects the potential benefits of synergizing conflicting worldviews of various stakeholders from the outset of design briefs and as a central aspect of the educational environment. The absence of tools in design education for visualising and comprehending the complexities of individuals, especially when considering their often-conflicting interests, assumptions, and backgrounds, profoundly affects how students are prepared to become future practitioners.

As we have seen throughout this article, the growing awareness of designers in the ever-growing sphere of wicked problems led to reframing the very role of designers in their communities and society in general. As such, designers in social design deal primarily with reframing value-oriented design to create change and tackle these wicked problems. Therefore, as teachers, the emphasis should be on educating—not merely instructing—future practitioners to expand their potential for deep and much-needed change in design practice. Further expanding this sphere of education needs a deeply rooted socio-cultural context stemming from understanding our values and those of our students, colleagues and communities. The core idea is that designers, when attuned to situational factors within groups, can foster a collective sense of situatedness, thereby cultivating a synergistic design language that is reflective of these factors. This approach is expected to enrich dialogues, encourage the exchange of ideas, and, hopefully, lead to

outcomes that reflect the diverse backgrounds of their creators. Furthermore, as new technologies such as social networks and generative AI, stimulating at first glance and frightening at a second glance, influence our work in ways not entirely comprehensible yet, the need for particular knowledge, sharing and meaningful dialogues is becoming more pressing. Both could be achieved through tools such as the model presented here.

Moreover, the temporal nature of design, i.e., meaning that designers are situated in the present, rooted in their past but designing for an uncertain future, holds immense implications for the use of our model in social design projects. As the future becomes more uncertain and crises are ever-growing and expanding, the necessity of a clear value-based system of professional guidance will become a must for individual designers and design educators even more so. In addition, the ability to navigate these obstacles and conflicts through dialogue techniques would be aided by such visual tools.

Finally, as we expand the possibilities of this model through empirical data (questionnaires, visual content analysis and observations) we wish to stress we are not offering a finalised one-stop-shop for use on the go. Rather, we offer a first stage for a new way of starting a project and facing the new faces of a fresh classroom. Furthermore, this is a part of a broader view of the history of design (see, Gal and Ventura, 2023) and our agenda towards the role of design and the designer in society and the upcoming future. We believe that designers are not problem-solvers, nor are they 'educated carpenters', but rather highly-professionals, multi-faceted mediators and visual-material interpreters of practical ideas (see www.socialdesignnetwork.org). As such, we hope this model will help us better understand our complex present to better face the uncertain future.

About the Authors:

Michal Pauzner is designer researcher, faculty member at the Visual Communication department and Head of the Center for Teaching Excellence at Shenkar. Engineering. Design. Art. As co-lead of PADLab, a post-anthropocentric design laboratory, Michal uses visual-material tools to explore the interplay among emotional well-being, societal relationships, and environmental changes.

Jonathan Ventura (PhD) is a design researcher, and Chair of The Unit for History and Philosophy of Art, Design and Technology at Shenkar. Engineering. Design. Art. Jonathan is the co-founder and co-director of the international Social Design Network. His latest book, *Introduction to Design Theory* was co-authored with Prof. Michelle Gal, published by Routledge, 2023.

Jennifer Schubert (PhD) explores the intersection between participation, collectivity and accessibility. As professor of Participatory Design and research representative at the Faculty of Design at Augsburg University of Applied Sciences (THA), she researches how materializations can contribute to additional knowledge generation.

Acknowledgements: We would like to thank our students who participated in the development and evaluation of the model, and showed interest, creativity and effort in learning and discussing this new tool.

KEYWORDS | SOCIAL INNOVATION, STEAM EDUCATION, DIGITAL MANUFACTURING, THIRD MISSION, DESIGN EDUCATION

ABSTRACT | Design for social innovation advocates for challenges Institutions are trying to align with in the evolving societal needs. This contribution reflects on the results of a series of laboratories designed and carried out at the 'Punto Luce delle Arti' of Ostia in Rome, with Save The Children, combat educational and material poverty using accessible technology. Eight workshops in different fields of creative manufacturing foster digital and manual skills, guided by computational and design thinking.

Design strategies stem from understanding social context and politics, fostering systemic change. Designers become politicized agents, transcending production, and technology to enhance social cohesion. New methods and tools emerge, defining well-being beyond economic values, emphasizing the balance of social and environmental capital for societal betterment. The Third Mission integrates University and Research with society, labor, and institutions, fostering territorial empowerment and meeting public demands for societal change. Design and education serve as strategic tools for social innovation, supporting initiatives in disadvantaged communities and empowering designers as infrastructure for autonomous development.

In the context of citizen empowerment, informal education, and STEAM disciplines fuels sustainable development and societal change. Citizen empowerment enhances community engagement and decision-making. STEAM education fosters creativity, innovation, and problem-solving through hands-on learning, offering a transformative perspective on societal challenges and promoting a "learning by doing" approach.

By these premises, the contribution offers an exemplary case study of how Design can effectively foster community building, sense making and introduce novel competences in replacing educational poverty, while advocating for a better urban development and vibrant neighborhoods.

1. Introduction

The reflection on methods and approaches that Design can adopt towards social innovation advocates the challenge that most of the institutions face in accomplishing and aligning with evolving societal expectations and specific knowledge demands (dos Santos et al., 2021). The diverse tools and strategies that can be used for this purpose stems from a symbiotic relationship between a profound understanding of social and political context (Manzini, 2018), fostering systemic change within operational contexts (Transit, 2017). Designers are called to rethink their role as politicized agents of change (Fry, 2010), expanding their impact up to a broader disciplinary field that overcomes production, technology, and market concerns (Meroni, 2007). This expansion enables new combinations of methods and tools (Villari, 2012) for social and territorial cohesion, ultimately contributing to the definition of new well-being indicators that encompass aspects beyond mere economic values, being conceived as the complementary balance of social and environmental capital (Stiglitz et al., 2009).

Within the realms of University and Research, these factors converge under the banner of the Third Mission, which bridges civil society, the labor system, and institutions. This principle facilitates territorial empowerment by enabling new forms of knowledge acquisition, competence, and skill development, aligned with public expectations and demands for societal change (Lange et al., 2019). Design and education serve as strategic tools in instigating, supporting, and enhancing social innovation beyond the academic environment, positioning designers as infrastructures to bolster initiatives for more autonomous or disadvantaged communities (Morelli & Sbordone, 2018).

To do so, it is crucial to understand the interplay between citizen empowerment and social awareness, which are factors commonly thrived through informal education and local activities derived by locals: in this context, it has been acknowledged how STEAM education can advocate for sustainable development and societal transformation (Taylor & Taylor, 2019) acting at the early stage of future civic society. While citizen empowerment garners attention as a means of fostering community engagement and participation in decision-making processes, STEAM approach and practices have also emerged as potent tools offering a comprehensive understanding of the world. They foster creativity, innovation, and problem-solving through a transformative lens and emphasize a "learning by doing" approach (Conradty et al., 2020).

By these premises, the project has been structured to have much clearer understanding of the following questions:

1. Can Design favor the creation of an environment where social inclusion and advanced technology collaboratively enhance the same educational scope?
2. Can Design in an educational context enhance the accessibility and inclusivity of those enabling technologies up to more marginalized social contexts?
3. How can education through Design stem a project culture aimed fostering cultural and social development?

To answer to these questions, the project "*Design for Children*" structured a didactic structured on a series of laboratories developed by Sapienza Design Research within the 'Punto Luce delle Arti' of Save The Children located in the Lido di Ostia Ponente district together with the local social cooperative of SS Pietro e Paolo.

The initiative has been designed to fight back educational and material poverty within the community by leveraging the accessibility of enabling technologies (Meutia et al., 2022) through eight laboratories focused on digital manufacturing in areas such as jewelry, gadget design, molding production, robotics, dynamic modelling, video creation, and serigraphy, ultimately aimed to foster the development of both digital and manual skills, underpinned by a computational and design thinking approach. Each workshop is presented and evaluated based on the skill and the competencies acquired by its young participants as well as by the technological challenge that the latter have been able to face and overcome thanks to the Design-driven approach.

Finally, the outcomes and the results of the workshops are measured based by 1) their capability to overcome the educational scope of the hosting local reality, 2) by the capability of the workshop to engage local users and stakeholders, 3) and ultimately highlighting the potential benefit it had at cultural and social level.

2. Education Through Design for Civic Empowerment

> "[…] digital has the ability to change content and form, a digital content does not remain identical but can be declined into very different versions from each other." (Magone & Mazali, 2016, p.110)

The aforementioned statement requires a deeper reflection on the different skills and abilities designers are required to have in nowadays processes and the development of technological skills. When tackling the issue of necessary update required to interact within digitalized systems, this project foreseen the necessity for a paradigmatic change that is leading the concept of education to provide the necessary knowledge and skills since the early stages of education through a "learning by doing" approach (Brown, 2009; Dziuban et al., 2018; Turakhia, 2022). Design and education acts as a strategic tool in triggering, supporting, and enhancing social innovation outside academic environment, while putting designers as infrastructures to support initiatives for those more autonomous or, so to say, disadvantaged communities (Morelli & Sbordone, 2018). Furthermore, the concept of situated learning in design education highlight the importance of authentic, real-world problem-solving experiences in architectural studio education (Buldan, 2021). This highlights the potential of design to create immersive learning environments that mirror professional practice.

Since first arguments on the role of the project in the civic context, the stability of architectural knowledge and its embedded nature within organizational practices, this stability underscores the role of designers as sense-makers, as their ability to navigate existing knowledge and drive innovation up to the social context (Henderson & Clark, 1990). In the realm of education, the people-centered and iterative nature of design thinking involves the use of specific sensible tools aimed not only to the comprehension of a context, but also to actively engage and provide fundamental tools to enable the civic society at the design process (Liedtka & Ogilvie, 2011). In the context, makerspaces can be configurated as center of learning, highlighting the significance of the physical environment in facilitating sense-making and learning (Woods, 2023). This underscores the role of designers as sense-makers in creating learning experiences that resonate with the needs and perspectives of learners, fostering a human-centered learning approach that involve and qualify the students and the teachers as enablers of conducive environments for learning purposes (Garcia-Lopez et al., 2020).

The concept of "Education through Design" (Bekker et al., 2015; Lewis, 2009; Lyon, 2016; Mentzer, 2011) encompasses diverse dimensions as design thinking offers a multifaceted approach to seek for potentialities or challenges and ultimately to envision solutions through the development of problem-solving skills (Brown, 2009; Cross, 2011; Kolko, 2015). In higher educational context, Design has already proved in many ways how it can emphasize collaboration, research, learning, and knowledge (Niederhelman, 2001). This highlights the potential of design to foster a holistic educational experience. What often is not considered is the way design can influence positively on the experience of learning (Beligatamulla et al., 2019). In this sense it could be relevant to address the importance of embracing the uncertainty that characterizes design education, which indeed often involves iterative processes, experimentation, and the acceptance of ambiguity, thriving for resilience, adaptability, and critical thinking skills among learners as well as in educators (Liedtka, 2015), thereby enriching the educational experience as a set of interaction towards common goals and achievements (Dym et al., 2005). Moreover, these highlight the role of design education in responding to social trends and needs, extending the learning environment through concepts such as Community-Based Education and Service. This bring to the attention the potential of Design to address real-world challenges and engage with communities (Tu et al., 2021), thereby promoting experiential and socially relevant learning.

Citizen empowerment means getting involved in activities that help everyone and make a difference in the community. (Lerner et al., 2009) This can lead to shared goals and positive changes. Impactful resources and solutions, in this sense, stem and derive from civic participation which involves engagement with local community, voluntary associations, local governments, that actively and collectively solve shared problems (Eccleston & Perkins, 2019; Ostrom, 1990; Sehner et al., 2022). Furthermore, empowerment programs are encouraged to provide greater opportunities for community roles in decision-making processes, especially for marginalized groups (Corbett & Le Dantec, 2018; Glowacki & von Rueden, 2015; Suwarno et al., 2019).

Social inclusion could be understood as the process of improving the conditions for the participation of individuals and groups in society, improving their skills, opportunities and dignity regardless of their identity (World Bank, 2013). In other words, a society is as much inclusive as all its individuals are valued while facing situations of marginalization and exclusion. In recent years, this theme of social innovation has become an integral part of the vocabulary of urban regeneration, where space plays a radical role in the production of this innovation (Ostanel, 2017).

> "[…] For Politics to regenerate, it must receive ideas and energy from social planning. Conversely, for social planning to flourish, expand, and endure over time, it must recursively find a favourable environment. And this, in turn, to exist, requires good Politics." (Manzini, 2018, p.4)

In his introduction, Manzini refers to *Politics* (highlighting the use of the capital *P*) as the set of organizations and actions that enables societies to thrive towards higher forms of civilization. These dynamics could also be understood as the exchange that nurtures systemic shifts within operational realms (McGill et al., 2023), which complexity underscores the need for fresh combinations of different and coherent methods and tools of design and production. This factors enables the growth of territorial empowerment opening to new forms of acquiring knowledge, competences and skills in support of public expectations and demands for societal change (Lange et al., 2019).

Said so, it could be possible to argue on the concept of citizen empowerment which has gained significant attention as a means of fostering community engagement and participation up to the decision-making processes. Nevertheless, this potential requires adequate sensibility and awareness by its users, to be considered truly impactful and inclusive.

3. Design-Enabled Technologies in STEAM Education

> "The problem will be that work itself will no longer exist and a large part of work as we understand it today will simply no longer exist." (Daclon, 2020)

The evolution of technology is driving changes in paradigms and dynamics that are impacting both the economy and society (Schwab, 2017). The reflections carried out along this project explore how those advanced models for cities livability that are aimed at citizen empowerment, are also defining the networks of information, services, and products that surround them (King & Cotterill, 2007). These models involve hybridizations and connections of processes that go beyond just the exchange of data: they structure new ways of establishing relationship between suppliers, users, interfaces, having direct consequences on the way people perceive daily life, especially in urbanized context (Calvillo et al., 2015).

Popular and participatory applications of technology are subverting traditional urban models and empowering citizens to take an active role in data collection. In this scenario, there is also another the responsibility each user is called to take towards the actions that could be made and the role each citizen cover while interacting in the system (Gatsios et al., 2020). On one hand, and among its pluralities, it could be possible to argue that *Design Research* mainly focuses on the application of competencies and skills in programs that would guide users through various disciplinary backgrounds and scientific developments (J. Li et al., 2022). On the other hand, *Design Education* integrates design thinking process into the

development of skills, providing a natural and essential component of an authentic STEAM program (Bautista, 2021). This approach fosters reflection and intentionality in Design and implementation in STEAM programs, demonstrating the ways in which design thinking can enhance student capabilities of dealing with advanced systems (Champion, 2018). For instance, in the Maker culture, the STEAM approach fosters a pedagogy model through technology that advocates for student autonomy and personal ownership throughout the design and making process (Weng et al., 2022), thereby enhancing student motivation and sense of ownership. This highlights the role of Design as culture in shaping educational experiences that foster a sense of agency and ownership among learners (Y. Li et al., 2019). In this context, it is important to consider the connection between citizen empowerment, informal and STEAM education can promote sustainable development and societal transformation (Taylor & Taylor, 2019).

If the citizen empowerment has gained significant attention as a means of fostering community engagement up to the participation in decision-making processes, at the same time, STEAM practices have also emerged as a powerful tool that offers a more comprehensive understanding of the world by fostering creativity, innovation, and problem-solving through a transformative view and a particular attention for a "learning by doing" approach (Conradty et al., 2020). At the same time, STEAM practices have also emerged as a powerful tool for enhancing innovation and creativity. In this context, it is important to examine the connection between citizen empowerment and STEAM practices, as these two concepts are closely intertwined. By integrating science, technology, engineering, arts, and mathematics, STEAM education offers a more comprehensive understanding of the world and fosters creativity, innovation, and problem-solving (Aguilera & Ortiz-Revilla, 2021).

By the reflections put in place so far, becomes clearer the need for a transformative approach, that becomes therefore necessary to challenge future people's assumptions and values and to ultimately inspire future citizens – whether they would become designers or not – to advocate for a sustainable and inclusive change. The following paragraphs introduce an exemplary case study of a program that could possibly lead to a deeper understanding in the creation of effective STEAM educational models. This case study exemplifies diverse STEAM education methodologies employing design principles to instruct students in the practical application of novel technologies and "modus operandi". The following paragraph presents the structure and the results of the series of workshops, designed by Sapienza Design Research at the Punto Luce in Ostia, in collaboration with Save the Children Italy and the Social Cooperative SS Pietro e Paolo.

4. Design for Children Case Study

In line with the objectives of the project, namely those of promoting a center with a high educational density, open to children and adolescents between 13 and 17 years old, where they can find opportunities for growth, development and experimentation through free access to activities ludic-recreational and training, the proposal of the Sapienza Design Research foster cultural, recreational and planning activities carried out with an educational and inclusive approach, capable of stimulating creativity. The initiative promotes the creation

of eight workshops that applied diverse structures to implement a complete STEAM education approach. In this sense, each workshop has been focused on different practices, technology, and context of application.

The eight workshops designed and tailored for this initiative stand out for their use of various technologies and applications guided by Design methodologies, practices through the application of those enabling technologies. The objective of this initiative, entitled "*Design at Punto Luce delle Arti di Ostia*" (Figure 1) was to highlight the capabilities of Design in producing social value by building strategic alliances with the Third Sector, to initiate processes of social inclusion in the most disadvantaged suburbs.

The program designed eight workshops related to the following areas of Design:

1. 3D modeling and rapid prototyping for jewelry design;
2. Dynamic Modeling;
3. Graphics for stop-motion;
4. Screen-printing Design;
5. Small Robot Design;
6. Art in 3D;
7. Comic Gadget Design;
8. Design for Cosmetics.

All those didactic activities involved diverse figures of the University among professors, researchers, PhD students which have worked side by side with local social operators and experts specifically invited for each activity. Over 250 students aged between 10 and 19 participated in the workshop activities organized by the project, which also involved professionals and local businesses that contributed to the development of the activities.

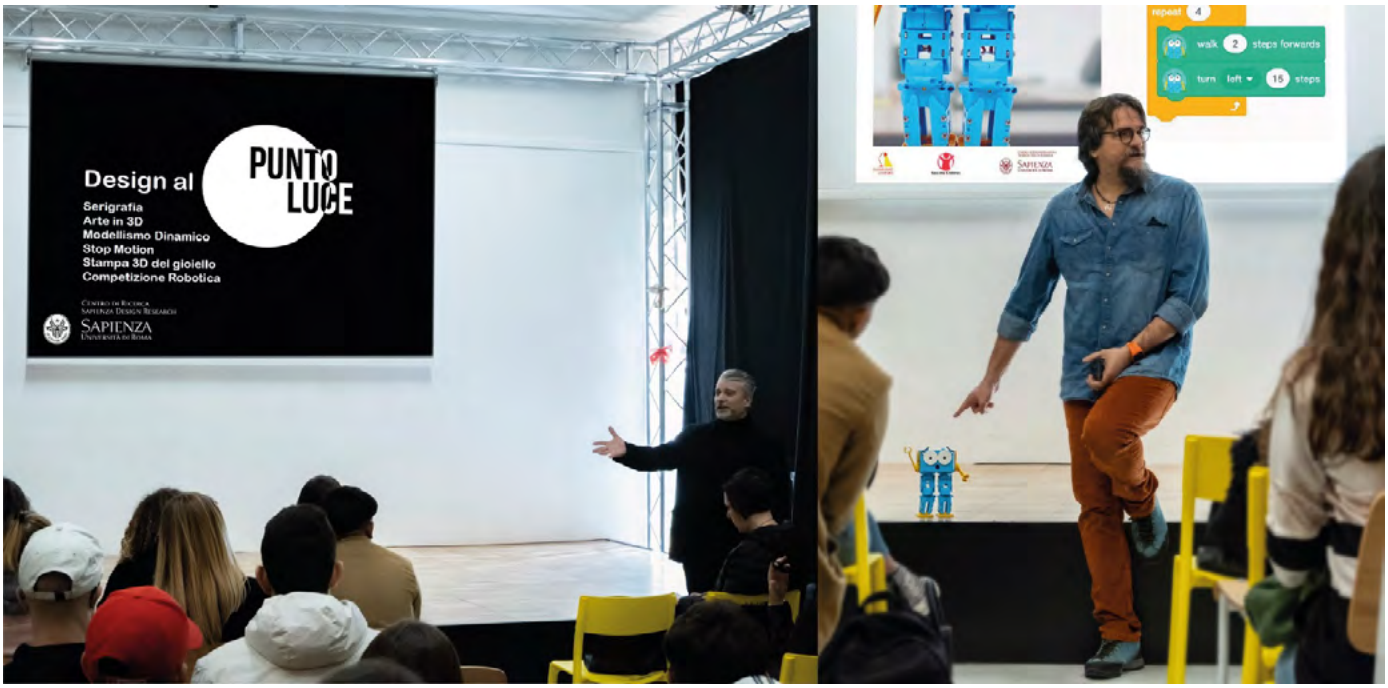

Figure 1. Kickoff day at the Punto Luce delle Arti di Ostia that introduced the workshops to the future students.

4.2 Design at Punto Luce delle Arti di Ostia

The following paragraphs are dedicated to the results of the aforementioned activities, with particular attention paid to the knowledge produced and the skill acquired by its participants. Each workshop is introduced by its structure of activities, followed by a small discussion on the skill developed by its participants and the impact this experience could have on the perception of the potential application of the technology.

3D Modeling and Rapid Prototyping for Jewelry Design

During the workshop, students were introduced simultaneously to CAD design, along with basic jewelry design techniques, while guided through a hands-on approach on the manufacturing process. Each lesson focused on a specific modeling process aimed solely at creating a finished model ready for the printing stage via a filament 3D printer.

Lessons were structured around various daily exercises that continuously produce different product such as rings, pendants, chains, bracelets, with a particular attention to the narrative of the products, which were aimed at communicating the territorial values of their territory or perceptions. Based on previous exercise, the last two sessions have been dedicated to their own designed jewel.

The entire structure of the course saw three main phases distributed in each session of 4 hours:

- The first phase was solely dedicated at introducing jewelry design principles (like ergonomical aspects, touching points, materiality) along with the narratives of formal choices (symbolism and aesthetical aspects).
- The second phase was straight to the practice, through a first rough and fast model on *Tinkercad*, where different shapes, related to the concept intended to be developed, were thrown on the digital scene to "assembly" the jewel. The main 3D modelling program was also used along with other free addon such as *3D2litophane* or *image2svg* to also implement a comprehensive customization of the designs. Once the elements were selected, they were assembled and optimized for the next 3D printing phase.
- The last phase was manufacturing, in which all the models were collected and ordered by the time required to be printed, to retrieve as many models as possible on the spot. In this way every day each student was able to retrieve its product immediately, giving a certain amount of satisfaction and confidence with the theory through a direct result of the practice.

Figure 2. Some of the projects designed by the students and its digital models realized during jewelry design workshop.

Throughout the course, participants gained expertise in 3D modeling, printing, and jewelry design, understanding the intricate relationship between products and bodies (Figure 2). They honed their design sensibilities, grasping principles of form, function, balance, and proportion. Through this, they explored how design choices affect wearability and usability. The integration of diverse disciplines—art, technology, engineering, and fashion—fostered an interdisciplinary approach, resulting in fashionable yet functional products.

Dynamic Modelling

The course aimed at designing and creating a dynamic model using rapid prototyping printers was adapted to the participants' prerequisites through reorganization into two phases:

- The first part involved students acquiring basic knowledge of sailing navigation principles and designing the customization of boat models.
- The second part focused on the creation of 4 sailboat models. Mechanisms for remote control of dynamic parts were installed, and customization was achieved through the creation of masks using vector graphics software, either in vinyl with a cutting plotter or with laser cutting and spray paint.

Figure 3. Picture of the models built and customized during the Dynamic Modelling workshop.

Conversely to other workshops, this course introduced students to the principles of dynamic mechanics, subsequently transitioning to a tuning phase conducive to customization (Figure 3). Furthermore, students were afforded the opportunity to delve into the principles of remote-controlled manipulation, thereby fostering enhanced proficiency in long-range 'hand-eye' coordination processes.

Graphics for Stop-Motion

The course was structured to introduce and guide students through its assembly technique. After an initial historical introduction, the course technically analyzed the differences between video and photography, positioning stop motion graphics between these two mediums. The workshop has been structured as such:

- The first step of the process approached the scripting part, where students imagined and wrote a small story to be told through stop motion, envisioning their characters, settings, and props. In this phase, participants were introduced by professionals to the concept of storytelling, in which they were invited to first describe a story (verbally) and then to reproduce every visual element they were able to seek in the story. Each element was listed and stored as potential "prop" of the scene.

- Secondly, students summarized the fundamental scenes of each story, creating a storyboard that visually shaped the scene. From the analysis of these scenes, each scene has been manually animated, acting as much on the character as the environment props made by hand with colored cardboard and improvised tools. A small photo set was created to capture individual scenes depicted in the storyboard, which have been later-on assembled through free online programs.

Creating narratives and storyboards stemmed advanced understanding for the young participant in developing critical thinking on the touching points of a narrative arc. In this sense, "crafting" their own narratives could ultimately help children to effectively communicate their ideas and thoughts by structuring it logically and conveying them clearly to others (Figure 4). Character and interaction design taught fundamental concepts for understanding the significance of actions, fostering empathy by considering diverse perspectives, while narrative structure analysis encouraged critical thinking about cause and effect, character development, and thematic elements. Ultimately, participants learned to identify patterns and comprehend how various story components contribute to the overall narrative.

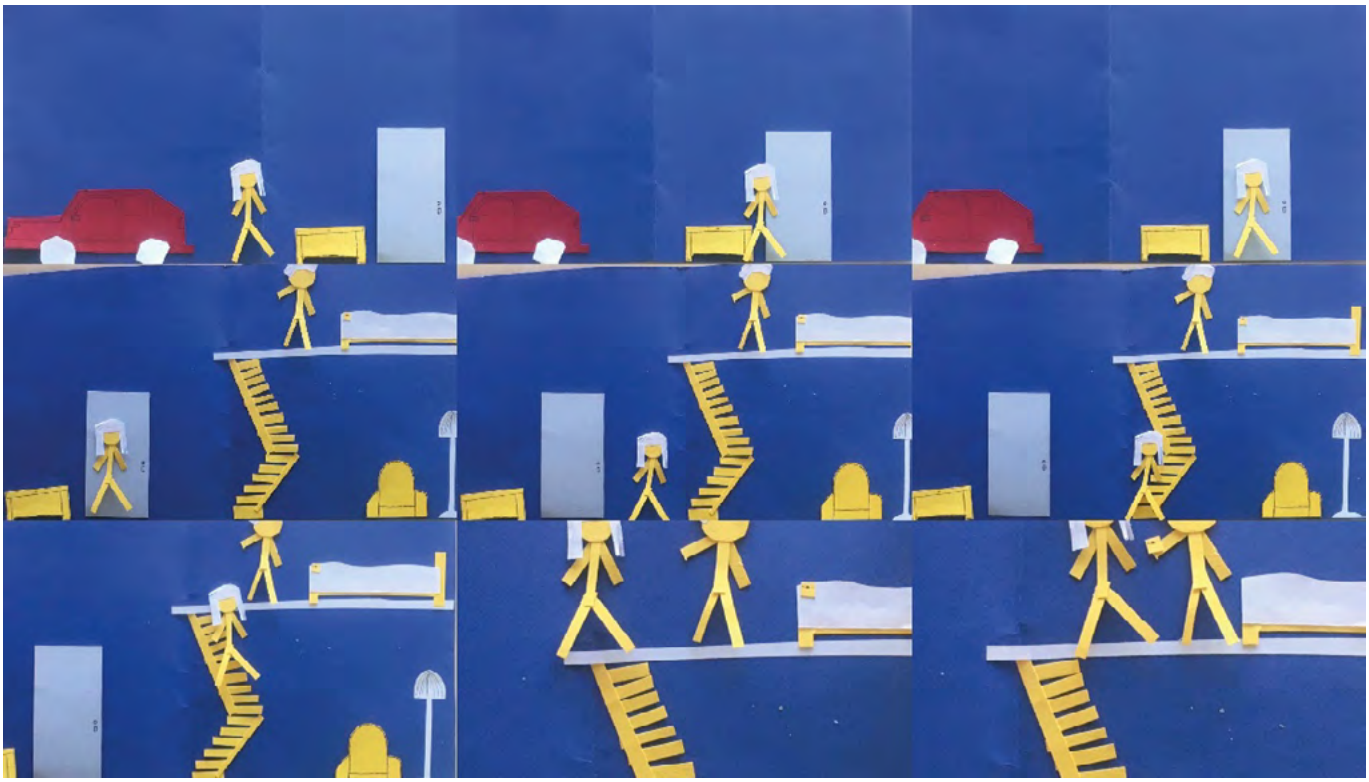

Figure 4. One of the novels represented by the "set" designed by the students during the stop-motion workshop.

Screen-Printing Design

The course aimed at creating screen prints on fabrics and was organized through learning phases, including the history of the screen-printing technique. A common project was identified to create the frame, engrave, and finally print. In its development and adaptation to the encountered context, the course was structured into two main phases:

- The first part involved a theoretical component of screen printing related to designs graphics that each participant wanted to reproduce. Each drawing was then to match the necessary characteristics to be transferred onto a screen-printing frame (by defining shar edges and small details).

Figure 5. The process of silk-screen printing was carried out with the students and some of the results of the workshop.

- The second part focused on the creation of the frames, which were then refined through engraving. Each step involved all the necessary phases of the screen-printing frame creation process, from reproduction on paper to the final exposed fabrics. Approximately 18 students aged between 12 and 16 participated in the course.

Participants have acquired practical manual skills, further deepening their understanding of the serial production process of t-shirts (Figure 5). Moreover, the developed drawing techniques have instilled an initial seed for the development of creative manual dexterity, encompassing drawing skills and selective analysis of the compositional elements of an artwork.

Small Robot Design

The course introduced students to computational thinking and related design, considering the growing impact of artificial intelligence on technical-economic development in various sectors, teaching them to master both the autonomous behaviours of digital systems and the programming of intelligent physical products. The course adopted a simplified model of a two-wheeled robot controlled, equipped with additional sensors and actuators. The course has seen Three main phases along its eight appointments:

- In the first phase the participants were introduced to the computational thinking and coding language through analogue exercises and the use of a development environment called *Makeblock*.
- After assembling the components and becoming familiar with the fundamental concepts of programming for robotics, participants focused on programming behaviours such as drawing on a horizontal whiteboard, creating repetitive patterns, managing input from sensors, and interacting with other robots for a competition.
- The course ended with a small tournament where participants could test the capabilities of their programmed robots.

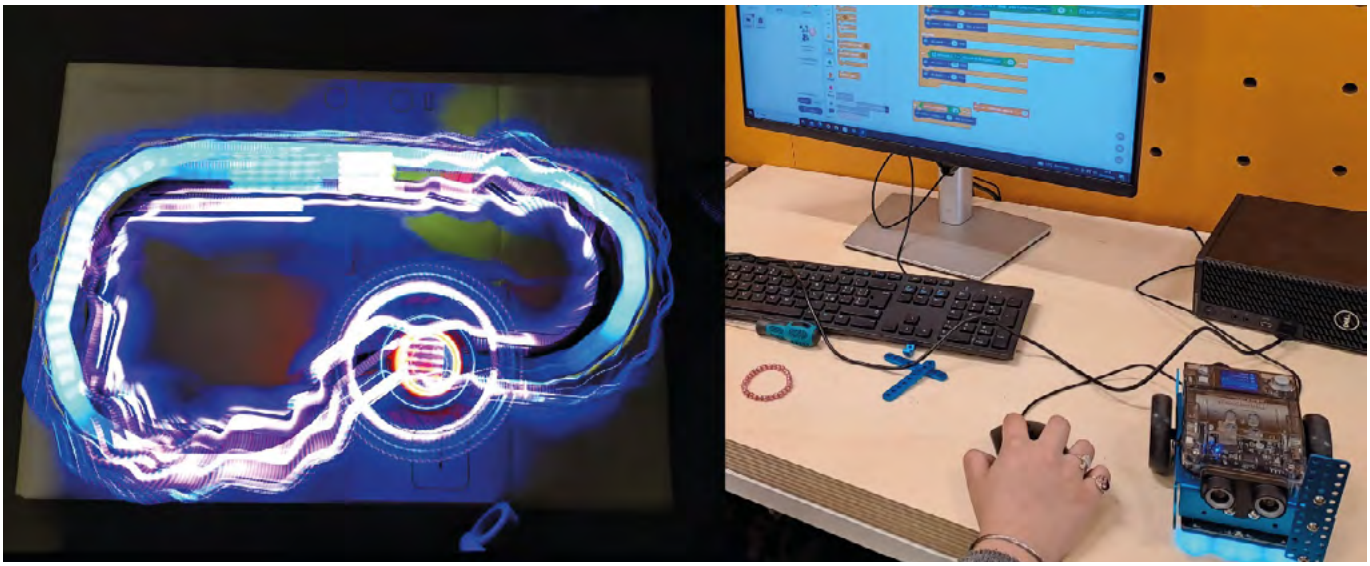

Figure 6. A light effect made to define the path of the robots programmed by the students and the program used to program the small robot.

Through hands-on robotics (Figure 6), children have been able to acknowledge and develop engineering and advanced design skills. While STEAM approach considers computational thinking and coding activities as crucial for children's skill development, the course has instilled in its young participants the ability to identify the basic logic of commonly used electronic products and the ability to perceive the communication patterns of automated processes. Additionally, the course enabled young participants to explore new forms of expression and representation such as light painting and pattern design. Similarly, it opened up to the development of new skills and the possibility to redesign (rather than reprogram) specific behaviours previously considered "preset" and inaccessible.

Art in 3D

The workshop of *Art in 3D* has been designed to let students approach to history of art through the analysis and to then digital redesign it of paintings using 3D modelling software. The course was divided into two phases:

- In the first phase, participants learned to use digital tools and fabrication by working together on a historical art masterpiece (such as *Piazza d'Italia*, 1948, by Giorgio de Chirico).
- In the second phase, the students developed critical observation and individual creative expression, repeating the exercise previously tackled collectively, but this time referring to abstract art pieces and increasing compositional complexity.

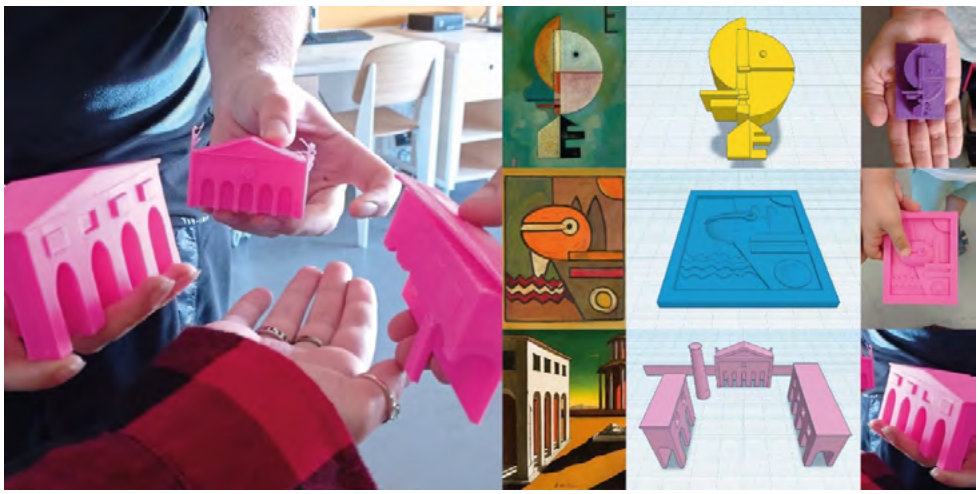

Figure 7. Some of the art pieces that were designed and printed by the students during the *Art in 3D* workshop.

In both phases, the painting was introduced through a short documentary on the artist's poetics and then reproduced in 3D. Here, greater emphasis was placed on individual creativity and problem-solving approaches, creating spaces for peer education. The characteristics of the suggested artists and Paul Klee's specific poetic of layering were discussed and provided the basis for the creation of new 3D interpretations by the participants. The resulting works, that were finally 3D printed (Figure 7), enable students to engage the original artwork from different perspectives, stimulating a process of "active reading" that enhance, above creativity, a sense of critical thinking and analysing skills towards the existing scenarios.

Comic Gadget Design

The workshop was structured with the aim of creating 3D-printed gadgets of hand-drawn characters, covering design, 2D graphics, 3D modelling, and 3D printing. In a very straight forward structure, the workshop consisted of three sessions, organized as:

- In this initial phase, participants engaged in the creative process of drawing their characters. This step involved short sessions of brainstorming, sketching, and refining ideas to create compelling designs. Participants adopted traditional drawing activity (through a piece of paper and a pencil) in which the only requirement was to keep an heavy stroke of the trace.
- In the second phase, participants started the digital design and 3D modelling. They made use of the usual *Tinkercad* software to transfer their 2D drawings and translate them into three-dimensional digital models, adding depth, volume, and eventual details to their characters. This phase involves learning the basics of 3D modelling and applying them to their designs. Lastly, the designs were applied on a plan keyholder 3D model to give final portability and functionality to the design.
- In the third phase, the designs were 3D printed. Participants learned about the process of setting up 3D models for printing, including considerations like scale, orientation, and support structures.

Figure 8. Students during the design process and an example of the final outcome of the printing process.

The structure of the workshop was linear and progressive, with each phase building upon the work completed in the previous one. By dividing the workshop into distinct phases, participants focused on specific skills and tasks related to each stage of the design and production process. Additionally, this structured approach allows for clear learning objectives and facilitates a logical progression of knowledge and skills acquisition throughout the workshop.

Through various phases of analysis, development, and production, young artists navigated through the world of reproducing and revisiting plan graphic designs into 3D models (Figure 8). During the course, the main 3D printing technologies were explained, along with materials, techniques, and common issues. Participants also learned the basics of three-dimensional modelling, applying them to the creation of customized keychains using their own drawings, which were first hand-drawn on paper and then digitized and converted into vector format for modelling.

Design for Cosmetics

The laboratory focused on the use of digital technologies for modelling and prototyping, aiming to create 3D printed prototypes of moulds for the casting and compression of solid detergents. Through various phases of theoretical study and practical exercises, a series of prototyping was carried out using moulds made with additive manufacturing, followed by considerations on the efficiency of the mould and its improvement through the optimization of shape, material, and process. The workshop has been structured on 5 sessions of 3 hours each one:

- The first two sessions have been dedicated to the acknowledgment of the material, like its density, and malleability. Along with a design thinking approach, students have been also introduced to evaluate the stimulus they could retrieve from the sensorial features of the material such as the smell or the colour: this phase introduced the students into a first phase of sense making in design.
- This step involves the practical application of technology (3D printing) to create moulds. Participants gained technical skills related to digital fabrication and mould-making during this phase as well as they have been introduced to practical mechanical issues of moulding process (like the most common undercut issues). This part was particularly sensible since was the critical part in which participant started to develop problem-solving skills to intercept and resolve possible issues in the opening of the mould. Moreover, conversely to the previous workshops, in this phase participants were asked to model the final shape of the soap to perceive the potential result, but then were required to subtract the latter to the mould to have the proper tool. So, they have been also guided to think at their shape as the negative of their actual print.
- In the final step participants used the printed moulds to produce the final shape of the soap. It involves applying their understanding of the material and the design thinking principles to create a tangible product.

Figure 9. Examples of final soap resulted by the moulding process and other designed digital models.

Despite the complexity of the subject, which required young participants to think of their design as the master for a mould, the participants were particularly engaged in the process, especially in customization phase, actively participating, generating, and achieving excellent results (Figure 9). Moreover, since the continues practical activities carried out along with the participants, the entire course has been able to adapt the activity based on the response retrieved by the participants and the technical requirements of the cooperative and the technical consultant. Lastly, the emphasis on sense-making participants interpreted and understood information by evaluating sensorial features like smell and colour, opening to a more comprehensive approach to design. This enhanced their ability to create products that engage users on multiple sensory levels.

5. Discussions

The project has had significant impacts on various aspects, which can be framed within fundamental aspects for territorial development and social fabric. In particular, the impacts of this project have had repercussions analysed concerning the territorial scope, specifically looking at the development of new awareness and social empowerment for the young beneficiaries. Furthermore, consideration is given to the economic, social, and cultural dimension of the structure itself that hosted the courses and the positive impacts for the educational staff, as well as the enhancement of the identity and reputation of the initiative gathered within the spaces. The overall project outcomes and impacts have been evaluated based on the following factors: 1) Educational Scopes, 2) Users Engagement and Involvement, 3) Local Cultural Development.

Educational Scopes

The eight creative workshops were characterized by activities that included the use of both manual arts such as screen printing and dynamic modelling, and digital ones such as 3D modelling, programming for robotics, and animation.

This diversification has allowed the development of specific skills, aiming to provide the Punto Luce with the ability to offer students advanced training in the context of project culture and new manufacturing technologies. The close collaboration with Save the Children Italy and the partner Social Cooperative SS Pietro e Paolo has therefore extended the social and territorial impact to the entire neighbourhood, involving profiles at risk of social exclusion from different municipal areas.

Users Engagement and Involvement

Main beneficiaries of the project were youths aged 12 to 19, including secondary school students, young people with learning disorders, those from families at risk of social exclusion, and NEETs (Not in Education, Employment, or Training). With regards to those more sensible citizens, the laboratory activities have contributed to social inclusion, countered educational and material poverty, and facilitated the orientation and integration of young people into the workforce. Collaboration with the University has also allowed beneficiaries to come into direct contact with the academic institution, opening prospects for educational growth. The project enabled students to approach new manufacturing technologies and programs for 3D modelling and robotic programming, taking an important first step towards learning both technological tools and thinking. Furthermore, the entire project pathway involved various actors, professionals, and local stakeholders who are nowadays continuing their participation in the project by contributing to the teaching and the sponsorship of the Punto Luce, as well as by participating at the dissemination of the project's results.

Notably, the overall project has ultimately increased the number of enrolments in the extracurricular courses offered by the Punto Luce delle Arti in Ostia, offering inclusive and highly relevant teaching in the acquisition of practical knowledge regarding new technologies.

Local Cultural Development

From a social and cultural perspective, the project has addressed the educational poverty of the Ostia Ponente area, becoming a reference point for local cultural development. Collaboration with the Social Cooperative SS Pietro e Paolo has introduced a project for creating jobs dedicated to individuals at risk of social exclusion at the city level. The project expanded its impact area through the organization of events, including an exhibition of the course results and the open conference "Design and Third Sector: Stories and Perspectives", which gathered testimonies and reflections from various actors in the world of scientific research, institutions, professions, businesses, and civil society. The event also hosted a workshop open to very young students from the Ostia neighbourhood hosted at the Save the Childrens headquarters.

Furthermore, the project considered an important temporal component in imagining the impact that such activities could have on the territory and specifically on the economic aspects of the Punto Luce space: it aimed both at the training of the very young, introducing them to the world of design and its rudiments, and at the enhancement of the internal staff of the space. The staff of the Punto Luce delle Arti in Ostia was therefore adequately updated and trained in the use of the tools necessary for the courses (robotics, 3D modelling and printing), which they could then integrate confidently and autonomously into their spaces. The results of the courses are also exhibited in an exhibition that, in addition to arousing the interest of students and young visitors, proudly represents the work that motivates young designers to offer themselves for mentoring programs to new members, thus promoting the knowledge production chain.

6. Conclusions

The research and experimentation activities applied during the workshops have brought out from the Capitoline social fabric a latent planning of the communities and new design spaces which, together with the theme of social inclusion and the active role of the citizen, are issues addressed marginally by the Public Administration when it comes to social innovation (Balbo, 2015). In this open scenario, design can operate to reveal the needs and will of the community, transforming them into possible solutions of public utility.

The result of the project has been ultimately exposed for at the Sapienza Faculty of Architecture in Valle Giulia (Figure 10). This project has been also selected as part of a dynamic observatory, launched during the national event *Design & Terzo Settore. Storie e Prospettive* (Design & Third Sector. Stories and Perspectives) in which occasion a final workshop has been setup to let participant of 8/10 years old discover the University and the design practices.

Figure 10. Exposition of final works at Exposition Gallery of the Sapienza Architecture Faculty in Valle Giulia.

The project and its outcomes highlight the role of Design Research in connecting Universities, citizens, and municipalities in applying design knowledge and principles to real contexts (Meyer & Norman, 2020). This research explored a built environment made of both physical and digital products that acknowledge the cultural richness stemming from the ethnic, cultural, social diversity present in cosmopolitan cities such as

Rome. The project provides in last instance, an overview of an emerging and ever-evolving alternative scenario which entangles on a global scale, and which ultimately could work as a means for further actions and research towards Design-driven education for social innovation and citizen empowerment.

About the Authors:

Luca D'Elia (PhD) is a designer and Researcher at the PDTA Department of Sapienza University of Rome. His Research activity focuses on digital manufacturing and co-design practices in urban context and within the Makers community. His expertise relies on an interdisciplinary research-action approach, where the theoretical status of artifacts emphasizes product design and the role of the digital fabricator in post-industrial society.

Lorenzo Imbesi is a Full Professor of Design at Sapienza University of Rome, where he is the Director of the Sapienza Design Research Interdepartmental Centre and the Coordinator of the PhD in Service Design for Public Sector. Currently, he is the President of the Global Association Cumulus, a member of the Board of the Italian Scientific Society of Design SID, and member of the Executive Committee of the EAD European Academy of Design.

Acknowledgements: the workshops, its results and final exposition has been developed by the Sapienza Design Research as part of the Sapienza Third Mission project "Design for Children"

KEYWORDS | MENTORSHIP, INTERNSHIP, INDUSTRIAL DESIGN, DESIGN EDUCATION

ABSTRACT | Building off previous studies demonstrating the positive impacts of internships for undergraduate students (Binder et al., 2014), this investigation explores how mentor/mentee relationships support positive internship experiences. Much has been written about the benefits of mentorship (Hamilton et al., 2019), including the development of 'soft skills' and greater opportunities for employment post-graduation. Notably, mentorship has up until this point not been researched specifically as it relates to the ultra-competitive and ever-evolving field of industrial design. This work has direct implications for university industrial design departments who are focused on providing a pathway for student success in entering professional practice. In order to assess the impact of mentorship programs on internship placements, we conducted a case study and research analysis examining three different industrial design departments' approaches to mentorship programs. These approaches include the absence of a formal mentorship program, the option for an informal mentorship program with professionals, and the option for a structured mentorship program with professionals. Other formats including peer-to-peer mentorship and on-the-job mentorship, are also considered. Obstacles to positive mentorships, including scheduling challenges, unclear expectations, and misaligned expertise are discussed. Results indicate that students engaging in any mentorship program demonstrate a higher likelihood of both applying for and securing internships. This investigation is a model for further investigations involving a broader range of institutions, mentorship, and internship experiences.

1. Introduction

The majority of Industrial Design (ID) also known as Product Design (PD) programs in the United States aim to prepare students for the demands of the profession upon completing their studies. This study focuses specifically on ID programs at three public, comprehensive universities that emphasize preparing students for entering professional practice. In many ID programs in the U.S., professional internships are an integral component in this preparation, typically conducted outside the confines of the academic institution. These internships are highly competitive and are widely acknowledged in improving students' prospects for success in the workforce. They offer invaluable opportunities for industrial design students to learn on-the-job skills, grow their networks, and build workplace readiness that cannot be replicated within a classroom setting alone. Students who have had internships have competitive advantages with post-graduate employment: internships help students feel more prepared and prospective employers value the work experience they've already had. Research indicates that students who engage in internships relevant to their profession stand a 14% higher chance of securing employment in their chosen field (Binder, Bagueley, Crook, & Miller, 2014).

Additionally, beyond the practical experience gained during internships, mentorship plays a significant role in growing students' professional development. Mentorships pair experienced individuals (mentors) with others who have less experience (mentees). Mentoring relationships are a long-standing tradition in many fields and range from periodic, informal conversations to structured mentorship programs that include regularly scheduled meetings. When professional industrial designers mentor industrial design students, students benefit from individualized feedback, perspective on the design industry, and guidance on how to elevate schoolwork to a professional level. Mentors directly connect students with their goals and opportunities to help them succeed.

Both internships and mentorships link design education to design industry, preparing students for entrance into the workforce. Although research has demonstrated the importance of industrial design internships and the benefit of mentorships in other fields, there has been limited research focused specifically on mentorship for industrial design students.

1.1 Types of Mentorships

This study focuses on five different types of mentorships:

- **Organic**: Not organized by a school or group, these connections often come from friends or family and are generally more casual in format.
- **Peer to peer**: This is a student-lead initiative connecting third- and fourth-year students with first- and second-year students. Although there may be some focus on professional practice, these mentoring relationships tend to focus on school.
- **Project-based support**: An industrial design department seeks out professional mentors for students in a specific project (i.e. the senior capstone). This is an organized program where each student is intentionally paired with a mentor.
- **Professional mentorship program**: Students opt-in to have their industrial design department pair them with a professional for general guidance and support. The department may make efforts to pair students with professionals based on skill expertise or sub-industry (i.e. automotive, footwear, etc.)
- **Internship-based**: Many of the best internship experiences include an on-the-job mentor who serves as a point person for the intern/student while they are at the company. These relationships sometimes continue even after the internship has concluded.

1.2 Participating Universities

The University of Kansas, Western Michigan University, and the University of Kentucky, all 4-year comprehensive university ID or product design programs in the United States, participated in this study. Each program has a distinctly different approach to mentorship, and this investigation looks closely at each program in an effort to assess how mentorship impacts internship placement.

University of Kansas
University of Kansas' industrial design program, established in 1941, is a four-year program with approximately 70 undergraduate students. Graduation does not mandate an internship; however, students are able to participate in internships during the school year and earn academic credit toward their graduation. This program has two voluntary mentorship programs for all students from 1st through 4th year, pairing a professional (usually alumni or personal contact of the Program Director) with two students, one 1st or 2nd year student with one 3rd or 4th year student. Both mentorship programs are affiliated with student clubs, IDSA and Women in ID. The Program Director spearheaded and now manages all aspects of both programs.

Both student clubs offer mentorship programs following the above structure, however the Women in ID club offers female identifying professional mentors for members of the Women in ID club. Interestingly, all female identifying students opted to participate in the Women in ID mentorship program rather than the IDSA mentorship program which does not specify which gender mentors are.

University of Kansas' mentorship programs are both structured, with an onboarding process for all mentors where expectations and best practices are discussed. The Program Director checks in every 3 months with all mentors to ensure their needs are met. Mentees are paired to mentors with the area of ID that they are most interested in mind, for example, research-minded students are paired with research-focused professionals, and consumer product design-focused students are paired with designers in the field of consumer product design. The mentors meet with both students together biweekly, usually virtually, so both students receive feedback from the professional. The 3rd or 4th year student also mentors the 1st or 2nd year student. The Program Director meets with students regularly to ensure the mentorship is running smoothly.

Western Michigan University
The Richmond Institute for Design and Innovation at Western Michigan University was established in response to local industry demand, and offers a relatively new four-year Product Design program. The program, which had its first graduating class in 2021, maintains an average enrollment of 100 students. Corporate partners have engaged with the program since its inception, with many individuals offering to support students in a mentorship role. The first director of the program personally paired professionals with all third and fourth-year students, providing contact information but no guidance or oversight for how and when mentors and mentees should meet, or what they might want to discuss.

Since the departure of that Program Director in 2022, the mentorship program has been in flux and there is not an established process for a consistent mentorship program. The school is continuing to develop their mentorship engagement including a new student-lead peer-to-peer mentorship initiative. Western Michigan University has internship participation as a graduation requirement, and students occasionally stay connected to mentors from their internships after they return to school.

University of Kentucky
University of Kentucky has a Product Design Department and graduated its first class in spring 2024. This is a burgeoning department with an anticipated average enrollment of 60 students. The University of Kentucky does not require internship participation in order to graduate from the program. Project-specific professional mentors were coordinated for the first graduating class during the fall semester of their fourth year. The focus of the mentorship program is currently to offer guidance and perspective on the senior thesis project. Mentors, most of which are not local, have been consistently invited to participate in virtual classroom critiques. The majority of mentors were found via the department Chair's personal connections or from online platforms such as Linked-In as the program does not yet have any alumni to pull from.

2. Research Setup and Focus

2.1 Measures

University
Participants were asked to identify their university. The options included: Western Michigan University (WMU), University of Kansas (KU) and University of Kentucky (UK).

Mentorship Program
Participants were asked to identify whether they were participating in a mentorship program. Participants were asked: “Do you participate in an ID mentorship program?”. They were given the following options: 1) yes, my department offers a mentorship program, 2) yes, I'm in a mentorship program outside my department, 3) no, my department does not offer a mentorship program, and 4) no, my department offers a mentorship program and I'm not participating. In one analysis, we recoded this variable into two categories due to small samples sizes; this recoded variable had the following categories: 1) yes, I am participating in any internship program, and 2) no, I am not participating in any internship program.

Internship Experiences
Internship experiences were measured three indicators. First, participants were asked if they had participated in any internships since beginning their ID program (responses were “Yes” or “No”). Second, participants were asked: “How many internships/ apprenticeships have you participated in?” with a range of 0-4 provided.

Third, among participants with internships, participants were asked “How did you land your internship? Please select all that apply” with the following options: 1) you responded to a job/internship posting, 2) you met someone at the company through networking, someone outside your university to the company, if so who?, and 3) someone inside your university referred you to the company, if so who? And Other (open response). For analytic purposes, we recoded these variables to include two categories: 1) applied via a posting only (participants who only selected “responded to a job/internship posting”) and 2) applied with any personal connections. Importantly, or our analyses, we focus only on how participants landed their first internship (if they reported more than one internship).

Internship Impact
Participants who had participated in at least 1 internship were asked: “How would you rank the impact of all your internships on each of the following? (With 0 showing no impact, and 5 showing maximum impact)” with the following domains: 1) career/professional learning, 2) benefit to your future, and 3) benefit to your industrial design education. Our analyses use each individual scale as well as a summed version of the three scales to determine overall impact, where higher scores indicate greater perceived impact.

Mentorship Program Benefit
Participants who reported participating in a departmental mentorship program were asked: “Rank benefit of mentorship, 1 being not beneficial 5 being extremely beneficial.”

2.2 Sample Size & Missing Data

In total 117 participants began the survey. Of these participants, 116 provided answers to which university they attended, but only 114 provided answers to the question about mentorship programs. Among those that provided information about mentorship programs, 109 provided information about whether they had ever participated in an internship. Among participants who had ever had an internship (n=35), 30 provided information on mentorship program participation, how they landed their internship, and how impactful they perceived their internships to be. Finally, among those who reported participation in a departmental mentorship program (n=55), 50 provided feedback on how beneficial they perceived this program to be.

2.3 Analytic Plan

The focus of this paper is on the impact of departmentally supported mentorship programs on internship experiences and impact as well as exploring perceived mentorship program benefit among students. To address these research questions, we used descriptive cross-tabulations and chi-square tests of independence as well as bivariate ordinary least squares (OLS), negative binomial and logistic regression models. Logistic and negative binomial regression coefficients are exponentiated to ease interpretation. Due to small sample sizes, we did not employ multivariable tests. Qualitative data from open-ended survey questions as well as interviews with n=12 students will be leveraged alongside quantitative data in the analysis.

2.4 Results

Mentorship Program Participation
Among the participants, 48.3% reported participating in a departmental mentorship program, 30.7% reported their department had a mentorship program they were not participating in, 17.5% reported their department did not have a mentorship program and they were not participating in another mentorship program, and 3.5% reported participation in a non-departmental mentorship program. A chi-square test of independence showed mentorship programs and university were not independent (chi-square=56.10, $p<0.001$) (Table 1).

As expected, Aa bivariate logistic regression analysis showed that compared to KU there were no statistical differences in likelihood of participating in a mentorship program at WMU. However, compared with KU students, students at UK had significantly lower odds of participating in any mentorship program (OR=0.0203, SE = 0.0216, $p<0.001$, Table 2).

Mentorship Programs and Internships
Next, using bivariate logistic regression we analyzed whether the 4 types of mentorship programs were associated with having any internships and how those with internships landed their internship (Table 2). Compared with students participating in departmental mentorship programs, students in departments with mentorship programs they were not participating in had lower odds of having any internship (OR=0.318, SE=0.162, $p<0.05$). In addition, there was a marginally significant lower likelihood of students having any internship experiences among students whose departments did not offer a mentorship program compared with students participating in departmental mentorship programs (OR = 0.318, SE = 0.200, $p<0.10$). Notably, however, there was no significant difference between the likelihood of having an internship between students participating in departmental versus non-departmental mentorship programs.

We found no significant differences in types of mentoring programs and the likelihood of landing a first internship via personal connection/networking versus responding to an ad alone (Table 2).

A negative binomial regression model, suitable for count outcomes, showed that students not participating in available departmental mentorship programs had significantly fewer internships compared with students who were participating in departmental mentorship programming (IRR=0.37, SE=0.16, $p<0.05$). There were no significant differences in the number of internships between the other groups and the reference group (Table 2). A Poisson model was also fit to these data, and the results did not substantively differ (available upon request).

Among students who had any internships, there was no association between the impact scale and the various mentorship programs (Table 2). However, respondents not participating in an available departmental mentorship program who *had* participated in an internship ranked the impact of their internship on their career lower than their peers who were participating in the departmental mentorship program (β =-0.900, SE=0.367, $p<0.05$).

Perceived Mentorship Benefit
Among students who participated in a departmental mentorship program, the average perceived benefit was 4.02 (SD =0.869) on a scale from 1 (least useful) to 5 (best). The perceived benefit of mentorship did not vary by internship experience (Table 2).

Participants also were asked an open-ended question: "Explain how your mentorship has or has not been beneficial." These qualitative responses provide further insight into the quantitative findings, suggesting that having a professional contact is helpful for getting more feedback on school projects and specifically for portfolio preparation. For example, one student drew a direct connection between their mentor and job placement: "My mentor… helped me prepare for interviews, better build and fill my portfolio to better attract jobs, and helped me construct strong presentations. Great experience!"

A few students mentioned differences in personalities with mentors and busy schedules as challenges. According to one student, feedback from mentors is not necessarily positive or empowering: "They also discouraged my participation/choice of degree in industrial design and claimed that I am not correct for this profession."

Interviews
Informal, semi-structured interviews (n=12) offered the opportunity to understand student perspectives and experiences with mentorship programs, mentors, and internships. Four students from each participating university, including equal numbers of 3rd and 4th year students, were interviewed via Zoom. Mentorship-specific questions were posed after a series of questions focused on internship experiences, which may have had an impact on how students framed their responses.

Questions posed:

For students who have a design mentor:

- How did you get paired with your mentor?
- How formal or informal is the relationship? When do you meet, what are those meetings like, etc.?
- What is one thing you've learned from your mentor?
- What do you think the benefit(s) of having a mentor are?

For students who do not have a design mentor:

- If not, would you like to have one? Why?
- How might you go about finding a mentor and starting the sort of exchange that would be most beneficial to you?

For everyone:

- Have internships or mentorships (if they had one or both) changed your approach to school?

Types of Mentorship

- Students mentioned many types of mentorship: peer-to-peer, professional, and on-the-job. All types of mentorships were perceived as supportive and beneficial.
- Internships that provide students with an on-the-job mentor were especially good experiences.
- These mentors act as a point person for the student, providing insight into company culture and guidance for the internship while also offering skill-based demos.
-

Mentors Facilitating Storytelling

- Mentors often focus on portfolio reviews and guidance for giving presentations.
- Emphasis was consistently on how to tell the story of a project or portfolio in a way that would resonate with the audience.

Mentors and Confidence

- Students are hesitant to engage with a professional mentor if they are not yet confident in their portfolio. There is a sense that professionals will only want to engage with students at a certain (high) skill level.
- Working with a mentor helps students feel more confident, which may encourage them to apply for internships.
- Mentors are a valuable resource for students on internships who need support navigating the professional landscape.
- During internships, students are not as engaged with the academic environment and less likely to seek out guidance from faculty.

Mentors are Desirable

- Students who don't have mentors due to lack of support from their program want them.
- Students are unclear on how to find a professional mentor if their program does not facilitate the process.
- At department C, most students were initially unfamiliar with the concept and function of mentors. However, after learning about them they all were interested in having one.

Mentors Define Professional Expectations

- Mentors offer up-to-date, professional, outside perspectives on student work.
- Students who have worked with a mentor are empowered and ready to graduate/enter the workforce.

Mentorship Program Structure Impacts Mentorship Experience

- Department A has guidelines for their mentorship program (how often to meet, what to discuss), which ensures all students have an opportunity to build a relationship with their mentor.
- Department B has provided mentorship pairing, but very little structure. The rate of success for mentorships in this program varies more widely.
- Department C offers mentors for one specific project. Students did not understand they could ask for guidance outside the bounds of that project.
- Internships consistently were recognized as providing valuable mentorship; students defined the difference between an internship and a job as the mentorship aspect during their tenure at the company.

Table 1. Mentorship Program Participation by University.

	B	A	C	Total
Yes, my department offers a mentorship program I am participating in	24	30	1	55
	63.16%	62.5%	3.57%	48.25%
Yes, I'm in a mentorship program outside my department	3	1	0	4

3. Discussion

Mentorship has proven to be an overwhelmingly positive experience for industrial design students, especially in preparing for and navigating internships. This research shows that students who don't engage in mentorship opportunities have lower odds of having any internship. Students who were not participating in mentorships even when they were available often cited a lack of confidence in their skills and not wanting to seem incapable or unprepared for the engagement or interaction. This study also indicates that students whose departments did not offer a mentorship program were less likely to have any internship experience when compared with students who participated in a departmental mentorship program. This raises a question in regards to the goals of higher education and reveals an opportunity to investigate the tension between the historical ideal of universities as hubs of knowledge creation versus the contemporary expectation that upon graduation, university-educated students will successfully enter the workforce. All three programs have a different approach to internships, including requirements to graduate, and that has an impact on the results of the study. That being said, for programs that are focused on professional practice, these findings demonstrate the importance of offering a department-organized mentorship program and encouraging all students to participate.

Students who have worked with a mentor emphasized the focus of that interaction being primarily on presentation skills and portfolio preparation. Mentors who are working in industry are well situated to teach students to talk about their work in a way that will resonate with professionals during internship interviews. Portfolio development often takes place outside of a classroom setting, without the formal guidance of a faculty member. Mentors offer an especially important point of contact for portfolio direction and feedback.

Mentorships can be a confidence contradiction. Students who don't feel confident in their work or skill level are less likely to seek out a mentor, but working with a mentor is a proven way to build confidence. Students felt that their mentors were a direct line to what is current and relevant in the field and trusted their input. Mentors at internships offered techniques and skill refinement, which helped them feel confident in their work. Mentors also offer students a networking foundation, connecting mentees with colleagues who are actively hiring. Departments that maintain a mentorship program, in which every student is paired with a mentor, ensure that all students have access to the demonstrated benefits of mentorship without the opportunity to opt-out.

The different mentor program approaches from the 3 institutions showed that when a mentorship is a school requirement, not all students are necessarily engaged, and this can be difficult to manage. If research shows that mentorships have a positive impact on students' success in finding internships, then it is imperative that programs have consistent and structured mentorship programs that ideally include all students from 1st through 4th years. This is likely to improve retention rates and student success. Importantly, it would also increase student confidence and the likelihood of gaining a competitive internship. Mentorship programs bring many challenges, including finding qualified mentors, identifying mentee/mentor pairings, and counseling mentors on expectations and goals. While most programs do not have a specific faculty or staff member who gets credit for managing their mentorship program, one individual typically takes responsibility. This can lead to inconsistency if there is faculty or staff turnover, resulting in the mentorship program dissolving or becoming disrupted.

Mentors benefit students in myriad ways, including helping them feel comfortable and confident while job searching. Students felt prepared to apply for internships, and they felt confident in the interview process due to the coaching they received from their mentors. The wide range of mentorships reflected by this study reveal that there isn't a standard structure or approach in industrial design departments or the industrial design profession. Developing guidelines for how to facilitate student engagement with professionals could encourage more departments to develop a mentorship program, and offer a strategy for pre-existing mentorship programs to improve.

Although most students who had a mentor considered it a good experience, some faced struggles. At least one mentor advised his or her mentee to consider changing majors, without offering counseling on how to improve after the student stated that they wanted to remain in the program. Others found it difficult to find available time to meet. Students did not always know how to navigate these situations, sometimes resorting to letting the mentorship lapse. Industrial design departments need to be aware that the mentor pairing may not be a good fit and need to have a system in place with regular check-ins with the student and the mentor to ensure that the relationship is beneficial and functional.

It is worth noting that a degree in industrial design is expansive (graduating students are equipped with a range of skills), and the field is competitive. University of Kansas will only offer academic credit for internships focused on industrial design, and intentionally pairs students with mentors currently working in industrial design. Western Michigan University and the University of Kentucky don't have the same guidelines, so students included in this study may have mentors and/or internships that fall outside the 'classic' definition of industrial design. Additionally, it can be a challenge to find suitable mentors if there is not a large pool of alumni to draw from. The benefit of engaging with alumni is that the faculty know their personalities and skills and are better equipped to pair them with students.

4. Conclusion

Both mentorship and internship experiences prove to be beneficial by offering industrial design students exposure to professional practice, contextualizing school work, and improving students' confidence in their ability to succeed in school as well as being prepared to enter the workforce. This study suggests that students who work with a mentor are more confident, consequently more likely to apply to and land internship opportunities. Students need support in initiating and maintaining mentorships, and one way that industrial design departments can offer that support is through organized mentorship programs.

This investigation is decidedly student-centered, seeking to better understand student experiences and perceptions. There is immense opportunity for further research concerning other stakeholders: industrial design departments, mentors, and companies where the mentors are employed. Although this research shows that departmental mentorship programs lead to better student outcomes, organizing those programs is a significant logistical burden. The mentorship program at Western Michigan University dissolved when the faculty member who organized it left the university. Given the clear benefits of mentorship, this suggests the merit of developing a more structured approach to insure consistency, regardless of faculty turnover.

There is merit in continuing investigation, including:

- Other fields, including medicine and engineering, have a long history of relying heavily on mentorship and internship. A comprehensive literature review of scholarship on mentorship and internship in these fields would help inform best practices for internship and mentorship in industrial design.
- Since there is no universal or consistent structure for mentorship programs in industrial design education, a wide-reaching audit of current mentorship programs would help inform strategies for organizing and executing successful mentorship programs.
- The perspective of mentors must be considered. A study focused on mentors could uncover insights on why mentors mentor, what they get out of it, and how they learn to guide and interact with students. This, in turn, could be beneficial for better equipping mentors for more consistently successful mentorships.
- Although mentorships are routinely integrated into educational experiences, they are less frequently assessed. It would be beneficial to identify the elements of a successful mentorship and consider development of an assessment tool for mentorship programs.
- Unwillingness to participate in a mentorship program could indicate lack of interest or ambition, but it could also reflect a student's need to be employed while in school. (Having a job limits time for extracurriculars like mentorship and internship.) Considering structures and formats that allow for wider access to the benefits of mentorship would lead to more universal improved student outcomes.

KEYWORDS | BIODESIGN, BIOMATERIALS, LATIN-AMERICAN DESIGN, INDIGENOUS KNOWLEDGE, ECOLOGICAL PRACTICES

ABSTRACT | The contemporary design discourse has witnessed a heightened usage of the terms “vernacular,” “bioregional” and “ancestral”, particularly against the backdrop of the prevailing climate crisis. Traditional knowledge of materials and techniques have been referred to as those capable of illuminating the future and frequently serves as a starting point for Biodesign, an emerging design approach that often commits to ecological practices. However, despite being a growing trend, there is a lack of well-documented case-studies that clearly connect contemporary design practices to ancient knowledge.Within this milieu, Latin-American design has recently arisen prominently, benefiting from the region’s abundant biodiversity and the indigenous presence. This study delves into the examination of four projects related to bio-products or biomaterials design undertaken in Latin America by different designers in the last five years, each employing indigenous ancient knowledge – clearly mentioned by the designers, in three different countries. As a result, we present clear evidence on contemporary design projects that incorporate indigenous knowledge as a pivotal reference point, spanning regenerative practices, biotechniques development, and biodiversity preservation. The subsequent discussion and conclusion show that, even though it is not always the first intention of their work, these designers have been amplifying the voices of relegated groups, inviting us to engage in intercultural dialogue and review the design field (Santos, 2008). We also identify a design trend wherein designers, in their pursuit of ecological practices related to Biodesign and Biomaterials, recognize traditional knowledge as a legitimate and invaluable source for contemporary design endeavors.

1. Introduction

1.1 Local and Traditional Knowledge's Relationship to Biodesign

The worsening of the climate crisis at the start of the new millennium has prompted designers to explore novel avenues. One discernible trend in recent years is the growing interest in local and traditional knowledge, evident in design-related exhibitions, events, and publications. In the global North, still considered the design mainstream and the birthplace of the discipline following the Industrial Revolution, three noteworthy examples underscore this thematic shift:

1. "Bioregional Design Practices" is the title of a 2023 book showcasing the endeavors of Atelier Luma, a French initiative established in 2016 and led by design curator Jan Boelen, supported by Foundation Luma in Arles. Boelen mentions that the practice started by mapping the surrounding territory of Arles and identifying local resources for contributing to social and environmental improvement. The term "bioregional," elucidated in a footnote, draws from John Thackara's definition emphasizing natural rather than political or economic boundaries (Atelier Luma, 2023, p.22). Atelier Luma's projects, featuring circular design and biomaterials like natural dyes, salt, sunflower panels, and algae-based objects, have gathered attention in major European design exhibitions. The book organizes these projects into four phases: finding, connecting, engaging, and sharing. During the "finding" phase, designers actively seek various resources, including agricultural byproducts and artisanal skill sets passed down over generations, highlighting the high value placed on traditional knowledge (p.27).

2. "Super-Vernaculars" was the name of the 27th Biennial of Design in Ljubljana, 2022. The curator Jane Withers explains that the term "vernacular" in design denotes practices based on local traditions, materials and ecological knowledge—representing structures deeply rooted in local culture, terrain, and climate (Withers, 2022, p.12). While acknowledging the past, the Biennial's exhibition aimed not to evoke nostalgia but to inquire about lessons from history for shaping a more sustainable future and seeking inspiration for innovation (p.13). The exhibition catalogue showcases design projects intimately connected to their respective territories and populations, with some projects explicitly recognizing their reliance on Indigenous knowledge.

3. "Lo-TEK: Design by Radical Indigenism," a 2019 publication by Julia Watson, amplifies this interest by bringing together indigenous examples of architecture and landscape design. Watson's objective is to demonstrate how societies labelled as primitive possess knowledge embedded in shaping our future (Watson, 2019, p.27). Traditional Ecological Knowledge (TEK) is elucidated as a cumulative repository of multigenerational knowledge, practices, and beliefs, inherently sustainable and responsive to environmental extremes (p.21).

A closer examination of the content within the aforementioned books and exhibition reveals proximity to the design approaches of Biodesign or Biomaterials, both emerging design practices with a central ecological concern. Biodesign is commonly defined as a strategic approach that incorporates nature or living entities in its processes to generate alternative sustainable materials or products (Camere & Karana, 2018; Collet, 2017; Karana et al., 2020; Myers, 2018). This sets it apart from Biomimicry, a well-known approach proposed by Benyus (1997), where designs emulate biological forms, processes, patterns, and systems through analogy (Kennedy, 2017).

In the realm of Biodesign, the predominant justification for the utilization of living organisms is to create material artifacts with a minimal ecological impact, while creating novel material expressions and functions (Karana et al., 2020). Myers (2018) posits that initiatives in Biodesign signify “an overdue shift in social priorities towards sustainable approaches to building and manufacturing” (p.8). He further asserts that through the harnessing of biological processes, Biodesign projects hold promise in replacing industrial methodologies while demanding fewer resources of both materials and energy. Aligned with Myers' viewpoint, numerous authors argue that Biodesign marks the start of a new frontier or signifies a paradigmatic shift within the domain of Design (Esat and Ahmed-Kristensen, 2018; Karana, 2020; Mironov et al., 2009).

Some scholars extend the boundaries of Biodesign to include properties of formerly living organic elements (Esat & Ahmed-Kristensen, 2018; Mironov et al., 2009), incorporating Biomaterials into Biodesign practices. Ginsberg and Chieza (2018) define Biodesign as the practice of Design that operates concerning Biology, encompassing three fundamental modes: “of,” “with” and “from” Biology. They also note that, despite its contemporary veneer, Biodesign is rooted in traditional practices such as the refinement of organisms through selective processes, as exemplified in agriculture and animal husbandry.

In line with this comprehensive definition, the example of “The Living Root Bridges of the Khasis, India” showcased in the book “Lo-TEK” (Figure 1), featuring a bridge made from the surrounding tree's roots that withstands monsoonal rains, serves as a clear manifestation of Biodesign. Despite taking centuries to develop and not conforming to a typical Western design project, this example integrates local trees, highlighting the interconnectedness between traditional practices and the recent Biodesign trend. Another pertinent example is the project “Bananatex,” developed by Swiss designers in 2018 and exhibited at “Super-Vernaculars.” The canvas-like textile made from abaca fibers serves as an alternative to polyester: “One of the strongest of all-natural plant-fibers, they have been used to make textiles in the Philippines for hundreds of years. The Portuguese explorer Ferdinand Magellan recorded the use of abaca to make textiles when he visited the Philippines in 1521.” (Withers, 2022). These instances underscore the interplay between traditional practices within the design domain and the contemporary Biodesign trend, often associated with Biotechnology and innovation, with little acknowledgment of these venerable and significant roots.

Figure 1. The Living Root Bridges of the Khasis, India. Source: Watson, 2019.

1.2 The Latin-American Approach: Ancestrality

The current Design community's interest in local and traditional knowledge is a global phenomenon, extending beyond the confines of the global North[1]. Notably, Latin-American designers stand out in this trend, benefiting of the region's abundant biodiversity and the resilience of indigenous peoples, whose profound connection to nature is increasingly considered advantageous from an ecological perspective, steering new directions in Design and related disciplines. Several noteworthy events and publications across different Latin-American countries underscore the prominence of this thematic shift in the region:

1. The “What Design Can Do Mexico” event in 2023 dedicated a segment of its program to discussions on “Ancestral Knowledge and Heritage.” Speakers included Gabriel Calvillo, co-founder of Refugio, focused on design as a tool for native pollinator conservation; Rosa Hanhausen, curator of the exhibition 'Replicating Resistance: Landscape Revolutions,' based on research she conducted on the impact of maize on urbanization in Mexico; and Gerardo (Jerry) Osio, co-founder of Tierra de Saberes, a project that investigates, documents, and disseminates traditional knowledge in northeastern Mexico (What Design Can Do, 2023).

2. The magazine “Piseagrama,” established in 2010 in Brazil with a focus on public space discussions, has increasingly featured indigenous-related or, more recently, indigenous-authored texts. In 2022 and 2023, the platform launched books such as “Vozes indígenas na Saúde” (Indigenous Voices in Healthcare), “Saberes dos Matos Pataxó” (Knowledge of the Pataxó Forests), and “Terra: Antologia afro-indígena” (Earth: Afro-indigenous Anthology), aiming to provide direct access to the ideas of underrepresented groups and envisioning possible futures in alliance with various resistance collectives (Piseagrama, 2024).

3. The Latin-American Biodesign and Biomaterials meeting “Biopolimérica 2023” in Valdivia, Chile, organized by LABVA (Laboratorio de Biomateriales de Valdivia), emphasized the selection of projects based on the use of local biological raw materials and regional identity. The catalogue of the event describes Latin America as “a territory as diverse and abundant as it is exploited” and mention a growing articulation that positions Latin America as a reference for new and diverse material possibilities from the understanding of its own territory. The event proposed a space for understanding, recognizing and reflecting on this movement, as well as the opportunity to express from the material, sensory, personal and territorial aspects what characterizes and differentiates this community (Besoain et al., 2024) .

4. In 2023, Brazil received the award for the best National Participation at the Venice Architecture Biennale with the pavilion “Terra” (Earth). Curators Gabriela de Matos and Paulo Tavares sought to reevaluate the past to design possible futures, spotlighting Afro-Brazilian and Indigenous communities often overlooked by architectural mainstreams (Angelopoulou, 2023). The pavilion, filled with earth, symbolized both memory and future, urging a reconsideration of architecture in the face of contemporary urban, territorial, and environmental challenges.

[1] The Australian Design Centre, for example, mentions clearly their engagement with First Nations in their website and how it relates to the practices of the museum. Source: https://australiandesigncentre.com/latestnews/celebrating-first-nations-engagement-at-adc/.

In the Latin American context, unlike the global North, it is common to reference “ancestral” knowledge and employ the term “heritage” when discussing local and traditional knowledge. Labva designers observe that in Latin-America, biomaterials practices, while acknowledging the influence of the global North, primarily focus on the link with the origin—territorial and cultural—of materials and their potential in terms of biodegradability and compostability (Weiss & Besoain, 2022).

Arturo Escobar, in the book “Design for the Pluriverse,” underscores that ancestral knowledge, while rooted in a community's history and long-term practices, does not imply an inflexible attachment to the past. Instead, it represents a “living memory directly connected to the ability to envision a different future” (Escobar, 2018). Indigenous philosopher Aílton Krenak explains that ancestral peoples, retaining a spiritual connection to nature, learn through rituals to “get back to the root of existence,” where they transcend individual identity, experience other forms of life, traverse the future and past, and return to the present. Ancestral memories, according to Krenak, originate from ancient ancestors, and rituals serve to revive these memories (Krenak, 2023, p.37).

2. Methods

Although ancestrality is frequently mentioned in biodesigners' and specialized media texts as a “component” of many recent product design-related projects, the explicit integration of traditional knowledge is often challenging to discern, and comprehensive studies on this topic are lacking. In light of this, and with a focus on Latin-American examples, the primary inquiry of this study revolves around the question: how exactly these Biodesign projects incorporate ancestral indigenous knowledge?

This research was conducted between October 2023 and January 2024. Following a review of the events and exhibitions highlighted in the introduction section and an examination of key terms that motivated this study (traditional, vernacular, ancestral), we compiled an extensive list of projects that could serve as examples of the integration of Biodesign and ancestral knowledge. The projects of this first list were sourced from various outlets, including relevant publications (when accessible), events’ catalogues or press releases (Biopolimérica 2023 and What Design can Do México), the designers’ official websites and Instagram accounts, and texts

from reputable online specialized media (such as websites like Dezeen, Designboom, Wallpaper, Domusweb, and Frameweb). The criteria for inclusion in this list were the project's origin in Latin America and the presence of specific keywords in the project description, such as “ancestral,” “heritage,” “indigenous,” “traditional,” “historical,” as well as terms related to Biodesign and Biomaterials.

The refinement of this list, which led to the selection of the case-study projects (Table 1), involved using selection criteria that explicitly mentioned, in the project description texts provided by the authors, the utilization of indigenous ancestral knowledge, ensuring it was a deliberate design decision. A second criterion was to ascertain whether the specific knowledge could be identified for subsequent analysis. This was only possible when scrutinizing the designer´s texts. This meticulous approach was necessary due to the observation that many projects vaguely reference the use of “ancestral references,” making it challenging to discern the precise ancestral component, such as a material, technique, or specific use of an object. Additionally, the selection process aimed to encompass a variety of Latin American countries and approaches, resulting in the identification of four case studies, one of which was developed by the primary author.

Table 1. Case studies selected.

Project	Designer(s)	Year	Country
Totomoxtle	Fernando Laposse	2017	Mexico
Maqui Biotextile	Labva	2021	Chile
Cuia Colab	Andrea Bandoni	2022	Brazil
Carmín	Edith Medina	2022	Mexico

This study delves into the examination of four projects centered around the design of bio-products or biomaterials. These projects explicitly draw upon indigenous ancient knowledge and have been executed by different designers in three distinct Latin American countries over the past seven years. The main objective is to provide concrete evidence of contemporary Biodesign endeavors that integrate indigenous knowledge as a pivotal reference point, offering an analysis of their processes and outcomes whenever feasible. In the case of one of the projects developed by the authors, critical reflection also played a pivotal role in the analysis, contributing to a comprehensive examination of the integration of indigenous ancient knowledge within the design process.

3. Case-Studies: Indigenous Knowledge Applied to Design in Latin America

This section encapsulates the principal information regarding the selected case studies, providing an overview of each project and complementing it with a figure. Following this, Section 4 delves into the findings and interpretation of the case studies, and Section 5 summarizes the main conclusions drawn from their analysis.

3.1 Totomoxtle (Mexico)

Totomoxtle (Figure 2) is a biomaterial crafted from the vibrant husks of native Mexican maize. This sustainable veneer is derived from the naturally colorful leaves of native Mexican corn and is developed in collaboration with the community of Tonahuixtla, an Indigenous farming community.

These farmers lost their native seeds after the introduction of genetically modified corn to the area, and their traditional methods of growing native corn are at risk. This is because the small producers face unfair competition with big companies and the hybrid maize, which when combined with synthetic herbicides and fertilizers has bigger yields than native species. The consequence is that traditional farmers leave the area (Laposse, 2024).

In response to this situation, the Totomoxtle project, with the support of the world's largest maize seed bank (CIMMYT), undertook the reintroduction of 16 endangered varieties of heirloom corn with colorful husks native to Tonahuixtla. By incorporating these husks into the craft, the project not only adds value to the material but also creates local employment opportunities. Prior to the project, corn husks were considered leftovers, but now they contribute to the material's worth, generating additional income for locals and incentivizing the continued cultivation of native Mexican corn species.

According to Laposse, the creator of Totomoxtle, aiding a small community in Mexico in preserving their native corn is crucial. The risk associated with depending solely on few types of grain makes societies more susceptible to famine. Laposse (2024) emphasizes the importance of biodiversity in cultivated plants as a guarantee for the future, asserting that it is essential for adapting to the challenges posed by climate change.

Figure 2. Totomoxtle. Source: Dezeen, 2019.

3.2 Maqui Biotextile (Chile)

The *Aristotelia chilensis*, commonly known as the Maqui tree, is a native and abundant species in Chile (Figure 3 – left). Revered by the Mapuche community, it holds sacred significance as a symbol of benevolence and peaceful intent (Vogel et al., 2014). The Mapuche people incorporate Maqui into their daily diets, and, in their cosmovision, the Maqui tree plays a pivotal role, with its fruits serving as food, natural dyes, and medicine (such as wound healing and diarrhoea treatment).

The maqui is a pioneer species: the first to take over degraded soils, establishing the ideal conditions for other native plants to grow and also a food source for birds (LABVA, 2022). The Maqui fruits, classified as "superfruits," boast extraordinary antioxidant capacity and offer a range of health benefits, including anti-inflammatory, antimicrobial, antiatherogenic, anticancer, astringent, analgesic, and nutritional properties (Fuentealba-Sandoval et al., 2021).

Labva's Maqui Biotextile project is a manifestation of the designers' commitment to understanding local abundance and fostering autonomy and sovereignty in biomaterial production (Abud, 2022). This unique biomaterial (Figure 3 – right), made of bacterial cellulose with textile applications, is derived from Maqui trees located in the native forests of southern Chile, where Labva is physically based. The biofabrication process involves fermentation, akin to the kombucha production process, where bacteria and yeasts from the microbiota of the Aristotelia chilensis leaves and fruits engage in a symbiotic process. The outcome is a fully biobased, environmentally friendly material characterized by high mechanical resistance and flexibility, with a texture and appearance reminiscent of leather (LABVA, 2022). The designers emphasize their incorporation of information from ancestral processes, stating, "we borrowed the information that came from ancestral processes" (Abud, 2022, p.21).

In addition to its material attributes, the Maqui Biotextile project has heightened Labva designers' awareness of various details in processes. This increased consciousness enables them to confidently assert the environmental benefits, positive impacts on human well-being, and the promotion of biodiversity (Abud, 2022, p.21).

Figure 3. Maqui tree (left) and the material created (right). Source: Labva, 2022.

3.3 Cuia Colab (Brazil)

Cuia Colab is a project conducted in Pará, Brazil, within the context of the Amazon Forest. Cuias, derived from the fruits of the *Crescentia cujete* tree, have a rich history of artisanal transformation by women in the Santarém region. Historically utilized as daily objects, particularly vases, bowls, and containers, cuias bear a distinct black color, resulting from a natural resin that enhances their durability and allows for intricate ornamentation, carved onto them. These objects hold significant cultural value, embodying a profound partnership between humans and plants (Bandoni et al., 2023). Presently, the traditional craft of making cuias in the Low Amazon is recognized as a cultural heritage of Brazil, with local riverine artisans continuing this age-old practice (Carvalho, 2011).

Upon delving into the history of cuias, Bandoni observed disparities between ancient objects found in books and museums, credited to the indigenous populations of the area, and contemporary cuias. The older objects exhibited a broader spectrum of colors and modified shapes, with evidence indicating that ancient indigenous populations employed molds on growing fruits, reflecting an early form of “Biodesign” (Bandoni et al., 2023), a knowledge that had been forgotten over time.

In response, Bandoni initiated the Cuia Colab project with the aim of creating moulded cuia-objects including traditional techniques still practised by local artisans. This involved designing reusable molds placed on the cuia's buds as they grow on the tree, resulting in varied shapes and textures (Figure 4). Post-harvest, local artisans would then complete the objects by sanding and applying resin to the cuias. The project sought to provide a durable and fully compostable alternative to domestic objects while simultaneously strengthening local artisan communities. Cuia Colab emphasizes the collaboration with the tree and the crucial role of riverine women artisans who, due to their lifelong coexistence with cuieira trees, possess profound knowledge of the cuia craft and the intricate process involving the black resin cumate (Bandoni et al., 2023).

Initially supported by a Brazilian start-up program focused on bioeconomy and propelled to expand production, Cuia Colab encountered scalability and logistical hurdles during its first phase. These challenges, coupled with the prospect of adverse environmental repercussions, prompted a reevaluation of the project's trajectory. This stance underscores dedication to an approach that prioritizes the local environment and its ecosystem over large-scale production methodologies.

Figure 4. Cuia Colab prototype being molded (left) and the harvested object (right). Source: Andrea Bandoni, 2022.

3.4 Carmín (Mexico)

Carmín (Figure 5) is a material development project that harnesses the potential of “grana cochinilla,” a substance derived from the insect *Dactylopius coccus*, renowned for its ancestral applications in the realm of dyes. The utilization of this insect has historical roots in Mesoamerica, where it was traded and used, and it has been domesticated in southern Mexico since pre-Hispanic times (Besoain et al., 2024).

Designer Edith Medina conceptualizes Carmín as a venture that goes beyond the conventional use of cochineal for dyeing. Instead, it aims to rediscover and accentuate the insect's value as a substrate for creating a robust and pliable biopolymer. This biopolymer serves as the foundation for various textile applications, including organic sequins and bioleather (Medina, 2023). The unique chemical composition of cochineal opens avenues for revaluing and expanding its applications. By incorporating cochineal into this contemporary project, the designer not only accentuates its local significance but also broadens its applications beyond traditional dyes, imparting social, cultural, and economic value to this ancient material.

Medina explicitly emphasizes that the primary objective of Carmín is not mass-scale material sales but rather the reevaluation of the production of a historically significant insect in the context of material history (Besoain et al., 2024). This perspective underscores the project's commitment to fostering a deeper understanding of the intrinsic value of cochineal and its potential contributions to the material landscape.

Figure 5. The production of Carmín (right) and a detail of the biopolymer created (left). Source: Besoain et al., 2024.

4. Results and Analysis

The case studies presented above showcase diverse ways in which ancestral indigenous knowledge is incorporated into contemporary design projects. Each project highlights specific Indigenous knowledge and demonstrates how it is integrated into the design:

- Totomoxtle: The knowledge of growing native corn in the region of Tonahuixtla, Mexico, is central to the project. This knowledge enables the creation of a variety of corn husk colors showcased in the veneer panels and products. Moreover, the social aspect of the farmers' condition is also addressed, with the project not only creating local employment opportunities but also reviving the ancestral technique of planting a diversity of native corn varieties.

- Maqui Biotextile: The project draws inspiration from the knowledge and importance of Maqui in Mapuche culture and the diverse possibilities of utilizing the tree's resources. This aspect leaded the designers to pay attention to the tree's microbiota and explore symbiosis with its yeast and bacteria to produce bacterial cellulose. Natural dyeing properties of Maqui are also incorporated into prototypes, adding value to ancestral knowledge and to the many non-human species involved: the Maqui tree, the bacteria and the yeast.

- Cuia Colab: The indigenous knowledge integrated was the the reintroduction of the Biodesign or Biofabrication technique involving molding cuias while they are still growing on the tree, a practice no longer known or utilized by contemporary artisans. The project involves riverine artisans with knowledge inherited from ancient indigenous practices related to utilizing black resin and practical details when working with the cuieira tree. Concerns about social and ecological impacts are demonstrated in the process.

- Carmín: the grana cochinilla´s dyeing properties, indigenous knowledge, was revisited by the designer, who found that its use could be expanded through a biomaterial exploration. The knowledge of the designer on the field definitely played a crucial role to produce in generating Biomaterial innovations.

Several parallels emerge when discerning and aligning the approaches of the aforementioned projects. While the maqui fruit in the Maqui Biotextile project and the corn husks of Totomoxtle may not be readily identified as conventional design materials, projects Cuia Colab and Carmín center around pre-existing materials and methodologies, ingeniously re-evaluating their inherent worth. It is noteworthy that, in the instances of Maqui Biotextile and Carmín, the integration of scientific knowledge, particularly in the realms of chemistry and biology, played a pivotal role in conceiving and materializing innovative biomaterials. This strong interdisciplinary collaboration constitutes a necessity of the field of Biodesign (Bandoni et al., 2022).

Furthermore, the inclusion of diverse perspectives is manifest in Totomoxtle and Cuia Colab. Designers deliberately involve local actors, such as farmers and artisans, who serve not only as practitioners but also as custodians of ancestral knowledge. This intentional incorporation of different viewpoints underscores the projects' commitment to cultural heritage and social engagement.

Table 2 summarizes the analysis and gives an overview of each case study, emphasizing how indigenous knowledge was utilized, and the outcomes of the projects.

Table 2. Synthesis of the case studies.

Project	**Ancestral Indigenous knowledge**	**Biomaterial outcome**	**Other outcomes**
Totomoxtle	The cultivation of native corn in Tonahuixtla, Mexico.	Veneer / panels made with native Mexican corn leaves that are naturally colorful	Inclusion of the local farmers and alternative income generation
Maqui Biotextile	Importance of Maqui from a Mapuche perspective and the tree's versatile uses.	Bacterial cellulose with textile applications, derived from Maqui trees´ microbiota	Discovery of a symbiosis between maqui´s bacteria and yeast
Cuia Colab	Biodesign or Biofabrication technique with cuias while growing on the tree.	Cuia-objects that ally biofabrication to other traditional techniques	Revival of a forgotten technique and inclusion of local artisans
Carmín	Grana cochinilla's dyeing properties	Biopolymer with textile applications such as organic sequins and bioleather	Expansion of the applications of the insect

5. Discussion and Conclusion

Ibarra and Ribeiro (2014) assert that since the mid-20th century, design has been approaching and embracing pre-industrial modes of production, emphasizing vernacular solutions. This shift has prompted designers to appreciate local expertise, revive traditional practices, document them, and, in essence, acquire a substantial repertoire of opportunities. The adoption of a pre-industrial approach appears fitting, especially in an era where envisioning solutions to the environmental challenges posed by humanity becomes increasingly complex. As Santos (2008) wrote, a critical reassessment of design is imperative, and the precondition for this is the reconsideration of its cultural dimensions within the plurality of various cultural universes.

This study presents compelling evidence of the incorporation of ancestral indigenous knowledge as a central reference point in design projects. These works align with what LABVA designers' term "territory-based biomaterials" or "situated biodesign" (Weiss & Besoain, 2022, p.10). To varying degrees, these projects encompass regenerative practices, the development of ecological techniques, and biodiversity preservation. Each of them has produced fully biobased and compostable materials and objects, underscoring the Latin-American designers' foundational ecological concerns. Additionally, it can be

asserted that, while not always the primary intention, these designers have been amplifying the voices of marginalized groups, prompting an invitation to engage in intercultural dialogue and reconsidering the Design field (Santos, 2008).

These works illustrate a trend wherein designers, in their pursuit of ecological practices associated with Biodesign and Biomaterials, acknowledge traditional knowledge as a legitimate and invaluable source for contemporary design endeavors. Despite their looking at the past, these works are not driven by nostalgia; instead, they revere ancestrality and value indigenous knowledge, recognizing its distinct relationship to nature—one that is more respectful than the prevailing Western perspective. Therefore, it is suggested that this indigenous knowledge can illuminate our future as a species. Notably, in the recent past, Indigenous peoples and their references were entirely marginalized in the designers' scope. Today, there is a substantial interest among designers in this subject, although many projects still appear to remain at a superficial level.

The superficial treatment of traditional knowledge raises ethical considerations. On one hand, designers must “ensure that Indigenous communities who are most at risk from climate change aren't once again exploited for their knowledge” (Withers, 2022, p.17). On the other hand, there is an imperative to learn from these communities, actively engage with their knowledge, and contribute to its evolution. Addressing the issue of cultural appropriation demands robust discussions aimed at identifying pathways that mutually benefit all stakeholders. As emphasized by Aílton Krenak, “the future is ancestral” (2022).

5.1 Limitations and Suggestions for Future Studies

This study was limited to the analysis of four case studies featuring design practices originating from Latin America. It is noteworthy that in different geographical contexts, the methodologies employed by designers may diverge from those elucidated within this study. Examining other regions where Biodesign intersects with traditional knowledge can yield novel insights and unveil nuances that may hold greater significance within alternate contexts.

To extend the findings of this study, future researchers could engage in qualitative interviews with Biodesign practitioners to elicit direct insights into their engagement with indigenous knowledge systems. However, it should be acknowledged that the temporal constraints of this study, coupled with the availability of the selected designers, restricted the present analysis.

Furthermore, it is pertinent to reflect on the research question entitled “Vernacular Biotechnologies” posed by Professor Elizabeth Hénaff (2023) within the Biotechnology Design community of the Journal Research Directions: “what are we missing” in the (western) mainstream definition of biotechnology and design? She contends that despite the perception of biotechnologies as recent developments within Western scientific discourse and capitalist frameworks, societies have historically employed their understanding of biological organisms and systems to address diverse hierarchies of needs long before Western scientists. Consequently, Hénaff urges researchers to identify, evaluate, and speculate on this pressing topic.

Following Hénaff's inquiry, we may also pose the question: How can we disseminate the creative insights derived from “Vernacular Biotechnologies” to other cultures? The pursuit of answers to such questions not only underscores the importance of indigenous and traditional knowledge systems in contemporary society but also serves to mitigate colonialist perspectives within the domain of Design. This emphasizes the relevance of such inquiries in advancing the field of Design.

KEYWORDS | EPISTEMOLOGY, AGNOTOLOGY, WRITING PRACTICE, STANDPOINT

ABSTRACT | This paper has a twofold objective: 1) to provide leads to explore design's epistemic potential, through standpoint epistemologies and agnotology. The former because they defend the possibility of a knowledge that is relative to a point of view, thus highlighting a pragmatic tone that fits very well with design's ambition. The latter because the acknowledgment of ignorance supports the consideration of ethical stakes– thus defining more accurately the designer's position; 2) to outline a writing practice that would embody this epistemic potential and solidify design as its own science. I believe that design provides a great opportunity to produce an irreducible knowledge, grounded in a specific social situation, embracing different social dynamics that structure it. I advocate the idea that such knowledge would come to existence if designers were to integrate a "writing phase" within the design process.

1. Introduction

This paper has a twofold objective. First, it intends to explore design's epistemic potential, to present leads for work to come that will support design as a science in itself. Secondly, it advocates for the integration of a writing practice within the design process, supporting the idea that writing will allow designers to extract knowledge from their field–information that would not be accessible by another discipline. I believe that these two dimensions are linked to each other: because writing is not merely an expression of knowledge but a way to consolidate its existence, notably by rendering it shareable. So while I intend to outline ways for designers to make the most of their singular perspective on reality, to redefine their epistemological ambition, I advocate that each of these ways should indicate something about the type of text designers should write.

One might want to ask first: what do designers pretend to know? What "object" to they "study"? One could say it is "the collected experience of the material culture, and the collected body of experience, skill and understanding embodied in the arts of planning, inventing, making and doing" (Archer, 1979). This implies that the kind of problem they face presents a specific complexity and that the skills that are better suited to solve them are not universally applicable (Cross, 2007). Each project asks designers to produce, *ad hoc,* the form of research demanded by the field of intervention. Regarding that requirement, designers occupy an ambivalent position. They approach a field, *borrowing* various tools from social and human sciences (Nova, 2014). But where do they "stand" vis-à-vis said tools and methods? What preliminary hypothesis underlies their inquiries?

Social sciences are somewhat torn between empiricism and theory (Berthelot & Collectif, 2012; Merton, 1997). The danger of an empiricism-dominated science is that it fails to place data into a broader context that will give its meaning (Moreau de Bellaing, 1990). That is the need for theory: only theories make sense of the phenomenon observed. Designers have empirical tools, but do they have theory? We have been struggling with this question for decades without coming to a consensus (Jones et al., 2016). There are different epistemologies out there: some are more dominant, or "popular", or "prestigious" than others (Silva, 2019; Studley, 1998), some aim at universality while others prefer local approaches, some are realists, some are constructivists (BonJour, 2009), some are individualistic, some are social (Bouvier et al., 2007). Which ones are the most fitting for designers?

In this paper, I intend to use two epistemological approaches that can, I believe, benefit design as a discipline: standpoint theories and agnotology. I will start by defining the conceptual foundations of my analysis and will try to clarify the designer's position vis-à-vis standpoint theories (1). I will then dive a little deeper into standpoint theories and, more specifically, into feminist epistemologies, in order to defend the idea that valuable knowledge comes from embracing the singularity of a point of view as well as the specific interests–ethical and/or political–that accompany said point of view (2). I believe these epistemological theories justify a pragmatist dynamic that fits very well with the design practice. I will finally explore the relatively unknown discipline of agnotology in order to show that ignorance is not a simple absence of knowledge but something to consider and deal with in order to tackle a design problem (3). These two approaches should help designers build ad-hoc theories, hypotheses grounded in the concrete situation their project takes place in. I will defend that these theories should admit a pragmatist dimension and assume a minority point of view.

2. What Epistemology? What Knowledge?

How do I understand epistemology? Here, I will leave behind an epistemology that is understood as the study of forms of justification of knowledge to prefer a conception of epistemology as the study of the modes of production of knowledge and ignorance, as well as of the social dynamics implied in the formation of cognitive and affective capacities involved in the production of knowledge (Frega, 2013). In that regard, I defend that knowledge is not only the representation of states of facts but also the knowledge that agents have of themselves, of others, and of the social world (Sullivan & Tuana, 2007).

Standpoint theories and feminist epistemologies insist on "situated knowledge" and reveal links between a social situation–its distribution of power–and the specific access to knowledge the situation allows. They highlight the epistemic privilege associated with a socially situated perspective. In other words: one's social situation defines the kind of knowledge they have access to. It is no surprise Marxism presents a classic model of standpoint theory, the standpoint of the proletariat offering an epistemic advantage over questions of social science and history (Lukacs, 1972; Marx, 2015). Workers attain this epistemically privileged standpoint through collective consciousness of their role in the capitalist system of production. Their oppression leads them to find out the truth about capitalism. The centrality of their role implies an experiential access to the relations of capitalist production.

Moreover, standpoint theories show that political and axiological neutrality isn't necessary. On the contrary: being involved in the situation, being concerned, letting one's value guide their research gives access to some information that would remain unknown otherwise (Harding, 2010). Since design projects are always grounded in a concrete social situation, and since design aims at changing the situation for the better, this conceptual frame appears fertile. But at the same time, because of the ambivalence of the designer's role within the capitalist system, one must clarify their position. They are closer to the client's brief than to the user's experience and, by default, occupy a dominant position (Beaubois 2019). Can designers work for the minor point of view while embodying a dominating perspective?

The position of being epistemically dominated favors the development of three epistemic virtues: humility, curiosity/diligence and open-mindedness. On the contrary, the dominant position, as shown per the Critical Race Theory, implies the symmetric epistemic vices: arrogance, laziness, and narrow-mindedness (Medina, 2012). I do not have the statistics of social representation among designers. There are obviously designers of different genders, races, sexual orientations… It would be counterproductive to reify the category of "designers". I cannot affirm they all are in a socially dominant position but I will start from the principle that they are for two reasons: 1) because of their dominant position within the system of production–they conceive for the user, they are the ones deciding what the user's experience will be like, and that is by definition a position of power (Beaubois, 2019); 2) because the goal is to embrace dominated perspective as much as possible (without reification). So, I invite designers to chase all the blindspots that can come from social privilege.

Because standpoint theories not only address perception and information availability–it also outlines whole realities or worlds (Chamois, 2019). What we know and what we ignore define what we call reality. Whether designers know it or not, each design project implies the building of a bridge over a gap: it is all about responding to the user's needs or desires which are, evidently, rooted in their "world". In that regard, I believe that designers should address both their own social situation and the user's, in order to appreciate the gap that exists between them.

Following standpoint theories (Anderson, 2020), for both perspectives, designers should define (i) the social location; (ii) their scope: (on what subject matters do they differ; (iii) the aspect of the situation that generates epistemic dis/advantage (social role, gender, ethnicity…); (iv) the ground of its dis/advantage ; (v) the type of epistemic superiority/inferiority it implies (accuracy, diversity, exhaustivity…); (vi) the other perspectives that may access/miss relevant information; (vii) the accessibility of the perspective (can one temporarily adopt it? Does it rely on years of experience?). Designers should investigate, in collaboration with the users, the epistemic privileges of the subordinated. What kind of fundamental social regularities do their perspective reveal? What arbitrary–and thus mutable–social arrangements?

Designers are not scientists and when they convey science in their work, they do so with a certain conception of science that they inherited. There again, a proper survey among designers to assess their understanding of epistemology would be extremely useful. Meanwhile, I postulate that they adopt the dominant conception of science: realist, formal, ideologically and axiologically neutral (Harding, 2010). In one word: positivist. This postulate is supported by Nigel (Cross, 2007) who presents the "values" of science as "objectivity, rationality, neutrality, and a concern for 'truth'", while humanities would favor "subjectivity, imagination, commitment, and a concern for 'justice'". Moreover, Cross considers that the

former's phenomenon of study is "the natural world" and the latter "the human experience". This is obviously caricatural: natural sciences can no longer pretend to be neutral (Girel 2017, Feyerabend, 1988) and human experience can evidently be objectively studied. In the following, Cross states that design's phenomenon of study is the "man-made world". I believe it is rather the experience of the man-made world. I want to defend the idea that design has a lot to say precisely about the experience of technical apparatuses, whether it is an object, a service, a system or an experience.

Audre Lorde famously said that the "master's tools will never dismantle the master's house" (Lorde & Clarke, 2007). And if a positivist approach to science is so intimately linked to the rise of modern industry (Carnino, 2015), designers who intend to take a step back from the industrial world should probably, following Lorde's wisdom, question the epistemic tools they're using. This paper is addressed to the community of designers who believe the trade must play a role in the cultural and political shift that is needed today. I believe that the specific knowledge designers can have access to is revealed to them only insofar as they embrace an activist attitude towards their project. Only when they see clearly what value they are defending through their project can they attain an epistemically privileged perspective.

3. Minorities and Perspective

3.1 Stronger Objectivity: Feminist Epistemologies

Bruno Latour called for a "proper description" (Latour, 2004), as a way to produce knowledge that is relevant to an issue. He semi-ironically claims to defend objectivist sociology as a way to reaffirm the necessity to conceive objects rather than just propose symbolic interpretations. A good description reveals the complexity of the object. It isn't a mere compilation of evidence-based data but a way to highlight the reality of one point of view, as an objective reality. The description is objective, not absolute. It does not pretend to say everything there is to say about the object, but it tells us everything one perspective has to say. The question that immediately arises then is how to define the designer's point of view. To answer that question, one has to first define the designer's object. What constitutes a designer's problem? I believe it to be the "technical experience" (Laborde 2023).

One way to represent it is to picture a spectrum going from pure technicality or functionality to pure speculation. For any topic, say, IA, there are an infinite number of discourses possible. At one end of the spectrum, there is the IT engineer's which describes the mechanisms of said IA, how it works. At the other end of the spectrum, one finds the philosophers questioning what IA means for human beings. Designers occupy a space at the middle of the spectrum: neither pure functionality nor pure meaning, they deal with the "meaning of functionality", the experience of a technical apparatus (object, service, system…) in all its complexity, calling in imagination, and values among other things. Designers are no philosophers, sociologists or psychologists, but they can channel these discourses to build their own: a description of what it means, for the users, to experience a technical situation. Once the object is determined, the perimeter of the description also is.

The idea that a pure description could be more than "just a description" resonates with standpoint theories: describing what you see, when you're the only one seeing it, becomes valuable information for everyone else. The minor point of view reveals unknown parts of reality–the mere expression of it can be enough. It is no surprise, then, that feminist epistemologies recognize the value of description. If one were to characterize Donna Haraway's "way of theorizing, it would be to redescribe, to redescribe something so that it becomes thicker than it first seems" (Haraway, 2013). In that perspective, one could picture the designer's job as an investigation in order to report on the minor point of views that are engaged in the project's situation. If done properly, a thorough description of the situation from these dominated perspectives would provide valuable information. But how to describe it? Where to start and where to stop?

For each project, there is a multitude of experiences and some of them are marginalized. As shown by feminist epistemologies, valorizing the forgotten point of views can lead to building stronger objectivity

(Harding, 2010). Thus, each project should call for a mapping of the relations of domination involved in the situation. The ones that are directly concerned (the relation between users) as well as the ones that are indirectly concerned (the social situations of all parties involved). For instance, if a designer were to work on a school classroom, they should take into account the relation of domination that constitutes a teacher-learner relationship but also, the social class of the teachers and students. As I experienced it myself, teaching in a school where students have a much higher social status than the teacher can alter the pedagogical dynamics of the teacher-learner interaction. Moreover, the social situation students aspire to also defines the class dynamics. To put it bluntly: if students aim at jobs that pay a lot more than the teacher's, it can have an impact on the learning experience in its whole.

Beyond the specificity of the situation designers intend to intervene in, they need to be able to situate the project within the broader context of social, political and cultural ideologies. In that sense, one would expect designers to be able to diagnose said ideologies: which ones are prevailing? How is their domination manifesting? What are their allies? Their "weapons"? They need a cultural understanding of the conflicts that structure the society they live in, in order to understand how their project is going to fit among these different forces. Acknowledging the complexity and diversity of these social conflicts will lead designers to see the world as a "non-neutral" reality. Certain paradigms are, indeed, getting the best of their opponents. Understanding as thoroughly as possible the unbalanced nature of society can help designers decide how to position themselves.

If designers, after their investigation, choose to embody a minor position, if they decide to take on some of the dominant forces, it should lead them to access data that would remain invisible otherwise. In other words, a win-win: access to data should be good for the project itself and also enable designers to produce knowledge. If they were to write/describe all the information they gather from the dominated perspective they investigate through, they will reveal specific knowledge that is irreductible–that only designers could reveal. This would support an epistemic ambition for design, participating, along other social sciences, in the description of an objective reality. Assuming the limit of one's perspective becomes the best way to reaffirm its epistemological ambition.

3.2 Embracing the Limitations & Mapping the Balance of Powers

Instead of trying to grasp and comprehend the situation in its entirety, instead of aspiring to attain a synoptic view, designers would work with and from blindspots, without pretending to overcome them. The goal could be to produce a map of all the ignorance and knowledge involved in the situation, as they approach it. Who knows what? What is unknown? What is needed to know? What should remain unknown? Designers aim at finding solutions to issues which can lead them to search for positive data to ground their project on. That can lead to an overconfidence bias and a false sense of expertise (Gigerenzer, 1991). Their research could very well, rather than just gather available information, highlight ignorances that are involved in the potential settlement of the product or service. In order to complicate the relationship between the project and reality. The project is not a pure solution to a problem and knowledge is not pure data answering a question. Knowledge is uncertain and ignorance is even more uncertain. To write about the evidence (or lack thereof) that constitutes the background of the project is to reveal its limits as well as its potential. It highlights the complexity of the design intervention.

Mapping the design intervention through the lens of domination, and situating the field of intervention within social dynamics and hierarchies will help designers free their views from the dominant perspective. Because if they do not produce that work, that critical map, they will be, inevitably, oriented by the dominant perspective. The dominant perspective feels neutral–it appears as "apolitical" precisely because it favors the status quo: norms are an expression of power (Deleuze & Guattari, 1980). Designers should, in that regard, approach the situation and the project as situated in a non-neutral social reality. In order to identify the axiological components intricated in the situation, designers need, in my opinion, to produce textual artifacts that report on all the dimensions involved. How is the power distributed? Who is heard? Who is invisible? Who is concerned? What are the material conditions of existence? What norms are convoked? Who has to put up with said norms?

Standpoint theories do not limit themselves to highlight a difference of experience. It is not enough to acknowledge that different situations imply different points of view. Standpoint theories insist on the relationship between knowledge and power, rather than knowledge and difference. And that is inspiring for designers: in order to understand the specificity of the perspectives of all parties involved in the project, they need to assess and clarify the relationships of power that structure the situation. It is not only about listening to the people concerned but also about working with them to build, through the writing of a text, a representation of the network of powers that frame and determine their experience. More than mere "social subjects", the goal is to establish minority political subjectivities. The design project then becomes the occasion to turn from an experience-centered approach to a situated-knowledge approach. Considering the design project as a political struggle, as a work that is in conflict with dominating forces, would help transform the mere experience into a situated knowledge (Hartsock, 1983)

Situated knowledge is the type of knowledge that is rendered possible by a position of minority, which can be described as a position of resistance. One has to identify the forces that we resist to in order to understand the form of knowledge that the position offers access to. It is because the individual experiences something that prevents them from expressing their power, that limits their actions, that they need to perceive, observe, analyze the situation. When one dominates a situation, they can act spontaneously. When one is dominated, they cannot but think things through. This is something that can be observed among handicapped persons: they create tools and services that answer better to their situation than the ones proposed by institutions (Ménard, 2023). This is the type of "stories" designers need to write about. They are in the best position to describe the system of powers that spreads in a situation that involves a technical apparatus (object or service). Thus, they can tell us about the hidden dimensions of the experience. As Maria Puig de la Bellacasa puts it: "we need to analyze the dominating, structural and institutional remit through which the experience is built and that is not necessarily readable in the experience" (Puig de la Bellacasa, 2014). Approaching a situation through the distribution of power allows to highlight information that is usually hidden.

4. Knowing & Doing

The second epistemological perspective that I find to be helpful for design is agnotology (Proctor, 2008). Every knowledge is related to what is ignored, every research is defined by what is left unfound or unsearched (Girel, 2017). Science practice and thus the knowledge produced by science are intricately linked to political decisions, if only in terms of fundings (Frickel, 2014b). No science or research is ever exhaustive nor neutral. Since design is not a science in itself and since its goal isn't a mere description of reality but rather an intervention, a modification of it, the research designers engage in is even more subjected to this form of partiality. Rather than fight it, I advocate for designers to embrace this partiality.

4.1 A Pragmatist Epistemology

As per William Kindon Clifford, science is not reducible to knowledge itself–science is a specific way to obtain and to use knowledge (Clifford, 1901). This is all the more interesting that such a definition can help support the goal of conceiving design as science–since design projects always articulate knowledge and action. If the design project can pretend to produce science, it is, precisely, because the knowledge that designers seek is directly correlated to a function, a practical goal. There is a pragmatist foundation to the epistemology design can aim at. Understanding knowledge within a pragmatist paradigm leads us to shift our values: what matters is not to know X but to understand what problem is concerned/affected by/solved by X.

In my opinion, a consistent writing practice for designers should adopt a similar approach: every information gathered, through inquiries, interviews, observations or theoretical research must be linked, as precisely as possible, to a practical problem. I believe that research for the project would be more efficient if it were driven by a pragmatic posture: what does this information change for our issue? This implies that design research should be about questioning the value of any information. When starting a project, designers face multiple issues embedded in each other. Some issues are entirely practical and concern the

feasibility of their concept. Other issues are more theoretical and concern their understanding of the situation they plan on intervening. Other issues are more clearly political and address inequalities, accessibility, inclusiveness… To clarify the goal is to clarify the relevancy of the data gathered.

There is a vast spectrum of questions that structure the research for a design project. These questions lead the designers to encounter various information/data/knowledge. To organize all that knowledge, to take advantage of the sum of information gathered, I believe designers need to write–specifically to produce science, to actualize links between knowledge and problems, data and function, information and value. Designers should always come back to the questions that started the investigation in the first place: why is this situation problematic/sub-optimal? What does the user's experience mean to them? What should we aim for, and why? These are some of the questions that should accompany the first step of the design process. Every information should be confronted with these questions. What does this knowledge tell us about them? What does this finding change? Does this observation ask us to reformulate them? Does it render them obsolete? To investigate the value of an information demands to write–because it demands to produce a discursive text, a reasoning, because problematization supposes to confront concepts with each other.

4.2 Knowledge and Ignorance

How is science, more broadly the production of knowledge, understood by designers? To wish for design to produce a scientific perspective, one has to question the relationship designers have with the "idea of science" and of knowledge. What constitutes knowledge? When is one able to state that X is a knowledge? What is a fact? What can we trust? Designers are not engineers. Engineers work within a perimeter of knowledge that has been established for more than a century–engineering is basically applied science. Their conceptions follow well established scientific facts. But because design intends to build an experience, it immediately steps out of the secure space of "well-established facts". It needs psychology, sociology, ethics… and these disciplines are built on very complex epistemologies. How does a designer conduct their research? What source do they privilege? When do they know they can trust a study–rely on it?

These questions are clear methodological issues. But I wonder, beyond these challenges, at the root for their inquiries, what do they aim at? By that, I mean to ask about the phenomenology of their experience of research: what are the signs they identify and believe in? What do they think is "supposed" to happen during research? When do they start thinking they reached a satisfying amount of "knowledge"? To explore this dimension of our problem, one interesting discipline is agnotology (Frickel, 2014a)–the science of ignorance. One intuitive option is to conceive knowledge in relation to ignorance (Girel, 2017). But an easy mistake immediately pops up: to think of knowledge and ignorance as a binary opposition–like light and darkness.

Another way of saying this is that research and science may be understood as a way to gain knowledge and, thus, to reduce ignorance. One can picture reality as a map to explore–scientists being the explorers who discover new territories. And since the understanding of the laws of the universe generally leads to mastering said laws, to use that understanding in order to control our environment, the map metaphor easily changes. Not only do we explore territories, we also conquer them–we subjugate them (Merchant, 2006). Each knowledge gained is like an annexed territory. But this is obviously not a neutral representation of science by any means. And one could argue that this view is directly linked to the ecological disaster we are currently facing (Merchant, 1990).

If designers intend to be part of a bigger movement which aims at avoiding the disaster, then they need to approach their projects with a different conception of knowledge than the one that led us to the catastrophe in the first place. What could be a healthier way of dealing with ignorance? Brian (Wynne, 1992) invites us to abandon a logic that aims at reducing ignorance, to adopt a logic of integration of ignorance. Instead of pretending to eradicate ignorance, we take its existence into account. Ignorance questions the link between knowledge and the commitments that are taken on its basis. These are bets (technological, social, economic, political bets) placed on the completeness and validity of said knowledge. Integrating ignorance allows us to leave a binary logic where one either refrains from betting or goes all-in, to adjust our bets, to adopt a gradual logic.

Following that idea, to think that each project needs to ground itself in knowledge is both true and insufficient. Not only does it need knowledge, it also needs a representation of what is ignored. If science can be defined as an ignorance fully aware of itself (Firestein, 2012), then designers should not only try to gain information–they should try to define the function ignorance plays in the situation they will intervene in. This outlines another way of working: instead of going from ignorance to knowledge, one could go from belief to ignorance. Instead of trying to build, to establish, to construct a representation of reality, one could try to define what is unknown, what is uncertain, and what will remain inaccessible. In that regard, the goal is not to "understand the situation better", but to better "not-understand" it. To understand precisely why we do not comprehend it and why our understanding will forever be limited.

I believe this is one possible outcome for a design epistemic discourse. If designers were to produce an "ignorance map", if they were to identify blind spots, if they were to write about their projects through the lens of what is ignored, they would learn a lot about what constitutes a technical experience. To narrate how a design project evolves among ignorance is to teach precious lessons on how technical apparatus are built, and installed. It reveals how we place our bets, teaching us how technical apparatus are expressions of our mental representation of reality. To narrate the project and to highlight how blindspots are dealt with is to reveal a fundamental aspect of human existence–how our technical relationship to the world is linked to our understanding of it and our system of values.

4.3 Epistemic Relativity and Political Responsibility

By mapping what we do not know, we identify what we need to know as well as what we might never know, thus revealing the epistemic solidity of the bets that structure the project, and, by that, highlighting the designer's responsibility. How far must we carry our research for this project? How careful must we be? If research is the formulation of interesting ignorance that defines territories to investigate (Girel, 2017), one has to question who is in a position to identify said territories. Scientists are not the only ones: local residents' associations, communities, social movements… I believe designers are in a perfect position to co-construct these territories with the users. If designers were to produce texts that would report on what users identify as things they need to know for such matter, this would constitute a precious piece of knowledge as well. Because it would help map the technical experience, showing how knowledge and ignorance play a part in the user's experience of the apparatus.

It is neither realistic nor safe to ask designers to ground their projects on scientific sources. For one, they are not trained to navigate scientific data, even less so given that social and human sciences do not always aim for universal consensus. Secondly, in order to trust a sociology or psychology study, one has to have a deep understanding of the different methodologies used and epistemological backgrounds–an expertise that only professionals can hope to obtain. Thirdly, because lobbies and governments can actually "produce ignorance" (Girel, 2017). What we can expect of designers, though, is to produce a form of "local knowledge" which gathers, on top of the user's feedback, their hypothesis, the degree of confidence they have in said hypothesis and all the significant ignorance they've identified. We can expect designers to build an argued map of the beliefs and ignorance which play a part in the conception and implementation of the product or service. Thus, they can inform us both on the field they're intervening in through the lens of the improvement of experience that is initially aimed and on the epistemic opportunities and difficulties faced by those who try to build a "better quality of life".

4.4 Science of Design

As previously said, standpoint theories defend the idea that being engaged in a problem actually leads to better understanding. In that regard, I believe that designers should state their commitments and explicitly link these to their research of information. It is because designers assume the responsibility to work for better living conditions that they will access knowledge that remains invisible to the rest of the world. Good science is a science that takes its pragmatic and political dimensions on. Designers can become that very kind of scientist: instead of letting knowledge shape their understanding of the situation they will intervene in, they could render visible the connections between a practical goal and a complex ensemble of

knowledge and ignorance: "When one tries to fix X and Y, this is the type of information that arises". This means we should leave objectivism behind, in favor of objectivity. The former implies a form of scientism which leads to mimic the style of the more prestigious sciences (Puig de la Bellacasa, 2014). And this is a risk that concerns us vividly: designers are susceptible, to gain a form of legitimacy, to adopt the tone and perspective of more established voices (sociology, anthropology…). I have personally witnessed this numerous times with design students (Author). Objectivity, on the contrary, reveals a point of view, assuming its limits.

Design science should not adopt a form of discourse but, rather, build forms ad hoc, for each project, each commitment. Because each project implies different values, different dominations, different networks of powers, each project asks for a specific description of how the "problem" is discovered, how the intervention of design is called and how this call implies values. And that also means we need reflexivity: as any social scientist, the designer must submit to the "systemic examination of their own positions, of their own social causes and of the beliefs that motivate their research" (Puig de la Bellacasa, 2014). We need to encourage designers to produce theories–however unfounded or prejudiced. A flawed theory is better than no theory at all: it leads the inquiries and helps give data meaning. Meaning needs context to arise and I advocate for that context to be the technical experience in all its complexity (emotions, values, symbols…).

The goal, for scientists, is less to "tell the truth" than to "make themselves understood" by other scientists, to allow dialogues and the collegial building of knowledge. Each scientific practice is supported by an epistemology. But this need not be absolute, neutral, or universal. It can be "held" by a collective project–by a community. Designers can write and produce science that makes sense within the design community. Designers should write papers virtually addressed to other designers. For a said project, they would highlight how their values–and the attempts to conceive something that supports them–lead to discovering valuable information. It would help the community of design understand how an ethical or political commitment, an aspiration to a "better quality of life" (WDO), enables an objective yet partial representation of reality

5. Conclusion

Instead of producing research that pretends to be of scientific quality but is actually never checked nor peer-reviewed, I believe designers should give report on a limited triangular space defined by three terms in relationship with each other: 1) their goal (in terms of practicality as well as values); 2) their ignorance (what needs to be known and what will remain unknown); 3) the distribution of power among all parties involved in the situation their project takes place in.

I believe that if each team of designers, for each project, were to explore these three dimensions, very valuable knowledge could be extracted. I think such exploration necessitates the practice of writing. To question prejudices and beliefs, to assess reasonings and values, to investigate the difference between perspectives, one has to dive into conceptual nuances that are only achievable through discursivity: every scientific discipline expresses its findings, theories, and conclusions in papers. To produce a complex thought, one has to build it with words and sentences. Moreover, for something to become data, or information, it needs meaning. An observable phenomenon has meaning only in so far as it is related to a theory–to a hypothesis about how things are or should be.

KEYWORDS | DESIGN SPRINT, COMMUNITY OF PRACTICE, PRACTICE-BASED DESIGN EDUCATION

ABSTRACT | This paper introduces an educational approach implemented within the Design Products MA programme of the Royal College of Art in London UK, focusing on enabling students to develop their personal practice around their values, concerns, and materialities. The approach integrates Kolb's experiential learning theory, design sprints, and the community of practice framework to foster hands-on problem-solving within set time frames, encourage collaboration, and facilitate reflective discussions. The 'Experimental Design' unit, building on the 'Locating Practice' unit, aims to broaden students' horizons through consecutive 'Microbriefs,' emphasizing trial and error to expand creative bandwidth and explore various design practices, materials, and technologies. The six Microbriefs undertaken during the curriculum explore themes such as self-portraiture, spatial design, communication, error, traditional meaning-making, and ethics in design.

1. Introduction

This paper presents the educational approach developed in the context Design Products MA programme of the Royal College of Art s a practice-based master's programme that focuses on enabling students to build their personal practice around their values, matters of concern and materialities.

In Design Products we view products as influential leverage points encompassing not only tangible goods but also services and systems, extending beyond the final outcomes to encompass the entirety of the design process and the territories it instigates (Meadows, 1999). Within this framework, we advocate for a more pluralistic approach to design, wherein products (outcomes) of the design process serve as a gateway to uncharted territories, with the objective of advancing new disciplines, research methodologies, and practices.

The nomenclature of the Design Products MA program at the Royall College of Art originates from the fundamental belief that "design is more important than the product." This position deliberately challenges the traditional boundaries of design as a discipline, propelling it into unconventional spaces. The focus of the programme is on shaping, redefining, and promoting best practices within sustainable parameters, openly articulated.

Unconstrained by traditional manufacturing norms, our approach encompasses a spectrum of possibilities, including the exploration of new intellectual property models, systemic transformations, integration of digital technologies, design for repair, stimulation of new behaviours, and the continual scrutiny of our responses to climate change. Rather than conforming to established typologies, we view design as a versatile tool for provocation, future envisioning, research facilitation, contextualization, and the redefinition of design industries, transcending the mere production of artefacts. Fundamental to our inquiry is the question, "What constitutes a product?" as we challenge assumptions and seek to uncover critical insights that inform cutting-edge creative practices, aimed at designing more sustainable and impactful futures.

The programme rests on two central tenets, first is values-based design education and the second is practice based learning. This leads to the creation of a programme that aims to facilitate the exploration and emergence of a design practice that is rooted in the learner's value system, matters of concern, materials and production methods.

Values-based design education integrates a pluralistic educational model by embracing project-based learning and creating creative environments for design practice (Thoring et al., 2018). This approach aligns with the idea of integrating pluralistic educational models, as it allows for diverse perspectives and experiences to be incorporated into the learning process. Additionally, the work emphasises the significance of values-led participatory design, providing insights into how values can be incorporated into the co-design process, reflecting a pluriversal approach to design education (Noel, 2022) and decolonising design education (Ansari et al 2019; Turnstal 2023; Adibrata et al 2023) movements. By drawing from these perspectives, we aim to acknowledge and embrace diverse values, cultural perspectives, and participatory approaches within the design process. This integration not only enriches the educational experience but also prepares students to engage with the complexities of real-world design challenges, where multiculturality, interdisciplinarity and diverse values are inherent.

The 'Experimental Design' unit, building on the 'Locating Practice' unit, fosters exploration and experimentation with various practices, materials, and technologies. Through consecutive 'Microbriefs,' it aims to broaden students' horizons and leverage contemporary design approaches, emphasising trial and error to expand creative bandwidth. This unit extends students' capabilities in designing interventions and explores a practice-based approach to design as experimentation. Each Microbrief starts with a thematic provocation that puts forward a one-to-two-week design project, inspired by the notion of design sprints. These projects serve as lenses for collective reflection on emerging practices, fostering dialogue, creating a community of practice within the studio. Microbriefs drive fast experimentation, strategically testing concepts

across various mediums to offer diverse proofs of concepts and design directions. The experimental proposals are free to explore mediums including: physical (including performative), digital, material, technology, computational and biological techniques to create proposals for a product, artefact, probe or intervention.

2. Practice-Based Design Pedagogy

2.1 Design Studio

The design studio is a fundamental component of practice-based design pedagogy, serving as a space for experiential learning, creative exploration, and collaborative engagement. In the context of design education, the studio environment plays a pivotal role in shaping students' understanding of design processes, problem-solving, and critical thinking. This section will explore the significance of the design studio in practice-based design education, drawing insights from relevant literature to elucidate its role in fostering experiential learning and creative development.

The studio serves as a space where students actively engage in hands-on, project-based work, allowing them to integrate theoretical knowledge with practical application and through reflection feedback to the theoretical and methodological models around design. This learning by doing environment is essential for students to acquire design skills and knowledge under the guidance of tutors.

The design studio aligns with Kolb's experiential learning theory. According to Anderson & Dron (2011), the design studio environment facilitates instructional designs and interventions that promote active experimentation and knowledge application. This resonates with Schon's concept of the "reflective practitioner," where students engage in reflective conversations with peers and instructors to critically examine their design processes and outcomes (ibid). The studio's immersive nature allows students to integrate theoretical knowledge with practical application, fostering a deeper understanding of design principles and methodologies (Saghafi, 2020).

The weekly pattern of Microbriefs creates a sense of ebb and flow in the studio with the space filling up with materials and works revolving around the theme of the week. The very presence in the space takes on an experiential significance as the space acts like a halfway point between workshop and exhibition space. Furthermore, the design studio serves as the basis for a community of practice, where peer-based learning and collaborative interactions play a significant role in knowledge construction and skill development. Iranmanesh & Onur (2022) emphasise the design studio as the core of practice-based pedagogy, highlighting its role in nurturing a collaborative and supportive learning environment. Moreover, the design studio's pedagogical significance extends to its role in fostering originality, creativity, and critical thinking. Saghafi (2020) underscores the studio as a space where knowledge gained from various subjects is integrated, promoting interdisciplinary thinking and innovative design solutions. This aligns with Schon's emphasis on "artistry, invention, and discovery" within the reflective practice framework, where students are encouraged to explore creative solutions and challenge conventional design norms.

The design studio stands as a cornerstone of practice-based design pedagogy, providing a fertile ground for experiential learning, collaborative engagement, and creative development. By integrating theoretical knowledge with practical application, fostering a community of practice, and nurturing originality and creativity, the design studio plays a pivotal role in shaping the next generation of designers. Creating a studio culture that fosters peer-to-peer learning and critical reflection is essential for design education. According to Lee (2009), project-based learning can serve as a vehicle for learning in design education. This approach allows students to engage in hands-on projects, promoting collaboration and knowledge sharing among peers. Additionally, Thoring et al. (2018) emphasise the significance of creative environments in design education. By establishing diverse creative spaces, students can be exposed to different contexts and stimuli, which can enhance their critical thinking and creativity. These findings suggest that incorporating project-based learning and providing diverse creative spaces can contribute to the development of a studio culture that encourages peer-to-peer learning and critical reflection.

In order to cultivate peer-to-peer learning within the studio culture, it is important to recognize the unique aspects of design learning processes. Caban and Wilson (2002) and Jones (2006) argue that the design learning processes, particularly in terms of creativity, possess substantial uniqueness. Acknowledging and embracing this temperament of design education can help in tailoring the studio culture to effectively support peer-to-peer learning. Furthermore, Thoring et al. (2018) highlight the significance of context in creative environments for design education. By creating diverse and stimulating contexts within the studio, students can engage in critical reflection and draw inspiration from their surroundings, thereby enhancing their learning experience. Therefore, by integrating the understanding of unique design learning processes and providing diverse contextual environments, a studio culture can be cultivated to promote peer-to-peer learning and critical reflection. In order to facilitate the emergence of such a culture we decided to integrate a series of design sprints, Microbriefs, in the second term of the programme. In the following section the characteristics of these sprints will be presented and connect to our educational goals.

2.2 Design Sprints as an Educational Unit

Design sprints have gained popularity as an educational approach that promotes faster iteration, experimentation, and prototyping, fostering a dynamic and collaborative learning environment. This section aims to explore the application of design sprints in education, drawing insights from relevant literature to elucidate their impact on pedagogy, student engagement, and learning outcomes.

Design sprints have gained traction in educational settings as a method to facilitate rapid problem-solving, idea generation, and prototype development (Kruger et al., 2023; Winfield et al., 2022). The implementation of design sprints in industrial design education has demonstrated the potential to cultivate discipline and rigour in the design process, preparing students for real-world challenges (Thomas & Strickfaden, 2018). This aligns with the iterative nature of design sprints, where students engage in time-constrained activities to address complex problems and develop innovative solutions (Thomas & Shin, 2016). Sprints provide students with hands-on experience in navigating ambiguity, making decisions under constraints, and collaborating effectively within multidisciplinary teams.

Design sprints can support students in becoming confident in conditions of uncertainty. By creating an uncertain space which demands a quick, deft response, by stimulating students with knowledge that is potentially transformative but also inevitably very partial, the students are exercising de-facto being in the liminal space. This is exercising elements of pedagogy within the setting of the students' own making - making them not only better designers but mostly better learners.

Furthermore, the integration of design sprints in educational contexts has been shown to enhance student engagement and motivation. The resolution of a project within a short period of time offers students a unique and intensive learning experience. This intensive format encourages active participation, creativity, and critical thinking, fostering a sense of ownership and accomplishment among students (Sanglier et al., 2021). Additionally, the studio environment supports the collaborative nature of design sprints, promoting peer learning, as students work together to ideate, prototype, and iterate, aligning with the principles of cooperative learning and knowledge construction.

Kolb's experiential learning theory posits that learning is a continuous process involving concrete experience, reflective observation, abstract conceptualization, and active experimentation Kolb & Kolb (2012). Design sprints, as a time-constrained and structured approach, provide students with opportunities to engage in hands-on, experiential learning that resonates with Kolb's learning cycle.

Kolb's learning cycle and design sprints intertwine seamlessly to enhance learning experiences. In the first stage, students engage in hands-on problem-solving during design sprints, mirroring Kolb's concrete experience phase. Reflective observation, the second stage, occurs as participants analyse feedback and refine their designs iteratively. This mirrors Kolb's emphasis on critical reflection. In the third stage, abstract conceptualization, students synthesise their reflections to refine their designs, aligning with Kolb's notion of forming concepts based on experience. Finally, in active experimentation, participants apply their

refined designs, akin to Kolb's idea of applying conceptualizations in new situations. Design sprints, with their rapid cycles, foster active participation, peer learning, and skill development in design education, complementing Kolb's framework effectively.

In conclusion, design education is heavily based on human models of learning and design sprints add to that the capacity to go through multiple cycles within a short time, creating cycles within cycles. Design sprints thus enable better design education by promoting active participation, situated learning, the creation of learning communities, rapid iteration, and technological enhancement. These mechanisms contribute to a transformative and experiential learning environment, fostering peer-to-peer learning and skill development within the context of design education.

In summary, each of the design sprints undertaken during Unit 2 of the programme needs to be seen as a distinct learning cycle. By providing students with an array of different opportunities for concrete experience, reflective observation, abstract conceptualization, and active experimentation. The final pillar of the educational approach developed for this unit was the need to create conditions in the studio that fostered the emergence of a community of practice in the studio.

2.3 Community of Design Practice

The community of practice framework provides a social learning environment, in our case the design studio, where individuals can engage in reflective discussions, share experiences, and collectively develop a deeper understanding of design principles and practices (Joyce et al., 2015). In the next section we are presenting four characteristics of communities of practice that we feel are integral to our educational approach

Active Participation and Learning by Doing: Rogoff et al. Rogoff et al. (2003) discuss how people learn by actively observing and "listening-in" on ongoing activities as they participate in shared endeavours. The studio provides students with hands-on, experiential learning opportunities, allowing them to actively engage in problem-solving, idea generation, and prototype development within a time-constrained framework (Sanglier et al., 2021).

Situated Learning and Legitimate Peripheral Participation: Lave and Wenger (1994) emphasise the concept of situated learning and legitimate peripheral participation, which is integral to organic entanglements happening within the studio. Students participate in shared endeavours and gradually increase their involvement in the design process, thereby fostering peer-to-peer learning and knowledge construction through their everyday participation in studio life.

Creation of Learning Communities: Marshalsey and Sclater (2020) discuss the creation and support of learning communities in the era of distributed studio education. Studio acts as a platform for creating collaborative learning communities, where students work together to address design challenges and share their insights and expertise, thereby fostering peer-to-peer learning.

Technological Enhancement and Pedagogical Change: Crowther (2013) discusses the opportunities for technological enhancement of the design studio pedagogy. Implementing design sprints in design education can leverage technological tools and platforms to enhance the learning experience, providing students with innovative and immersive learning environments.

The space of the studio in design education, emphasises the physical environment as a facilitator of community building and collaborative learning. The informal communication and social engagement in the design studio, creates an environment that fosters peer-to-peer learning and collaborative interactions. (Corazzo 2019) These are integral parts of a community of practice. The centrality of the studio in design education, underscores the role of the community of practice where teacher-student communication and collaborative learning take place. The key ways the design studio fosters peer-to-peer learning are multifaceted and encompass various dimensions of pedagogy and collaborative engagement. (Goldschmidt et al. 2010)

Mewburn's (2011) empirical research examines how the theory of reflective practice (Schon 1987) is applied within the design studio. This study underscores the tutor's role as a coach, assisting students in conforming to disciplinary norms and cultivating a 'designer's mindset' to facilitate peer-to-peer learning. This relationship has underlying issues related to power and representation in community-based design. This includes the establishment of trust and negotiation of intricate power dynamics, both pivotal components in fostering peer-to-peer learning (Schiffer 2020). Fostering peer-to-peer situated learning by doing, as a reflective practice while addressing issues of power and representation is, in conclusion, the goal that the studio needs to achieve. The design studio serves as a vibrant and transformative space for collaborative engagement and peer-to-peer learning in the context of design education.

2.4 Conclusions

The design studio serves as a cornerstone of practice-based design pedagogy, providing a space for experiential learning, collaborative engagement, and creative development. By integrating theoretical knowledge with practical application, fostering a community of practice, and nurturing originality and creativity, the design studio plays a pivotal role in practice-based design education. We set out to create a studio culture that fosters peer-to-peer learning and critical reflection through the development of a series of design sprints. Project-based learning and diverse creative spaces contribute to the development of a studio culture that encourages peer-to-peer learning and critical reflection. Furthermore, recognizing the unique aspects of design learning processes and providing diverse contextual environments can cultivate a studio culture that promotes peer-to-peer learning and critical reflection. Integrating design sprints into the educational approach can enhance the capacity for multiple cycles of experiential learning within a short time, contributing to a transformative and experiential learning environment in design education. The emergence of a community of practice within the design studio further supports peer-to-peer learning, collaborative engagement, and the development of a vibrant and transformative space for design education. In the next section we will be presenting the different Microbriefs run during unit 2.

3. Microbriefs

Microbriefs aim to form a foundation to a variety of practices by allowing them space and subjects to develop around. They aim to be diverse enough to act as a collection of lenses that allow every student to find a focal point that is suitable for them. The diversity of student projects necessitates such a flexible educational approach. In the broader context of the trajectory of students on the course, the Experimental Design and MB briefs are intended to allow students to explore the bigger matters of concern they are interested in by focusing on different key aspects of practice weekly.

Towards the end of the unit the students also produce additional output which is not guided by a brief and is responding to their major subject of exploration more specifically. By this point the students are able to approach the process of questioning and responding as "another Microbrief"

Some key defining characteristics make a 'good' Microbrief:

- Relevant to creative practices so to allow interpretation within a more confined definition of Design. These titles cover elements of routine practice in design;
- Relevant and legible in a broader human / cultural / societal context as to allow a very low threshold of engagement. It needs to mean something for EVERYONE no matter how early a stage they are in. (legitimate peripheral participation).

The title WAHTSO: (we're not here to save the world) We Are Here To Save Ourselves - positioning the experimental design as an ex-territory with its own set of rules, independent of the agenda, ethos and curriculum of the college. There is a message by design here, that experimentation must be accommodated

regardless of the consequences. Such ethos is losing ground in a reality where design has to assume a responsible role and quite literally save the world.

The unit ‘Experimental Design’ aims to challenge and deschool some of the models the students have been formed by through their industrial design education. This is done by truly committing to a spirit of experimentation. This involves embracing failures and exercising the analysis of the action (as opposed to the outcome) to extract positives from all produced work. To foster this experimental spirit, individual briefs are not marked and the assessment is done by examining learnings achieved over the entire course of the unit. For the students this means that putting in the labour guarantees success. This aligns with Richard Sennett in The Craftsman (2008) where he suggests that potentially EVERYONE has talent.

This is an important message to be receiving as a student, when one is in the process of turning raw talent into applicable practice, moreso when the briefs are actively taking apart previous methodological structures on which the students rely.

In this section a brief presentation of the area of focus of each Microbrief is presented followed by some conclusions on how they achieve the goals set.

3.1 Making Faces

This brief uses practices of Self Portraiture and self-reflection to create an introduction to a person and a backdrop to frame subsequent work in the studio.

It follows from the first unit of the year: "Locating Practice" where the students produce a (mostly written) manifesto to launch them into a year of work. The self-portrait is an invitation to use other media and techniques, to bring their values to the forefront and to assume other positions as practitioners than those suggested in their previous education.

The brief itself asks the students to create a self-portrait. This is positioning a very accessible threshold for engagement. The human form is a classic subject, explored by all creative disciplines since the dawn of man and the face (and by extension the human form) is a readily available thing to be responding to.

Know thyself.
Understanding one's perspectives, positions and biases is key to being able to respond clearly to external stimulations. Articulating something about oneself is a way of calibrating one's tools of observation and critical response.

Being the first brief in a newly formed community of practice, this is an opportunity for students to introduce themselves to their peers through materials, techniques, storytelling etc. This enhances the sense of community and invigorates the social interactions, building scaffolding for peer learning.

We believe and endorse the notion that Design is a creative practice, not only a service or a job description. As such, the creative author is never absent from the work - in their creative input, their biases, attitudes. This is an opportunity to explicitly explore the role that designers see for themselves in their practice, placing their own (often physical) self-centre stage. Furthermore, this legitimises the personal perspective as a 'portal' through which to be reflecting on the world.

3.2 Scratching Both Walls, on Space and Spatial Design

This Microbrief invites students to respond to - and on the scale of - spaces of significance. Expanding from reflection on one's physical self, this Microbrief takes the students one notch up in scale and asks them to be considering and responding to spaces and the way our physical selves interact with them.

We recognise similar practices and processes operate across a scale of physical dimensions; be it jewellery, furniture making, architecture etc. but often students tend to suffer from the 'cat size' syndrome - producing things that are on a small, contained scale whose existence is often confined to the studio.

Working on a large scale creates conditions / obstructions that are beneficial in a number of ways: Technically, it is more difficult to skim over undecided details. Being large means all design decisions are more visible, making them more obvious subject for discussion.

Responding to a certain particular space forces the students out of the studio, out of their physical comfort zone and into a space that will inevitably contain other factors as well. This is forcing the students to open up to the world.

Borrowing its title from the work of Artist Rebecca Horn "scratching both walls at once" (1974-5) the brief carries the notion that the physical person of the artist and the space - any space - in which it is placed hold the tension and potential to create work around (shifting the emphasis from finding the most 'unique' location to the actual act of engagement with space).

The brief asks students to consider spaces as: physical objects, places, holders of stories, containers of human lives and activities, building blocks of larger human environments and cultures. To respond to spaces, students need to practise the language of space and architecture: solids and permeables, passageways and walls, technical details and objects.

3.3 Mechanism

This brief builds on the notion that design in the broadest sense of the term is a set of intentional actions done for a purpose, to produce an effect. This distils the practice to understanding all manners of mechanisms which tie cause and effect, action and reaction.

The brief asks the students to identify a mechanism and respond to it, exploring the very definition of what a mechanism is in various iterations and contexts. References presented in the briefing include physical mechanisms, principles and devices (like producing sound from textured surface as demonstrated by Yuri Suzuki's works based on vinyl records and the works of Jeroen Diepenmaat who is 'playing' the surface of the streets with a large-scale phonograph cone) and also less precise concepts like 'reflection' (as explored by Daniel Rozin's mirrors). This introduces the notion that effects take place as a result of a constellation of factors and the practice of design involves the ability to observe and identify this interconnectedness, to understand the factors involved and the potential of utilising them. The idea of mechanism extends also to terms which are less technical; like 'empathy' (exploring how to evoke a sense of empathy even with inanimate objects) or 'instructions' (explicitly guiding someone to take certain actions: assembling flat pack furniture or playing a music score).

The work produced by the students for this brief typically emphasises control: controlling the conditions and variables in a situation to produce a predictable outcome, a predictable process of action and result. This is always a challenge on both conceptual and production levels: framing work in terms of control inevitably leads many students to describe their output as 'success' or 'failure' which can be detrimental to the process and the experimental attitude. The following brief in the series takes off from this point.

3.4 A Catalogue of Errors (Brief by Sophie Clements)

This builds on very similar brief work done by Sophie Clements with students in other programs / schools in the Design Products and outside it.

This brief is about control, lack of control, accidents and serendipity.

One of the foundations of the Experimental Design unit is to support the students in developing confidence in conditions of uncertainty (the liminal space). This is key to creating resilient learners in the studio but is also precisely relevant to professional design practice.

Where ‘Mechanism' sees students creating contrived mechanisms with a clear intention of controlling the outcomes, ' A Catalogue of Errors' asks them to practise the creation of conditions which will deliberately yield an uncontrolled outcome which nonetheless is the result of these unique conditions. Here lies the distinction between 'random interference' and just 'making a mess'. The element of control is ever present in the creative process. To borrow from the artist Andy Goldsworthy: "total control can be the death of a work". In 'Mechanism', there is a binary line separating success from failure. The students create a mechanism that's meant to deliver an effect and if it doesn't then the experiment is deemed 'failed' or at the least 'not working' - which the students can be too conscious of. With 'A Catalogue of Errors', the process taking place is very similar but the emphasis is shifted to the richness of the set up and the space allowed for things to go wrong. The line between success and failure is then explored not by calculated tentative means of feeling but by racing across and beyond it.
On a practical note, working with such methods as Dadaist poems offers useful techniques to get past what Richard Serra called "the indecision of beginnings". These align well with techniques for boosting creativity such as IDEO Method Cards as well as the arbitrary character of design sprints.

3.5 "Μύθος" (Myth)

Myth is a brief that acts as an exploration of traditional ways of meaning making, ritual and embodiment in the design of artefacts. The brief asks students to Pick a time and place in history and examine how their positionality aligns with the system of values of that era. After selecting a civilization that echoes their values students were asked to "Create a found speculative ritualistic thing, describe its role within a ritual (existing or imagined) and narrate the myth around the rituals. This brief is grounded on work developed by Bofylatos (2020) in developing artefacts to explore how the material culture developed by prehistoric civilisations embodied notions of their human experience (Bofylatos 2022).

This Microbrief aimed to inform students practices about notions of embodied movement in the context of rituals (Grimes 2012), speculative pasts, values driven design for sustainability (Walker 2017) and how other ways of knowing can be integrated into contemporary practices (Latour & Porter 2010). The past, in this case, was used to challenge the cultural hegemony of modernity and enable a more pluriversal perspective of value systems. The way the language of myths speak about facets of our shared human experience was leveraged to point to examples of narratives developed collectively to guide people both in practical and ethical behaviours (Levi-Strauss 1955; Campbel 2008). The value of storytelling in design was an important aspect this Microbrief aimed to distil to the emergent practices of our cohort.

3.6 Resist / Complicity

Resist / Complicity carries with it an explicit agenda that places design practice within a broader context of politics, values and ethics. Acknowledging that in the current climate design very often must choose a side - to resist or be complicit - and be informed and conscious of the consequences.

The brief asks the students to find something worth resisting and resist it through design, or else, self-consciously assume the role of the complicit and "design like nothing is sacred".

This is a call for students to explore the broader contexts of things and phenomena, to identify flaws, wrongs, misuse of power or distortion of justice, to seek leverage points and respond in a designerly fashion. This is also a platform to put their moral position and attitude front stage, an invitation to flex their muscles of resistance, to practise the firm belief that being observant and critical is a citizen's duty. Designing then is quite forcefully extracted from its comfortable space of 'form giving' and placed bare naked as an act of civic responsibility and moral duty.

This is the last of the microbriefs in the unit, delivered when the students are at their most confident, having engaged the sprint model 5 times already. They are at this point ready to make a statement of intentions that will echo throughout the remaining terms of creative work.

4. Conclusion and Reflections

In this concluding section we discuss some of the key principles that emerged when this unit was run. These principles are grounded on the authors' reflections on the process, context and work produced with the students in the studio. These conclusions are informed by discussions with colleagues and students and the overall embeddedness of studio life.

The medium is the message:
The Microbriefs are curated. The selection of the titles and the choice to deliver inspiration from a very broad field of references is indeed taking a position. This position reflects an ethos about the role of design, of designers, of citizens, of practices of critique and more. Microbriefs are a tool, a tool to deliver ideology. We believe that there cannot, there ought not be design education (pedagogy) that is without ideology. Values are the basis of ideology and given the nature of practice-based education, knowing your values - and ideology by extension - is a prerequisite to develop a meaningful design practice.

The choice to bring inspiration from farther afield than just design work (mostly Art) is conscious. This is to deliver content that has not been processed through familiar methodologies of design. Art tends to respond to similar components that you'd find in design methodology but most notably it does not have to meet standards associated with design practice (user, costing, market etc.). At the same time, it is explicitly driven by clear ideologies, taking positions and working with materials and mediums in a conscious, calculated and skilful manner.

Each brief is presented with a collection of references that embody the values that the brief is exploring and they are being 'unpacked' to demonstrate their relevance in context, technique, attitude etc. The students are explicitly invited to begin their process of exploration through mimicry to set their creative process in motion. This builds on a process of "virtual apprenticeship" used by Author 1 in work with students, exploring copying as scaffolding for the development of new projects and practices.

Creating unexpected connections between referred items help highlight the presence of certain principles (titles) to be observed in the world. The same happens upon reviewing the many dozens of outputs, all responding to the same brief title.

Microbriefs are much about articulation of intention. This is delivered in the briefings too. At times, the same references will be used for different briefs with the emphasis and interpretation being different every time. This aspect of the pedagogical delivery is inspired by the apprenticeship models and their capacity to facilitate embodied learning (Downey et al. 2014), with the briefing sessions providing examples of how observations and insights could be articulated, discussed and argued about.

Faster. More often. Repeat:
All the elements mentioned above are acknowledged and familiar and applied in design education in its modern form since the days of Bauhaus school (Finedeli 2001). Microbriefs build on this but dial it 'to 11'. The impact is achieved both by turning the designers' gaze inwards, to their own process and by accelerating and repeating the process over and over again.

Repetition creates habit, conditioning, method, practice. In later units, when students are asked to: "think of it as a Microbrief" this becomes a reflexive methodology that has been iteratively developed. It becomes a form of work that delivers results. In a sense the Microbriefs invite students to shift form 'workmanship of certainty", where the exercises done are characterised by uniformity and predictability in outcomes, and the "craftsmanship of risk," (Pye,1978) where the outcome is uncertain and influenced by the interaction

between the material and the craftsman's skill. In the craftsmanship of certainty, the focus is on achieving standardised results and developing technique, while in the craftsmanship of risk, there is an acceptance of variability and an embrace of the creative potential within the process.

The multitude of iterations at hand forces learners to go through six repetitions of Kolb's learning cycle. The sprints are stressful and the confined time frame can prevent meaningful ideas. So we're doing multiple sprints but at the same time giving students time to reflect and for the new knowledge to 'ferment' between weeks. Also, the outputs of each Microbrief are not marked individually but in the end of the unit as a singular body of work. Secondly, we prioritise the process and not the results - (this is where transparent pedagogy is important so students can understand what they are a part of) - the result of the sprint is "know thyself", from the brief: "articulate your attitude to design and start to form an individual language" as such the material outputs are seen more as an anchor of learning, a means not an end,

Generalist approach to specialism:
The breadth of inspiration and freedom to respond in any medium are conducive of a generalist approach to design. It is established that design is effective as a mediator between stakeholders and experts, termed the 'science of the particular' (Buchanan 1992), and this requires agility and ability to be inspired and respond using multiple mediums. Going back to the central tenet of the Values-based design pluralistic education model adopted by the programme, the need to create a space where a multitude of diverse practices can emerge and flourish takes this need for flexibility further. Microbriefs need to be a tool for the divergence of ideas creating new creative pathways. Microbriefs need to be effective lenses, distorting existing perspectives in unexpected ways. By reflecting on the body of work produced students will be able to integrate these perspectives in their practice.

Work individually within a community of practice:
All students are responding to the same brief yet the responses are completely different. One of the central goals for this educational unit was to trigger the emergence of a community of, design, practice in the studio space the programme occupies. Active Participation and Learning by Doing, Situated Learning and Legitimate Peripheral Participation, Creation of Learning Communities, Technological Enhancement and Pedagogical Change were identified as the main drivers in fostering such communities. The development and undertaking of unit 2 aimed to address all these principles. The students had to create material provocations for each Microbrief forcing them to learn by producing design work. The tutors pushed students to inhabit their studio space not only during tutorials and lectures but during their autonomous learning, events were organised, both led by students and staff to create clusters of dialogue around specific matters of concern. The use of IT and innovative ways of making to extend the physical space of the studio to the digital realm was also leveraged to expand the scope of the studio beyond its walls. This included different platforms that were used to share resources, events and engage in dialogue.

About the Authors:

Alon Meron graduated from the RCA in 2008 and has been living and working in London since. His studio practice includes creating objects and commissioned installations, exhibition design and production in addition to his work in education.

Spyros Bofylatos is a Tutor (Research) in the Design. He has worked in various research projects dealing with design as an agent of change. His research sprawls around design for sustainability, craft, material driven design and social innovation**.**

Krity Gera is an architect, designer and researcher. In her research, she focuses on alternative mobility futures through the lens of gender.

Alex Williams is currently a Senior Tutor on the Design Products programme, with expertise spanning large Research Council funded grants and small community-based participative projects.

Bahbak Hashemi-Nezhad draws on design anthropology and aesthetics to develop methodologies that actively engage users and stakeholders within design processes

Thomas Wagner is an industrial designer, with ten years' experience designing and developing products and furniture on a broad range of projects for international market leading clients

Christina Youngmi Choi is an educator and researcher. Her research focuses one effectively utilising new technologies in the design and production of new products. She is Head of Programme of Design Products MA and Conran Chair

KEYWORDS | DESIGN EDUCATION, CURRICULUM DESIGN, EDUCATIONAL MODEL, CREATIVE THINKING STYLE

ABSTRACT | This study introduces a pedagogical approach in design education, using the Creative Thinking Style Index (CTSI) to foster collaborative creativity among students. It responds to educational changes driven by rapid technological and cultural shifts, emphasizing the need for collaborative and self-directed learning, especially for Generation Z students influenced by digital personalization trends.

The research highlights the growing importance of creativity in education, driven by the democratization of creative work through digital platforms. It highlights the personalized learning preferences of Generation Z and the urgent need for education systems to promote more collaborative learning methods. The study identifies a gap in current design education in Asia, particularly in South Korea, where students are not adequately prepared to meet the collaborative and creative demands of today's world.

The aim of the study is to propose a new model of design education that focuses on self-directed and collaborative relationships and enhances creative skills through the CTSI. This involves a comprehensive analysis of creative thinking styles and the experimental implementation of a curriculum that promotes collaborative learning. The methodology includes a sequential literature review and the practical application of the CTSI in curriculum development to enhance collaborative creativity and problem solving.
Findings indicate that the CTSI effectively enhances students' creative thinking styles and fosters a more collaborative learning environment. The CTSI-integrated curriculum was shown to improve students' ability to work together creatively to solve complex problems. The study highlights the importance of mutual understanding and shared perspectives in the collaborative creative process facilitated by the CTSI.

The research concludes that the innovative educational model using the CTSI can significantly contribute to the advancement of design education by preparing students with the necessary skills for collaborative and creative problem solving. The model addresses the challenges of personalized learning trends and equips students for future collaborative work environments. It is expected that future research will build on this educational model and continue to demonstrate the value of using CTSI at the undergraduate level through more sophisticated and quantitative experiments.

1. Introduction

1.1 Research Background

Today, rapid economic and cultural changes and the emergence of new technologies and media have led to a surge of interest in the meaning and possibilities of creativity, especially with the popularization of various digital tools and platforms that allow individuals to share their creations and ideas with the world. The democratization of creative work has led to a new valuation of the professional skills of creatives such as artists and designers, and this shift has contributed to increased awareness and interest in fostering creativity in education. This study was motivated by the question: “How can learners' collaborative creativity be fostered in the context of this paradigm shift?”

People have different thinking frameworks and orientations depending on their cultural backgrounds, and people from different cultures are constantly socialized to develop certain habits of mind from the moment they are born. However, as the world becomes more globally and locally connected than ever before, human thinking habits are gradually shifting toward a more individualized and diverse society. This is particularly true in higher education. The pandemic has led to a transition from a more personalized digital environment to a society that encourages individualization more than ever before, regardless of generation. In particular, the collaborative methods that today's learners, who have grown up with competitive relationships, are exposed to in higher education have proven to be a major hindrance to spontaneous creativity.

The current design education system (at least in Asia, including South Korea) does not prepare students to respond sensitively to these challenges. Especially in Korean culture, the concept of hierarchy plays an important role in structuring society and influences various aspects of life, including the educational environment. This hierarchical perspective often emphasizes vertical relationships, such as those between teachers and students, rather than horizontal relationships, such as those among students. For example, in a typical classroom in some Asian countries, the teacher is often seen as the ultimate authority and primary source of knowledge. This perception stems from cultural values that respect age, experience, and position. Students are generally expected to listen, absorb information, and not openly challenge the teacher's authority. This dynamic can sometimes lead to classrooms where student-to-student interaction is minimal because the focus is primarily on the vertical teacher-student relationship.

There are two main reasons for this. The first is the increasingly personalized nature of learners. This is not just a problem for the current generation of students, known as Generation Z. The societal shift that has occurred since the pandemic, which has dramatically increased our reliance on personal devices, is perhaps the biggest culprit. But for digital natives, this societal trend has created a culture that is even more deeply and intensely personalized than before. This trend is particularly strong among young people in South Korea, who consume more digital content than any other country.

The second cause is that society and culture are shifting to a situation that requires more collaboration and consultation than ever before. However, in Asian cultures, where there is a relatively high sense of hierarchy within groups, there is less awareness of horizontal relationships. In addition, learners who have learned through more intense competition than ever before have a deficit in learning about cooperation and consultation. In such an environment, the concept of group work or peer-to-peer learning may not be as emphasized or valued as in Western educational settings, where horizontal relationships are often encouraged to foster a more collaborative and interactive learning experience.

1.2 Aims and Methodology

The aim of this research is to propose a 'new' model of undergraduate education in which learners can form self-directed collaborative relationships and discover and enhance the creative skills central to design

learning through complementary relationships rather than individual skills. In other words, the "new design education model" referred to in this study is a shift from education for knowledge transfer and solution training to education for self-generation of knowledge and solutions.

While many design programs still maintain siloed perspectives and inefficient mechanisms for tacit knowledge transfer, the ability to develop creative solutions to complex problems has become increasingly important, and design industry employers are beginning to recognize this need (Davis, M., & Dubberly, H., 2023). At this point, it is necessary to discuss what insights design education has to offer and what its ultimate direction should be, which can be explored through new approaches to fostering collaborative creativity among learners.

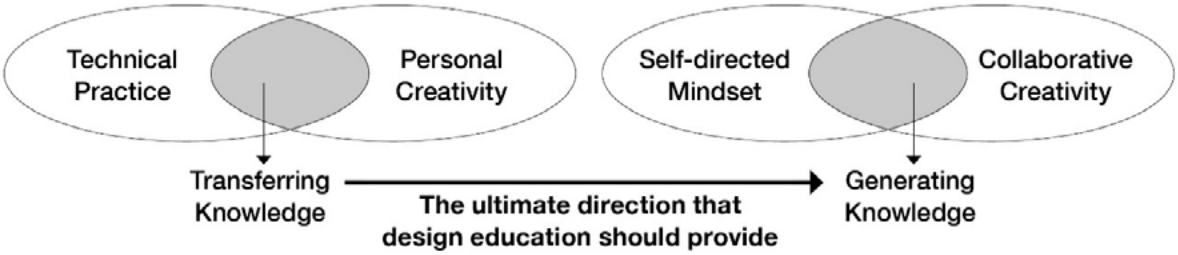

Figure 1. The relationship between two key factors for self-generating knowledge.

The focus of this study is to promote collaborative creativity for complex problem solving by helping learners develop a clear awareness of their own creative thinking styles and maximize their collaborative and self-directed skills. Through the Design and Creative Ideation class, which the authors developed and ran as a regular course at their school from 2017-2022, they found that design majors (at the undergraduate level and practical course in university education) were reluctant to collaborate. The course was a cross-curricular project that aimed to teach creativity through the extension of design concepts. This pedagogical experiment allowed us to discover the importance of encouraging collaborative creativity in higher education for both creatives and non-creatives, including designers. It also convinced us of the need for a new educational model in our time, where learning is accompanied by self-direction and the ability to generate knowledge and solutions on one’s own.

This led to the development of an index of “creative thinking style” to identify the ingrained creative tendencies and mindsets of individual learners. As an extension of this research, this study aims to examine whether the CTSI(Creative Thinking Style Index) can be used as a tool that can be applied to the undergraduate level of educational models. The main research method is a sequential literature analysis method that analyzes key data from previous research and synthesizes commonalities. Based on the results of exploring the theory and phenomenon, this study proposes an educational model by deriving a curriculum structure that applies the CTSI.

2. Theoretical Background

2.1 Implications of ‘Discovery Learning Theory’ for Design Education

Jerome S. Bruner’s Discovery Learning Theory, outlined in his influential work “The Process of Education” (1961), proposes a model of learning that emphasizes active engagement, exploration, and discovery. The theory is based on constructivist principles, which suggest that learners actively construct their own understanding of the world through interactions with their environment. However, in design education, which requires learning to balance logic and sensation, there is a risk that learners' self-expressive activities can lead to a somewhat subjective bias. For this reason, in today’s complex environment, we can expect a

greater synergy between active and collaborative approaches to design problem solving and the expression of creativity. Ultimately, discovery learning theory has positive and empirical implications for design education, allowing learners to construct their own knowledge and develop critical thinking skills.

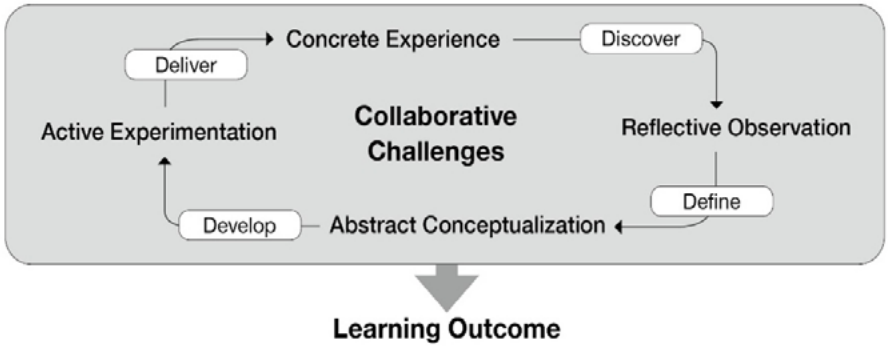

Figure 2. Design training course reimagined based on Bruner's discovery learning theory

These concepts are important in design education for fostering collaborative creativity because they empower students to take an interactive role in their learning, develop critical thinking skills, and cultivate a deeper understanding of design principles and practices. Students develop collaborative creativity through group exploration and problem-solving activities and gain confidence in their ability to experiment with different ideas and solutions to co-create design innovations and creative outcomes.

2.2 Group Dynamics for Fostering Collaborative Creativity

Creativity is a multifaceted phenomenon that is essential for innovation and problem solving in various domains. While creativity has often been perceived as an individual endeavor, the concept of collaborative creativity emphasizes the collective generation of ideas and solutions through group interaction.
The implications of collaborative creativity extend to the pedagogy of art and design. In education, collaborative creativity promotes active learning and critical thinking and prepares students for real-world challenges (Sawyer, 2006). Group projects, peer collaboration, and interdisciplinary initiatives foster creative skills essential for success in the knowledge economy. Collaborative creativity is explained by several mechanisms.

1. Diverse perspectives: Collaborative groups include individuals with different backgrounds, skills, and cognitive styles, increasing the breadth of ideas generated (Paulus & Nijstad, 2003). Diversity stimulates divergent thinking, allowing for the exploration of unconventional solutions.
2. Social interaction: Interaction within groups facilitates the exchange and integration of ideas and stimulates creativity through dialogue, debate, and feedback (Sawyer, 2007). Social interactions trigger cognitive processes such as perspective taking and idea elaboration, enriching the creative process.
3. Synergy and emergence: Collaborative environments enable synergistic interactions in which ideas converge, evolve, and combine to produce emergent outcomes that transcend individual contributions (Sawyer, 2012). This emergent creativity results from the dynamic interplay of ideas within the group.

2.3 Personalization Tendencies of Gen Z College Students and the Impact on Collaborative Learning

Generation Z, often referred to as Gen Z, comprises individuals born between the mid-1990s and the early 2010s. This cohort has matured in an era of rapid technological advancement and increased access to

personalized digital content, which has shaped their individualization tendencies. These tendencies have significant implications for their approaches to learning and problem solving in college settings. Notable research, such as Twenge (2017), highlights how Gen Z's upbringing in a digital environment inundated with personalized technology cultivates a preference for autonomy and self-directed learning. This inclination potentially diminishes their propensity for collaborative problem solving, as personalized content encourages a focus on individual preferences and experiences.

The influence of social media and prevailing educational paradigms further accentuate the trend toward personalization among Gen Z college students. The notion of "personalization" as used in this paper refers to tendencies among learners in a general socio-cultural sense, and it could be recombined and suggested in meaningful ways depending on the online platform or pedagogy. However, Boyd's (2014) analysis illustrates how social media platforms allow Gen Z individuals to create and curate their online personas, fostering a culture of individualism and self-centeredness. This digital self-curation may hinder collaborative efforts, especially in problem-solving scenarios that require collective thinking and collaboration. Furthermore, the traditional education system's emphasis on individual achievement, as discussed by Twenge and Campbell (2018), reinforces the notion of solitary success over collaborative efforts, potentially undermining the perceived value of teamwork in the learning process.

The trend toward personalization manifests itself in a variety of ways, with implications for collaboration among Gen Z students. Roberts and Foehr (2008) suggest that Gen Z's preference for personalized learning experiences may lead to a preference for solitary work, hindering the cultivation of essential collaborative problem-solving skills. Uhls (2019) notes that the generation's reliance on digital communication may hinder the development of important interpersonal skills, which are critical for effective collaboration. Additionally, Hershfield et al. (2018) discuss how Gen Z's online image consciousness and fear of failure may foster risk aversion, potentially stifling innovation and creative problem solving in group settings. Furthermore, Sullivan (2014) notes the potential pitfalls of over-reliance on technology, which could undermine the effectiveness of face-to-face collaboration and brainstorming, which are critical to collective problem solving.

3. Structuring Curriculum for Enhancing Collaborative Creativity Using CTSI

3.1 About CTSI (Creative Thinking Style Index)

The CTSI is an approach to finding a better understanding of creative competencies that focuses on creative mindsets, analyzes how creative mindset types are classified, and systematizes semantic categories, rather than assessing individual creativity. Creativity, which is presented as one of the core competencies in design education, has been measured by various assessment methods in the design of competency and skill-based curricula. However, it is not easy to diagnose the creativity of individual learners and apply it to education. In particular, different terminologies and concepts such as creativity, creative work, creative competence, and creativity seem to cloud the context of creativity research in the field of design. In addition, most creativity research has focused on assessing individual creativity skills. Since the basis for assessing creativity is based on the result of the creation of an output obtained through a limited process, it is inevitable that the criteria for creativity are variable and depend on many variables such as environmental factors, the purpose of the activity, and the learned state. In this context, the CTSI critically discussed the limitation that most of the studies related to creativity developed in various previous studies focused on the evaluation of individual competence, and reorganized the characteristics of creative thinking from cognitive factors to affective (non-cognitive) factors, determining the characteristics of creative personality and deriving the main keywords.

First, the key findings on the relationship between creativity and mindset are as follows. As a cognitive factor, creative thinking can be defined as a “purposeful mental activity” that starts from the recognition of a problem that cannot be solved in a conventional way and is not just an expression of imagination, but “something new”. At the same time, it requires an "active attitude" to solve a problem or perform a task in order to sustain it. The degree to which creative thinking skills can be expressed depends on how the inherent mindset is enforced. For example, ideation techniques such as the double diamond, brainstorming, and mind mapping used in the design thinking method represented by Design Thinking are tools for discovering the possibilities of incomplete ideas and promoting activities that connect the inner and outer logic. Therefore, the creative mindset presupposes an attitude that lies on top of an individual’s ideas and must meet the premise of an activity or method that enforces a way of thinking or a tendency to think.

Second, in the relationship between creativity and personality, the keywords are as follows: In the field of psychoanalysis, creativity is defined as an inner experience or personality centered on affective (non-cognitive) factors. The theoretical background of the relationship between creativity and personality has been proposed in various ways, but the most commonly cited theory is the five-factor theory of personality (Goldberg, 1992; Hofstee, de Raad, & Goldberg, 1992). In particular, de Young's (2006, 2015) cybernetic Big Five distinguishes five categories of personality based on two important hierarchical factors: plasticity and stability. Plasticity includes extraversion and openness to experience, which refers to a person's tendency to be social, active, and conversational. Openness to experience refers to how open a person is to new ideas, experiences, cultures, etc. People with high Openness tend to be curious about new ideas and creative, while those with low Openness prefer traditional and stable things and may be more resistant to change. Sub-keywords that can be derived from the plasticity category include outgoing, collaborative, open, and receptive. Stability, on the other hand, includes Neuroticism, Agreeableness, and Conscientiousness. Neuroticism is a personality trait that refers to an individual's emotional stability, which can make them more likely to react to everyday stressful situations or more sensitive to negative events. Agreeableness describes how a person interacts with others. People who are high in agreeableness tend to be cooperative and avoid conflict in their relationships with others, usually through respect and empathy. Conscientiousness is related to responsibility and diligence, and refers to people’s tendency to achieve goals, make plans, and do things thoroughly. Sub-keywords that can be derived from the Stability category include internal, solitary, closed, and conservative.

Taken together, creative personalities fall into a typology based on two non-cognitive factors: an individual's beliefs and attitudes, each of which dictates the corresponding conceptual categories of dependency and independence, growth mindset and fixed mindset. Creative mindset, on the other hand, is based on the cognitive factor of the form and direction of thinking, which dictates the corresponding conceptual categories of lateral thinking and vertical thinking, as well as narrative thinking and paradigmatic thinking. Based on the corresponding words in each conceptual category in this relational network, we were able to organize the tendency of each type of creative thinking according to its characteristics.

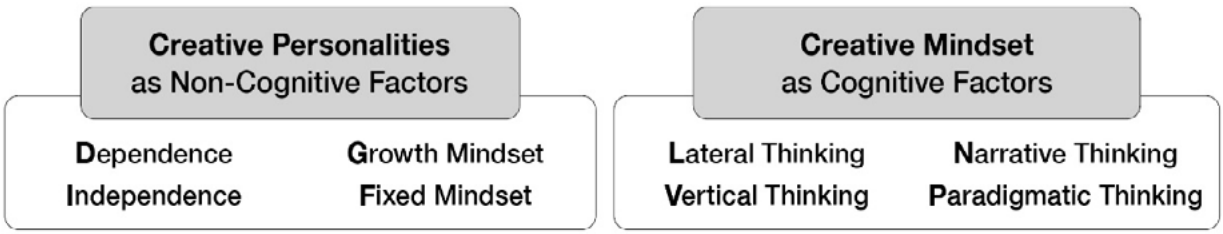

Figure 3. The Eight Factors of the CTSI.

3.2 Reframing the CTSI as Adaptation-Innovation Theory

Kirton's theory suggests that both adapters and innovators play essential roles in the creative process. Adapters contribute by refining and optimizing existing solutions, while innovators drive innovation and change through their willingness to explore new ideas and challenge the status quo. By recognizing and leveraging the strengths of both types of creative thinkers, teams and organizations can effectively address complex challenges and achieve creative results.

Adapters are individuals who prefer to work within existing frameworks and systems. They excel at making incremental changes, improving existing methods, and following established procedures. Adapters are pragmatic problem solvers who value stability, efficiency, and practicality. They tend to prefer familiar approaches and rely on proven methods to achieve their goals. Innovators, on the other hand, are individuals who prefer to challenge existing norms and explore new possibilities. They thrive in unstructured environments and are comfortable with ambiguity and uncertainty. Innovators are creative thinkers who generate new ideas, explore alternative solutions, and push the boundaries of conventional thinking. They value originality, experimentation, and unconventional approaches to problem solving.

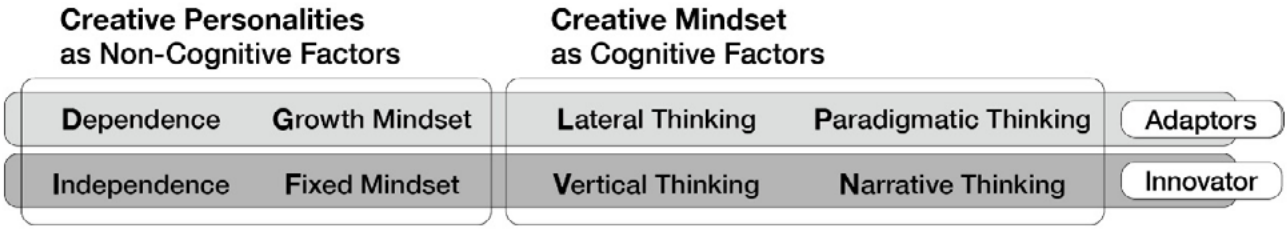

Figure 4. Reframing CTSI Factors into two categories.

The study on CTSI provides the 16 types of creative thinking styles by categorizing them into cognitive and non-cognitive factors. Cognitive factors are related to the individual's thought processes and can be divided into:

- Lateral thinking: Associated with creative idea generation, not focused on a single solution.
- Vertical thinking: Focused on finding the single best solution to a problem.
- Narrative thinking: Involves describing situations or problems in detailed and rich terms.
- Paradigmatic thinking: Relies on established norms and models to understand or solve problems.

On the other hand, non-cognitive factors are related to personal characteristics, attitudes, and motivations, which can be divided into:

- Dependence: Relying on external inputs and guidance.
- Independence: Focuses on self-direction and initiative.
- Growth Mindset: Believes in the ability to develop and grow skills and intelligence over time.
- Fixed Mindset: Believes that skills and intelligence are static and unchangeable.

The typology presented by CTSI can be compared and paired with the results of various psychological tests such as MBTI, TCI, etc., because it is based on psychological theory and derives the key factors necessary for creativity. Each of the 16 styles identified by the CTSI consisted of four pairs of corresponding keywords, each of which could be reorganized into categories of Innovators and Adaptors. Based on this, it is believed that teams can be organized according to the degree of individual creative mindset style to increase the efficiency of the collaborative creativity process.

For example, a dependent personality is used to getting energy from the outside world, while an independent personality tends to get their energy needs from within. In terms of how they think, those with a growth mindset tend to favor purpose and direction in their perceptions, while those with a fixed mindset tend to favor clear purpose and direction. On the other hand, people with a high preference for lateral thinking tend to be idealistic and rely on possibilities and meaning, while people with a high preference for vertical thinking tend to be realistic and grounded in experience. It can be said that narrative thinkers prefer to make judgments contextually and comprehensively, while paradigmatic thinkers prefer to make judgments based on logic and analysis. These interpretations, combined with the 16 types of creative thinking styles, provide a nuanced understanding of how individuals approach creativity and can be particularly useful in educational settings to tailor instructional methods and more effectively foster creativity in students.

3.3 Curriculum Structuring with CTSI

Building an academic curriculum requires careful planning and organization to ensure that students acquire the necessary knowledge, skills, and competencies in a logical and coherent manner. In the following four steps, which are fundamental to curriculum planning, learners will organize themselves into teams based on the CTSI and gain a clear sense of their own and their teammates' creative tendencies.

1. Learning goals and objectives state what learners should know, understand, and be able to do by the end of the entire course. They should be specific, measurable, attainable, relevant, and time-bound (SMART), and understanding learners through the CTSI has the advantage of clarifying goals and achievable roles in collaboration, not only for the instructor but also for the learners themselves.
2. Content sequencing is the determination of the order in which content is presented to learners after learning objectives have been identified. Starting with basic concepts and skills and moving to more complex topics, the logical progression of ideas and concepts is considered, ensuring that each concept builds on the previous one. Based on the CTSI, each learner recognizes his or her own creative tendencies, so there is no need to determine roles in the research and analysis phase as in the past, and there can be tacit agreement on each role naturally.
3. The curriculum, which organizes the content into units or modules, can also be determined by the learners themselves. When the curriculum is divided into units or modules based on thematic or conceptual groupings, each unit focuses on a specific topic or set of related topics, and activities such as Ideation and Conceptualization can be used to guide teams in scoping their projects. In this activity, teams can be divided into innovative and adaptive groups and encouraged to play to their strengths to achieve results. Organizing teams for collaborative creativity by dividing them into innovative and adaptive groups can create synergies that leverage the strengths of each group to achieve optimal results. The division of group composition for collaborative creativity is ultimately a refinement of the process of learners recognizing their strengths and pursuing their perspective roles.

Table 1. Comparing the concepts of Innovative Groups and Adaptive Groups.

	Innovative Groups	Adaptive Groups
Core Description	Innovative groups are characterized by their ability to generate novel ideas and explore unconventional solutions to problems.	Adaptive groups focus on refining and implementing ideas effectively.
Theoretical background	According to Amabile's Componential Theory of Creativity (Amabile, 1983), innovation is fueled by creativity, and innovative groups excel at generating creative ideas through divergent thinking and experimentation.	They excel at problem-solving within constraints and optimizing processes for efficiency and effectiveness. This aligns with the concept of adaptive management, which emphasizes learning, flexibility, and responsiveness to change (Holling, 1978).

4. In the process of developing learning activities and assessments, a variety of learning activities and assessments will be designed to engage students and measure their progress. At this stage, learner initiative and creative synergy can be at their highest. The two groups that have been active in each of the previous phases will be able to consult with each other to drive the final outcome. Synergies resulting from the interaction of the two groups include:

- Complementary strengths: By combining innovative and adaptive groups, organizations can leverage the complementary strengths of creativity and practicality. This synergy enables the generation of bold ideas and their effective implementation.
- Dynamic Collaboration: The interaction between innovative and adaptive groups fosters dynamic collaboration and cross-pollination of ideas. This collaboration creates opportunities for creative solutions to be refined and put into practice.
- Resilience and Agility: The combination of innovative and adaptive approaches increases organizational resilience and agility. Innovative groups drive change and adaptability, while adaptive groups provide stability and continuity during transitions.
- Feedback Loop: Adaptive groups provide valuable feedback to innovative groups, helping to refine and scale promising ideas. In turn, innovative groups inspire adaptive groups with new possibilities and stretch goals.

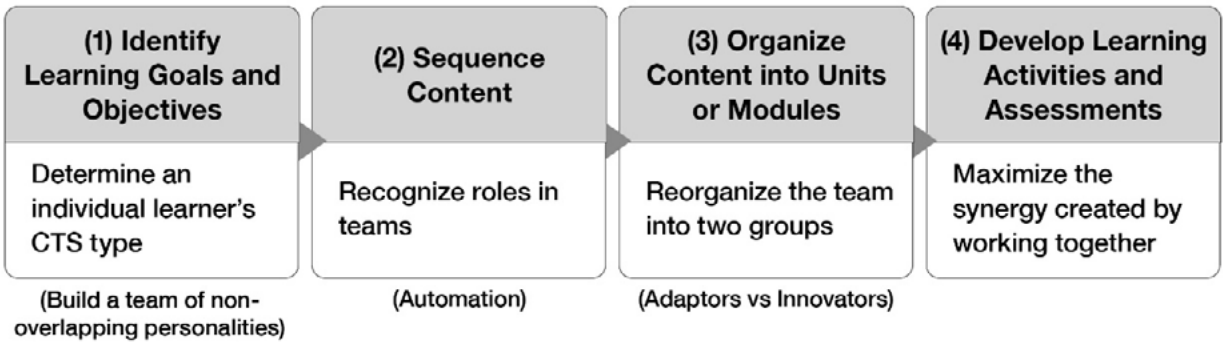

Figure 5. Utilizing CTSI across curriculum phases.

To summarize, engaged learners are aware of their own creative tendencies, which naturally consists of role awareness. Furthermore, organizing teams for collaborative creativity by dividing them into innovation and adaptation groups can optimize the innovation process and create synergies that drive organizational

success. This approach can leverage the strengths of each group while fostering collaboration, resilience, and agility in the face of complex challenges, and most importantly, all of these activities can be voluntary and the learning content can be learner-driven.

3.4 Proposing the New Design Education Model to Promote Collaborative Creativity

In the collaborative process of a design project, the meanings that individuals attach to objects may be different, and integrating them requires mutual understanding among actors. Forming and maintaining mutual understanding is essential because it is at the heart of intersubjectivity, and the goal of collaborative creativity is the formation and integration of knowledge (Kleinsmann & Valkenburg, 2008). CTSI helps to visibly form a congruent meta-perspective between oneself and others. This is because, as emphasized by Corti & Gillespie (2016), the meta-perspective contributes to achieving common ground in the context of the interaction, rather than just what the parties agree on.

The step-by-step learning of the design process, coupled with a structured training curriculum, facilitates the spontaneous interaction of participants that is necessary for collaborative creativity to flourish. As in any social activity, the development of mutual understanding is an important factor in the collaborative process. The design education model that is needed in this era is one in which the subjectivity of the creative process is mutually agreed upon and aimed at reaching the optimal conclusion, not the best outcome.

4. Conclusion and Avenues for Future Research

The design industry of the future will not be a simple process of problem solving, which is why design education is emphasizing collaboration and convergence more than ever before, redefining the concept of design education. Creativity is more valuable when the thought processes of many people are combined than when one person thinks alone. However, in design education of Korea, creativity has been focused on individual competencies, which has hindered the ability of students to work in teams and accomplish tasks through collaborative relationships. The CTSI promotes collaborative synergy among learners through self-assessment, was useful as a basis for the new educational model proposed in this study. In the new design education model, it is necessary to propose specific measures for structuring and phasing the curriculum before providing topic-oriented learning, because collaboration in the design learning process is possible when a group has a common purpose, and synergy within a group can be strengthened by the consensus or disagreement of participants, and higher learner-learner synergy can be expected when learners understand their own thinking tendencies.

This study is significant in that it provides a new direction for design education based on a comparison of theories and authors' previous research on creative thinking style. However, it should be acknowledged that this paper is based on qualitative interpretation and is still subject to much debate. In the future, the challenge will be to provide an education that enables students to actively think and form their own personalities by breaking away from the existing knowledge education in the regular college classroom. The authors are working to apply CTSI in the classroom based on this educational model and will continue to prove the value of using CTSI in the undergraduate level through more sophisticated and quantitative experiments in the future.

About the Authors:

Kyungwon Kim is a professor of the Digital Media Design major at Dongseo University. He is a graphic designer and design curator who has been working on typography, editorial, and identity design projects in various media over the past ten years. His research focuses on experimental screen media and graphic design education.

Prof. Juyoung Chang is the Dean at Dongseo University's School of Design and the Director of the Asia Design Center for Future. Her research focus is on design within Korean and Asian cultural contexts, enhancing understanding of cultural diversity in design.

ABSTRACT | The current era's social, environmental, and economic challenges necessitate a strategic, holistic approach to address their complexity (Cerruti, 2018). Simultaneously, there is a growing need to develop a de-structured and fluid mindset to counteract the trend of increasing specialization and compartmentalization within scientific, educational, and modern project environments. Addressing crises like climate change, social and cultural issues, economic downturns, and the digital divide requires strategic projects with real impact: although current emergencies are daily highlighted by a vast amount of news and scientific research (Buzzi, 1984), effectively sensitizing - and even before that, stimulating - public consciousness and opinion is particularly complex. This contribution aims to analyze the importance of strategic connections between seemingly distant disciplines to work on effective and unconventional communication design that goes beyond simple dissemination and is able to initiate a process of identification that triggers empathy mechanisms in the face of contemporary challenging issues, giving rise to a new field: Transformative & Immersive Storytelling Design (TISD). Following the theorization of this new field, it introduces an innovative approach that merges Design, Performing Arts, Digital, and Social sciences to overcome traditional discipline boundaries. Design's unifying role and Performing Arts' deconstructive capacity encourage a deeper understanding of reality, advocating for an "indisciplinary" approach for a successful communication (Nicolescu, 2014; Mitchell, 1995). To this end, two projects of a marked transdisciplinary nature, EMOTIONAL and INSIDE-ACT, are presented. The first is directly dedicated to TISD, and the second to the need to implement a training path for the profession of Immersive Storytelling Designer (ISD). In conclusion, the research approach leverages the diverse complexity of disciplines to foster a disruptive communication (TISD) and train a new professional figure (ISD), skilled in creating strategic, effective, and empathetic communication.

1. Introduction

We live in an era characterized by unprecedented complexity, intersections, and dynamics in constant change, which require the creation of cohesive strategic initiatives (Cerruti, 2018) that have the primary objective of effectively addressing the challenges of sustainability – encompassing environmental, social, cultural, economic, and digital dimensions. If we analyze the major crises of our time: the climate crisis, characterized by the increase in climate temperatures; the social and cultural crisis with issues related to identity and the increasingly regular episodes of violence (European Institute for Gender Equality, n.d); the economic crisis - transversal to all the previous ones - and finally the one produced by digitalization and the impact that this transition is having also in terms of digital divide. To bring about positive transformations, clearly communicating the issues and enhancing audience awareness is crucial. Thus, a proficient path may be discovered through the profound efficacy of emotional storytelling. Despite the consistent spotlight on current crises through various information channels and academic studies (Vaughan et al., 2022), the task of raising collective consciousness and significantly shaping public opinion remains fraught with challenges. Within this context, the role of immersive transformative storytelling assumes pivotal significance.

The introduction of the term "Storytelling" in the field of Communication Design emphasizes the fundamental importance of transforming information, visual messages, and scientific data into engaging stories that can leave a lasting impression (Ke, J. & Yoon, J. (2020). Storytelling, throughout history, has served as a conduit for the transmission of wisdom, values, traditions, and insights, often wielding persuasive influence. Aristotle, in his Poetics, astutely recognized the persuasive potency of narrative, positing that well-crafted stories possess the capacity to evoke emotions and engender receptivity to messages (Aristotle, 330 BC/1987). Stories can more or less subtly influence the understanding of the world, conveying ideologies and cultural values, thereby molding perspectives, influencing decisions, and compelling specific actions (Barthes, 1977) that resonate with the audience's experiences and beliefs (Fisher, 1984). Effective Communication Design can indeed transport the audience to another world, make them reflect or encourage action, communicating complex messages through a combination of meaningful elements capable of evoking emotions and creating deep connections with the end user in an effective and transformative manner, making storytelling a tool of impact for current and future scenarios.

From the perspective of innovative communication, design - and particularly Storytelling Design - assumes a pivotal role as a catalyst for change thanks to its ability to stimulate positive behaviors, ignite action, and foster participation. By encompassing both the transformative and narrative components, we could thus define the Transformative Storytelling Designer as a practitioner able to convey contemporary values and challenges, thereby fostering enduring positive behavioral changes. This approach stands out for its innovation, as the power of storytelling and dissemination has the capacity to influence by "awakening minds through the power of storytelling" (Kerrison, 2022), producing not only a strong emotional suggestion in the user but mainly contributing to actively engage them in more conscious and caring actions. In this scenario, design cannot take an isolated role; on the contrary, it is essential that it promotes, thanks to its fluid and critical nature (Bovo, 2022) and the ability to materialize (Faccin, 2017), a mixture of strongly interdisciplinary knowledge, for example:

- The ability of Communication Design to work closely with sociology helps to understand the social and cultural dynamics that influence the perception and interpretation of messages;
- The synergy of many disciplines - including those of main interest for the contribution are Design, Psychology, and Performing Art - with advanced digital technology (especially Extended Reality) allows to exploit of the latest innovations, ensuring cutting-edge and evolving needs of society, without losing the critical and ethical approach with which they must be used;
- The possibility for psychology to work on the impact of immersive digital tools by assessing their effectiveness and the related risks.

As stated by Papanek (1971), design has the task not only to create but also to understand, collaborate, and plays a significant part in shaping a society that is more inclusive and geared towards sustainability.

Design, due to its varied and complex nature, becomes a perfect candidate for mediating different areas of knowledge and conveying wisdom. Therefore, while on one hand, Communication Design facilitates the understanding and adoption of new ideas and innovations, on the other, it encourages imagining new possibilities and becomes a compass capable of navigating the complexity of the present and future.

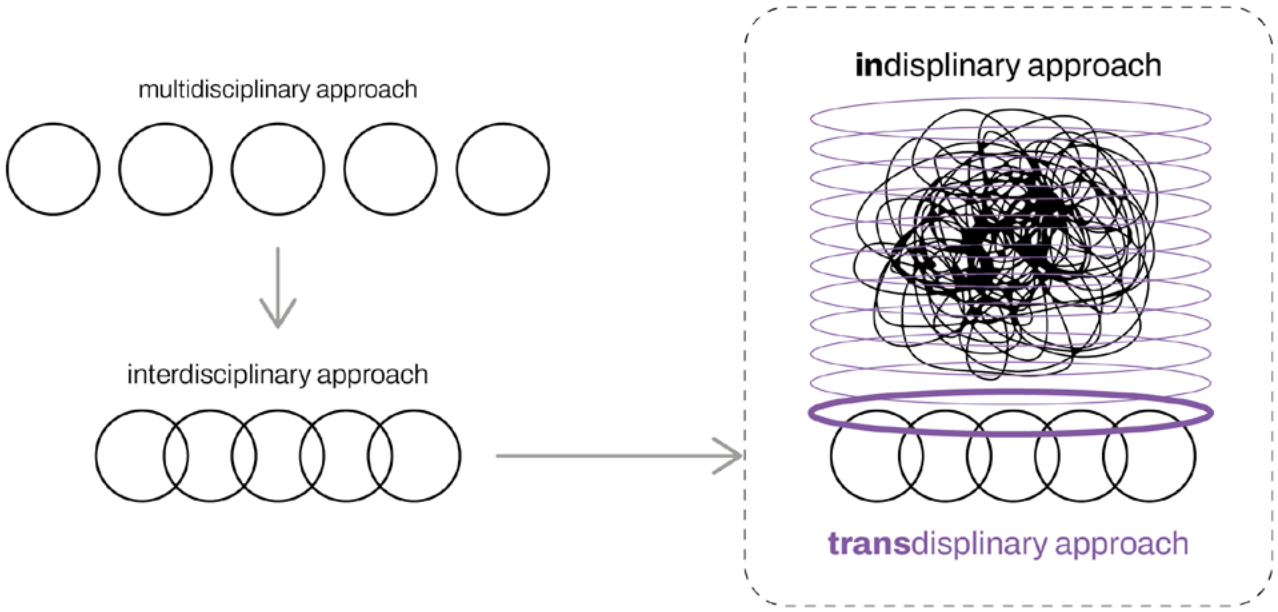

Figure 1. Indisciplinary approach.

2. Methodology

In this scenario focused on behaviors and awareness, transdisciplinarity emerges as a fundamental concept since emergency communication requires solutions that go beyond the conventional limits of disciplines, moving from the previously discussed interdisciplinarity which, although borrows methods and approaches from various fields, stays restricted to the confines of specific disciplinary boundaries.

As Nicolescu (2002) observed, transdisciplinarity should not be understood only as a methodology, but as a future perspective that recognizes the interdependence and connection between various fields of knowledge. Thanks to this systemic vision, it emerges how design must be placed within a fluid context in which to make its skills available. This context has been defined as DASD, as it hybridizes in an unconventional approach the disciplines of Design, Performing Arts, Social Sciences, and Digital. These four disciplines represent the 4 main pillars for the development of a Transformative & Immersive Storytelling Design (TISD). The collaboration between disciplines that seem so distant from each other can indeed give life to the design of immersive storytelling that is an excellent candidate for the development of transformative experiences, in which each of the involved disciplines can effectively impact based on their peculiarities:

- **Advanced digital technology (XR)** has been included in the research because, when well designed, it is capable of offering new possibilities for interaction, immersion for the design of transformative experiences that go beyond traditional boundaries. By immersing individuals in a reality different from the physical one, it is possible to allow transformative experiences that break the constraints of physical reality and open new possibilities for exploration and self-

discovery and of the other, allowing a greater sense of involvement and presence. These technologies transport individuals into virtual worlds, simulated and interactive environments that allow a greater sense of immersion. By immersing individuals in these digital realms, technology indeed enables transformative experiences that break the constraints of physical reality and open new possibilities for exploration and self-discovery.

- **Social sciences**, and particularly psychology and sociology, foster potential for behavioral transformation as they can analyze changes by studying, according to Grof (2000), the alterations of the normal stable structure of the mind and the "quantum change" (Miller & De Baca, 2001). Such transformation consists of a breaking point in which an individual would undergo a radical and irreversible change that can have both a primarily cognitive and emotional nature. Moreover, digital and new technologies are becoming increasingly pervasive to the point of becoming, in everyone's eyes, even invasive. For this reason, today it becomes essential to question especially the social repercussions that these tools have through the direct and active involvement of psychology and sociology, crucial actors capable of analyzing their impacts.
- **Design** plays a pivotal role in shaping the transformative experience, serving as an orchestrator that synthesizes insights from diverse fields to create and forge cohesive and impactful experiences. Designers apply their creative skills to translate psychological, sociological, and technological concepts into tangible, engaging, and, above all, impactful experiences. Design can at the same time unfold to interesting future scenarios thanks to its inherent ability to foresee and understand, for example, the strategic importance of new technologies, without limiting itself to technical aspects, but opening up to contamination and sharing with other disciplines for the development of high-value content.
- **Performing Art**, and particularly theater, is a fundamental discipline for the construction of such experiences. Although very distant from the use of advanced digital technologies (Dixon, 2006), it represents the possibility of exploring different roles, behaviors, and scenarios in a theatrical experience that by its nature is immersive. Performing Art allows the development of skills related to communication, empathy, and collaboration, aiding the process of identification, providing unconventional tools and skills. Through Performing Art, individuals can explore different roles, behaviors, and scenarios, putting themselves in the "shoes of others" (perspective-taking). Performing Art fits into this scenario by also strongly contributing to the development of a critical and interpretative attitude thanks to the solid cultural base inherent in the nature of the discipline. Furthermore, within the world of art, there is a fundamental aspect through which it is possible to increase empathy and implement immersive digital communication, making it even more effective through the concept of identification, typical of acting work. This sector, although usually distant from the use of new technologies, plays a crucial role in DASD thanks to such a significant approach to identification.

In the DASD framework, Performing Art - and specifically theater - assumes an exceptionally powerful "disruptive" role. This form of art, for its inherently deconstructive nature and free from schematic constraints, allows overcoming the traditionally disciplinary vision of contributions, thereby offering an "indisciplinary" approach that disrupts established norms and transcends traditional limits, questioning standard practices and beliefs. Consequently, it becomes clear that to create transformative communication, a deep alliance between different disciplinary fields is necessary. Through this "indisciplinary" approach, it is indeed possible to enrich the entire design process, taking into account different perspectives, hypotheses, and insights, overcoming the boundaries of sectors, and favoring a holistic vision that achieves as impactful results as possible. Although based on methods and tools from different disciplines, it is essential to detach from rigid models that do not reflect the fluidity of reality, capable of adapting and evolving in response to emerging and continuously evolving variables, facilitating processes of learning and active participation. Storytelling design, and particularly its ability to stimulate emotions and wonder, has the great ability to explore the transformative potential of experiences with a strong impact on society with particular reference to the stimulation of proactive behaviors of users

(Gaggioli, 2015) to the point of considering such transformative experiences when, in agreement with Kitson et al. (2019), they can reshape the individual vision and change their perspective and identity. Transformative storytelling design thus represents an important testimony of the role of transdisciplinarity and collaboration between very different disciplines, thanks to the possibility of drawing on the principles of psychology, sociology, theater, technology, and design. The integration of these disciplines recognizes a central role of design as a catalyst for design, able to foster connections, exploit the limits and opportunities of all the disciplines involved, and orchestrate experiences that evoke emotions, inspiring personal growth and stimulating reflection with the ultimate goal of strategically and functionally contributing to forming a society as attentive and empathetic as possible in the face of the critical issues that are affecting us. What is, however, fundamental to consider is that emotion can be evoked not only by the project itself but also and above all by the relational meaning of the experience linked to social implications (Desmet & Roeser, 2015) and personal associations trying to contribute to some positive behavioral trends, even reducing aggressive behaviors (Yang et al., 2016) and promoting, among others, ecological consumption (Wang et al., 2019).

3. Projects

Faced with this theoretical context, it was determined to begin a direct and substantial investigation, carrying out tangible projects at both the national and international levels, implementing both national and transnational projects of a marked transdisciplinary nature, such as the EMOTIONAL and INSIDE-ACT projects, where the first focuses on the Transformative & Immersive Storytelling Design itself (TISD), and the latter addresses the need to develop a training package for cultivating the profession of Immersive Storytelling Designer (ISD).

3.1 Emotional

The EMOTIONAL project, namely Experience Made in Italy: Immersive Storytelling Design for Contemporary Values and Sustainability, was born within the PNRR, the National Recovery and Resilience Plan, a crucial initiative for Italy for the relaunch and modernization of the country in response to the economic and social crisis triggered by the COVID-19 pandemic. The EMOTIONAL project aims to enhance "Made in Italy" through the use of immersive storytelling, emphasizing the quality, innovation, and sustainability of Italian products in order to valorize the cultural, creative, and manufacturing heritage of "Made in Italy" and promote sustainable consumption practices. The goal of the EMOTIONAL project is to explore the use of immersive technologies and storytelling to effectively communicate the tangible and intangible values of "Made in Italy" products and services, focusing particularly on sustainability and innovation. It involves designing immersive experiences that valorize the Italian cultural and manufacturing heritage, improving knowledge and action regarding sustainable and circular production practices, implementing sustainable design strategies, and responsible consumption behaviors. To achieve this goal, the project conducts a series of studies and research to better understand market dynamics and consumer expectations, collaborates with companies and institutions to test and implement the proposed solutions, and finally focuses on the development of immersive narrative content that exploits advanced technologies such as extended reality (XR). For this purpose, the project involves multidisciplinary public and private partners to combine diverse and complementary skills for the realization of the project's objectives. The partners involved are: University of Florence (project leader), Polytechnic University of Bari, University of Bologna, Polytechnic University of Milan, Polytechnic University of Torino, University of Brescia, University of Padova, Interior and Design District (DID), and companies from the Tuscan manufacturing sector. Therefore, the aim is to create immersive experiences that enhance Italian cultural and manufacturing heritage, improving understanding and action regarding sustainable and circular production practices, and promoting sustainable design strategies and responsible consumption behaviors. Specific objectives include strengthening the competitiveness of Italian businesses through the adoption of new technologies, promoting a cultural shift towards sustainability, and increasing global awareness and appreciation for the value of Made in Italy. To achieve this goal, the project focuses on a range of practical and methodological

activities, including the development of immersive and narrative content utilizing technologies such as Extended Reality (XR), analysis and research to better understand market dynamics and consumer expectations, as well as collaboration with companies and institutions to test and implement proposed solutions. The aim is to create an ecosystem of cooperation among research entities, businesses, and cultural organizations to foster innovation, technology transfer, and the enhancement of Italian cultural and productive heritage. The project design process of EMOTIONAL, currently underway, comprises the following 6 macro-phases:

- Baseline project definition and data analysis: this phase centers on analyzing the Made in Italy phenomenon, with particular emphasis on humanities analysis (historical, social, and cultural); sustainability analysis; analysis of digital media and new technologies; social perceptual analysis and evaluation; territorial analysis; identification and selection of the most successful companies within the production system to depict with a perspective aimed at disseminating the values of Made in Italy.
- Designing the new "Generative Made in Italy Identity": this phase encompasses the vision and design-driven strategy with the design of the most effective immersive storytelling model in terms of transformative design.
- Research on design processes, technologies, and tools for immersive narration (XR), focusing on identifying those most effective for the intended type of narration and storytelling, along with the subsequent implementation of immersive experiences.
- Executive design of immersive digital simulator development.
- Validation of the Proof of Concept: analysis and development of criteria for validating emotional parameters in relation to digital tools for immersive storytelling and social impact.
- Identification and valorization of other relevant Italian industries through focus groups, design-driven strategy guidelines, and toolkit development for capacity building, experiential testing of final immersive experiences, and the development of a corresponding toolkit.

Each of these phases represents a fundamental building block in the design process, working synergistically to achieve the objective of valorizing Made in Italy through immersive experiences. The project aims not only to disseminate and foster appreciation for the values of Italian excellence but also to stimulate positive and enduring change in the production and consumption sectors by specifically combining design, social sciences and advanced digital technology (XR). The goal is twofold: on one hand, to celebrate and share the cultural richness and distinctive quality of Italian products; on the other hand, to serve as a catalyst for the adoption of virtuous models reflecting the high standards of sustainability, innovation, and social responsibility that Made in Italy embodies. This holistic approach aims to influence the global production and cultural ecosystem, promoting a new awareness and appreciation for conscious consumption and qualitative excellence.

3.2 Inside-Act

The INSIDE-ACT project idea, on the other hand, emphasizes the importance of targeted training that has led to the design of a training package within the new field of transformative storytelling design. The design of the INSIDE-ACT training pathway was developed based on a framework of specific needs identified at three different levels related to the increasing demands from the labor market in relation to: i) the introduction of a new professional figure for advanced strategic-digital immersive communication; ii) the lack of integrated DASD (Digital, Arts, and Social Sciences) competencies; iii) the absence of a targeted training pathway to address current gaps and to train the required new professional figure. These needs were extrapolated from an analysis of quantitative data from European, national, and global labor market reports, scientific literature, and trends identified through formal and informal interviews conducted during the research process with leading entities in the immersive communication sector. The INSIDE-ACT training package aims to shape a new generation of professionals from different disciplinary fields and is the result of an in-depth analysis of recent digital market trends (OECD, 2023), the increase in the need for

digital communication skills, and the urgency to respond to current social, environmental, and economic challenges. INSIDE-ACT was written and conceived through a synergistic collaboration between various European partners (University of Florence (Italy), Elisava (Spain), Catholic University of Milan (Italy), Valahia University of Târgoviște (Romania), GOLD Production (Italy), GLUK (Lithuania), KOSMOS (Lithuania), ESPRONCEDA (Spain), FEST (Belgium), DID (Italy), AMBIT (Spain), CPI (Slovenia), ROGEPA (Romania), each of which brought interesting perspectives, through their own experiences and knowledge. This collaboration was fundamental to ensure that the training program could cover all the essential aspects of Transformative & Immersive Storytelling Design. The core of INSIDE-ACT is, in fact, the training of a new professional figure – the Immersive Storytelling Designer (ISD) - designed to meet the needs of a continuously evolving communication market, where the ability to tell stories in a new and engaging ways is increasingly demanded. The primary goal of INSIDE-ACT is to create the qualified profile of an Immersive Storytelling Designer (ISD), capable of integrating the knowledge of Design, Performing Arts, Social Sciences, and Digital (DASD) to realize immersive and strategic digital communications (XR), heighten the consciousness of recipients regarding contemporary European values and challenges. The INSIDE-ACT training program intends to combine theoretical teaching with experiential and practical learning, involving not only academic and training institutions but also cutting-edge companies in the field of Transformative & Immersive Storytelling Design. This enriches the learning experience, providing a real context for the development of tangible projects. This training model, in conjunction with all activities undertaken within INSIDE-ACT, provides insight into the transformative potential inherent in strategic immersive storytelling. Its objective extends beyond the dissemination of awareness regarding contemporary challenges and their ethical underpinnings; it also aims to cultivate virtuous behaviors within the community. At the core of this initiative lies the development of the professional profile of the Immersive Storytelling Designer (ISD), recognized as a catalyst for fostering sustainable, inclusive, and critically approaches who, positioned innovatively within the evolving landscape of the European labor market, symbolizes a dedication to facilitating positive societal change. The INSIDE-ACT training package is conceived as an intensive format consisting of 5 theoretical/experiential modules + 1 intensive practical laboratory module, aimed at creating concepts for immersive experiences that stimulate empathy, for a total duration of 3 weeks. The first two weeks are dedicated to completing the initial 5 modules, while the last, more intense week will focus on the final and practical laboratory module. Each training module will have a specific overarching theme: Digital Perception, Performing Design, Emotional Business, Extended Performing Art, and Immersive Storytelling Design.The objective is to connect various project areas, highlighting their common aspects and potentialities through the mutual recognition of strengths, to align and amalgamate them. The INSIDE-ACT project is structured as follows:

- Digital Perception (Digital + Social Sciences): this module focuses on the intersection between digital technology and social sciences, exploring how human perception is influenced and shaped by advanced digital technologies such as Extended Reality (XR). Topics covered may include user experience psychology and, notably, how digital interfaces influence behavior and social perception, highlighting their benefits, limitations, and opportunities.
- Performing Design (Performative Art + Design): In this module, students understand how to integrate principles of performative art into design. This may include designing interactive experiences, artistic installations, and environments that encourage active participation and performance. It is an approach that blends artistic and design creativity to create immersive and engaging experiences even without the use of advanced digital technologies.
- Emotional Business (Social Sciences + Business): the module emphasizes the need to evoke emotions through corporate communication that transcends traditional marketing, focusing instead on narrating the values and ethical initiatives adopted by companies. The goal is to use emotional strategies to promote understanding that goes beyond product details or technical aspects, aiming instead to express the principles and ideals pursued by the organization. This approach aims to actively involve employees in the communication process, emphasizing both

internal (employees) and external (customers and community) storytelling, presenting a corporate image that reflects values and ethical commitment.

- Extended Performing Art (Performative Art + Digital): this module explores the expansion of the boundaries of traditional performative art, incorporating innovative digital technologies to enrich it with new languages and artistic expressions, for example, through the use of Extended Reality (XR), which opens up new perspectives in performance creation, transcending conventional limits. Through this integration, performative art transforms, offering more immersive and multidimensional experiences that blend the real and the virtual to create radically new and compelling artistic forms.
- Immersive Storytelling Design (Design + Digital): in this module, the focus is on designing engaging stories through the use of advanced digital tools. This allows experimentation with interactive storytelling techniques, harnessing the power of digital media to innovate narrative modalities, intertwining storytelling and technology with the aim of generating immersive and captivating narrative experiences.

The final module of the course, namely the Workshop Immersive Experience Design for EU values, represents the phase in which participants of the training pathway engage in the design of immersive experiences with the aim of narrating stories capable of promoting and disseminating European values. In this case, students are called upon to experiment with the diverse knowledge acquired during the theoretical/experiential modules, synthesizing and appling the skills acquired in the previous theoretical/experiential modules in a practical context final module is therefore an operational training experience (learning by doing), characterized mainly by the direct interaction between trainers, companies (traditional, digital, and creative), and students. The aim is to stimulate interaction, even within the educational community, in a non-hierarchical manner, equating the roles of student and trainer: for this reason, each module includes a "design appointment" phase - during which small laboratories related to the reference module will be carried out - allocating a work session, thus increasing the percentage of hours dedicated to dialogue and exchange of experiences and knowledge.

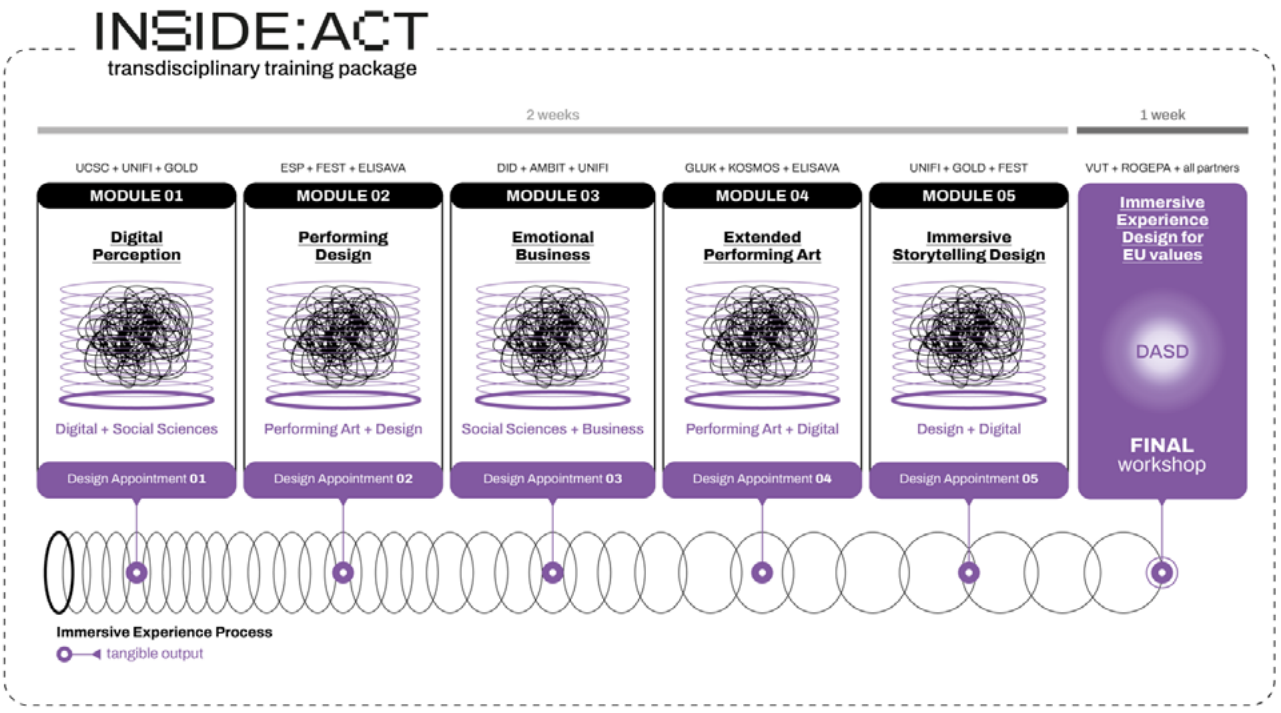

Figure 2. INSIDE-ACT training package structure.

4. Conclusion

In conclusion, Transformative & Immersive Storytelling Design emerges as an evolving field crucial for fostering awareness of present and future challenges. It seeks to elicit profound emotional responses from users, fostering introspection, personal development, and behavioral shifts in response to the complexities of contemporary and prospective issues. Through the interdisciplinary approach described earlier, which amalgamates methodologies from Performative Art, Social Sciences, and immersive technologies, transformative design offers a framework for fostering empathy and deeper connections with the presented complex framework, facilitating meaningful exchanges between individuals and their environments. In this context, the designer's role extends beyond merely creating functional objects or services to becoming a facilitator of transformative experiences capable of shaping the perception, attitude, and behavior of individuals. This requires a deep understanding of emotional dynamics and the ability to design with a clear intention to stimulate positive change. To fully realize the potential of transformative and emotional design, it is crucial to promote "indisciplinary" collaboration, leveraging the knowledge and skills of various fields to create solutions that are forward-thinking and ethically responsible. The "EMOTIONAL" project in the context of transformative design underscores the crucial importance of an approach that goes beyond functionality and aesthetics to touch the most intimate chords of human experience, promoting significant change through emotional connection.

Transdisciplinarity, then articulated in a subsequent "indisciplinary" approach, as above-mentioned, thus emerges here as a key element to inform and transform, adopting an ethical and responsible perspective, representing an invitation to explore new frontiers of design, where emotions are seen not as a secondary aspect but as the central core of the design experience and communication. This pioneering methodology, foundational to the INSIDE-ACT training project, underscores the significance of embracing disciplinary diversity to stimulate upskilling and reskilling, overcoming the limitations of professional backgrounds. The overarching objective is to cultivate Immersive Storytelling Designers (ISDs) capable of crafting strategic, effective, and empathetic communications, thereby contributing to the development of professionals equipped to face contemporary challenges through a transformative and immersive storytelling approach. In conclusion, the research and practical experimentation outlined depart from the intricate diversity of disciplines to blur their boundaries, endeavoring to cultivate a disruptive, effective, and empathetic storytelling design approach. The intersection of disciplines in Transformative & Immersive Storytelling Design, as exemplified in the paper, mirrors a paradigm shift towards more holistic approaches to problem-solving and innovation. In an era characterized by interconnected challenges, such as sustainability, social justice, and technological disruption, the ability to transcend disciplinary boundaries becomes increasingly crucial, especially in Communication Design but not only. This investigation serves, in fact, as a microcosm of this larger trend, showcasing how collaborative efforts across diverse fields can yield novel insights and solutions that resonate far beyond the confines of a single academic conference. Thus, while the immediate impact may not be readily apparent, the implications for interdisciplinary collaboration and holistic problem-solving are expected to be far-reaching.

KEYWORDS | LEARNING, NETWORK, ECOLOGY, MOVEMENT, NEW MATERIALISM

ABSTRACT | In the rapidly evolving landscape of learning network design, there is a critical need to construct networks that are at the same time resilient and adaptable, equitable and accessible, authentically engage the human and more-than-human and can address the increasing complexity of seemingly intractable global socio-ecological challenges. This paper proposes a reimagined network design by integrating principles from movement ecology, corridor ecology and new materialism, all of which engage the complexity, interactivity, and adaptability inherent in natural ecosystems. Such a design subverts traditional network relationships such that each node in a network can be seen to actively and equitably participate in the learning process. Hybrid ecological networks challenge conventional hierarchies, de-institutionalise learning and platform more resilient, adaptable, participatory and interconnected structures and organisations. The paper adapts the concept of permeability from corridor ecology to describe knowledge and experiential flows through a network. A learning network designed for high permeability encourages the unfettered and efficient exchange of ideas, akin to ecosystem scaffolding for a decentralised and fluid movement of species. By weaving together the principles of new materialism, movement ecology and corridor ecology, the paper shifts the narrative from networks as static constructs to ones that are dynamic, adaptable, and resilient and invites a whole-systems re-imagining of learning networks to support a regenerative future for education.

1. Introduction

Within the dynamic and ever-shifting terrain of higher education, there is an increasingly critical need to co-create networks that are at the same time resilient and adaptable, equitable and accessible, and authentically engage learning communities with the complexity of seemingly intractable global socio-ecological challenges. This paper reimagines learning network design by integrating principles from movement ecology, material ecology, corridor ecology and new materialism, each of which contributes to disrupting the fixedness of linear, static and anthropocentric organisational constructs by interweaving the complexity, interactivity, and adaptability inherent in the intersection of human and more-than-human ecosystems. *Hybrid ecological networks* challenge conventional hierarchies and binaries, deinstitutionalise learning and platform more resilient, adaptable, participatory and interconnected structures and organisations.

In a process-based and movement-centred network paradigm, information (defined here as *integrated experience, knowledge* and *skills*) moves, evolves and interacts with the nodes and edges it encounters, much as species migrate and interact with/in/across ecological systems. This conceptualisation of *networks as movement* is a foundation of the hybrid ecology view of networks as vibrant, living ecosystems. Just as migratory patterns are not purely linear but are influenced by various environmental (and increasingly economic and political) factors and an organism's own agency, the flow of knowledge, experience and ideas within networks is not merely dictated by existing network structures but is also influenced by the behaviour of the information itself, the context within which it operates, and the nodes and edges with which it interacts.

Focusing on movement as a core element of network design acknowledges that movement is itself an actor, and process a central agent, thus underscoring the *agency of information exchange* (leading to the potential of data autonomy within an object-oriented ontology (Harman, 2018)). Recognising movement as central (Nail, 2018a) situates the relational element of networks – the edges rather than the nodes – as an undulating meshwork on which meaningful learning experiences can be co-created to address the demand for more resilient, adaptable, and interconnected learning structures and organisations. For instance, some pieces of information might migrate quickly across the network due to their relevance or urgency, while others might move slowly or even become dormant. As we will see in the discussion of *ecological corridors* (below), the process of movement that this information embodies can be seen as *habitats* that may alter the information, hold onto it temporarily or help it evolve or develop further.

Thomas Nail postulates that society is essentially constituted by movement, with entities (be they beings, objects, or ideas) constantly in flux (Nail, 2018a). Applying a movement philosophy to network design can reframe the way we conceptualise the flow of information and ideas within networks. Rather than viewing data as static entities being transferred from *point a* to *point b*, Nail's articulation of *Movement Ecology* encourages us to see information, experiences, and ideas as migratory entities. In his reading of Lucretius', for instance, Nail re-interprets Lucretian atomism to emphasise that "one never finds a [singular] corpora, but only an infinite corporeal flow as the material condition of any discrete or composite thing" (Nail, 2018b, p.12). In this view, it is clear that relationality, receptivity, and process must be fundamental to any learning network that hopes to meaningfully engage with the dynamics of complex socio-ecological systems.

Hybrid ecological networks are *hybrid* on multiple levels: In their interweaving of site-based and practice-led learning with accessible online spaces to facilitate the exchange of reflection, experience, and knowledge; in their fostering of interspecies collaborations; in their explicit interrogation of boundaries, binaries and borderlands; and of our "interdependence and the mutual construction of . . . subjectivities" (Nasrullah Mambrol, 2016) in understanding cultural and socio-ecological contexts and engaging in the work of democratising and decolonising learning.

Interweaving Nail's articulation of *Movement Ecology*, socio-ecologically situated learning paradigms, and a processual and relational new materialist perspective on network evolution empowers a shift from building networks as static to foregrounding agential imperatives with/in the fluidity of receptive learning. The

integration of these ecologies invites a radically open approach to network design that leverages the complexity, interactivity, and adaptability found in more-than-human ecosystems to disrupt the sedimented conventions of disciplinary thinking and educational linearity. In this model, each node — whether an individual, an ecosystem, a more-than-human actor, a group, or an automated system — actively engages in the learning process. Learning as "knowledge transfer" thus evolves from a unidirectional process to a continuous cycle of interaction, adaptation, and evolution of lived experience. The theoretical imperative of the hybrid ecological network draws from the same critical enquiry with which Karen Barad and Daniela Gandorfer ground their conversation in "Political Desirings":

> "How can we think ontology in a way that opens up different concepts and practices of thought and being, or, to put it more precisely, what are the *onto-epistemological conditions* that allow you to imagine a different mode of doing theory?" (Barad & Gandorfer, 2021, p.16)

Hybrid ecological networks insist upon an onto-epistemological (or indeed *ethico-onto-epistemological* (Barad, 2007)) shift into new terrains of fluid and transdisciplinary thinking and demonstrate how insights from diverse fields can converge to innovate established paradigms. By considering the application of contemporary philosophical frameworks and living-systems thinking to learning network development, this paper proposes a holistic revision of learning network design — one that embraces complexity, cultivates receptiveness, and ultimately can form a pathway toward a more regenerative, ecologically and ethically grounded and resilient model of learning for the future.

2. Refashioning Relationality

Imagining, and then enacting, a different mode of doing — whether theory, learning, practice, relationality, or network development — becomes ever more critical as the crisis of education is layered with mounting socio-ecological polycrises. There is little doubt that we are engaging daily in a shared and compounding polycrisis — recently described by Adam Tooze as "so disorientating is that it no longer seems plausible to point to a single cause and, by implication, a single fix" (Tooze, 2022) and recognised even by the World Economic Forum as when "concurrent shocks, deeply interconnected risks and eroding resilience are giving rise to the risk of polycrises – where disparate crises interact such that the overall impact far exceeds the sum of each part" (WEF, 2023, p.9). Timothy Morton's articulation of this as a not-quite-yet postapocalyptic manifestation of *hyperobjects* that are so complex — dislocated, out of time ("massively distributed in time and space" (Morton, 2013, p.48), and deeply interwoven — so as to be nearly unfathomable and untenable.

Given the escalating complexity of global ecological and social challenges, the demand for more resilient, adaptable, and interconnected learning networks is paramount. *Hybrid ecological networks* propose a dynamic revision of network design — one that embraces complexity, cultivates receptiveness, and advocates for continuous adaptation and learning. This transdisciplinary approach insists upon reimagining traditional boundaries and dualistic thinking, fostering dialogue and collaboration across different areas of expertise and highlighting the potential for innovation.

Framing a learning network as relational can radically open learning to the complex web of interdependencies that exist among teachers, students, institutions, ecosystems, cultures, experiences, and indeed all parts of a learning network. In the context of practice-led learning, such networks underscore that learning is a shared endeavour grounded in authentic relationship – often through community practice, service, or shared activity inclusive of a full diversity of stakeholders that allows learning to be a cooperative evolving process co-created by multiple actors.

The combination of relational and receptive network ontologies offers a potent theoretical structure for understanding and promoting a reimagined learning paradigm that foregrounds relationship, receptivity, co-creation and collaboration in an authentically distributed framework. Acknowledging learners' interconnectedness, agency, and their openness to a diversity of knowledge and experience allows the co-

creation of inclusive and participatory educational spaces. By adopting this perspective, a distributed and deinstitutionalised learning network can foster an environment that promotes active learning, collaboration, and critical engagement. Specifically, it can empower new learning frameworks in the following areas:

2.1 Distributed Agency

Agency can be distributed among all nodes – student, teacher, human and more-than-human, treating each as a valid and capable participant. Whereas existing traditional learning architectures, "our fragmentary and linear approach to systemic problems leads to inadequate solutions and causes social, political, economic, and psychological crises" (Solonen, 2023, p.621), a revised learning approach can translate into a network where participants are not just passive receivers and providers of information, but active participants that engage and shape the network in unique ways. Beyond an emphasis on nodes, the *receptivity* of such a network would give equal agency to connections and relationships as to objects in relation. Practical applications include:

- Recognition of more-than-human agency
- Ethical frameworks for more-than-human participants
- Dynamic role allocation
- Interactive and responsive environments
- Integration of indigenous knowledge systems
- Adaptive learning pathways
- Empowering through technology
- Robust network feedback mechanisms

2.2 Collaborative and Co-creative Learning

A relational and distributed learning network emphasises collaborative, experiential, and embodied learning. The network could facilitate interactive experiences, encourage peer-to-peer learning, and even integrate with physical or augmented reality environments to support embodied learning experiences. Practical examples of co-creative learning include:

- Community engagement and service learning
- Community-based research
- Internships, externships, placements, practicums
- Project-based learning
- Global learning, partnership and networked learning - local, regional, bioregional, and global
- Living labs - partner-based living-learning communities
- Interspecies collaboratories
- Action learning
- Full learning community engagement in strategic planning, decision-making, process learning (including staff, students, trustees, directors, volunteers, external stakeholders)

2.3 Fluid and Dynamic Structures

Such a network can also have a fluid and dynamic structure, reflecting the constant flux and change of ecological complexity. Rather than being fixed and static, the network continually adapts and evolves in response to the actions and interactions of its participants – human and more-than-human (from *Aardvark* to *Albedo* to *AI*). Practical applications include:

- Adaptive learning models
- Decentralised decision-making
- Flexible organisational structure
- Peer-to-peer learning
- Modular course design
- Hybrid, blended, off-site practice-led learning
- Distributed programme development and delivery

2.4 Ethical and Inclusive Design

A key element braided together within an authentically de-institutionalised distributed network model is a foundation of ethical, inclusive, accessible and equitable design principles. The network is designed to inclusively evolve, giving all nodes a voice in shaping network changes, and ensuring that adaptations don't disadvantage certain groups. New identities that blend definitions of learner, teacher, and co-creator roles are valued within the network and contribute to a diverse, vibrant learning ecosystem. Any accessible network also engages in what EF Schumacher described as "appropriate technologies" (Schumacher, 1973), here in the context of minimal computing to empower "students to be their own arbiters of engagement" (Bessette, 2023). Practical applications include:

- Participatory design
- Universal design
- Cultural competencies
- Eco-literacy
- Ethical technologies
- Data privacy, autonomy, and security
- Continuous feedback and adaptation
- Robust systems to support whole community access

2.5 Development of New Network Identities

Finally, such a network (inspired as it is by the work of Karen Barad, Felix Guattari, Bruno Latour, Thomas Nail, Rosi Braidotti, Jussi Parikka and others) breaks down barriers between node and relationship; between human and more-than-human; between learning and experience. A receptive relational network could yield an evolution in network identities, an "ecology of practices" that "opens up a world: a world of relations, abstractions, spaces that turn into movements and it becomes an onto-epistemological framework" (Parikka, 2018, p.45). Practical applications include:

- Transdisciplinary programme architectures
- Holistic and whole-systems learning spaces
- Mentorship and partnership
- Collaborative and co-creative workshops across identities
- Transmedia storytelling
- Process-led curriculum design
- Networked performance
- Agential realism workshops
- Performativity workshops

Inroads into the development of distributed and relational learning are not entirely uncommon; however, engaging with dynamic learning networks to implement the elements above, particularly in the context of institutional frameworks can prove challenging. Nonetheless, there are huge opportunities for the co-creation of innovative network ecologies if learning is to continue to develop as a meaningful way to engage in the global ecological and social challenges that increasingly come to define this century.

3. (Re)imagining Materiality

Pioneering work in *Material Ecology* by Neri Oxman and her teams both at the MIT Media Lab and at Oxman Architects is an exceptionally helpful material-led framework for conceptualising relational nodes within hybrid ecological learning networks. Each node, akin to a unique material entity in Oxman's schema, possesses inherent characteristics that enable complex interactions and gives each node a unique material identity (*material ontology*) that reflects a symbiosis between the human and more-than-human worlds. Material ecology integrates design and computational biology with traditional fabrication and building processes, and emphasises materials are not simply passive substances used to build objects; they participate in the ecological systems in which they're situated. Oxman frames her work in material ecology in the principles of her *nevalogue*:

- Nature as Client;
- Growth over Assembly;
- Integration over Segregation;
- Non-human-centred Design;
- Difference over Repetition;
- Decay over Disposal;
- Activist Design;
- System over Object;
- Technology over Typology;
- Process over Product;
- Heterogeneity over Homogeneity;
- Scale over Size. (Antonelli and Burckhardt, 2020, pp.20-37)

Applying these principles to learning network design, nodes in the network can be viewed no longer merely points of connection; instead, they become unique material entities possessing distinctive characteristics that influence their interactions and behaviour within a network and create a latticework which enables us to manifest that "knowledge can no longer be ascribed to, or produced within, disciplinary boundaries, but is entirely entangled" (Ben-M 2020). In a *hybrid ecological network*, material characteristics manifest in multiple ways — a node's connectivity to other nodes (its positionality within the network), its ability to process and generate information (its capacity for computational or knowledge/experience/skills exchange), and, importantly, its resilience in the face of disruption.

Taking inspiration from Oxman's nevalogue enables a reframing of design from object-oriented to systemic through a process of organic growth where networks can themselves become activist through an integrative and mycelial embrace of a (new)material-led design where contextual flows and relational difference become a new design paradigm. Thus design sets a living and adaptive foundation for a reimagining of possible educational futures as decentralised, student-led, displaced, and deinstitutionalised. Educational thinkers have begun to acknowledge, "the increasingly corporatised, target-driven, and stressful nature of modern academic life far exceeds reasonable human limits. This leaves most of us with no energy to engage with the

greatest challenge of our time – tackling the climate crisis." (Urai and Kelly 2023: 1). Further, Dan Fitzpatrick offers, "in 2043 school will likely be a concept rather than a place where our children go to learn. Systems of education led by governments will not be able to keep up with innovation, and a decentralised offering will be where most parents go to educate their children" (Fitzpatrick, 2023, p.30).

Maggie Favretti asks toward the end of her book, *Learning in the Age of Climate Disasters*, "what if the purpose of school was actually to engage people of all ages in the co-creation and tending of interrelated, living communities of coherence, belonging, and agency?" (383) Favretti's positive vision of possible learning futures resonates with the work of educational futurists including Fitzpatrick (2023), Urai and Kelly (2023),

Alexander (2020), and more) who see the potential of a regenerative pathway despite the continued financialisation of student enrolment, unethical international student fees in the UK and US, and a general "[m]arketization of international higher education [that] exacerbates issues of educational inequity" (Tannock, 2013) that further distances learners from being full participants in a whole-systems approach to education.

We need a more nuanced understanding of learning networks and their design and an understanding of the urgency of re-thinking learning structures: "To remove … barriers to action, we need to rethink academia" (Urai and Kelly, 2023, p.1). Acknowledging the inherent variability and dynamism of network participants (nodes), can empower the design of more flexible, resilient networks that can adapt to changing circumstances and (re)generate solutions.

4. (Re)/(Dis)locating Pathways: Corridor Ecology

One example of extending a *Material Ecology* grounded design paradigm explicitly into the more-than-human world is through *Corridor Ecology*, an interdisciplinary field including biodiversity corridors and landscape linkages, which lends principles crucial to designing pathways within networks. One can frame hybrid ecological networks as enactive relational spaces through the lens of *ecological corridors* (also known as biodiversity corridors or wildlife corridors). Of the hundreds of corridor projects active worldwide, there are many successful corridor and linkage projects across human and more-than-human relationships across a range of scales and geographies addressing the needs of a diversity of species.

Seeing network pathways as analogous to ecological corridors can open our perception of them as dynamic conduits that facilitate the flow of information and interactions, much like how ecological corridors facilitate species movement. They are not just passive infrastructure but active and vital parts of the network that can adapt and evolve over space and time to better serve the network's needs.

Ecological corridors are essential for connecting fragmented habitats, allowing species to move and interact — often over multiple generations — thereby enhancing biodiversity, resilience and integration with the surrounding environment. Similarly, in a network context, these "corridors" or pathways can connect different nodes — individuals, groups or systems — and allow for steady, organic evolution of connections between nodes that might otherwise remain siloed from one another. They invite the transfer, mixing, and evolution of ideas and knowledge and foster intellectual diversity and innovation.

By designing pathways that facilitate diverse interactions, we can create networks that are not only more cohesive but also more resilient. These networks can better withstand shocks (such as the loss of a node or disruption to network connections) and are more adaptable, capable of evolving based on the needs of their nodes and the environment.

In addition, the concept of corridor ecology introduces the idea of *permeability*, which refers to how conducive a landscape is to species movement. In network design, this would translate to how easily information and ideas can flow through the network. Designing a learning network with high permeability would mean creating pathways that enable the smooth and efficient flow of knowledge and ideas. Integrating corridor ecology principles enables a transition from a perception of networks as static, rigid structures to an understanding of them as dynamic, adaptable, and resilient systems, much like ecological landscapes themselves.

Multi-scale learning networks are always/already in the process of co-becoming, manifesting a world in which human and more-than-human organisms communicate always in an unfinished processual dynamic. For example, large-scale ecosystem corridors known as landscape linkages allow for the movement of a diversity of both plant and animal species and are designed for multi-generational movement and flourishing of species *within* the linkages themselves. Following the recognition of transboundary (transnational, intercultural, interspecies) linkages, a globally distributed site-based experience can build a

far more resilient learning network than existing site-based, online, or hybrid higher education allows. A hybrid ecological network emphasises the interconnectedness of global partners to integrate site-based and community-centred learning around the world and interweaves it in a multi-species transdisciplinary cross-cultural approach to build a resilient, adaptive, and multi-scale curriculum (Bailey, 2021).

Annika Keeley of the Center for Large Landscape Conservation explains that to address changing habitats and migration patterns resulting from climate change, wildlife "corridors can also incorporate climate refugia. Examples are canopy cover, deep snowdrifts, valleys where cold air pools, northward facing slopes, and areas near or in large deep lakes or oceans." This often incorporates "modelling current species distribution and their future distribution, using climate change projections, and then designing corridors linking current and future habitat patches". (Keeley, 2022) Corridors are as much about the interrelatedness of the network partners as they are about inhabiting the space between the network nodes.

Keeley notes, however, that "corridors should be part of larger ecological networks" and will ultimately only be successful when paired with "measures to reduce human population and consumption, while increasing access to resources" (Hilty, 2019, p.275-6), thereby underscoring the need for a broader systemic approach — in and of themselves, ecological corridors — and connectivity initiatives of all kinds — will only succeed if actively and fully embedded in a holistic approach.

Much as flows of more-than-human species across networks need not have rigid connections, but rather flexible, permeable, organic and regenerative connections that evoke and engender flourishing tendrils of new and sometimes unexpected growth. The very movement of species within corridors is itself a dynamic of inhabitation, often with multi-generational and inter-species frameworks, where the static fixedness of 'being' gives way to the relationality of 'becoming' and the "notion of 'animaling' can also shift perspective from animal essences to a study of the material-semiotic performativity of human/animal relationships". (Birke et al., 2004, p.169-170)

Drawing on these fields as well as on communicative ecologies and hybrid or gradient epistemologies (see Altheide, Oxman, Haraway, Tsing, Morton, Witzagal, Crabtree and Rodden, for example), there are ample models for inhabiting the permeability of network edges to engage in the cultivation of further connection and partnership development. It is useful here to draw on the foundational framing of these fields (demonstrated tangibly in the work of Oxman and others) in the articulation of *assemblage* in the work of Deleuze and Guattari and subsequent posthuman articulations. They write, "an assemblage is precisely [an] increase in the dimensions of a multiplicity that necessarily changes in nature as it expands its connections. There are no points or positions in a rhizome, such as those found in a structure, tree, or root" (Deleuze and Guattari, 1987, p.8). Their emphasis on defining the rhizomatic roots of assemblage in movement, action, and transfer underscores the processual underpinnings of active distributed networks in which the nodes themselves recede and "there are only lines" (Deleuze and Guattari, 1987, p.8).

Neri Oxman's work on (often experimental) hybrid ecological architectures foresees a future in which "material property gradients may be programmed across space and time" (Oxman, 2024) that explodes our current binary paradigm of place-rooted vs distributed and affords entry to a hybrid network model that becomes the meshwork (Morton 2013) for a relational gradient of knowledge and experience exchange. It is useful here to draw on Arthur Koestler's work, particularly in *The Ghost in the Machine* where he scaffolds emergent systems and complexity theory by balancing his concept of the *holon* between part and whole. Koestler resists a complete holism – what Morton might describe as "some vague sludge of Anaximander's *aperion*" (Morton, 2013, p.119) or Thales' *arche* before him – in favour of an almost fractal nesting of interrelated parts, wholes and sub-wholes. He describes "organisms and societies [that] are multi-levelled hierarchies of semi-autonomous sub-wholes branching into sub-wholes of a lower order, and so on" wherein "'wholes' and 'parts' in [an] absolute sense just do not exist anywhere" (Koestler, 1967, p.56-58). Koestler's holon and the accompanying notion of holarchy offer a lens through which to view the interconnectedness and interdependence of entities in both biological and social structures, suggesting that the nature of reality is neither fully reducible to its parts nor entirely explainable as the sum of its parts. Instead, it proposes a dynamic, integrative view of systems where both *partness* and *wholeness* are

essential for understanding the organisation and functioning of complex systems.

Further, Ervin László built upon Koestler's concept of the holon to assert that "consciousness is not produced by the brain, and is not confined to the brain. It is a fundamental phenomenon" that exists everywhere (László, 2017, p.3). This robust form of extended cognition and "active externalism" (see Clark & Chalmers, 1998) reaches into the *alive-space* of human and more-than-human interconnectedness, where "all spheres of consciousness partially overlap… [And] the overlapping part of the spheres of consciousness forms the world that is common to all". (Schrodinger, 1956, p.9) The complementarity of *part* and *whole* held in a permanent state of (co)becoming can empower a shift from hierarchical, pre-structured educational models to fluid, process-oriented, and relational models that prioritise practice-led and experience-based learning networked through a rhizomal architecture, thereby offering a transformative vision for 21st-century education.

5. Unsettling the Classroom

The writer and activist Gloria Anzaldúa describes the experience of inhabiting borderlands as *nepantla*, a Nahuatl term meaning *in-betweenness* or *ambiguity* (Anzaldúa, 2015, p.127). Nepantla captures the complex and often contradictory nature of identity formation within borderlands, where individuals navigate between multiple cultural, linguistic, and social contexts. In this liminal space, Anzaldúa argues, new forms of identity and consciousness emerge, challenging traditional binaries and hierarchies — between cultures, gender identities, nation-states, human and more-than-human communities, and between ontology and epistemology.

Anzaldúa writes "you're not contained by your skin—you exist outside your body and outside your dream body as well. If the body is energy, is spirit—it doesn't have boundaries. What if you experienced your body expanding to the size of the room, not your soul leaving your body. What if freedom from categories occurs by widening the psyche/body's borders, widening the consciousness that senses self". (Anzaldúa, 2015, p.134-35) As they explore the "enfleshed geneological sensiblities" embodied in the linguistic and cognitive dance between Anzaldua's experience and her readers, Nancy Tuana and Charles Scott, point to blurring of place, where, "Enfleshed genealogies remember the reciprocal vulnerability of things in the making. Not my body, your body, but the complex imporings of environments, institutions, norms, sensibilities, elements". (Tuana & Scott, 2020, p.118)

In this *alive-space,* where ultimately, "corporeality is a nexus of flux" (Tuana & Scott, 2020, p.118), place itself can be critically unmoored from romantic conceptions separating terrain from its context; Cecil Goodman underscores that "sense of place is a social construction that builds on a socio-cultural context, which includes spatial memory, experiences, and social world relationships" (Goodman 4) and further enriches this discourse framing hybrid ecological networks, advocating for a learning model that is de-institutionalised, distributed, and deeply entwined with socio-cultural and ecological contexts. Arizona's Prescott College, "a leader in experiential and collaborative education" ("Mission, Vision & Values"), demonstrates, for instance, that "reframing recreation *on*, to one of relation *with*, may help to challenge this paradigm and requires the re-learning of Indigenous wisdom erased through the pursuit of western values of escapism and conquest" (Greeson at al., 2022, p.10). Advocating for practice-led, community-centred and ecologically focused education not only challenges but also dismantles romanticised separations between place and context, advocating for a justice-centred education system that mirrors the resilience and adaptability of ecological networks and invites a radical reimagining of place, learning, and community in a way that fosters a regenerative, interconnected educational ecosystem, reflective of and responsive to the complex web of relations that define our socio-ecological landscape.

In the practice-led processual classroom, learning is itself "an iterative process… growing from reflexive positionality, entangled empathy, and involving earth-based ways of knowing and indigenous cosmologies… Such learning is modelled on resilient ecological systems, recognition and celebration of diversity, collaboration, reflexivity, emergent understanding, and individual responsibility and

accountability" (Greeson, 2019). The enfolding of diverse externalities within the curriculum, and indeed modelling the learning framework on an active regenerative paradigm situates learners in an active relationship with process and experience, rather than with siloed knowledge transfer that re-inscribes hierarchical anthropocentric paradigms within and beyond the classroom.

The MA *Movement, Mind and Ecology* at Schumacher College in South Devon, England, now in its third year, provides additional context within a transdisciplinary environmental humanities course focused on exploring and interrogating interrelationships, communications, and performative practices between human and more-than-human participants around the world. The programme's four taught modules are built upon concepts of out, to use embodied practice, ecological thinking and environmental philosophy to explore the alive-space between human and more-than-human communities, taking as one of its foundations the assertion that concepts "are not descriptive but *performative*. … calling into question of the presumed separability of epistemology, ontology, and ethics". (Barad & Gandorfer, 2021, p.25) In the final module, *Performing Place*, students embody their experience in the course and develop meaningful public and community-facing practices that can move both conversation and action forward, inhabiting what Elizabeth St. Pierre describes as an "ontology of immanence, [where] one becomes less interested in what is and more interested in what might be and what is coming into being". (St Pierre, 2019, p.4)

Movement, Mind and Ecology is delivered both onsite in England and online for students across multiple time zones, ecosystems, and cultures and thus presents a tangible opportunity to explore and assess the manifestation of interspecies collaboration, cooperation, and communication in site-based and online contexts. In my (far too) occasional seminars on the course, I would challenge students to consider what happens to a network model when we focus exclusively on the connections over the nodes, and how we might use such a relational framework to reimagine the process of learning through experience. It is precisely this sort of reworking of networks with the motion and movement of experience through the network corridors – rather than fixing on the nodes of the network themselves, that speaks clearly to the need to diversify, decolonise, and democratise the development of learning networks by taking a decentralised view of network development. If we decentralise network architectures and establish a framework based on the active sharing of experience that validates the authentic experience of site-based participants, then we have come a long way indeed toward a democratic & ecological relational network.

Foundational for such an innovative approach to learning — often more apparent in curricula of small progressive colleges and universities (including Schumacher College (UK), Prescott College (US), Sterling College (US), Green School (Bali), Black Mountains College (UK), College of the Atlantic (US), MOME University (Hungary), the international UNDP Conscious Food Systems Alliance (CoFSA) and others) is that "thought cannot get outside itself in order to compare the world as it is 'in itself' to the world as it is 'for us'". (Meillassoux, 2009, p.3)

6. Conclusion

Whether grounded in knowledge exchange, distributed approaches to practice-led learning, or other, "the problem remains … that organised networks do not yet exist as recognised actors either within the stratum of policy discourse or as concrete-potentialities". (Rossiter, 2006. p.34) It is clear that in the context of network identity and data autonomy, looking through the lens of dislocated (Morton 2010) interspecies inhabiting, "inclusivity can also enhance innovation" (Chiles et al., 2021: 956), the role of the network itself as an actor within a framework of agential realism that seeks to disrupt "the sedimented assumption in Western philosophy that holds that ontology is strictly a matter of being". (Barad & Gandorfer, 2021, p.17)

A hybrid ecological network re-frames institutional learning through a deterritorialised epistemic ontology that invites critique of fixedness inherent within and outside of institutions. In this era of polycrises (among which is a fundamental crisis in education), we need to interrogate existing learning paradigms to challenge the notion of institutional fixedness and construct authentic theoretical and practice-led frameworks for de-institutionalised learning. Such a framework invites an inhabitation of an *alive-space* at

the intersection of human and more-than-human identities and encourages a refashioning of how learning communities are formed, how knowledge is engendered and shared amidst these communities, and how the process of learning unfolds in non-hierarchical, open-ended, and interconnected ways.

Hybrid ecological networks open a collaboratory space for a new philosophy of de-institutionalised learning that transcends the conventional boundaries between teacher and learner, formal and informal learning environments, and online and offline educational experiences. Within and around de-institutionalised models, learning unfurls through non-linear, assemblage-driven entanglements. Thus reimagined, learning is less paradigm or framework and more a dynamic, ever-evolving network of relations, where knowledge is not transferred, but emergently co-constructed through the intricate interplay of experiences, practices, and relational engagements.

The openness of distributed learning networks subverts bounded, discrete and siloed learning "centres" that gatekeep and disseminate "knowledge" across a centralised institutional network apparatus. As Anna Tsing offers, "assemblages are open-ended gatherings. They allow us to ask about communal effects without assuming them. They show us potential histories in the making". (Tsing, 2021, p.22) It is these potential histories – learning unfixed and always in process, that is at the heart of unfinished network assemblages.

Hybrid ecological networks, in their emphasis on relationality and process for learning insist upon transformative action for education and advocate for resilient, adaptive learning networks that integrate human and more-than-human interactions with/in socio-cultural and ecological contexts. Distributed networked learning calls for dismantling hierarchical educational structures in favour of participatory, interconnected learning networks. These networks can shift the future of education from seeking to sustain an unsustainable status quo toward a flourishing, collaborative and regenerative future. When we recognise through relational networked imagining to authentic practice that "all that matters…is that the sensible *is* a relation, rather than a property inherent in the thing" (Meillassoux, 2009, p.2), we can better engage the dynamic interplay in the alive-spaces between human and more-than-human actors, aiming to address global challenges through a regenerative, inclusive, and ethically grounded paradigm. We are urged to embrace this model, fostering a collaborative effort towards sustainability and ethical engagement with our planet.

Collaboration is the foundation of a regenerative approach and helps us recognise that we are always in the process of evolving. It is through cultivating relationships across boundaries (with education providers, businesses, communities of practice, and human and more-than-human communities) and inhabiting both virtual and actual rhizomal or mycelial networks, that we can build a resilient and adaptive regenerative future for learning that explicitly integrates radical openness, interactivity, adaptability, and equitable participation.

There is no single solution to this crisis; however, "we must see academia not as a research-producing factory but as an organic, diverse, dynamic organisation. An organization where, in the right conditions, small seeds can grow into a diverse ecosystem". (Urai & Kelly, 2023, p.6) It will take different perspectives and many approaches, but critical will be an acknowledgement that it is through working together — by re-building our relationships with one another, that we can hope to shape a more regenerative future for higher education.

KEYWORDS | LEARNING & TEACHING APPROACHES, INCLUSIVE DESIGN PRACTICES, DIVERSE DESIGN APPLICATIONS, BODY FOCUSSED CLOTHING, PARTICIPATORY DESIGN

ABSTRACT | Fashion is a powerful tool for self-expression and empowerment. People with disabilities (PwD) however, are often excluded from fashion, as mainstream clothing is often not accessible or adaptable to their needs. The limited awareness surrounding disabilities specifically in fashion education does not help in fostering inclusivity and assimilation within society, which not only requires infrastructural adjustments but also innovations in adaptive clothing solutions. This challenge is particularly pertinent for educators in design disciplines, such as interiors or fashion, who must navigate the complexities of incorporating inclusive practices into their curricula. Design, inherently a problem-solving discipline, often overlooks this aspect when applied to fashion in particular, which instead gravitates towards the celebration of identity and clothing as a form of an artistic communicative language. Addressing this lacuna, the fashion department at a well-known design college initiated the "Body and Diversity" brief for second-year fashion students which delves into the human body as a composite entity, considering its diverse abilities as well as its limitations. Students engage with a spectrum of body types, gaining insights into factors that deviate from the norm. Adapting a personalised client study, students undertake rigorous research, including the collection of primary data and visuals from their clients (who may be PwD), analysis of diverse body requirements, and the subsequent development and delivery of tailored clothing solutions. This paper employs the "Body and Diversity" brief as a case study to elucidate the diverse design approach that can shed light on an innovative learning application.

1. Introduction

Fashion design, operating as both a discipline and a pedagogical framework within fashion education, embodies a multifaceted interplay of contextualisation, technical proficiency, industry orientation, and technological integration. Its dynamic nature necessitates constant innovation in both its approach and delivery. This presents a formidable challenge not only for fashion educators but also for fashion students. The focal point lies in equipping these students with future-proof skills while simultaneously grounding them in historical and cultural contexts. Contemporary discourse within the field emphasises not only the exploration of the "why" and "what" of fashion but increasingly interrogates the "how" of its various manifestations. As articulated by Steven Faerm (2017), this multifaceted inquiry underscores the evolving landscape of fashion education, demanding a nuanced understanding and response to its complexities.

Over the past two decades, fashion education has undergone significant transformation, spurred notably by the prevalent influence of social media. This medium has facilitated the rapid dissemination of ideas, fostering discussions that have propelled certain movements to global prominence. Among these, the notion of sustainability in fashion stands out as a salient example. The emergence of sustainability as a prominent concern within fashion design reflects a conscientious recognition of the industry's immense environmental impact. Various dimensions of sustainability, including recycling and upcycling practices, embrace of make-and-mend approaches, promotion of circularity, emphasis on local sourcing and consumption, appreciation of the value chain, and cultivation of craftsmanship, are being systematically integrated into design pedagogy across diverse educational institutions worldwide. Consequently, academic curricula are being restructured to embrace this newfound imperative, as educators seek to instil in students an ethos of sustainability vis-à-vis clothing and fashion.

The evolving landscape of fashion consumption has propelled an earnest shift in the role of the designer. While consumers continue to seek meaning and self-actualisation through fashion, Maslow's "Hierarchy of Needs" suggests that contemporary consumers, having had their primary needs met, now yearn for deeper forms of non-physical stimulation (Faerm, 2015, p.190-191). Consequently, there is a burgeoning demand for fashion offerings that transcend mere product functionality, eliciting deeper emotional resonance. As posited by Pink (2005, as cited in Faerm, 2015), the future trajectory of fashion design necessitates a departure from mere aesthetic appeal towards the cultivation of narratives that resonate with an increasingly discerning audience. Designers, positioned as creative innovators, are tasked with the pivotal role of “bridging the chasm between thinking and doing because they are passionately committed to the goal of a better life and a better world around them”(Brown, 2009 as cited in Faerm, 2015). In this vein, the design process transcends its conventional confines to emerge as a potent catalyst for societal health, economic prosperity, and personal fulfilment. As Brown (2009, as cited in Faerm 2017) further contends, the elevation of design within this broader paradigm holds the promise of enriching not only individual lives but also the fabric of our collective existence, inculcating it with deeper meaning and purpose.

The acknowledgment of the need for change within the fashion system and education has prompted critical reflection, yet few theorists have explicitly advocated for the integration of a problem-solving approach as a universal design principle within the discipline. This paper seeks to address this gap by providing insights into the potential benefits of incorporating problem-solving methodologies into fashion design pedagogy, thereby advancing inclusive practices in the field of fashion and clothing.
Utilising a qualitative, observational, and case study approach, this paper aims to present evidence of successful project delivery and student reflections that underscore the significance of adapting diverse problem-solving approaches within fashion design education. In doing so, it also aims to expand upon Steven Faerm's argument regarding the evolving role of the fashion designer in the contemporary knowledge-based economy. Faerm's (2017) proposition of the "Designer-As-Social-Scientist"(p.6) underscores the necessity for designers to transcend traditional boundaries of aesthetic creation and instead engage with the psychosocial needs and desires of their audience. By crafting narratives and design processes that strategically address both practical and emotional aspects of consumption, designers can better resonate with their target consumers.

2. Introduction of Facts and Figures of PwD and Diverse Body Types, Issues, Concerns: The Case of 'Why' This is Essential

According to UNDP (2018, p.3) 'Persons with disabilities are one of the largest minority groups in the world, estimated to represent over 15 percent (approximately 1.5 billion people) of the world's population. 3 out of 5 persons with disabilities are women and disability is more common among children and adults who are poor. 80 percent of persons with disabilities live in UNDP programme countries. Persons with disabilities face challenges to fully participate in society which is further heightened by discriminatory social attitudes – this culminates in marginalisation and significant barriers to their inclusion and participation in society and in development. The extent of inequalities experienced by persons with disabilities in all areas of development is often the result of shortcomings in the structural, social, political, and cultural environments in which they reside, including lack of accessibility to physical and virtual environments; institutional and attitudinal barriers; exclusion; and unequal opportunities.'

This demographic reveals the urgency for fostering inclusivity and assimilation within society, necessitating not only infrastructural adjustments but also innovations in spatial design and adaptive clothing solutions.

2.1 What Do We Understand by Inclusive Environments in General

When discussing an inclusive environment we take into consideration race, ethnicity, gender, sexual orientation, age, religion, disability, socio-economic status and how space (physical) and an environment (sensory and emotional included) is deemed fit and wholesome for every person who may inhabit that space. While inclusivity and diversity are outlined in various theoretical frameworks and government documents in most countries, the practical implementation often lags behind. Policies and documents advocate for equal opportunities and anti-discriminatory measures, yet the ground reality reveals persistent barriers. Addressing disability as a human-centric issue involves tackling spatial, accessibility, and clothing challenges. Across the world, efforts are being made to enhance infrastructure for better mobility, such as wheelchair ramps and accessible public spaces. Initiatives also aim to create awareness, dispel stereotypes, and foster a more inclusive mindset within communities. In the realm of clothing as well there is a growing realisation for the need for adaptive designs to cater to the diverse body requirements of PwD.

2.2 Bringing Focus to Clothing, Fashion and Fashion Design Education

Fashion is a powerful tool for self-expression and empowerment. People with disabilities, however, are often excluded from fashion, as mainstream clothing is often not accessible or adaptable to their needs. Adaptive fashion is clothing that is designed to be easy to put on and take off, and to accommodate the needs of people with disabilities, especially in the case of mobility concerns. It is an important part of creating a more inclusive and accessible society.

Fashion courses worldwide often prioritise trends and the pursuit of idealised body types, perpetuating a narrow definition of beauty. Within these courses, students are encouraged to explore the interplay between materials and forms, with an emphasis on innovation and the creation of unique designs. The curriculum typically revolves around techniques for enhancing the aesthetics of clothing, often overlooking the broader implications of design beyond mere appearance. There is a growing recognition of the need for inclusivity within the industry, spurred by awareness campaigns advocating for representation of diverse skin tones and body sizes. Despite efforts to diversify representation within the fashion industry, there is still a pervasive focus on conforming to traditional standards of beauty. This perpetuates an exclusionary environment that fails to celebrate the full spectrum of human diversity. While strides have been made in acknowledging the importance of representation, with the inclusion of dark-skinned and plus-size models, the overarching emphasis remains on materiality and form whereas true inclusivity requires a fundamental shift in the way fashion education is approached.

In her manifesto, ANTI_FASHION: A manifesto for the next decade, trend forecaster Li Edelkoort claims that most fashion institutions encourage student designers to become unique individuals who aspire to future roles as celebrity runway designers for luxury brands (Edelkoort, 2014, as cited in Sala, 2016). It would be fair to state that central to the teaching and learning of fashion is the cultivation of a discerning eye for aesthetics, serving as the cornerstone of the discipline. Within this realm, students are tasked with not only honing their ability to critically assess designs but also to recognize emerging trends and craft their own unique design aesthetics, drawing from their personal perspectives and experiences. While problem-solving skills are often emphasised in garment construction and form exploration, there exists a tendency to overlook the broader context of addressing functional needs of clients or real individuals, thereby neglecting to identify potential design gaps.

Sala (2016) in her paper further

> "discusses ideas of progress, innovation and possibilities for transformation present in fashion education practice and learning, specifically in reference to the fashion educator's role in enabling student designers to become critically aware of their place within the current fashion system. To transform ideas, to encourage or experience a shift in paradigm, requires the recognition and reinterpretation of what has come before".

(Williams & Askland, 2011, as cited in Faerm, 2015, p.197-198) have raised a similar point

> "To prepare their future graduates, many design schools are moving away from teaching to the mere 'artifact', into pedagogy that increasingly emphasizes the design process, the interrelationships between creator and audience, and the role of (often implicit) rules and boundaries. This is a more contextualist approach as it considers the interactive engagement between the individual and the social environment. The New Design Education, then, is one that encourages and facilitates partnerships between design and the social sciences. After all, design is, on many levels, a service to society and end-users."

Despite the presence of leading design schools and prestigious fashion programs worldwide, there remains a conspicuous absence of specialised courses catering to adaptive clothing, which is particularly noteworthy given the industry's obligation to inclusivity and accessibility. The dearth of focus on adaptive clothing within fashion education is not surprising, considering that fashion designers typically do not enter the field with the explicit intention of catering exclusively to individuals with disabilities. However, it is imperative to acknowledge that fashion design, as a subset of the broader design discipline, possesses inherent problem-solving capabilities and should be adept at addressing diverse societal needs.

2.3 What Does Design and Design Teaching Mean: Are We Applying the Same Principles of Design Pedagogy to Fashion as in Other Disciplines?

Early literature on design or the process of designing has laid the groundwork by proposing several definitions or approaches, each offering unique insights into the nature of design. Some of them as quoted below from Jones' book 'Design Methods' (1992, p.3) elaborate upon this very approach:

- "A goal-directed problem-solving activity (Archer, 1965)": This definition highlights design as a deliberate and purposeful endeavour aimed at solving specific problems or achieving predefined objectives. It underscores the importance of intentionality and direction in the design process.
- "The conditioning factor for those parts of the product which come into contact with people (Farr, 1966)": Here, design is viewed as a determinant of the user experience, particularly focusing on the aspects of a product that interact directly with individuals. This perspective emphasises the human-centered nature of design and its role in shaping interactions between people and products.

- "Relating product with situation to give satisfaction (Gregory, 1966)": Gregory's definition emphasises the contextual nature of design, highlighting its function in establishing a harmonious relationship between products and their intended environments. Design is seen as a means of enhancing user satisfaction by aligning products with specific situational requirements or contexts.
- "The optimum solution to the sum of the true needs of a particular set of circumstances (Matchett, 1968)": This definition underscores the idea of design as a process aimed at identifying and fulfilling the genuine needs of a given situation or context. It suggests that effective design involves finding the most suitable solution that addresses the inherent requirements and constraints of a particular scenario.
- "A creative activity - it involves bringing into being something new and useful that has not existed previously (Reswick, 1965)": Reswick's definition highlights the innovative aspect of design, emphasising its role in generating novel solutions that serve practical purposes. Design is portrayed as a creative endeavour that manifests new ideas into tangible forms, thereby contributing to the advancement of human knowledge and utility.

These early perspectives on design lay the foundation for understanding its multifaceted nature, encompassing elements of problem-solving, user experience, contextual adaptation, needs fulfilment, and creative innovation. Jones' statement "The objectives of designing become less concerned with the product itself and more concerned with the changes that manufacturers, distributors, users and society as a whole, are expected to make in order to adapt to, and benefit from, the new design" offers a profound perspective on the evolving role of design. While Jones's observations were originally framed within the context of architecture, engineering, or industrial design, they underscore a fundamental truth applicable to design across various disciplines.

Design, as a principle, should indeed be grounded in certain universal parameters and deliverables, irrespective of the specific field—its essence remains rooted in creativity and problem-solving. Therefore, while the objectives and focus areas of design may vary depending on the context, there exists a foundational framework that defines its fundamental purpose.

In the realm of teaching and learning within the visual arts and creative disciplines, there exists a notable emphasis on cultivating a rich contextual understanding and translating it into tangible outcomes through an exploratory process. The expectation is that students will become independent, self-analytical, critical thinkers that inform the entire period in higher education from the start of the course (Drew et al., 2002, pg 346). They have made a strong case of the role educational research can play in the development of thinking concerning pedagogical issues. Their approach to Martin and Saljo's (as cited in Drew et al. 2002) seminal work on deep and surface approaches in the visual arts, as well as their subsequent study (2002), provides valuable insights into effective pedagogical strategies within creative education. Among the four approaches identified, one stands out: a 'concept-focused strategy with the intention of developing the student's own response and ideas in relation to the project, ultimately a search for intrinsic personal meaning'. This approach aligns with the concept of cultivation of students' intrinsic motivation and personal engagement with the subject matter. Furthermore, it serves as a conduit for promoting the development of Personal and Professional Development (PPD) or Personal Development Planning (PDP) outcomes, underscoring the holistic nature of learning within creative disciplines.

> "When it comes to assessment as well, there have been criticisms in visual arts being subjective and lacking in rigour, where tutors usually arrive at grades after discussion with each other, in a process that is rigorous but socially negotiated and includes unwritten criteria. Further it is stated that 'In order for students to understand the assessment process and develop the capacity for effective self-evaluation and development, opportunities must be provided for them to understand assessment practices through formal explication and through social learning. This

> can enable students to benefit and learn from assessment rather than seeing it as something that is 'done to them'" (p.350).

In some cases of industry live briefs, especially in the higher levels and master's programs, this engagement most often takes place, but this is still via the understanding of fashion as the students know it. As a case in point, if fashion students were designing for a PwD and if this understanding was built around a problem-solving approach where student was designing for a real-life client, the feedback would be real time, in-person and objective, specific to the outcomes that were to be achieved. This approach is further elaborated in the specific case study below.

3. Body and Diversity: A Case Study of Students' Design Project Fostering Inclusivity in Fashion

Addressing this lacuna identified above, the Fashion department at the Indian Institute of Art and Design (IIAD) initiated the "Body and Diversity" yearly project for second-year (level 4) fashion students in 2017. Spanning 6-8 weeks, this project delves into the human body as a composite entity, considering its diverse abilities as well as its limitations. Students engage with a spectrum of body types, gaining insights into factors that deviate from the norm, including but not limited to body types, shapes & sizes, differently-abled, gender studies, etc. and their association with clothing and fashion. Emphasising on a personalised client study, students undertake rigorous research, including the collection of primary data and visuals from their clients (who may be PwD), analysis of diverse body requirements, and the subsequent development and delivery of tailored clothing solutions as a live project with a real-life client.

3.1 Details of the Project with Its Aims, Learning Outcomes, Objectives, Student Work, and Reflections Expanded Upon Below

Aims:

- To empathise with human needs and user focussed concerns (Process 1)
- To enable students to explore their own status as future design professionals (PPD 1)

Learning Outcomes:

- Analyse the relationship(s) between contexts & design outcomes (CONTEXT1)
- Identify the user needs through research and iterative design development (PROCESS1)
- Study diverse processes & agents of design realization within the relevant ethos (DESIGN OUTCOME1)
- Reflect on being aware & ethical students of design (PPD1)

Learning Objectives:

- Research: Conduct in-depth research into the experiences, needs, and preferences of PwD in relation to clothing and fashion.
- Ideation: Generate creative and inclusive design concepts that address the identified challenges and requirements.
- Prototyping: Develop toiles/prototypes of fashion designs tailored to the specific needs of PwD, incorporating feedback and iteration.
- Test fitting: Collaborate with PwD and relevant stakeholders to test and evaluate the toiles/prototypes in real-world settings.

- Learning and Reflection: Reflect on the design process, outcomes, and learnings, considering both successes and areas for improvement.

To explain the brief comprehensively, it is divided into 3 sub themes under the overarching theme of 'the Body' where a student's understanding is built with respect to the whole body, its physical, emotional and physiological attributes.

Body and diversity (overarching) is built around the wide spectrum of body variations: from varied body shapes and sizes to people with special needs, it could be people who wear prosthetics or people who identify with a different gender, etc. To further the understanding of the body, students look at the body through different lenses - from body as a form to finally interrogating the relationship between body and fashion, discussing both the historical perspective as well as present scenarios of how the body has been perceived. This would include covering *body* in the arts, in history, in clothing from the earliest time known etc. They question normative body ideals, and how the culture influences how we feel about our bodies.

Table 1. This segment is further divided into 3 subparts that are primarily based around class discussions and individual reflections.

Part I - Body as self and as the other, Vitruvian Man, Body as physical (torso, limb, face - senses & expressions), Body as an emotional being	**Part II** - Body in arts, sculptures, nudity, sexuality, armours, etc.	**Part III** - Ideal body image, mannerisms, body language & attitude, positivity, self-portraits, selfies, facial recognition

The next part of the brief focuses on understanding 'Body and gender' where the aim is to expose and sensitise students to gender studies and the social issues surrounding these. From looking at the body as a form to seeing the body as gender and then finally interrogating the relationship between body and fashion, discussing both the historical perspective as well as present scenarios they question how they feel about their bodies and gender. In the process of building a unique contextual narrative around the renewed understanding of gender, students chart out our own pathway by assimilating parallels between factors that have been defining gender till now, sieving through the newer viewpoints on the subject and by questioning the structures in the societies & within our own mindscapes. They methodically construct a curated context around the relationship between "Mind, Body & Gender". Within this they understand the difference between *Unisex* and *Androgyny* and what design approach they may have to undertake to design for either of the categories. Building a technical understanding of the placket, collar or yoke for example, and how its application shifts when addressing different gender types.

The last part of the brief is understanding 'Body and movement' and its role in a garment, for example - how different professions require different garments. Answering questions like 'Does movement play an important role in defining a certain occupation? Does the movement of a dancer and corporate employee differ? How does it affect their clothing? Ever wondered what costume designers keep in mind while designing for dancers and performers?' and then moving onto restriction of movements because of mental or physical ailments, as well as for differently-abled people or people with disabilities, and how these can turn into problem solving approaches for students of fashion. A masterclass and workshop on understanding anthropometrics and its relevance in this topic is integrated. They also understand how movement of body may be impacted if someone is physically challenged, or when the body is fit but the person is mentally not fully fit and what kind of interventions may be required in either case.

3.2 Deliverables

By culminating the above learnings, their main task (described below) is to identify a client who is facing challenges in movement or is PwD, or is struggling to identify with rigid gender norms. They look and seek within their surroundings - family, friends, immediate and close circle or through known contacts to build a prospective group of ‘clients’ from whom they then shortlist one that they will be designing for. They arrive at the 'design problem' in the way of this live client engagement and this sets a premise to base their design context and design process on.

The final deliverable is supported by lots of other supporting tasks and learnings (in addition to the core aims, learning outcomes, and objectives outlined in the project as stated above) to ensure a holistic and enriching educational experience for students:

- Client Profiling: Students learn how to conduct thorough client profiling, understanding the unique characteristics, preferences, and needs of the target audience, particularly Persons with Disabilities (PwD). This process involves gathering detailed information through interviews with the client and their families or support staff, observations, and research to inform the design process effectively.
- Context Building: Emphasis is placed on building a strong contextual framework to guide the design process. Students explore the broader societal, cultural, and environmental factors that influence fashion and inclusivity, enabling them to develop designs that are not only aesthetically appealing but also culturally sensitive and socially relevant.
- Iterative Process: Students engage in a rigorous iterative process to refine their designs and arrive at successful outcomes. This iterative approach involves continuous evaluation, feedback, and refinement, allowing students to address challenges, experiment with new ideas, and achieve optimal design solutions.
- Technical Construction: Students learn the technical components of garment construction, including pattern-making, sewing techniques, and fabric manipulation. Some are covered as charrettes and some as a continuation of design discussion, students also learn why volume, ease or other elements of addition may be required in the form. They look at pleats, tucks, shirring, gussets, godets, trims such as Velcro and snap buttons etc. to bring in required elements within their iterations.
- Representation Skills: Students acquire proficiency in representing their design concepts through various mediums, including hand sketches, computer-aided design (CAD) software, and body scanning technologies. This multi-modal approach enables students to effectively communicate their ideas and visions to stakeholders and collaborators.
- Soft Skills Development: Through interactions with clients and stakeholders, students develop essential soft skills such as communication, empathy, and active listening. They learn to engage in meaningful dialogues with clients, demonstrating empathy and understanding to address their specific needs and preferences sensitively.
- Reflection and Awareness: Reflective practice is integral to the learning process, with students documenting their progress, insights, and reflections through reflective logs. This process encourages introspection and self-awareness, fostering a deeper understanding of their creative process, as well as their physical and emotional surroundings.

By integrating these additional learnings into the project, students are provided with a comprehensive and immersive learning experience (figures 1-8) that goes beyond technical skills to encompass critical thinking, empathy, and cultural awareness. As a result, they emerge as well-rounded and socially conscious

designers equipped to make meaningful contributions to the fashion industry and society at large. All the above are covered via various teaching and learning methods such as lectures, small group discussions, large classroom discussions, panel discussions, peer engagements, masterclasses and guest lectures, in order to build a strong foundation for the design premise.

"The role of the future fashion designer, then, is not merely one of 'aesthetic provider' but as a practitioner who approaches the design process with deeper levels of empathy, sociological pattern-recognition, innovation, and big-picture capabilities" (Faerm, 2015, p.193). This brief compels design students to think beyond basics of form and material while really integrating a thinking and intervention possibility.

3.3 Example of Work

One student's work is presented below as an example of the brief culmination. There is an identification of a '*design problem'*, engaging with an iterative '*design process'* and thinking of possible *'design solutions'*. The initial context building and design development happens by hand. These are supported by many hand drawing sessions of 'the body' its movement, its gestures, curves, fold, wrinkles, skin colour etc. This is a final submission therefore does not capture an explicit design process however it does evidence a new design thinking approach (many journal pages and process sheets are omitted due to space constraints).

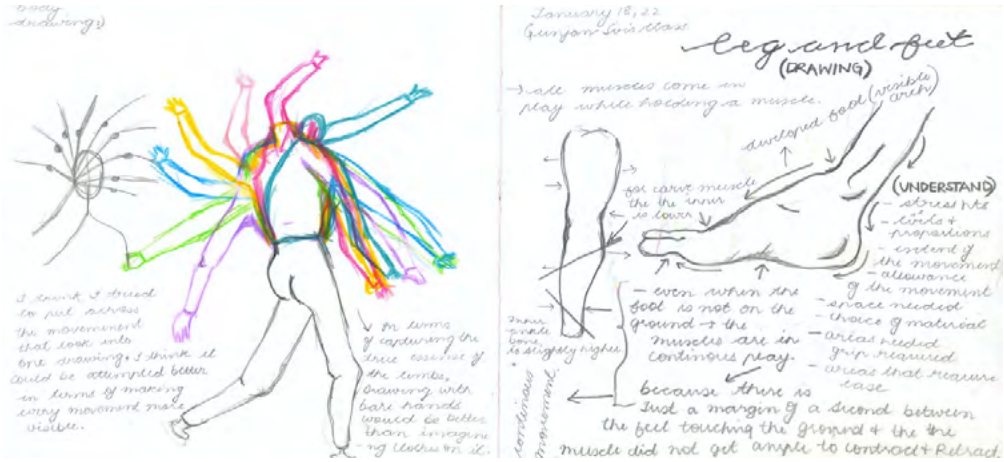

Figure 1. Journal entry, understanding the design problem – studying movement of the body.

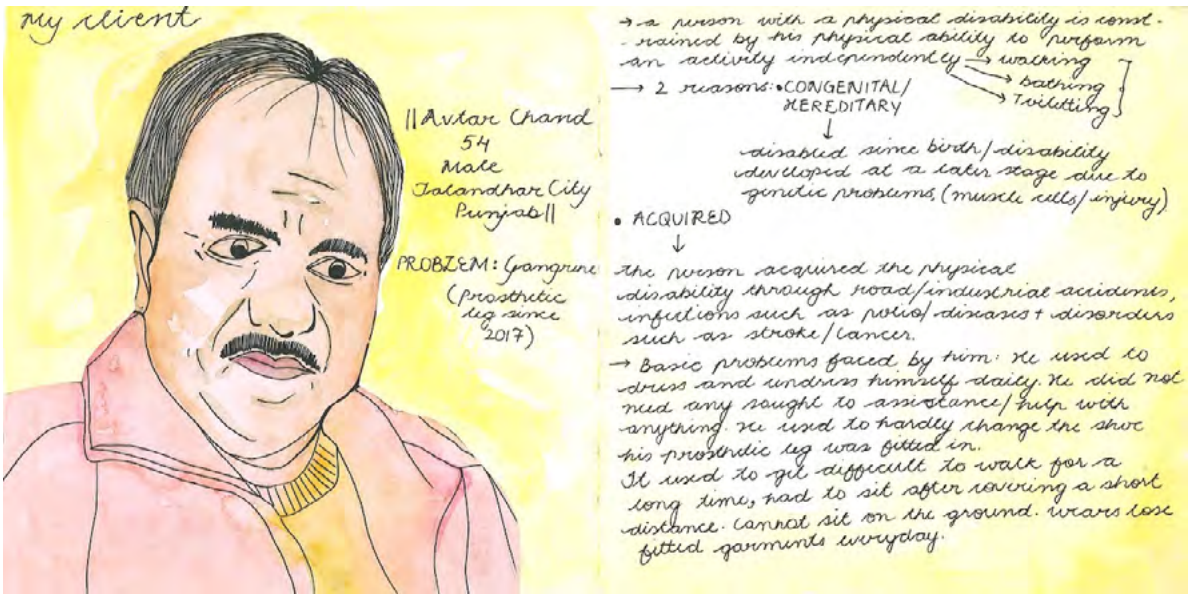

Figure 2. Journal entry, understanding the design problem.

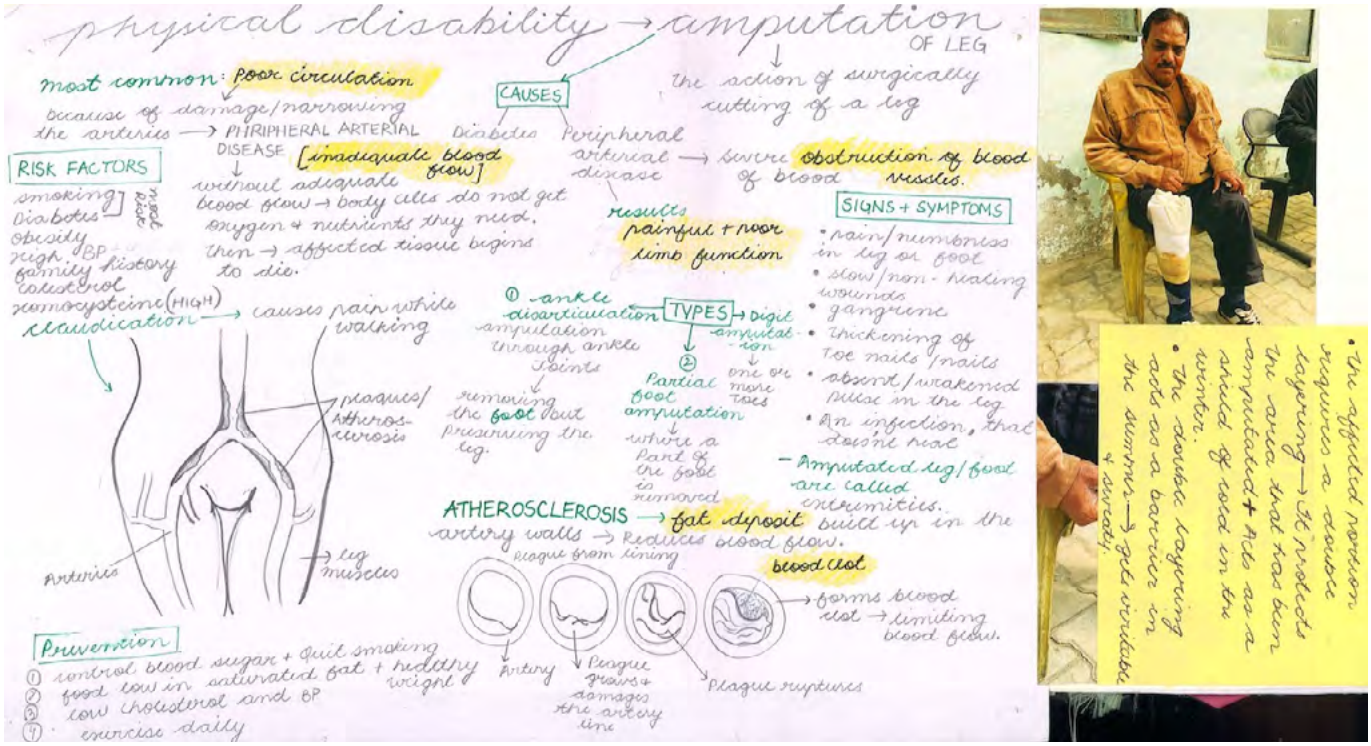

Figure 3. Journal entry, understanding the design problem.

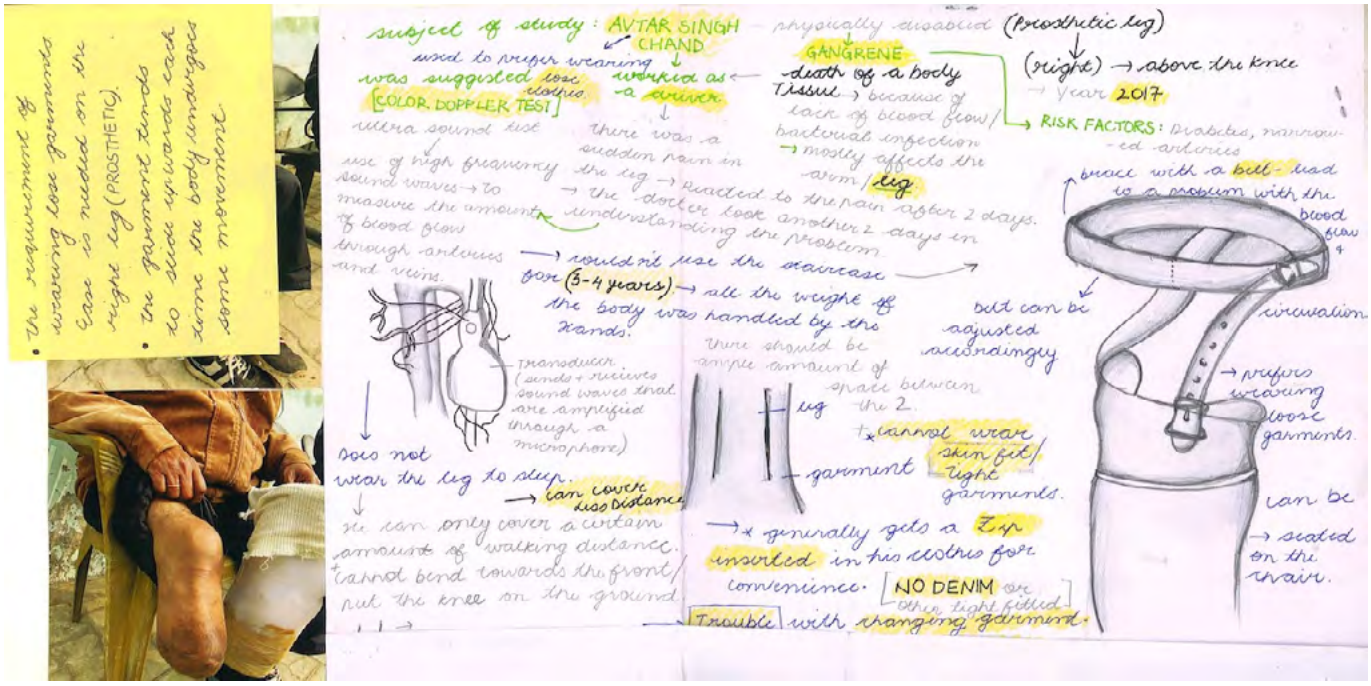

Figure 4. Journal entry, understanding the design problem.

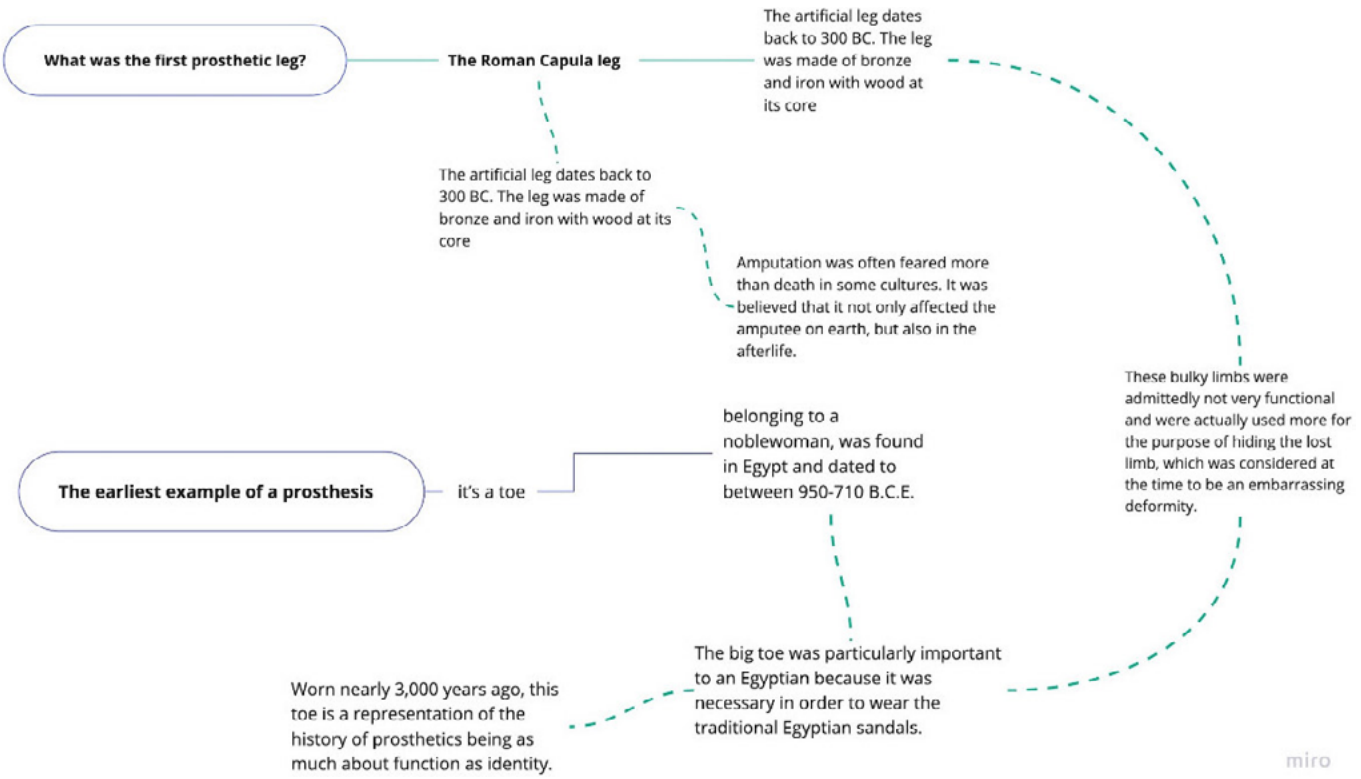

Figure 5. Online journal entry, research and analysis.

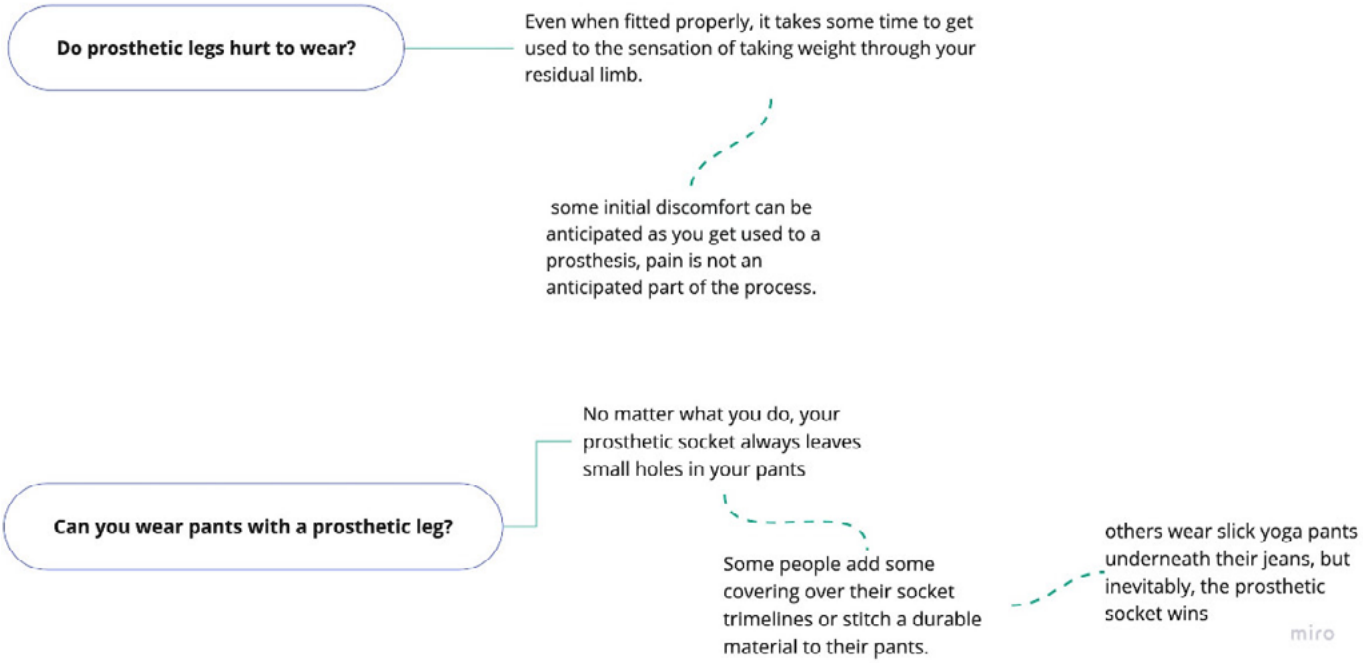

Figure 6. Online journal entry, research and analysis.

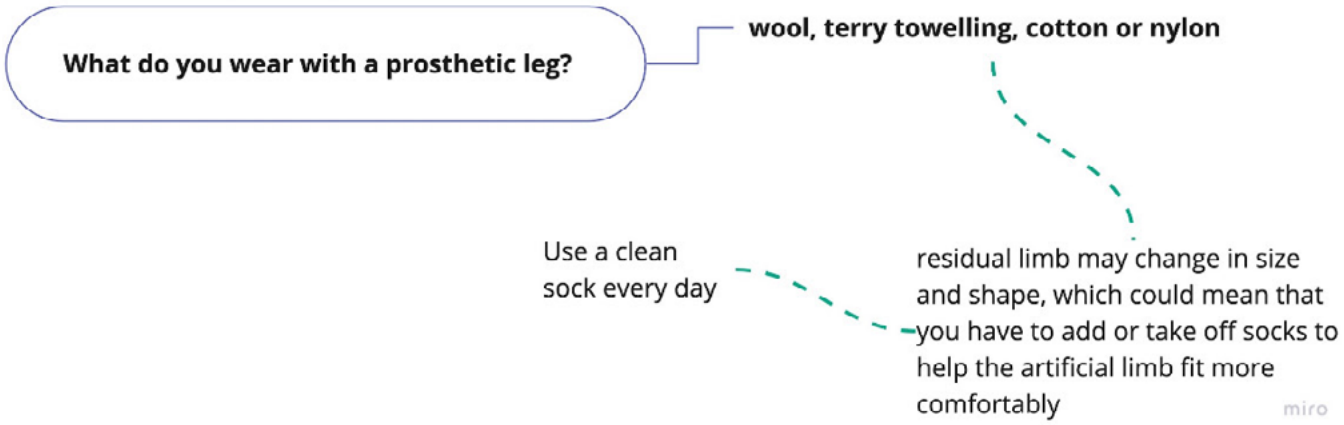

Figure 7. Online journal entry, *research and analysis*.

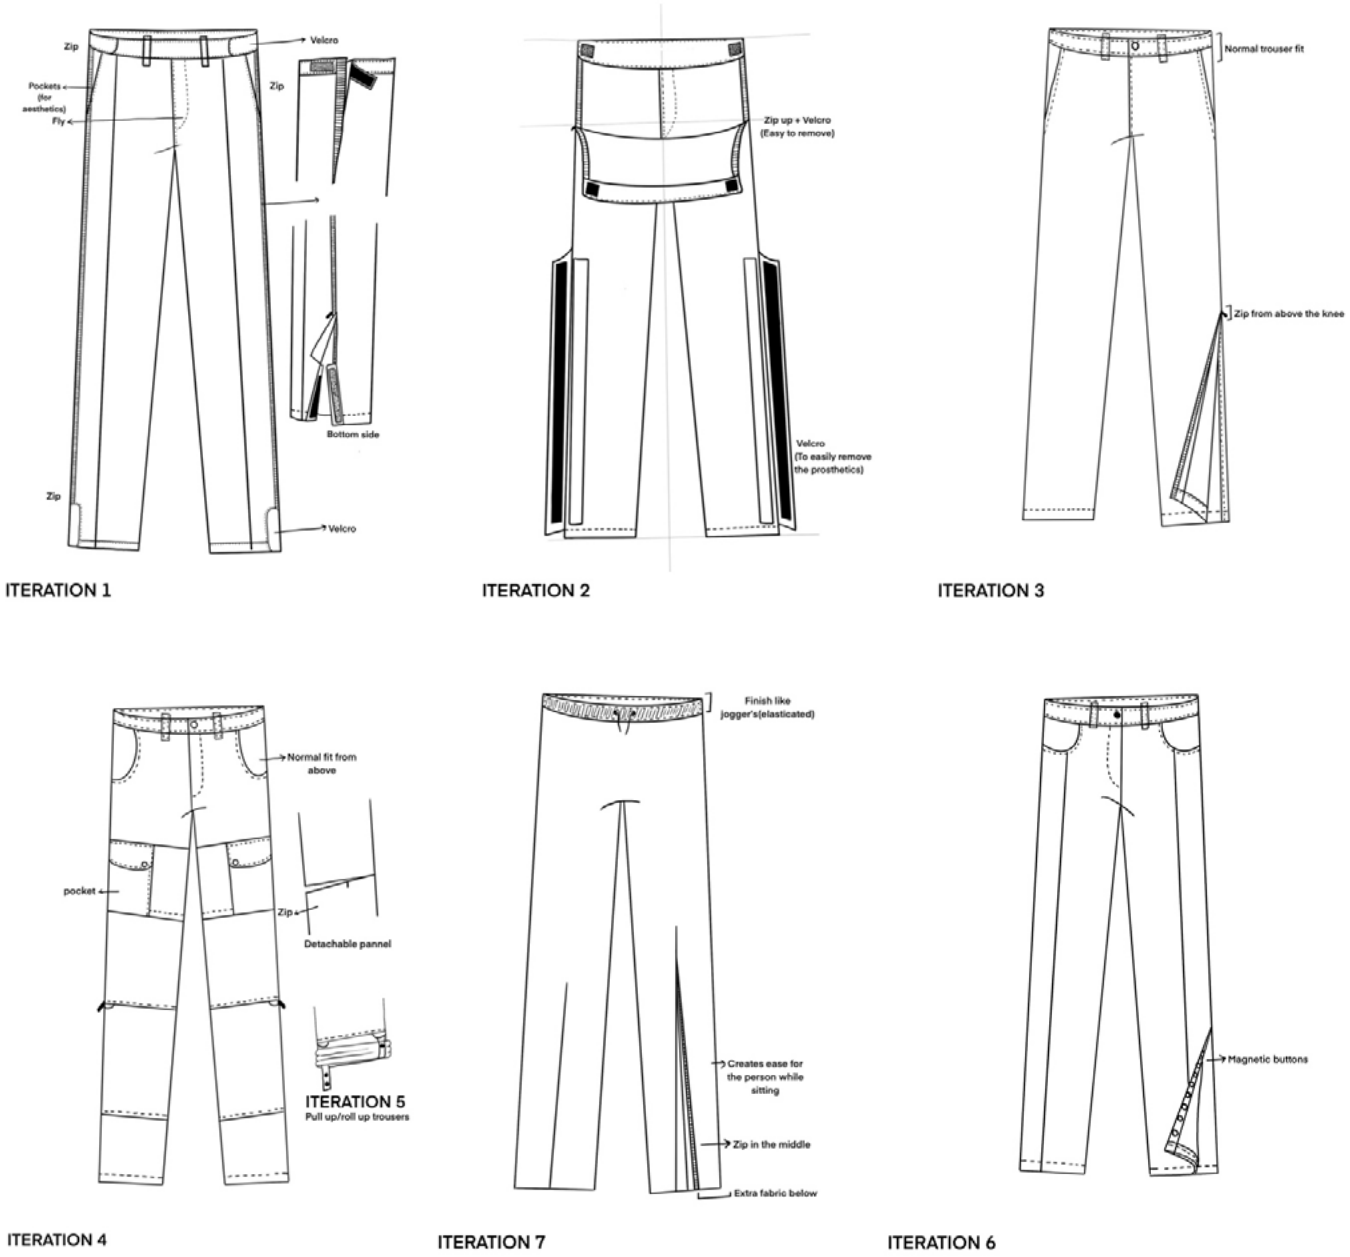

Figure 8. Finding a design solution – *iterations for the client.*

Student's self-reflection during the submission is quoted below:

> "Understanding body as a totality and understanding someone else's body was an interesting task to take on. From developing a basic framework in my head of what really is, the perspective did not remain constant at even one stage of the brief. My opinion kept shaping and changing from day to day. This brief was not just intuitive and sensitive towards certain topics but also helped us understand that vulnerability lies within us all. It was the most draining task to understand what really could be helpful for a man with prosthetic leg and how I could make his life simpler and also not make him feel excluded. I have gained so much through the course of this project and certainly think that my technical skills have improved because of making the final garment during this brief."

3.4 Student Survey and Feedback on the Brief

A survey was conducted with the L6 (final year) students who had attempted the brief when they were in L4. This cohort is now in their final graduation term (doing their MDP or Major design project) and now as independent learners they were asked to reflect on the brief. This was to assess if according to them the brief had been relevant, created value and if it is helping them approach design from a more robust perspective right now. It is pertinent to note here that while this brief was on, this cohort had struggled with the amount of primary and secondary research and data they had needed to collect in order to build their context. Keeping in mind this point, question 4 was added so one could get feedback on the brief within the curriculum as a whole and to assess if the students had changed their mind as they have become more 'seasoned designers'.

The questionnaire was as below:

1. Did you find the approach of body and diversity brief to be a problem-solving approach?
2. As a designer do you think the above approach equipped you with building a competence that would encourage you to take on difficult design problems in the future?
3. Did you find it challenging to engage with the context building because it required you to go in-depth into research and client engagement?
4. If you think this brief developed good understanding and wholesome learning and should stay as a part of the course, could you please elaborate on that as well?

Some of the replies received are presented below:

1. Did you find the approach of body and diversity brief to be a problem-solving approach?

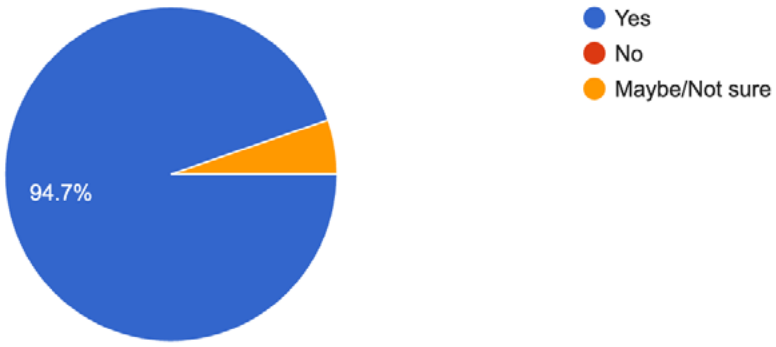

Figure 9. Gathered result from question 1.

2. As a designer do you think the above approach equipped you with building a competence that would encourage you to take on difficult design problems in the future?

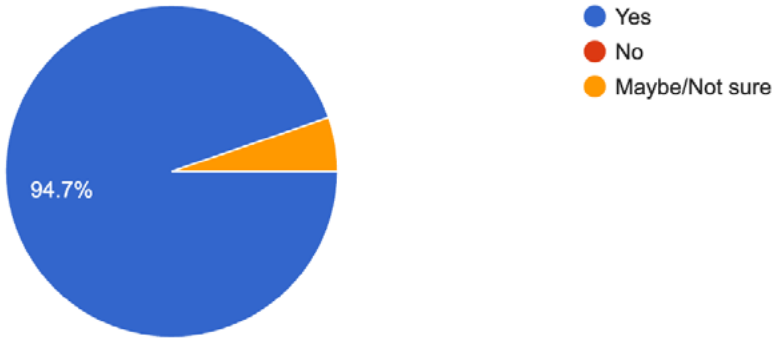

Figure 10. Gathered result from question 2.

3. Did you find it challenging to engage with the context building because it required you to go in-depth into research and client engagement?

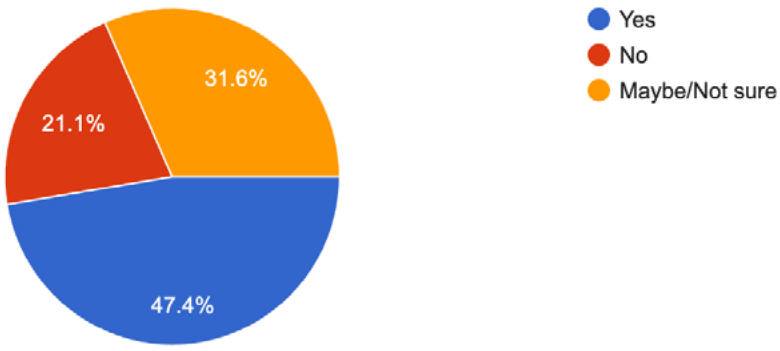

Figure 11. Gathered result from question 3.

4. If you think this brief developed good understanding and wholesome learning and should stay as a part of the course, could you please elaborate on that as well?

It is a good introduction to working with a real client for the first time in the course I, it is important since as designers, we have to cater to problems in the future and provide with what's needed.

Because by understanding bodies beyond the limited standard size helped me learn various design approach and solutions and also challenged me to create designs that are different, multi-functional and body inclusive. It also helped me understand the customer needs and how a garment could be playful yet functional for the wearer making their lives easier. I think it's important to know and learn about body/form, to be able to understand a garment as well or how one fabric falls different on different bodies that's were the learning started.

Figure 12. Gathered result from question 4 (contd).

I think it is necessary to know problem solving as a design practitioner and also the understanding of body is of the uttermost importance and should be there since L4. We see different boy types, structures daily but are not able to very exactly imagine garments on it because of the in-depth understanding of the body. Through my understanding of briefs in the past 2 years, I feel that the continuous sketching and understanding of body is important, for all briefs that line up after, even while the internship period. It makes planning the garment easier not just in terms of openings, closures, problem solving but most importantly understanding that every client is different.

As a designer we all have responsibilities. We are problem solvers but for a while fashion designers are only thought of beautification and making pretty dresses. But the responsibility reaches far beyond into having contributions in all sectors of life.

I didn't knew the right meaning of problem solving as a designer before this brief came up. It changed the way i used to think about clothing. A type of clothing which can actually make a difference in someone's life. I understood about consumer market and diversity of people who are in need for adaptive clothing. Interacting with a client was the major part of understanding someone's personal need that we wont get or understand through secondary research. Even the conceptual based designs became easy when I discussed with the client which helped me to get through the designing phase conceptually. Technical part was a bit difficult because making a shirt was a big task. Execution became quite easy because my ideology and purpose was clear.

Figure 13. Gathered result from question 4 (contd).

These type of projects are also important for fashion students because it help student to understand what people need from their clothes and help in practical application of what they have learnt. These projects help students to create garments that not only look good but also feel good to wear, comfort, better at problem solving thinking.

it's a requirement to understand how to do a project based on client needs as this will also widen the understanding and learning to working with clients as well as opening our minds and opportunity in adaptive clothing

As a fashion design student it is really important to understand a human body, the basis of our design and body and diversity as a project really immersed us into the understanding of it and creating design solutions to make it easier and accepted by the diversity in bodies around. To constantly evolve and upgrade these solutions.

I think a lot of learning about body and adaptive clothing begins with the help of this project.
A crucial part of this project is research which gets stronger in this project.
Introduction to clients and how to study them also adds to the learning which we don't do in other projects.

Figure 14. Gathered result from question 4.

4. Conclusion

This brief not only adds layers of complexity to students' thought processes but also cultivates empathy for diverse human experiences. It contributes to the creation of an inclusive environment within the academic setting and prepares students to tackle clothing challenges with a human-centric approach as future design practitioners and entrepreneurs. By expanding the scope of fashion education to encompass societal living and holistic design solutions, we can equip future designers with the tools and insights necessary to create meaningful and impactful contributions to the industry. Ultimately, fashion design should strive to bridge the gap between aesthetics and functionality, recognizing that clothing is not merely about "dressing up" but also about facilitating self-expression, comfort, and accessibility for all individuals.

As one of the student's reflection during the feedback survey (below) evidences the same:

> "Adaptive clothing is something that I got to know of from this project only. It has made me think of my future choice in this industry, which helped me to think how many people are suffering and still people working with fashion or clothing are yet not engaged enough with it. It is also about choice what a person makes and to continue with something that could mean everything to someone at a point of time. It is an emotional and strongest brief at the same time because you get to understand what the person has been through and how he is standing tough and dealing with those things both physically and mentally as well as spiritually. Every era that was taught and discussed at that time made me think about how a body figure that we know from Vitruvian man is now so diverse that we are now standing between GenZ and millennials. It's a lot to study and a very vast topic to undertand body and diversity."

There is a pressing need for fashion courses to place greater emphasis on diversity and inclusion as well as rethinking gender norms, both in terms of representation and design philosophy. This involves challenging existing norms and expanding the definition of beauty to encompass a wider range of identities and experiences. By doing so, fashion education can evolve into a more inclusive and equitable space that celebrates the richness of human diversity. "This also requires a shift in thinking from taking away from our world, community, economy, and environment to giving to it" (Doyon, 2016, as cited in Sala, 2016).

As educators and mentors in the field of fashion, it is incumbent upon us to integrate these critical conversations into our curricula and projects. By doing so, we can provide students with a more comprehensive understanding of the multifaceted nature of design and the role of fashion within it. It is essential for students to grasp that fashion encompasses more than just clothing; it is an expression of identity and inclusion that transcends gender, ability, and societal norms.
Through this exploration, the paper is attempting to illustrate how the incorporation of problem-solving approaches in fashion design education can stimulate alternative perspectives and nurture a more holistic understanding of the design process. If the aims and learning outcomes of the module state this is as a learning requirement, the approach of design pedagogy can cater to this existing need. Ultimately, this paper aims to contribute to the evolution of fashion education by advocating for a paradigm shift towards problem-solving-oriented pedagogy, thereby preparing future designers to meet the demands of an ever-evolving industry landscape.

KEYWORDS | FUTURES CONSCIOUSNESS, GENERATIVE AI, DESIGN CURRICULA, AFRICAN FUTURES

ABSTRACT | The COVID-19 pandemic has underscored the necessity for adaptable and innovative curricula in design education, particularly emphasising the integration of futures thinking to adeptly navigate the complexities of the modern era. This research, grounded in the South African design education landscape, investigates the confluence of futures consciousness and attitudes towards generative artificial intelligence (AI) among South African design educators. By leveraging the Futures Consciousness Scale and an adapted AI Attitudes scale, the study evaluates educators' preparedness to incorporate AI into their pedagogical practices, ensuring a balance between technological progression, cultural pertinence, and ethical considerations. Our findings reveal a nuanced understanding among educators of the complex systems shaping our world, coupled with a balanced anticipation of future possibilities. Notably, a statistically significant correlation was identified between educators' time perception and their positive attitudes towards AI, suggesting that a temporal understanding of past, present, and future influences receptiveness to AI in educational contexts. Despite the overall positive inclination towards AI as a driver for creativity and innovation, this enthusiasm is moderated by pronounced ethical concerns and a commitment to preserving cultural authenticity in design practices. This investigation enriches the dialogue surrounding the amalgamation of futures literacy and AI in design education, advocating for a curriculum that nurtures a forward-thinking mindset while sensitively navigating the socio-cultural nuances of the South African milieu. The insights garnered highlight the pivotal role of educator preparation in traversing the evolving design education landscape, advocating for the responsible harnessing of AI to cultivate an educational ecosystem that is both future-oriented and deeply rooted in cultural integrity.

1. Introduction

The evolution of education in Africa, particularly in the realm of design, is at a pivotal juncture, influenced by a rich historical tapestry and the pressing need for forward-thinking educational paradigms. The historical context of African education, marked by efforts to decolonise and localise curricula post-independence, sets the backdrop for our inquiry. However, the transition has been fraught with challenges, from pedagogical conflicts to resource constraints (Odoch Pido, 2014; Sawyerr, 2004). In South Africa, these issues are compounded by the legacy of apartheid, necessitating a nuanced approach to integrating new technologies and future-oriented thinking into design education (Heleta, 2018; Mampane et al., 2018; Mudaly, 2018). This research focuses on assessing futures consciousness and attitudes towards generative artificial intelligence (AI) among design educators in South Africa, a region with a unique educational landscape shaped by its colonial and apartheid past. Futures consciousness is crucial for nurturing the ability to anticipate and shape future scenarios (Lalot, Ahvenharju, Minkkinen, & Wensing, 2020), while generative AI represents a transformative force in creative disciplines, offering new possibilities for innovation and collaboration (Ooi et al., 2023).

The study aims to bridge the gap in understanding how futures consciousness and technological readiness intersect in the context of African design education. By exploring the attitudes of design educators towards the integration of generative AI into their teaching and design practices, we seek to uncover the potential for fostering a more adaptive and innovative educational environment. Our research is driven by the following objectives: to assess the level of futures consciousness among a sample of design educators in South Africa, to explore their attitudes towards the use and potential of generative AI in design education, and to understand how cultural and contextual relevance influence these attitudes. This exploration is set against the broader goal of enhancing educational practices to better prepare students for the complexities of the future.

The Futures Consciousness Scale (Lalot, Ahvenharju, & Minkkinen, 2021; Lalot et al., 2020) and an adapted AI attitudes scale (Schepman & Rodway, 2020) were used to gather data from design educators, providing a comprehensive view of their perspectives and readiness to embrace these concepts. In acknowledging the critical perspectives on technology integration, we emphasise the importance of cultural relevance and ethical considerations, ensuring that the adoption of generative AI in design education aligns with the principles of decolonisation and inclusivity (Adams, 2021; Mohamed, Png, & Isaac, 2020)). As we explore the intricacies of futures consciousness and AI attitudes, this study serves as a foundational step towards understanding the dynamic interplay between technology, education, and cultural context in shaping the future of design education in South Africa.

The significance of this study lies in its potential to ascertain the current state of educator readiness to incorporate AI into design education, based on their futures consciousness. By identifying key concerns and strengths, the study can offer insights into how design education in Africa can evolve to meet the demands of the future. By integrating futures consciousness and generative AI into the curriculum, educators can equip students with the skills and mindset needed to navigate and shape an increasingly complex world.

1.1 From Futures Consciousness to Futures Literacy

In the evolving landscape of design education, understanding the future is imperative. Futures consciousness refers to an awareness and understanding of the myriad possibilities that the future holds, serving as a foundational layer for perceiving, imagining, and understanding various future scenarios (Ahvenharju, Minkkinen, & Lalot, 2018). The five dimensions of future consciousness detailed in Figure 1—Time Perspective, Agency Beliefs, Openness to Alternatives, Systems Perception, and Concern for Others—encompass an individual's sense of efficacy and control over the future, optimism, capacity for critical thinking, tolerance of uncertainty, holistic and systemic thinking, eco-psychological self, and moral and communal considerations, all of which inform a person’s engagement with future possibilities (Ahvenharju, Lalot, Minkkinen, & Quiamzade, 2021).

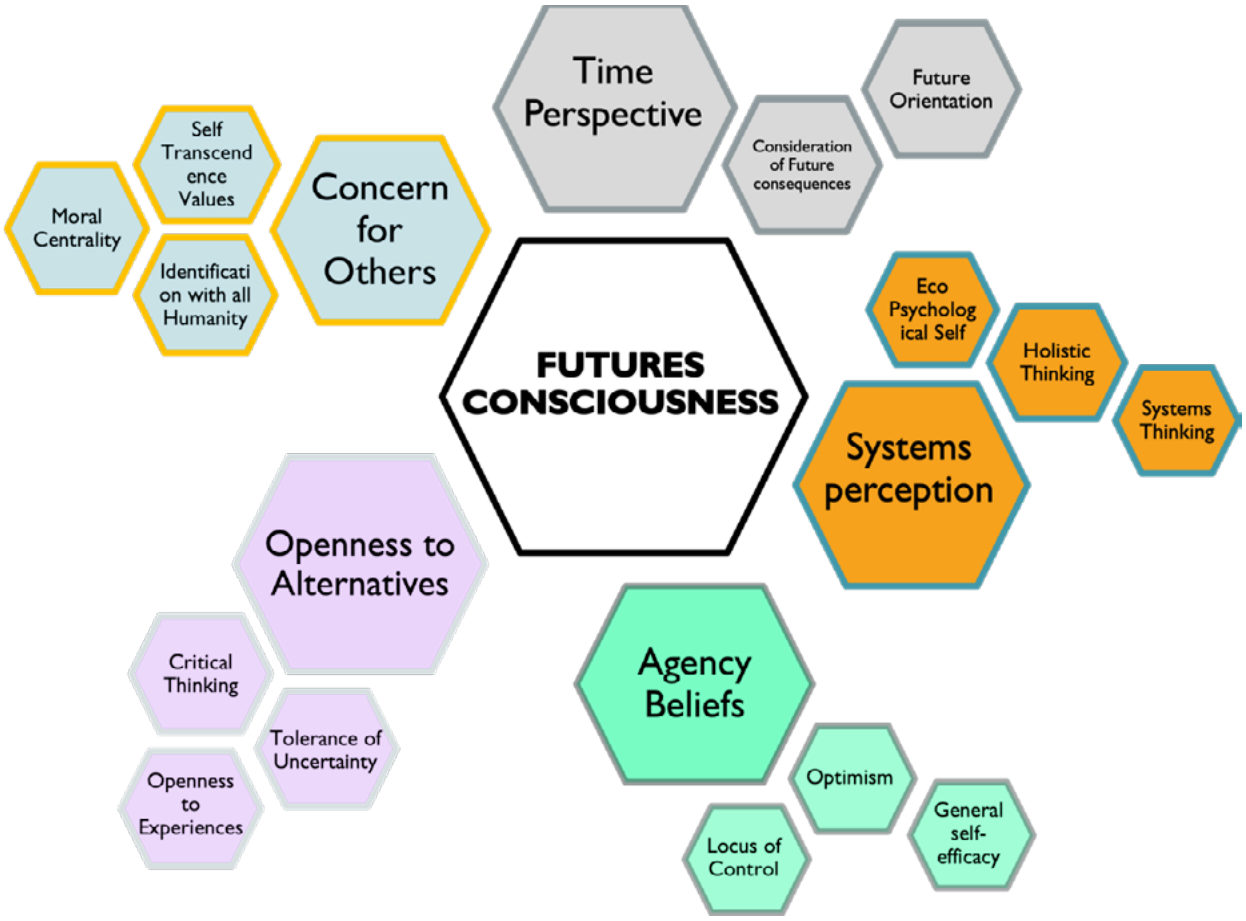

Figure 1. The five dimensions of futures consciousness (Finland Futures Research Centre, Ahvenharju et al., 2018).

Conversely, futures literacy builds upon futures consciousness, equipping individuals with the skills and methodologies to apply their orientation towards the future in practical decision-making and innovation, thus enhancing their ability to navigate and shape complex future contexts (Miller, 2015). Table 1 outlines the distinctions and overlaps between futures consciousness and futures literacy, highlighting their complementary roles. Understanding and engaging with future possibilities requires both, yet assessing futures literacy in educational contexts is challenging due to its broad and sometimes intangible skill set (Häggström & Schmidt, 2021; Mangnus, Oomen, Vervoort, & Hajer, 2021). Therefore, our study pivots toward exploring futures consciousness as a more accessible starting point for assessment in design education, using the Futures Consciousness Scale as our initial measurement tool (Lalot et al., 2021).

Table 1: Comparison of Futures Consciousness and Futures Literacy (from Ahvenharju et al., 2021, 2018; Facer & Sriprakash, 2021; Mangnus et al., 2021; Miller, 2015).

Aspect	Futures Consciousness	Futures Literacy	Similarities
Definition	Refers to an individual's awareness, attitude, and approach towards the future.	Involves the skills, knowledge, and abilities to effectively use information about the future.	Both relate to how people engage with and think about the future.
Focus	Emphasises psychological and cognitive dimensions, including beliefs, values, and emotions related to the future.	Focuses on the ability to analyse, interpret, and apply future-related information and scenarios.	Aim to enhance understanding and interaction with future possibilities.
Key Components	Time perspective, agency, open-mindedness, concern for the future, and participation in shaping the future.	Critical thinking, anticipation and scenario development, and the ability to apply these in decision-making.	Involve elements of forward-thinking and anticipation.
Educational Approach	Often developed through reflective practices, mindfulness, and emotional intelligence training.	Developed through educational programs that teach foresight methodologies, futures studies, and scenario planning.	Both can be cultivated through structured learning and personal development.
Application	Used to foster personal growth, resilience, and adaptability.	Employed in strategic planning, policymaking, and innovation to navigate future challenges and opportunities.	Both can enhance individual and organisational capacity to face future challenges.
Outcome	Enhanced personal well-being, a sense of purpose, and proactive engagement with the future.	Improved decision-making, innovation, and strategic outcomes by incorporating future insights.	Lead to more informed and considered approaches to future possibilities and challenges.

In African design education, the integration of futures consciousness and literacy is essential. Africa's journey through issues like climate change, rapid urbanisation, and socio-economic disparities calls for a forward-thinking approach to problem-solving and strategic planning (Cobbinah, Erdiaw-Kwasie, & Amoateng, 2015) Design educators have a responsibility to prepare students to create solutions that are not only innovative but also culturally and environmentally sustainable . By fostering futures consciousness, educators can encourage students to think beyond traditional design paradigms and consider long-term impacts and ethical implications of their designs. In the context of African design education, where unique socio-economic and environmental challenges prevail, such an approach is not just beneficial but necessary. The five dimensions of futures consciousness can serve as guiding principles for educators, helping to instil a holistic and forward-looking mindset in students. This is particularly relevant as they devise innovative and culturally relevant solutions to address issues like climate change, rapid urbanisation, and socio-economic disparities.

By prioritising the assessment of futures consciousness, we establish a baseline of future-oriented thinking among educators, which is a critical step toward enhancing futures literacy and fostering culturally and environmentally sustainable design solutions. The preparedness of educators is key to this integration, with support required to relate futures literacy to classroom practices effectively (Bateman, 2012; Slaughter Richard, 2008). Recognising futures consciousness as foundational allows for an inclusive development of futures literacy, which encompasses a wide range of adaptable methodologies. This approach ensures that futures literacy is informed by and respects diverse cultural landscapes, promoting a bottom-up approach where visions for the future are reflective of internal cultural landscapes, thus reducing the risk of cultural recolonisation.

1.2 AI and Design in Africa

That generative AI has had an impact on the design industry is undisputed (De Peuter, Oulasvirta, & Kaski, 2023, p. 85). These new tools are reshaping the workplace in many difference areas (Edberg & Beck, 2020). Digital design, a broad field that can be especially impacted by AI, includes professions that create and package graphic solutions used in “websites, mobile apps, video games, animation, and digital marketing materials” (Forsgren & Schröder, 2023, p. 6). The value to this industry of AI tools include time-saving, generating more options (such as colour palettes or layouts), possibly more creativity and reducing errors. Efficiency and innovation can be fostered using AI tools. Mundane and repetitive parts of the design process can be automated by AI, streamlining the process (Forsgren & Schröder, 2023, pp. 41–42). In fact, humans cannot compete in terms of speed of processing, prediction and project execution with automated systems or machine learning (Matthews, Shannon, & Roxburgh, 2023, p. 368).

While a variety of graphic design software was the first tool that revolutionised the creative processes, these increasingly include AI tools. In their 2020 study in the field of digital design, Edberg and Beck concluded that “AI has affected the nature of the digital design profession”, indicating a subtle yet significant shift in the design landscape that many practitioners may not fully recognise. Most designers, whether they realise it or not, engage with AI to some extent in their work, affecting the way they approach design problems (Edberg & Beck, 2020; Forsgren & Schröder, 2023, p. 41). This pervasive integration of AI invites scrutiny on its impact on employment and the potential for a homogenisation of design creativity (Forsgren & Schröder, 2023, p. 41).

Moreover, the integration of AI in the design process inherently involves the risk of perpetuating existing biases. Whether intentional or not, the issue of human bias and prejudice becomes part of the algorithms designed for AI, as seen in ”racist software” (Matthews et al., 2023, p. 374) . This highlights that a computer “cannot easily” develop a context appropriate response (Matthews et al., 2023, p. 372) and thus decolonialising AI is a concern amongst African design professionals and educators. The literature and discourse on decolonising AI emphasise the critical need to integrate decolonial theories to mitigate the complex risks AI technologies pose, particularly their potential to exacerbate vulnerabilities among marginalised groups.

Acknowledging these issues, Mohamed, Png, & Isaac (2020) advocate for a critical science approach that incorporates post-colonial and decolonial insights into AI development. They argue for the adoption of critical technical practices that are self-reflexive, recognise power imbalances, and incorporate learning from marginalised communities. These practices are aimed at reshaping educational methods to ensure AI development aligns with ethical standards and community-centric values.

At the heart of this new approach is a commitment to epistemic disobedience and border thinking, as conceptualised by Mignolo (2011). This involves challenging the dominance of Western knowledge systems and fostering a plurality of understandings that embrace the diverse "borderlands" of culture, thought, and knowledge production. By doing so, AI design can subvert traditional power dynamics and contribute to a design landscape that is not only inclusive and equitable but also rich with a multiplicity of socio-political, ecological, and economic perspectives.

This holistic view extends to the educational sector as well, where the decolonisation of AI is seen as a vital part of curriculum development. Zembylas (2023) underscores the importance of decolonial educational strategies that promote algorithmic fairness and counter digital neo-colonialism. The objective is to design and use AI in ways that foster decolonial futures and support equitable and just outcomes, particularly for communities that have been historically marginalised by colonial structures (Adams, 2021). Thus, the conversation about AI in design is not just about efficiency and innovation, but also about ensuring that these advancements contribute positively to all sections of society.

2. Research Methods

2.1 Participants

The study was conducted within the Applied Design department of a South African University of Technology (UoT). Participants were recruited through an electronic survey distributed to the department's educators, with an aim to capture a diverse representation of experiences and viewpoints. The survey reached 26 participants, which is approximately 65% of the department's faculty, ensuring a substantive sample for analysis. Participant demographics were recorded - encompassing gender, age, teaching experience, educational qualifications, and linguistic and racial background - to understand the diversity within the responses.

2.2 Instrumentation

The research instrument was a single, comprehensive, electronic questionnaire that amalgamated two scales and incorporated open-ended questions to capture qualitative data.

- **Futures Consciousness Scale (FCS):** The Revised Futures Consciousness Scale was used to measure the educators' future-oriented mindset across five dimensions. The scale is designed to be answered on a Likert scale, providing a quantifiable measure of each dimension of futures consciousness.
- **Adapted General Attitudes towards Artificial Intelligence Scale (GAAIS):** The GAAIS was adapted to specifically address attitudes toward generative AI within the design context. This adaptation included items that evaluate the perceived impact of generative AI on creativity, innovation, and educational practices in the South African design context.

The questionnaire also contained three open-ended questions aimed at eliciting qualitative insights into the participants' willingness to integrate generative AI into their curriculum, the perceived benefits of such integration, and their main concerns.

Data Analysis

Quantitative responses were subjected to statistical analysis to discern patterns and correlations within the data. Descriptive statistics illuminated the central tendencies and dispersions of the Likert-scale responses. Kendall’s Tau correlation coefficient (Salkind, 2007) was employed to identify relationships within the scales' dimensions and between futures consciousness and attitudes towards AI. Statistical software was used.

Qualitative responses from the open-ended questions were analysed thematically to extract deeper insights into the participants' perspectives, enriching the quantitative findings and providing a more nuanced understanding of the educators' stances.

2.3 Ethical Considerations

Ethical clearance for the study was obtained from the university's ethics committee, ensuring that the research adhered to the highest standards of academic integrity. Participants were informed about the purpose of the study, their right to confidentiality, and the voluntary nature of their participation. Informed consent was acquired electronically before the commencement of the questionnaire.

2.4 Limitations

Acknowledging the limitations inherent to electronic surveys and self-report measures, concerted efforts were made to mitigate bias and ensure the reliability of the data. To reduce self-selection bias, the study used targeted reminders to encourage a broad spectrum of participants to respond (Christensen et al., 2015), thereby aiming to secure a representative sample of the population. Despite these efforts, the potential for self-selection bias persists, as individuals who are more engaged or have stronger opinions may be more inclined to participate.

The study's generalisability is limited, as the participant pool was drawn from a single department of Applied Design, which may not reflect the diversity of design education settings across South Africa or other contexts. The findings, therefore, are not overstated and are presented as exploratory. This study serves as an initial foray into understanding the futures consciousness and AI attitudes within this specific educational context and provides a basis for future research that could expand to broader populations and regions.

3. Results

3.1 Futures Consciousness

In examining the data from our study, a pattern emerges regarding the participants' outlook on their influence over and understanding of the future. The dimension where participants rated themselves highest was *Systems Perception*, with a mean score of 4.19, indicating a strong collective grasp of the interconnectedness of various systems. On the other end, *Agency Beliefs* received the lowest mean rating at 3.44, suggesting a more moderate view of their ability to shape future outcomes.

The median scores in most dimensions lean higher than the averages, particularly in *Time Perspective*, *Openness to Alternatives*, and *Systems Perception*, hinting at an optimistic self-assessment among most participants in these areas. This is clearly visible in Table 2.

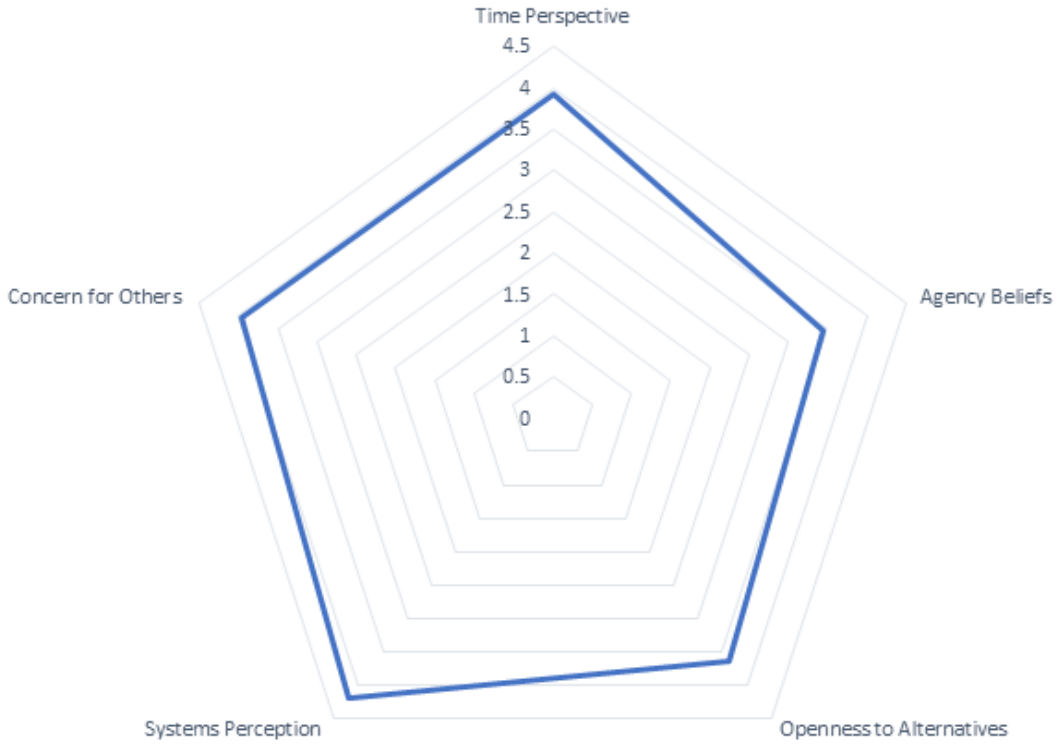

Figure 2. The mean results for the five dimensions of futures consciousness.

The standard deviation is relatively small across all dimensions, but it is narrowest in *Openness to Alternatives* (0.55), pointing to a high level of agreement in participants' willingness to consider different future possibilities. Although *Time Perspective* shows the widest spread in scores, its strong mean and median suggest that participants consistently consider the past, present, and future in their thinking. The similarity in scores for *Concern for Others* and *Openness to Alternatives* suggests a group that equally values the impact of their decisions on others and is open to new ideas.

Table 2. The mean, median and std deviation of results for the five dimensions of futures consciousness.

	Time Perspective	Agency Beliefs	Openness to Alternatives	Systems Perception	Concern for Others
MEAN	3,91	3,44	3,63	4,19	3,96
MEDIAN	4,00	3,50	3,75	4,38	4,00
STANDARD DEVIATION	0,80	0,69	0,55	0,70	0,61

Overall, the findings indicate a group with a shared and well-rounded perspective on futures consciousness, particularly marked by an insightful understanding of complex systems and a somewhat restrained belief in personal or collective agency.

3.2 AI Attitudes

This section presents responses from revised AI attitudes scale. The scale measured the perceptions of generative AI in the design field, particularly within the South African context. The responses are categorised into five options: Strongly Disagree, Disagree, Neutral, Agree, and Strongly Agree. The data was analysed to understand the participants' attitudes towards the use of generative AI in design, its ethical implications, its impact on creativity and innovation, and concerns about cultural sensitivity and privacy.

Figure 3. Visualisation of Positive Attitudes to AI results.

The dataset (figure 3) offers a perspective on the South African design community's views towards generative AI, characterised by a mix of optimism and caution. Ethical worries are pronounced, with 30.8% expressing 'Disagree' and 46.2% 'Neutral' on the ethical deployment of generative AI by design organisations. The responses show a divided stance on employing generative AI for routine tasks, with responses spread evenly across all options, indicating no definitive preference.

Nonetheless, there is a noticeable optimism regarding generative AI's capacity to enhance creativity and innovation, with 38.5% 'Agreeing' and 11.5% 'Strongly Agreeing'. The capabilities of generative AI are particularly impressive to many, as evidenced by the highest 'Strongly Agree' rate (38.5%) in this aspect.

There's a robust interest in integrating generative AI into design practice and education, with both 'Agree' and 'Strongly Agree' garnering 30.8% each for practice integration. Similarly, positive responses are seen for its potential to improve educational outcomes (42.3% 'Agree', 19.2% 'Strongly Agree') and to stimulate development (30.8% 'Agree', 26.9% 'Strongly Agree').

Despite varied opinions on AI's efficiency for routine tasks, with 'Neutral' (34.6%) being the most common response, there is a belief in its beneficial applications in education (30.8% 'Agree', 19.2% 'Strongly Agree'). The responses are split on AI's capability to outperform humans in creative tasks, yet there is a cautious optimism about its wider benefits, with 'Neutral' (38.5%) and 'Strongly Agree' (23.1%) being significant. The eagerness to use generative AI in teaching is evident, with 26.9% 'Agreeing' and another 26.9% 'Strongly Agreeing', showing a readiness to embrace AI tools in educational settings.

In essence, the data depicts a community that is cautiously optimistic about the role of generative AI in fostering design creativity, innovation, and education, albeit with reservations about ethical issues and mixed views on its efficiency and creative edge.

Figure 4 depicts the sample’s concerns about integrating generative AI, with a focus on cultural and ethical implications. A significant portion of respondents, 57.7% ('Agree') and 15.4% ('Strongly Agree'), express apprehension that the unique cultural aspects of South African design might be lost with the increasing use of generative AI. Concerns about privacy and surveillance issues in design education due to generative AI are also prominent, with 50% strongly agreeing this could be a risk.

The fear that generative AI may not fully comprehend the cultural context of South African design is shared by 26.9% ('Agree') and 53.8% ('Strongly Agree'), indicating a widespread concern. Similarly, 50% ('Agree') and 23.1% ('Strongly Agree') find the use of generative AI in design concerning due to potential cultural insensitivity, suggesting significant apprehension.

The possibility that generative AI might overshadow traditional design methods, integral to cultural identity, is another major concern, with 57.7% ('Agree') and 23.1% ('Strongly Agree') reflecting a majority viewpoint. Ethical considerations are also paramount, with 34.6% ('Agree') and 53.8% ('Strongly Agree') wary of uncritical generative AI use leading to unethical design practices.

Additionally, there is unease about relying on generative AI for creative aspects of design, with 30.8% ('Agree') and 26.9% ('Strongly Agree') showing varied levels of concern, while 42.3% remain neutral.

In summary, the data highlights significant apprehensions about the impact of generative AI on cultural integrity, ethical practices, and traditional design methods. The potential for privacy and surveillance issues is notably alarming to half of the respondents, with broad concern also about generative AI's ability to respect and understand the unique cultural context of South African design.

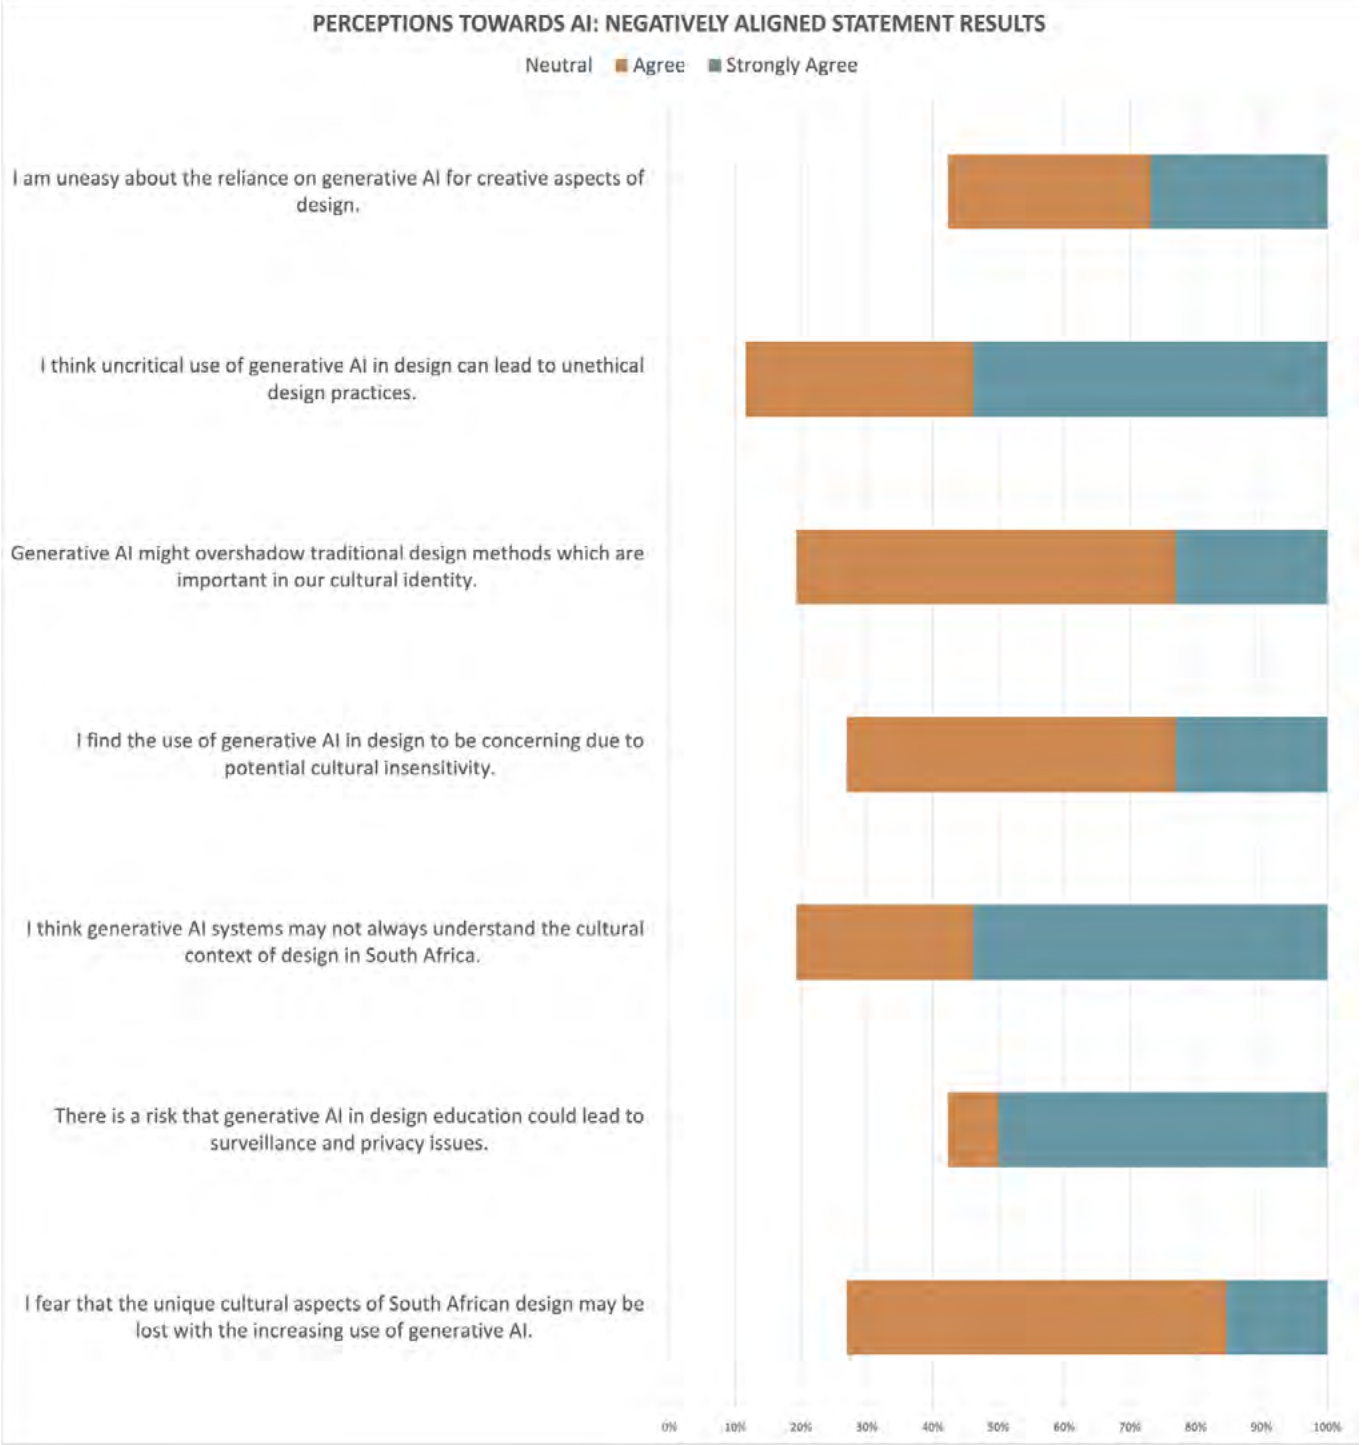

Figure 4. Visualisation of Negative Perceptions to AI results.

3.3 Correlation Between Quantitative Results

The Kendall's Tau correlation (Table 3) analysis conducted on the survey data from design educators revealed significant and meaningful relationships, underscored by confidence intervals that affirm the robustness of these findings. A significant positive correlation emerged between 'Systems Perception' and 'Time Perspective' (Tau = 0.461, with a 95% CI of 0.170 to 0.752, p = 0.003), suggesting a strong association between a comprehensive time perspective and an acute awareness of systemic interrelations. Correspondingly, 'Openness to Alternatives' showed a notable positive correlation with 'Agency Beliefs' (Tau = 0.475, with a 95% CI of 0.247 to 0.704, p = 0.002), indicating that educators who are more receptive to alternative ideas also tend to hold more potent beliefs in their efficacy to effect change. Moreover, a positive relationship was identified between 'Time Perspective' and 'POSITIVE' attitudes towards AI (Tau = 0.420, with a 95% CI of 0.178 to 0.663, p = 0.005), linking a forward-looking perspective with a propensity towards embracing AI in design education. These statistically significant correlations, bolstered by confidence intervals that exclude zero, provide a compelling narrative about the orientations of design educators, while also laying a foundation for subsequent studies to build upon and explore.

Table 3. Correlation of results for the five dimensions of futures consciousness and positive and negative attitudes toward generative AI in design.

Correlation

Kendall's Tau Correlations

Variable		Time Perspective	Agency Beliefs	Openness to Alternatives	Systems Perception	Concern for Others	POSITIVE	NEGATIVE

3.4 Qualitative Responses

The questionnaire asked three open-ended questions, and these reflect the perspectives of educators in the South African design education environment on three interrelated aspects: factors influencing their willingness to integrate generative AI into the curriculum, main concerns regarding the use of generative AI, and potential benefits of its integration. Across these responses, several themes emerged (Figure 5), encapsulating the complexities and nuances of introducing AI technologies into educational practices.

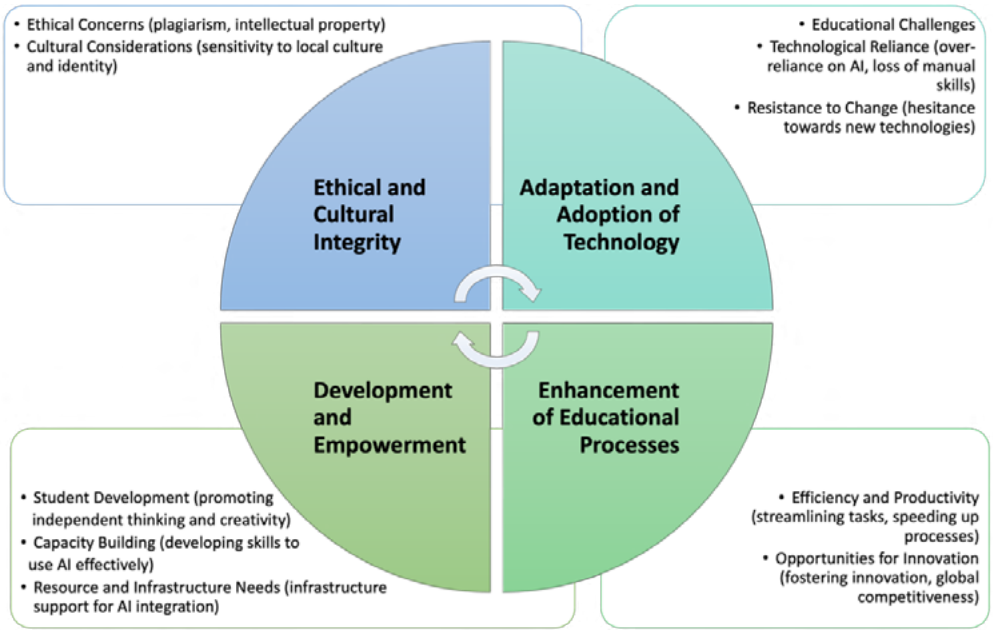

Figure 5. Considerations for introducing AI technologies into educational practices.

In the theme of *Ethical and Cultural Integrity*, educators express significant ethical concerns. Issues such as plagiarism and the safeguarding of intellectual property rights are at the forefront of the discourse. For instance, Participant 4 voices a critical perspective on the potential misuse of AI, underscoring the ethical dilemma with "Ethics in the use of/incorporation of the work of other designers." This concern is echoed by Participant 17, who stresses the systemic failures in the current educational milieu that might be exacerbated by AI without careful implementation. Simultaneously, an awareness of cultural considerations is evident. Participants are mindful of the need for generative AI to be sensitive to local culture and identity. Participant 24 articulates this by emphasising the need to "Guard against losing human touch that identifies us as South African," reflecting a desire to maintain the unique cultural fabric in the face of homogenising technologies.

Adaptation and Adoption of Technology is another overarching theme, where educational challenges such as updating curricula and teaching methods are considered critical. Participant 5 points out the risk of educational systems falling behind due to not keeping up with AI advancements. Further, technological reliance is a subtheme highlighted by Participant 15's concern about "Fear and not understanding the fundamental technology behind generative AI," illustrating the anxiety over an over-reliance on AI that may diminish manual skills and critical thinking. A resistance to change among academics was mentioned by Participant 19, who notes that "Academics hate change in particular certain groups more than others." This might point to inherent inertia in academic circles towards adopting new technologies. The potential for enhancement of educational processes is also recognised, for example participant 4 see generative AI as a means to eliminate mundane tasks for better use of time. This is tied to the prospect of opportunities for innovation, where generative AI could potentially keep South African design education on par with global standards, as per the hopes of Participant 26, who looks forward to "Integration that will keep us on a global par."

Lastly, the theme of *Development and Empowerment* the need for student development in the use of generative AI is noted, where fostering independent thinking and creativity is crucial, as Participant 7 fears the loss of originality and personal creativity. Capacity building is also underscored by Participant 31's mention of the "Lack of capacity building," indicating a need for skill development to effectively leverage AI. Resource and Infrastructure Needs, is also identified as a significant barrier by Participant 17, considering the existing "failed school education system."

These thematic insights reveal a complex and cautious optimism among educators, balancing the potential for technological empowerment with a commitment to maintaining ethical and cultural standards, and a cognisance of the significant systemic changes required for the successful integration of generative AI in design education.

4. Discussion

The integration of Artificial Intelligence (AI) into design education prompts a re-evaluation of pedagogical strategies and curriculum design to meet the demands of a rapidly evolving future. Our study has surfaced a key finding: the presence of a relationship between futures consciousness and attitudes toward AI among design educators, particularly within the dimension of time awareness. Educators with a deeper understanding of the interconnectedness of past, present, and future demonstrate more positive attitudes towards embracing AI. This correlation suggests that a nuanced perception of time might influence the adoption of future-oriented technologies.

Our investigation also reveals a general readiness among educators to integrate AI within design education, tempered by an understanding of the ethical considerations and a commitment to preserving cultural integrity, aligning with Adams (2021) concern for cultural integrity in technological adoption. This is also in line with Miller's (2015) notion of futures literacy, which emphasises the capacity to employ foresight and innovation within the context of one's culture.

However, our research also highlights critical areas requiring attention. The ability of educators to critically evaluate AI outputs for potential biases underscores the need for robust training programs focusing on AI ethics, culturally inclusive content, and the strategic use of AI in preserving cultural identity, aligning with Mohamed, Png, & Isaac's (2020) advocacy for decolonial approaches in AI development. Such educational initiatives are vital for fostering a futures consciousness that embraces the ethical dimensions identified by Ahvenharju et al. (2018), namely ethical pragmatism which emphasises practical wisdom and the integration of knowledge with ethical action, and an ethical concern for the future of others, highlighting the importance of values, morals, and ethical thinking in shaping futures.

Despite the optimistic stance on AI integration, the study confronts limitations due to its scope and sample size. The insights drawn from a single department at a South African University of Technology may not encapsulate the full spectrum of design education settings across Africa. Therefore, while the detected correlation between futures consciousness and AI attitudes is suggestive, it is not conclusive. The findings invite further inquiry into the diverse educational landscapes, cultural contexts, and design disciplines across the continent.

Considering these limitations, we conclude with strategic recommendations for advancing AI in design education. Curricula must evolve to integrate AI in ways that are consistent with decolonisation and inclusivity principles, reflecting the critical perspectives highlighted by Ndlovu-Gatsheni (2020). There is a clear imperative to close the infrastructure and resource gaps that hinder the full realisation of AI's potential in this field, as pointed out by Cobbinah et al. (2015). Moreover, the curriculum design must evolve to embed AI literacy, ensuring that students are equipped not just as users but as critical evaluators and ethical creators of AI technologies.

5. Conclusion

While the futures consciousness of our sample group appears relatively high, suggesting a forward-thinking mindset among educators, we recognise that futures consciousness alone may not suffice to navigate the rapidly evolving landscape of the design industry, especially with the advent of AI and other emerging technologies. This understanding serves as a critical starting point and a means to establish a baseline; however, the cultivation of futures literacy, particularly the cultural and ethical dimensions emphasised in Miller's framework, becomes imperative.

Miller's (2015) concept of futures literacy goes beyond mere awareness of future possibilities; it involves the ability to employ foresight and innovation within one's cultural context, thus enabling individuals to envision and shape futures that are culturally coherent and ethically sound. As echoed by insights from the All Africa Futures Forum (Karuri-Sebina & Miller, 2018, p. 166), capacity-building in futures literacy must engage with the rich tapestry of African culture and history. Findings from the forum concluded that "cultivating African Futures Literacy was seen as one mechanism for fostering identity precisely because it depends on a meaningful consciousness of heritage." This aspect of futures literacy is critical in design education where cultural relevance and ethical considerations are pivotal in the creation and implementation of design solutions.

To this end, our study underscores the importance of integrating futures literacy into design education to equip educators and students with the skills necessary to critically engage with AI technologies, assess their cultural and ethical implications, and apply this knowledge in their professional practice. The development of such competencies is essential for fostering a design education ecosystem that is not only technologically advanced but also culturally sensitive and ethically responsible.

Based on the study's findings, it is recommended to develop training programs focusing on AI ethics and to embed futures literacy within design curricula. Institutional support mechanisms are also suggested to aid in the ethical and culturally sensitive integration of AI in design education. These initiatives are vital for nurturing a futures consciousness that is attuned to the ethical and cultural dimensions of design practice.

Further research is needed to confirm the statistical correlation between time perception and AI attitudes, to explore the longitudinal impact of AI integration and to conduct comparative studies across different African cultural contexts. As we advocate for the integration of AI in design education, we must also champion the advancement of futures literacy as a key component of this transition. The journey towards a technologically enriched future in design education demands a concerted effort to uphold the rich tapestry of cultural diversity and ethical integrity that characterises the African continent. Our collective responsibility is to ensure that this evolution not only embraces technological innovation but also fosters an environment where cultural confidence and ethical considerations are at the forefront of educational endeavours. Educators play a pivotal role in shaping an educational ecosystem that embraces technology while staying true to cultural integrity. The importance of adaptability and responsiveness to technological advancements in education is emphasized, ensuring alignment with cultural values and ethical standards. Continuous research and adaptive strategies will be paramount in achieving a balanced integration of AI, where the future of design education is shaped by a harmonious blend of technology, culture, and ethics.

KEYWORDS | HARBIN BAROQUE ARCHITECTURE, INTERCULTURAL PRACTICE, SPATIAL EXPERIENCE, ARTISTIC EXPLORATION, EDUCATIONAL WORKSHOP

ABSTRACT | In an era where social connectivity burgeons, cultural diversity has become a mainstay in the tapestry of modern existence. Intercultural dialogue encourages individuals with different perspectives to overcome cultural barriers, to embrace others' values, and to find their place in society. In art and design education, art focuses not only on decorative aesthetics but can also stimulate innovative thinking and critical reflection through a multicultural lens. This paper revisits the "Through History" art education workshop held in the Baroque Architectural Area of Harbin, Heilongjiang Province, China, exploring cross-cultural practice's transformative role and value in artistic creation. Students engage with the environment to explore the connection between space and culture. Guided by practical creation, students experience space, proactively and passively enter intercultural contexts, and promote the creative transformation of complex cultural backgrounds. Based on the interaction between the space and the individual, this critical transformation encourages students to perceive and understand the cultural layers behind architectural environments and urban landscapes. The workshop fosters delicate interregional dialogue through self-reflection and cultural participation, enhancing the cultural identity of individuals and the community while potentially influencing local culture.

1. Introduction[1]

As the interconnectivity between societies continues to grow, cultural diversity is recognized as an inevitable reality of modern life. UNESCO supports interculturalism as a practice and approach that can deepen understanding of others' global perceptions. Interculturalism allows participants with different views to communicate, promoting acceptance of others' values and contributing to the peaceful coexistence between different cultures and identities.

In higher education, intercultural themes are highly regarded by educational scholars. As Tonkin (2004) stated: "If our young people do not learn about other societies, they may well be unable to cope with their own complexities." Interculturalism provides effective solutions; it encourages students with diverse cultural backgrounds to learn to cross cultural barriers, communicate and collaborate in an increasingly smaller multicultural world, enhance communication, decision-making, and teamwork skills, and find their position in the complex work environments of the future.

In art and design education, art provides profound inspiration. Art is not limited to exploring form, resulting in shaping or mere "decorativeness." It also finds ethical ways to intervene between social humanities and technological development through understanding the art creation process and critical construction of imaginative and creative scenarios. In other words, through artistic, creative methods, cultural diversity becomes an essential catalyst for inspiring innovative scenarios and critical thinking. In the digital age, art helps to cultivate the core professional qualities of the next generation of creative and humanities industry practitioners (Eldridge, 2003).

This article will take an interregional art education workshop as an example to explore the critical transformation of intercultural practice. The workshop, titled Traversing History, held in the Baroque Architectural Area in Harbin, Heilongjiang Province, China, aimed at cultivating students' creativity and encouraged students to use themselves as research tools, focusing on the direct and indirect experiences of spatial information. It explores the relationship between spatial sites and psychological cognition in the context of cultural diversity. Students are guided through acts of artistic creation to actively or passively explore multicultural scenarios and reflect on the significance of complex cultural environments in stimulating individual creativity. Moreover, the article will discuss the contribution of the workshop, separated as educational influences and the potential impact of fostering creativity on the cultural development of the Baroque architectural area.

This article explores three parts:

The first part explores Harbin's urban history and the Baroque District's environmental changes. Cultural diversity and complexity construct the unique civilization system of Harbin, which provides an objective existence for exploring channels of communication and multicultural coexistence.

The second part discusses the transformation process of artistic methods in a cross-cultural context. In this part, the workshop promotes students' participation in regional cross-cultural narratives through teaching methods. It introduces visual arts practices after interacting with their multiple identities with environmental sites and knowledge information guided by practice.

The third part unfolds in three stages of discussion: Stage [i] explains the narrative logic of spatial sites, underpinning a theoretical base for the on-site exploration for the next. Stage [ii] concerns how art, as an educational method, guides students to dig out and translate local cultural information, train cross-cultural thinking, and cultivate creativity. Stage [iii] analyses the contribution to the educational environment and the indigenous culture.

[1] This research is supported by the Natural Science Foundation of Heilongjiang Province of China (Grant No. LH2023E049).

2. Background

2.1 Urban History and Baroque Architectural Complex

Harbin, located in the southeastern part of China's Heilongjiang Province, has a history that traces back thousands of years. However, its development as a city began from the late 19th to the early 20th centuries. In 1896, the Qing government, to accelerate the Northeast region's development, permitted Russia to construct a railway that would traverse the Northeast—known as the China Eastern Railway and the Bin Zhou Railway. With the construction of the railway, many Russians, as well as Han Chinese from other regions of China, moved in, spurring local economic development. Harbin gradually evolved into an important commercial center and transportation hub. Due to its strategic location and unique historical background, Harbin rapidly developed from a collection of villages into a major metropolis in the Far East (Clausen & Thogersen, 2016) (Wenzhuo, 2021).

At that time, China Eastern Railway divided Harbin into two parts: Daoli and Daowai. In Mandarin, "Dao" refers to the railway; thus, Daoli is the western area of the railway, and the central was known as “Bu Tou District”[2]. While Daowai, known as "Fu Jia Dian District" is the eastern area (Figure 1), and consisted of several villages that formed a settlement area for Chinese people.

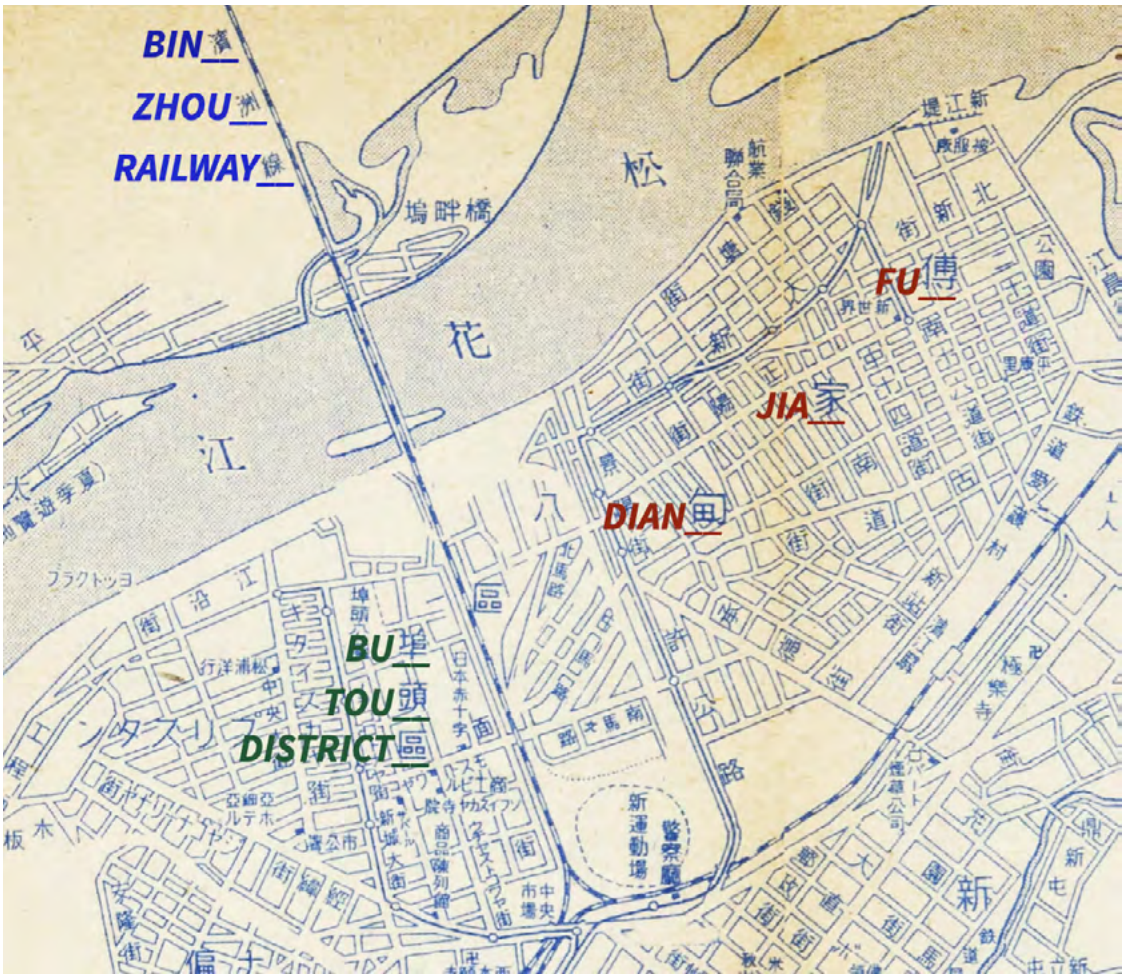

Figure 1. Partial street map of Harbin City, Japanese made in 1940.

[2] Daoli was separated in three parts by the Japanese military in 1932, Bu Tou District was the one of the three, see details: http://www.hrbdl.gov.cn/hebdlq/col6/202302/c01_862585.shtml.

Daoli and Nangang Districts were territories associated with Tsarist Russia. The foreigners led the large-scale urban construction - buildings featuring Art Nouveau, Baroque, Classical, Renaissance, and Eclectic styles appeared one after another. Among these, Chinese Street (now Central Street) is relatively well-known. In Daowai, Chinese national capitalists and immigrants acquired land in the hinterland of Daowai (Fu Jia Dian) (Figure 2). The enthusiasm and prosperity of Baroque architecture coincided with their desire to flaunt wealth, leading them to replicate the opulent Western-style buildings across the street. They employed symmetrical design to emphasize the centrality and balance of the buildings.

Figure 2. Historical street view: Chinese street in Daoli District and Zhengyang Street in Dowai District.[3]

Under the meticulous design and craftsmanship of Chinese artisans, architectural concepts influenced by Western systems harmoniously blend with the distinct socio-cultural characteristics of the local area. Across the facades of these buildings, one can witness the emergence of ornate Chinese motifs that symbolize good fortune and prosperity, such as intricately crafted bats, vibrant pomegranates, auspicious money toads, and delicate peonies. These decorative elements exude an aura of luxury and sophistication, elevating the aesthetic appeal of the structures.

Regarding their functional layout, the buildings in the Daowai area serve predominantly for commercial purposes. The front sections are designated as bustling shops in a cost-effective arrangement, drawing in customers and showcasing merchandise. In contrast, the rear sections are set as factories, serving as versatile spaces that accommodate living quarters and storage facilities. This clever utilization of space caters to the practical needs of the community while optimizing resources (Carter, 2000).

The convergence of diverse cultural influences has contributed to the development of a distinctive architectural landscape in the Daowai area. The fusion of Western-inspired architectural concepts with traditional Chinese decorative motifs has given rise to a unique architectural form and style.

2.2 Current State of the Baroque Area

In the 21st century, the economic development of Harbin still relies on traditional heavy industry and manufacturing, particularly in sectors such as aviation, aerospace, and automobile manufacturing, as the global financial market demands internationally shift. The singular industrial structure in Harbin is under significant pressure to transform.

Despite Harbin possessing some well-known scientific research institutions and higher education establishments, its innovative drive, oriented towards high-tech industries, is insufficient compared with its former industrial economic status and the innovative developments in China's southeastern coastal regions. The lack of innovation has led to reduced job opportunities, directly resulting in the outflow of the young population. This, in turn, has exacerbated the issue of an ageing population, with increased

[3] Source: https://kehilalinks.jewishgen.org/harbin/Sitsky_Postcards.html.

demands for medical care, pensions, and other social welfare needs. Consequently, this leads to slow economic growth and increased financial pressure on the government, particularly in maintaining infrastructural investment, which is reflected in the preservation of local historical buildings (Kirichkov & Levoshko, 2016).

Figure 3. Current street view: Baroque Architectural Area, Daowai District.

Due to the lack of economic impetus and unclear government policies, the Baroque Area needs more cultural maintenance after relocating its original residents. Many buildings have fallen into disrepair over time. Although the buildings have largely retained their original appearance, varying degrees of ageing and damage have appeared on the main brick and wood structures and exterior walls, with some walls showing fractures and partial collapse. In 2007, the local government listed the "Chinese Baroque District" as a critical project for protection and renewal, starting the restoration of the Chinese Baroque architectural complex. However, due to development constraints, the quality of these renovation and renewal projects was low, which showed an excessive homogenization of renewal, leading to a decrease in the regional cultural appeal (Figure 3).

The Baroque architectural area serves as a hub of integration for various cultures, positioned at the geographical crossroads of different cultural spheres and having experienced many economic shifts and political influences throughout history. The intersection of these two factors reveals how cultural diversity and complexity have evolved gradually in this region under the influence of diverse social forces. These evolutions have shaped the local social identities and cultural affiliations and contributed to the construction of Harbin's distinctive civilizational system. This scenario provides a tangible framework for exploring intercultural communication and the coexistence of multiple aspects of cultural context.

3. The Workshop on "Traversing History"

The "Traversing History" workshop was a 10-day immersive program designed for interdisciplinary education, focusing on exploring Harbin's Chinese Baroque Historic District under perspective fields such as facades, courtyard, and historical context. This unique workshop aimed to unite students and professionals from various disciplines, including architecture, intelligent buildings and construction, landscape design, digital media arts, trade economy, Chinese international education, and social service, to comprehensively analyze and creatively represent this architecturally rich area.

In addition to these explorations, participants engaged with literature on space and memory, seeking to broaden their thinking and connect with the multitude of cultures that intersect in the district through the tutoring of scholars. This challenge encourages breaking free from conventional environmental perceptions and constructing imaginative scenarios for the visual translation of poster design. The workshop culminates in an exhibition where these thematic pieces, rich with personal expression, are open to scrutiny from different perspectives of their peers. This fosters a critical understanding of one's views and those of others in the context of the shared spaces and nurtures an individual's poetic and sensory awareness.

3.1 Description

The discussion will be opened by the following three Tables (see Table 1, 2, 3). The workshop is structured into five phases, each designed to build upon the last, offering twenty-six participants a comprehensive and layered understanding of the subject matter. The second phase of the workshop is particularly intensive, comprising four separate tutorials that provide in-depth knowledge and hands-on guidance.

Table 2. Participants with their perceptual touchpoint during city walk phase 1 and 2.

CITY WALK PHASE 1: Leading by Local Harbin Scholars

City Walk Phase 1 is a unique educational experience designed to immerse students in the rich cultural and historical tapestry of Harbin. Students are required to conduct **immediate observational recordings** to capture and retain the depth of their engagement with the architectural heritage in Baroque area.

TUTORING PHASE

SECTION 1: Introduction
Students & All Tutors
The introduction section is designed for students to communicate and share what they recorded during City Walk Phase 1, as well as to get to know one another's backgrounds in the presence of all tutors. This initial interaction will establish a collaborative learning environment and enable everyone to build upon the diverse experiences and insights gained from the first phase of our exploration.

SECTION 2: Facade
Tutors (British art scholar lead)
In architecture and city planning, a facade is the exterior front face of a building that is one of the most important architectural elements, as it sets the tone for the building's design and the surrounding environment. In this section, students are encouraged to observe the design elements, and stylistic features through an artistic and poetic way.

SECTION 3: Courtyard
Tutors (China Harbin-based literary scholar lead)
Yard refers to the grounds surrounding a building or a communal space within an urban setting. In Harbin, yards might be a part of residential complexes, public spaces, or historical sites. This examining yards section teaches students to understand how these spaces are used by residents, their role in community interactions, and their significance in urban design and planning.

SECTION 4: Cultural study
Tutors (UK London-based art & design scholar lead)
The historical component of this section focuses on the way Harbin's past shapes its present. This involves examining the city's development over time, the influence of various cultural and political forces, and the preservation of historical sites. As well as understanding the importance of creativity through the transformation of visual design practice.

CITY WALK PHASE 2: Leading by British art scholar

City Walk Phase 2 enriches the initial experiential layer established in the first phase by incorporating additional scholarly dimensions—namely, the analysis of architectural **facades**, **courtyards**, and **historical evolution**. During this stage, an art scholar from the UK engaged with the locale for the first time, leading two academic readings as part of the walk. The initial reading was sourced from the 2016 article "Tourist Quarter 'Chinese-Baroque' of Dao Wai District in Harbin City: Experience, Problems, and Perspectives of Renovation," which examines the preliminary stages of the district's urban renewal. The ensuing discourse was based on Wenzhuo Zhang's 2021 paper, "Renovation, Gentrification, and Revitalisation of the Chinese Baroque Area in Harbin: Lessons Learned from a Heritage-Driven Urban Development Project." The introduction of this work delineates the derivation of the 'Chinese Baroque' concept, with Zhang referencing Yasuhiko Nishizawa, a Japanese architectural historian, to illustrate the area as a testament to intercultural architectural practices. This phase's objective is to re-evaluate and deepen the understanding of the immediate urban environment by juxtaposing the established local knowledge shared by regional knowledge with the fresh perspectives brought by international scholars. This integrative approach aims to foster a comprehensive re-examination of the urban experience through a multifaceted academic prism.

EXHIBITION

Table 3. The workflow of the workshop.

Participants are engaged in city walks for the initial phase and again in the third phase. These city walks serve as practical settings where attendees can directly observe and interact with the subject of their study - the Harbin Baroque Architectural Area. The first city walk is a quick-look exploration and observation, allowing participants to familiarize themselves with the area and its unique characteristics. Following the initial city walk, participants engage in the second phase with scholars who provide valuable insights and theoretical frameworks relevant to the district. This learning phase is critical as it equips participants with the necessary tools to analyze and interpret their observations. After introducing the participants and scholars, they had an initial impression of each other. Then, the third phase sees another city walk, but this time with a more analytical lens. Participants are encouraged to apply the knowledge gained from the scholarly tutorials. They compare and contrast their initial recordings and impressions with a more informed perspective. This juxtaposition aids in understanding the evolution of their perceptions and the depth of their learning.

Notably, the tutoring phase has one introduction section and three sections in facade, yard, and history perspectives led by three scholars. This structured approach allows students to delve deeply into their subject matter, preparing them to undertake their second city walk in phase three with a more critical and informed eye (Figure 4).

Figure 4. City walk phase 1 and 2.

Participants also have the opportunity to synthesize their observations and insights in the creativity phase. They engage in collaborative projects that challenge them to represent their understanding of the Chinese Baroque Historic District through various forms of visual communication. The final phase culminates in a showcase where participants present their projects. This phase is designed to foster an environment of peer review and open dialogue, allowing for a rich exchange of ideas and feedback. It is an opportunity for participants to display their work and reflect on their growth and the collective knowledge they have built throughout the workshop, contributing to the existing method of education.

3.2 Significance

The workshop's significance is deeply rooted in its structured approach, which integrates classroom learning with experiential activities by combining tutoring (Figure 5) and city walk phases.

Figure 5. Tutoring phase.

As the Table 3 shows, the Tutoring Phase is fundamental in laying the groundwork for a multifaceted exploration of culture and creativity. The diversity acknowledged in the self-introduction session celebrates variety and strategic recognition of the rich tapestry of experiences that can inform and enhance learning. The students were exposed to a spectrum of perspectives, from the Baroque-inspired works of Pablo Bronstein to Julia Cameron's insights into creativity (Cameron & Bryan, 1993).

This phase is significant because it primes students for a transformative journey, urging them to step beyond their comfort zones and habitual perceptions. Another one is the City Walk Phase, which is crucial in embodying the learned concepts and transitioning from theoretical instruction to tangible, real-world engagement (Bradfield et al., 2022).

The dual-part structure of the walks - from local insights to an external academic lens - enhances the learning experience by contrasting and complementing local knowledge with broader, philosophical interpretations of space, as inspired by thinkers like Gaston Bachelard (2014). The evolution of student perception from an aesthetic appreciation to a deeper contemplation of authenticity and cultural narratives illustrates the profound impact of active, observational learning.

The workshop's holistic approach signifies a powerful educational paradigm where the integration of stimulating classroom discussions and direct observation leads to rich, contextually grounded creative expressions. This methodology promotes cultural intelligence and sensitivity, equipping students with the necessary skills to produce culturally meaningful and impactful work. As they transition from passive learners to active creators, they engage in a deeper dialogue with their subject matter, resulting in a more comprehensive understanding of intercultural art education.

3.3 Creativity Outcomes

In the creativity phase, post-tutoring, students were tasked with transforming their sensory abstractions into visual forms within an educational setting intentionally crafted to disrupt the norm. The instructors galvanized students to venture beyond the typical, urging them to rethink and reshape standard visual interpretations and representations, resulting in pioneering and unorthodox visual creations. The following images (see Figure 6-10) are of the students' works, along with five students' feedback.

Figure 6. Students' practices part 1.

Student P2: The inspiration for the work stemmed from a city walk along the Chinese Baroque-style street. At that time, the entire street was undergoing restoration and renovation of dilapidated buildings, thus intertwining traces of new and old architectural context were visible, alternately revealing a sense of historical depth and vibrant life. It felt like with each step, one might step into a different era. One could

only measure it step by step. As a result, I combined the photos I took at the time with historical photos from the historical era to create a collage poster. This poster is intended to express the feeling of traversing through time and space and hopes to remind people to protect historical architecture and to appreciate the enduring charm of Harbin, which remains even after dramatic changes over time.

Figure 7. Students' practices part 2.

Student P5: "Behind the Window" captures the visage of women from the historic Chinese Baroque district using a two-dimensional composition. Wandering through the Chinese Baroque streets, I came to realize that it once harbored the marginalized, including many deaf-mute women, who had lost their agency in life, their traces are now scarcely discernible in contemporary documents. "Behind the Window" seeks to preserve their narratives.

In the piece, Baroque window designs are merged with the traditional peony motif, symbolizing the women's view of the outside world; while the courtyard staircases represent the cyclical and confined lives within the 'front shop, back factory' layout. "Behind the Window" serves both as a tribute to these women and a poignant reflection on that era.

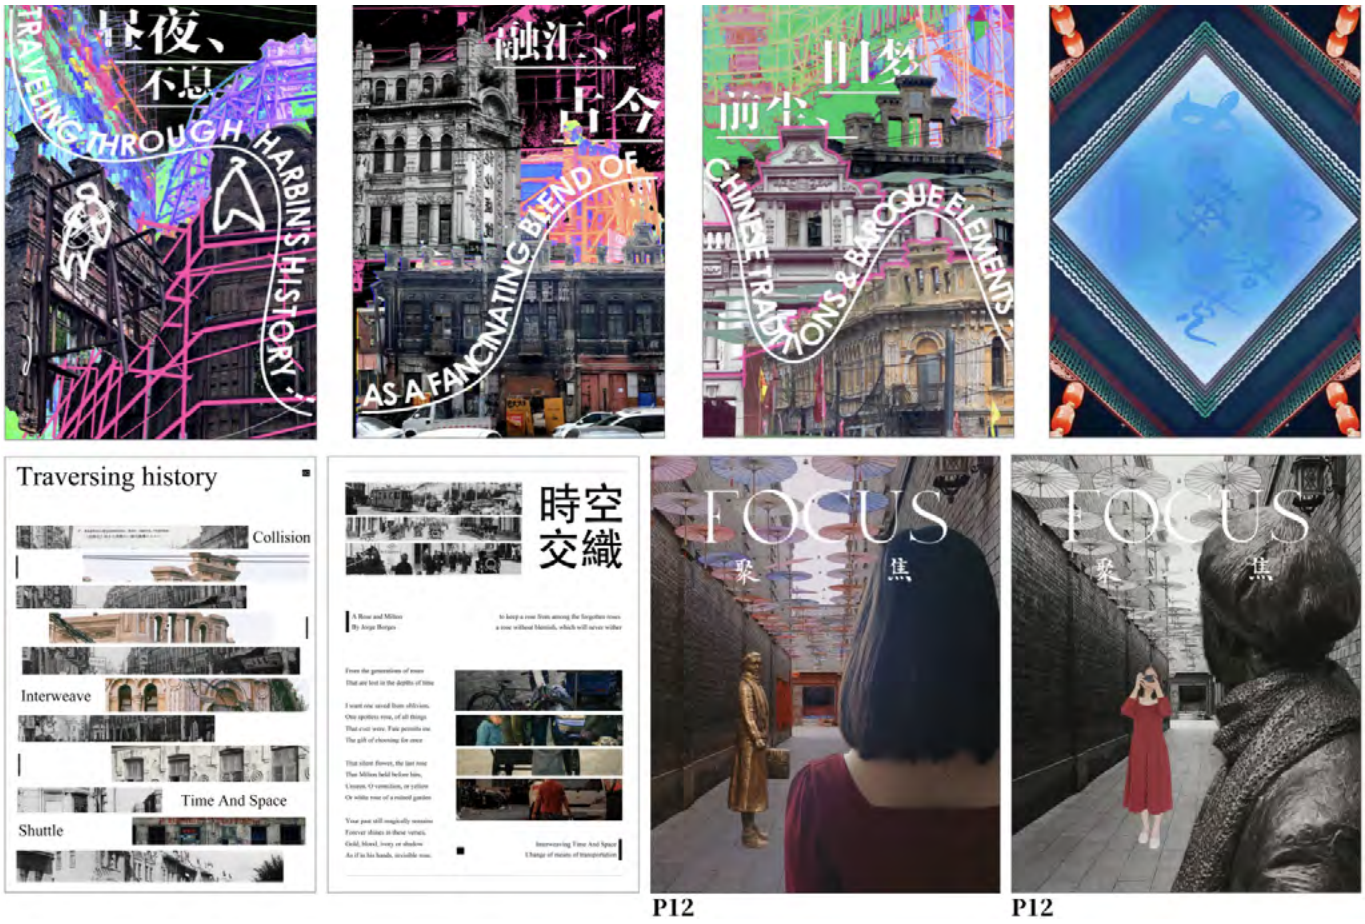

Figure 8. Students' practices part 3.

Student P12: The "Focus" series posters showcase the historical depth and modern vitality of Chinese Baroque streets. The two posters depict a girl and a statue of Xiao Hong (1911-1942, a female writer born in Heilongjiang Province), gazing at each other, seeking a connection between history and the present, and exploring their implications for the future.

The first poster features the image of a modern girl representing the present, with the statue representing history. The red color in the poster, inspired by the little girl in the red coat from the film "Schindler's List," symbolizes the power of life and the longing for the future. In the second poster, the girl is seen with her back to the camera, looking towards the statue that symbolizes history, representing reverence for the past and anticipation for the future. The blending of red and gold hues emphasizes the vitality of life and the significance of history. The statue of Xiao Hong not only commemorates this literary master but also serves as a bridge between history and modern times, inspiring us to draw strength from stories to move forward.

Figure 9. Students' practices part 4.

Student P13: The Baroque district under renovation is draped with a fabric-like protective cover, and even the broken mesh cannot hide the variegated walls sculpted by time. The once-magnificent decorations are gradually falling away. Visitors stop to ponder over the concealed future-a dazzling whiteness that will shimmer in the sunlight. I wish to capture this moment of transition, to document the neighborhood's story as it steps from the old into the new.

Figure 10. Students' practices part 5.

Student P22: Lacking a background in art, I have used a handwritten diary to reflect my personal contemplations and understanding of the Baroque district. How have Chinese architects integrated traditional eastern thought into Baroque style while ensuring the continuation and enhancement of its culture? Delving into the architectural details, I noticed that elements of Chinese blessing culture, such as pomegranates and grapes symbolizing fertility and good fortune, are prevalent, resonating with the meaning behind the character "福fú" (fortune). Western Baroque, by contrast, employs angels and eagles to represent glory and strength. Both styles express their cultures' emotions and values through architecture. Despite its Western facade, decorative façade, still reveals the essence of Chinese culture, reflecting the wisdom of craftsmen and the flexibility of the culture.

This process of creating posters was underpinned by a strong focus on critical evaluation of one's work and that of peers, fostering a more profound connection with their subjects and a more nuanced conveyance of intricate concepts through their art. Students were encouraged to channel their distinct experiences into their work, infusing their visual output with deep personal meaning and symbolism. They were also steered to contemplate the complex interplay between their mental constructs and artistic expressions. This practice refined their capacity to manifest abstract ideas visually and deepened their comprehension of the interdependence between conceptual thought and creative actualization.

3.4 Key Findings

The workshop's initial phase of spatial exploration set the stage for participants to develop a fundamental grasp of Baroque architecture's intricacies. A notable observation was made by an international architecture student from Russia (e.g. P24), who approached the study focusing on the primary spatial forms, and also expressed an interest in Chinese typography. This approach allowed for a comparative analysis of architectural styles, highlighting the distinctive differences between Russian and local Baroque edifices. Such insights reveal how cultural and geographic backgrounds influence the initial engagement with and interpretation of architectural styles.

Students with a more diverse academic palette, including those from architecture (e.g. P19) and digital media arts (e.g. P12), demonstrated a broader and more integrated understanding of their surroundings. Their observations transcended mere structural analysis, delving into history, memory, and the literary aspects of the Baroque environment. This group's balanced approach underscored the value of interdisciplinary perspectives in grasping the full spectrum of the cultural and aesthetic significance embedded within architectural spaces.

On the other hand, those with a background in intelligent architecture (e.g. P13), whose studies typically lean towards engineering and data-focus, exhibited a markedly different cognitive orientation. Their understanding of the environment is more direct, and their analysis process is more structured, prioritizing practical logic over abstract aesthetic factors. Additionally, after their initial walk, they develop a sense of disregard towards the aging structures. Students not trained in art and design (e.g. P22), they often require guidance from scholars to delve into the understanding of cultural and human narratives, and to build confidence in aesthetic expression.

Despite these initial inclinations, the tutoring phase of the workshop facilitated a shift in understanding across the board. After engaging with the second, third, and fourth modules, the students began to appreciate the purpose of their observational walks. Their understanding evolved to encompass abstract interpretations of the environment, especially within the Baroque context. Yet, even with this newfound appreciation, remnants of skepticism persisted, particularly regarding the efficacy of walking as a method of knowledge expression. This skepticism is influenced by their diverse backgrounds, hinting at the entrenched educational paradigms that shape their approach to learning and knowledge articulation.

Additionally, compared to educational impact, the influence of geographical factors seems to be weaker, which may be attributable to the smaller data volume that doesn't allow for more definitive conclusions. However, these initial data also indicate that in the era of informatization, the intensity of Interregional (partly international) cultural exchange and communication has reached a new height, rendering geographical distance no longer an effective barrier to cultural exchange.

3.5 Communication and Feedback at the Exhibition Site

Upon the workshop's conclusion, an exhibition was chosen as the preferred medium to display the students' artworks at the site they visited. However, due to construction inside the building, the students displayed their works by affixing them to the walls inside the courtyard. This seemingly compromised choice transformed this outside space as an exhibiting realm, while showcasing the architectural characteristics, also displaying the reality of the building.

Figure 11. Exhibition event.

The curating of the show aligns with the sentiments of authors Susan Liggett and Mike Corcoran (Liggett & Corcoran, 2018), who argue that exhibitions, due to their open, creative, and engaging nature, serve as an effective means of communication situated at the nexus of diverse audiences. They further assert that exhibitions play a significant role in overcoming challenges associated with interdisciplinary communication. The culmination of these meticulously orchestrated experiences produced a compilation of visual imagery that was multifaceted, innovative, and deeply interconnected with the individual's cognitive processes. Consequently, the exhibition transformed into a pivotal platform, operating as a visual language that encapsulates the essence of the ideas, concepts, and emotions that the students sought to convey (Figure 11).

The exhibition space in the Baroque Architectural Area fosters a dialogue between the viewer and the exhibited works. The on-site exhibition transcends a mere showcase of the students' creative outcomes and is a robust medium for communication and knowledge dissemination. In conjunction with the exhibition, presentations profoundly influenced this cross-disciplinary educational process. This approach transformed the display from a mere exhibition into a dynamic discourse within the public space, engendering a collaborative learning culture and shared understanding. This engagement nurtured a multicultural community ethos and facilitated an open dialogue surrounding the designs. Each exhibited piece initiates a conversation, fostering a deeper understanding and appreciation of the students' visions and the subject matter explored during this workshop.

The workshop successfully established an environment of cultural integration deeply rooted in the local community's culture, customs, and everyday life, nurturing a harmonious coexistence based on mutual respect and symbiosis. Against this backdrop, not only was there a respect for local traditions but also an infusion of new ideas and innovative inspiration. The exhibition drew a continuous flow of visitors to the courtyard, engaging in meaningful interactions with students to explore the event's substance. Residents participating in the exhibition responded enthusiastically, looking to this platform to promote their native culture and hoping for it to gain wider recognition and preservation. Moreover, we aimed to avoid collecting data on-site to preserve the relaxed atmosphere of community interaction. Therefore, we relied on local media's online coverage to gauge the event's impact, with readership data from news pages indicating that the activity had reached a substance.[4]

3.6 Problems and Improvement

The workshop's exploration phase highlighted the influence of individual cultural and academic backgrounds on the perception and analysis of Baroque architecture. Students with interdisciplinary studies showcased a deeper, more integrated understanding of the Baroque environment, suggesting that a diverse academic palette may enhance the comprehensiveness of analysis. This inclination towards the structural at the expense of the historical and cultural suggests a potential disconnect the workshop's design may need to address.

Meanwhile, encouraging students to incorporate personal meaning into their art was commendable. Yet, critiquing and refining these expressions requires further elaboration to ensure that students can effectively evaluate and improve their work. The further incorporation of guided techniques for visual representation and structured critique sessions would likely enhance the learning outcomes of this phase. We aim to involve a more detailed strategy for engaging the audience and a systematic method for collecting feedback. This would significantly bolster the exhibition's role as an educational tool and a medium for interdisciplinary dialogue.

[4] The event was reported by an local online media news, with a readership reaching 8,176 views, up to 31th March 2024. Source: https://zmt-m.hljtv.com/news_details.html?from=wap&id=819789&timestamp=1707800454893.

4. Discussion and Future Work

By the preceding text, the discourse is sequentially delineated across three distinct phases. Initially, the discussion examines the impetus behind student engagement within architectural environments, investigating the presence and underlying logic of narrative elements within these spaces and delineating the interplay between the spatial constructs and the participants. Subsequently, the conversation pivots to how such interplay might be harnessed and transmuted into a pedagogical strategy, aiming to augment the students' competencies to interact with and comprehend the intricacies of cross-cultural narratives. Conclusively, the treatise probes into the potential ramifications of such pedagogical interventions on the autochthonous culture prevalent within the Baroque area.

4.1 The Phenomenon of Spatial Position

The entire process of the workshop was concentrated on the experiential aspect of the spatial environment, and what follows will discuss the fundamental framework of this theory. Langer and De Certeau(1988) referenced the theory of walking in the city to characterized Manhattan as a space constructed for life, where the complex grid of the city manifested a kind of syntactic logic similar to that of a literary text. Here, the "text" differs from the text in actual language; it is composed of the volumetric system of the urban landscape, edited for experience.

Through his perspective, the regularity of the city is transformed into a specific spatial language or code. Individuals navigate the city based on the physical clues of their surrounding environment. In the context of the Baroque area of Harbin, this means interacting with the rich architectural details that tell of the city's multicultural past, thus developing a dynamic urban experience. Maurice Merleau-Ponty (2002) proposed that space is an immersive experience transcending the physical environment. Walking through this historical complex validates this concept, where the spatial system constructed by the architectural facades is not just objective but an all-encompassing state.

Norberg-Schulz (1979) also wrote that the definition of space contains dual dimensions: one is geometrical, and the other relates to the cognitive "perceptual field." Space intersects these dimensions, where geometric complexity overlaps with cultural significance and links with participant interpretation. This linkage constructs a composite information, a process of individual thinking stimulated by the spatial environment to turn back to the space itself. The ensuing personal experience opposes purposeless imagination, instead searching for clues about the things themselves (Cody & Siravo, 2019). Thus, the experience is a perceptual response that evokes personalized and rich cognition, emphasizing the interaction between the architecture's physicality and the participants' subjectivity. This theoretical reflection supports the activities in the Baroque architectural scene, where cross-cultural thinking and the multicultural background of the regional environment interact, intertwining physical and abstract spaces and thereby sparking individual experiences and thoughts.

4.2 Art as Methods

Neri Oxman's Krebs cycle of creativity (Figure 12) is an interdisciplinary design methodology that links art, design, science, and engineering. It is inspired by the Krebs cycle in biochemistry, which is a fundamental process of energy transformation within cells. In the realm of design, Oxman's Krebs cycle of innovation draws on the concept of this biological cycle to advocate for a cyclical approach to innovation and collaboration among art, design, science, and engineering (Oxman, 2016).

Figure 12. Krebs cycle of creativity.

In this cycle, art is explored for its decorative aspects and as a catalyst for innovation. Art fosters the development of innovative thinking through personalized and autonomous expression, as well as a critical attitude, creating scenarios filled with new ideas and imagination. This, in turn, establishes connections between societal needs and technological advancements, leading to the development of new designs and solutions (Blacklock, 2024) (HadaviBavili & İlçioğlu, 2024).

The intercultural emphasized in this paper is understood as an operational method that encourages students and practitioners to enhance their perception of cultural diversity through the practical activities of walking, observing, and reading. Furthermore, in image translation, practitioners are encouraged to cross cultural barriers and, by establishing a critical viewpoint, to more clearly recognize how their work translates environmental and cultural information. They are also encouraged to understand their position in this translation process and become aware of the skills that match this position (Roguska-Németh, 2023) (Gros, 2014) (Slak et al., 2023).

Translating cultural information trains each student in cultural sensitivity and autonomous critical capacity. Cultural sensitivity (Alam, 2020) allows for recognizing cultural differences. This cognitive ability is the foundation of independent criticism because practical critical thinking requires respect for the cultural content to be analyzed and its interpretation from multiple perspectives. Consequently, this process actively or passively trains the ability to convert structured thinking into abstraction, establishes unique perspectives, and enhances independent creativity. Furthermore, the artistic scene constructed by the entire exhibition serves as a contemplation and protest against the disappearance of regional cultural values.

4.3 Contributions

This event adopted a relatively conventional approach in its teaching methods. Still, its uniqueness lies in establishing direct connections with the region, creating a context for cross-cultural studies, and sparking dialogue and collaboration among participants to explore the potential influences of cultural diversity on regional development. Therefore, the discussion of the contributions can be divided into two parts: firstly, it is centered on the educational environment; secondly, it pertains to the potential impact on the Baroque architectural region.

Impact to the Educational Environment:

The ways of training the individual creativity were promoted by a collaborative learning technique in the workshop. The process, known as peer review in the classroom (Pirttinen & Leinonen, 2022), prepares students for future career-related assessments and collaboration (Le Sueur et al., 2020). Through this activity, the teaching module of peer review in the classroom has made the following three aspects of education:

First, facilitating active learning: Each student brings a unique perspective of knowledge. In explaining concepts to peers and providing constructive criticism, they immediately express and give feedback, evaluate arguments, identify strengths and weaknesses, and understand high-quality work standards.

Active involvement in the learning process through peer review promotes a deeper engagement with the material. Students are not passive information recipients but active learning environment contributors. When classroom peer review is well-structured and guided by clear objectives and standards, it can significantly enhance the educational experience. It supports a dynamic learning process in which students actively receive and provide feedback, making the educational journey more engaging and effective.

Secondly, increasing engagement and responsibility: Knowing that peers will review their work can motivate students to exert their most significant effort. Moreover, being responsible for providing high-quality feedback to classmates can create a sense of accountability.

Furthermore, encouraging a community of practice: Classroom peer review fosters collaboration with the broader community. Students engage in mutual learning and support each other's academic growth, leading to a more active and inclusive classroom environment.

Potential Impact to the Local Context:

The impact of this workshop event on the culture of the Baroque area is transient. In the long term, similar activities are a dynamic development process, and their changes will be subject to various objective factors that constrain and influence them. This will lead to the topics it triggers being broad and complex. In this teaching session, after the research, observation, and evaluation conducted jointly by teachers and students, individual creativity will potentially impact the historical architectural area in the following aspects.

First, establishing cross-cultural dialogues with an interregional perspective provides opportunities for interaction between local cultures and other cultural groups. Workshop participants, through multi-angle learning and diverse interpretation of the indigenous region's cultural arts, historical traditions, and values, can help the area's local people recognize the importance of individual thought. It enables them to rediscover their cultural interests from a broader perspective, to appreciate their cultural heritage, and to enhance their sense of identity and artistic confidence. Secondly, against the backdrop of continued economic downturn. Cross-cultural activities centered on art education potentially encourage local people to re-express the cultural value of regional architectural resources through artistic means, creating new economic growth points through cultural innovation. Furthermore, from an interregional perspective, the activities are driven by both cultural resources and economic transformation, enhancing the recognition of the importance of architectural culture and the awareness of the protection of the Baroque architectural complex.

5. Conclusion

The informational essence of this particular architectural complex transcends mere physicality. The material properties embody a confluence of diverse elements, serving as a direct expression of both historical context and regional cultural characteristics. The expression of personal practices requires a foundation of confidence. This confidence is deeply rooted in the student's cultural experiences and ability to project these onto the regional culture.

Therefore, this engagement with the built environment offers a unique perspective through which students can interpret and interact with their surroundings. Through this lens, they learn to see the layers of history and culture that buildings, spaces, and cities embody. When students approach their creative practices with a robust sense of self, informed by an intimate understanding of their cultural narratives, they are better positioned to contribute authentically to the regional cultural milieu. This interplay of self-awareness and cultural immersion ultimately cultivates a rich, nuanced dialogue between the individual and the region. This exchange can enrich both the personal and collective spheres of cultural expression.

About the Authors:

Fangyu Cheng, an art and design practitioner, scholar who explores phenomenological experiences in the spatial context. He holds a distinguished MA and PhD from Chelsea College of Arts. He teaches at School of Architecture and Design, Harbin Institute of Technology.

Xi Li is a curator, assistant professor at Shenzhen International School of Design, Harbin Institute of Technology, and co-founder of Aiiiii Art Center. She holds an MA from Central Saint Martins and a BFA from Central Academy of Fine Arts.

Mengyao Guo is an award-winning artist, illustrator, and graphic designer, and researcher based in Shenzhen. She is an assistant professor at Shenzhen International School of Design, Harbin Institute of Technology, and a PhD candidate at the University of Macau.

Acknowledgments: We sincerely thank Dr Marsha Bradfield, Ms Bing Yu, and Dr James Lander for their invaluable collaboration and generous support. Our gratitude is also directed towards the Summer School Program at the School of Architecture and Design, Harbin Institute of Technology, along with the London Artfiled Projects and the Harbin Brilliance Baroque Creative Design Center. More importantly, we are profoundly grateful to all the students whose active participation and outstanding contributions were crucial to the success of this event.

KEYWORDS | DESIGN EDUCATION, PERSONAL DEVELOPMENT, VALUE & PURPOSE DRIVEN, SELF-AWARENESS, GROWTH MINDSET

ABSTRACT | In the dynamic landscape of higher design education, the traditional emphasis on technical skills and theoretical knowledge often overshadows the essential role of personal development, individual values, and self-reflection. This paper advocates for a paradigm shift towards a more holistic approach, contending that integrating these elements into the curriculum not only enhances the overall educational experience but also cultivates well-rounded, socially conscious designers.

Our reasoning is explained and explored with reference to three aspects, which we believe are essential for creative excellence within the context of design education. Firstly, personal development is integral to nurturing creativity and innovation. By allocating dedicated time to foster self-awareness, resilience, and emotional intelligence, students can harness their unique perspectives and experiences, thus enriching the creative process. This approach empowers students to navigate the complexities of the design world with confidence, adaptability, and a heightened sense of purpose.

Secondly, incorporating core values into design education instills a sense of ethical responsibility and social consciousness. By exploring and understanding individual and collective values, students can develop a framework that guides their decision-making process, ensuring that their designs align with principles that prioritize sustainability, inclusivity, and ethical considerations. This integration not only contributes to responsible design practices but also prepares students to address the societal challenges of our time.

Lastly, self-reflection serves as a crucial tool for continuous improvement. By encouraging students to reflect on their work, experiences, and evolving perspectives, design education can foster a habit of critical thinking and adaptive learning. This reflective practice enables students to refine their design processes, identify strengths and areas for growth, and ultimately evolve into designers capable of making meaningful contributions to their field.

Besides theoretical deepening, the above aspects are also evaluated in teaching practice. This paper describes 3 concrete initiatives within the Product Development programme at the University of Antwerp in which Personal Development was integrated into the curriculum:

- Skillslab, which focuses on the development of supporting and soft skills for designers with the aim of helping them grow as a person, and thus as a designer.
- My designers' values project (pilot), where we integrated a workshop on what values drive you as a designer in an existing design assignment.
- Design professionalization as a separate learning path, from 1 Ba until 2 Ma, in the curriculum, where there is room for self-exploration.

In conclusion, higher design education must evolve to accommodate personal development, values exploration, and self-reflection and foster a more holistic learning experience. This approach not only prepares students with the technical expertise required by the industry but also cultivates empathy, social responsibility, and a commitment to sustainable practices in design. Meeting this challenge requires ongoing innovation, adaptable teaching strategies, and a dedication to collaborative learning. Despite the complexities and demands of the educational landscape, the focus on personal and professional development in design education offers a pathway to cultivating designers who can shape a more inclusive and sustainable future.

1. Introduction

In order to enhance personal growth, improve communication and gain trust when collaborating, educators should foster and stimulate students' interpersonal awareness, identified by Luft and Ingham in the Johari window framework as the arena (Luft & Ingham, 1955). The more people know about themselves and others, the more open and trusting their relationships become. They will be more productive, cooperative and effective when working in a team.

The Johari window framework can be instrumental in integrating personal development, values, and self-reflection into design education. By using this framework as an underlying foundation, educators can create a more holistic and inclusive learning environment that fosters creativity, collaboration, and self-awareness, which are essential for deepening learning (Maher & Root, 2014). This approach aligns with the shift toward a more comprehensive and human-centered paradigm in design education, where students are encouraged to explore their inner selves while engaging with the broader social and ethical context of design.

A range of studies have explored the integration of personal development, values, and self-reflection in design education. Rivard (2012) underscores the significance of reflexive learning in the context of design education to enhance creativity and self-leadership in design practice and positioning it as a pivotal aspect of the learning process.

In the exploration of pedagogical frameworks within design education, Shim (2018) contributes insights into an inclusive framework that can be further enriched by the integration of personal development and self-reflection. This approach aims to foster a more comprehensive and participatory educational experience for students.

Additionally, Tracey (2018) sheds light on the pivotal role of reflective writing in helping students explore their beliefs and experiences. The act of reflecting in writing serves as a mechanism for designers to articulate and refine their evolving professional identities.

Collectively, these studies underscore a shared perspective on the imperative for a holistic approach to design education. This approach, integrating personal development, values, and self-reflection, emerges as a vital framework for nurturing a well-rounded and reflective educational experience within the field of design.

The traditional focus on technical skills and theoretical knowledge in higher design education has been critiqued for overshadowing the importance of personal development, individual values, and self-reflection (Salmon, 1992; Peruccio, 2019; Doorn, 2008; Meyer, 2020). These elements are crucial for cultivating well-rounded, socially conscious designers. Salmon (1992) and Peruccio (2019) advocate for a more holistic approach, emphasizing the integration of liberal arts, social sciences, and transdisciplinary knowledge into the curriculum. Doorn (2008) and Meyer (2020) further stress the need for the development of designers' attitude and the inclusion of practical, real-world experiences in design education. These perspectives collectively support a paradigm shift towards a more comprehensive and inclusive approach to higher design education.

Research consistently supports the idea that personal development is crucial for nurturing creativity and innovation. Stolk (2009) and Hargrove (2012) both emphasize the importance of self-directed learning and metacognitive abilities in fostering creativity. Danko (2003) and Ulibarri (2014) further highlight the role of emotional intelligence and resilience in this process, with Danko specifically noting the use of narratives to enhance emotional development. These findings collectively underscore the need for dedicated time to develop self-awareness, resilience, and emotional intelligence, as these are key factors in harnessing unique perspectives and experiences to enrich the creative process.

Design education plays a crucial role in instilling ethical responsibility and social consciousness in students, as it equips them with the skills and mindset needed to address societal challenges (Zande, 2011). This is

particularly important in the context of design responsibility and sustainability, where students are encouraged to adopt sustainable design thinking (Ashour, 2020). The integration of core values into design education is further enhanced by the incorporation of scientific knowledge, which enriches the design process (Zubrowski, 2002). This approach is exemplified in the Industrial Design Program at the University of New South Wales, where students are immersed in projects that highlight design's potential as a catalyst for social change (Ramirez, 2011).

As design education navigates the complexities of the 21st century, the OECD Future of Education and Skills 2030 initiative offers a visionary blueprint. At its core lies the Learning Compass 2030, a guiding framework that underscores the multifaceted nature of learning.

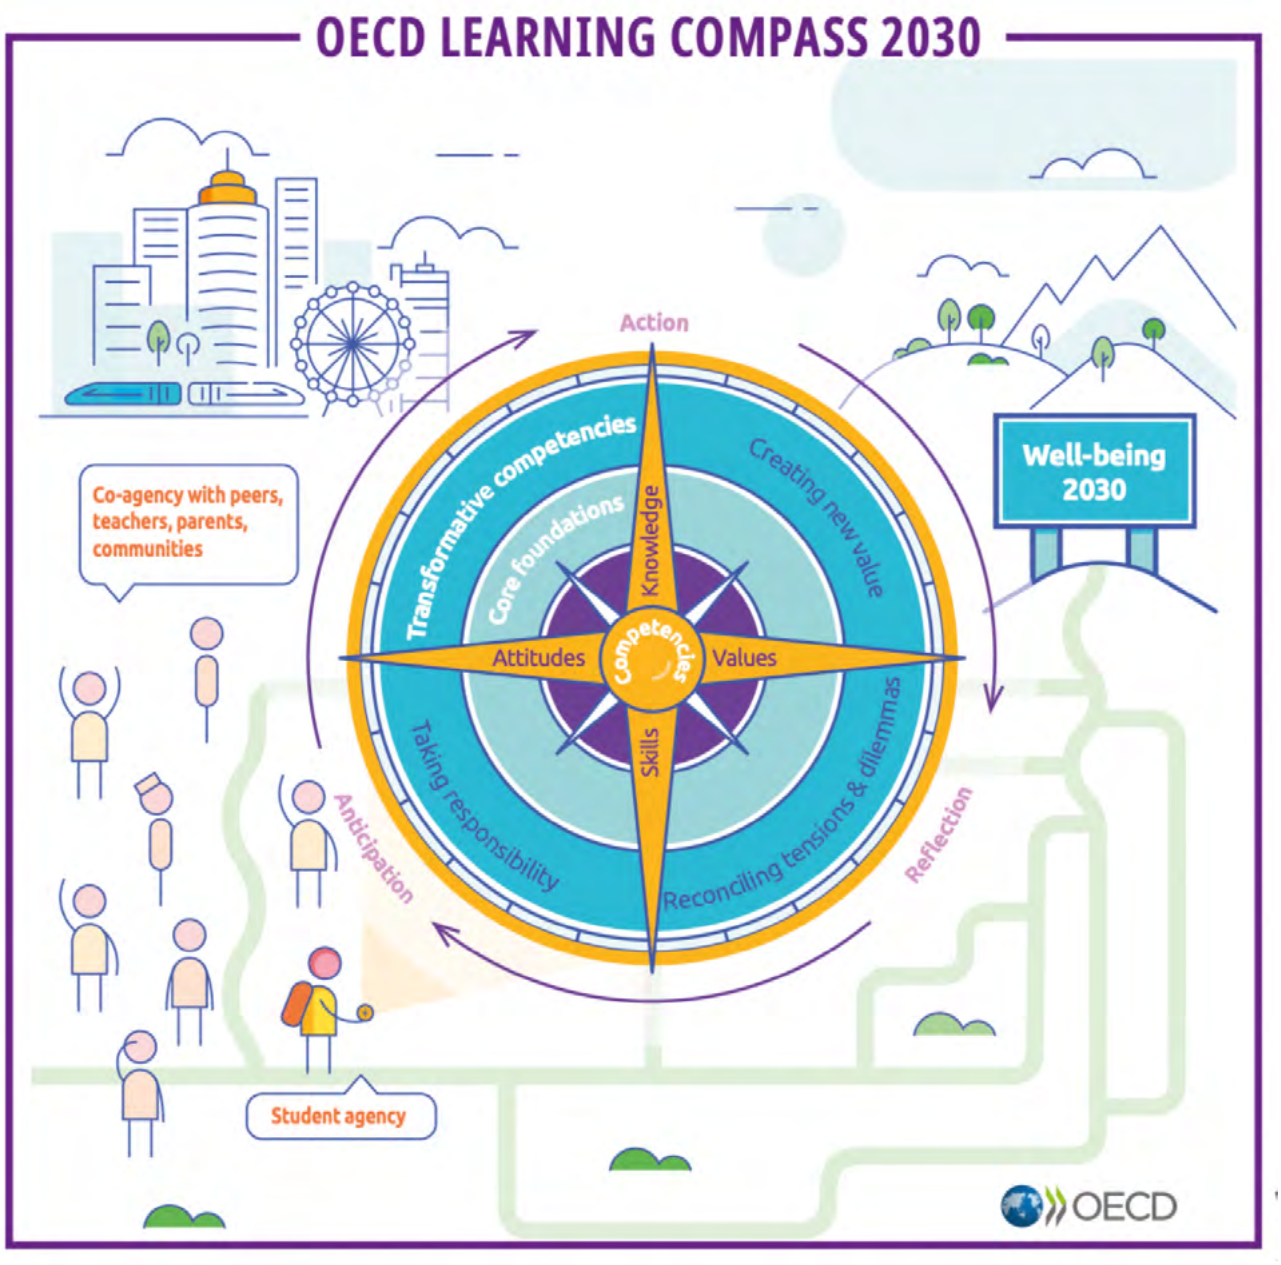

Figure 1. The Learning Compass 2030, a guiding framework that underscores the multifaceted nature of learning. (OECD, 2023).

The Learning Compass 2030 (OECD, 2023) underscores the importance of fostering values as one of the key domains alongside Knowledge, Skills, and Meta-Learning. The integration of values in education aligns with several crucial aspects that are relevant to personal development:

- **Ethical Decision-Making:** Values are foundational in cultivating ethical decision-making skills among learners. The Learning Compass 2030 acknowledges the significance of values in shaping attitudes and behaviors. By instilling a strong ethical foundation, education contributes to the development of responsible and conscientious individuals capable of making ethically sound decisions in diverse contexts.
- **Social and Emotional Competence:** Values are integral to fostering empathy, cooperation, and cultural understanding. Education that incorporates values contributes to the creation of socially aware individuals who can navigate and contribute positively to diverse social settings.
- **Global Citizenship:** Values are central to the cultivation of global citizenship. In an interconnected world, learners must develop values that promote tolerance, respect for diversity, and a sense of global responsibility. The integration of values in education aligns with the vision of producing global citizens capable of engaging with and contributing to the international community.
- **Lifelong Learning and Adaptability:** The Learning Compass 2030 places emphasis on Meta-Learning, which involves learning how to learn and adapt. Values such as curiosity, resilience, and a growth mindset contribute significantly to an individual's ability to navigate lifelong learning. Integrating values into education promotes a holistic approach, preparing learners not only with knowledge and skills but also with the values that foster adaptability and continuous self-improvement.
- **Personal Development and Well-Being:** The OECD Future of Education and Skills 2030 recognizes the importance of holistic development, including well-being and personal fulfillment. Values play a crucial role in guiding individuals toward a sense of purpose and fulfillment. Education that integrates values supports learners in developing a strong sense of self, contributing to their overall well-being.

Values are not just a component but a cornerstone in the development of learners who are not only knowledgeable and skillful but also ethically grounded, socially aware, and prepared for a future characterized by complexity and rapid change.

One dominant theme surfaced in the Global Youth Talks report, conducted by Higher education for good in 2022 is the emphasis young people are placing on understanding, debating, and prioritizing values and virtues. They want this to be core to the education they receive, which is quite different from what they are currently getting (Higher education for good, 2023). Youth Talks is the largest-ever global consultation inviting people aged 15-29 to share their opinions, concerns, and aspirations for the future. 45000 participants in 212 countries and territories participated.

In a survey conducted among graduates of the Product Development program at the University of Antwerp, encompassing Personal Development in 2020 (N=282), participants suggested that our attention should be directed towards the following areas:

- 86% on soft skills (like communication, teamwork…);
- 86% on sustainability;
- 82% on systems thinking;
- 77% management and entrepreneurial skills.

Note that they could select from a list of themes and more than one selection was possible.

When asked if they would choose the same program again, 89,7% responded with “Yes”. The main reasons why mentioned for this were:

- The versatility;
- The generalistic character;
- The multidisciplinarity;
- The atmosphere of one big happy family;
- The balance between theory and practice;
- It enabled and strengthened their problem-solving and pragmatic approach;
- The different profiles emerging from our program;
- The emphasis on the role of bridge builder that we cultivate in the program.

Which implied that we should not loose these aspects when reforming our curriculum.

This was confirmed by a focus group of 15 Alumni in 2023, who added leadership, ethics, lifelong learning, and a holistic approach to the list of themes that our product development program should prioritize.

This culminated in the creation of 3 initiatives: Skillslab, My Designers' Values Project, and the Professionalization Learning Path. These 3 initiatives, which we believe are essential for creative excellence within the context of design education, highlight our ambition for the integration of personal development, values exploration, and self-reflection in our educational model,

1. SkillsLab: Via extracurricular workshops we aim at cultivating soft skills align with the Johari Window framework (Luft & Ingham, 1955), where greater interpersonal awareness leads to improved communication and collaboration. This initiative supports students' personal development and promotes self-directed learning, as advocated by Stolk (2009) and Hargrove (2012). By fostering skills such as communication, teamwork, and emotional intelligence, SkillsLab contributes to expanding self and interpersonal awareness, creating an environment conducive to effective collaboration and a stronger sense of community.
2. My Designers' Values Project: This initiative, part of the Sustainable Design course, encourages students to explore their values and reflect on the question, "Which designer do I want to be(come)?" This aligns with the emphasis on self-reflection and personal development in design education discussed by Rivard (2012) and Shim (2018). By integrating reflective writing and values exploration, as noted by Tracey (2018), this project facilitates students' personal growth, ethical decision-making, and commitment to sustainability. It also contributes to building a sense of identity and purpose among design students, promoting a more comprehensive approach to design education.
3. Professionalization Learning Path: Running across five cohorts, this initiative helps students grow in a structured manner, promoting continuous improvement and adaptability. The framework aligns with the OECD's Learning Compass 2030, emphasizing lifelong learning and adaptability, as well as Maher & Root's (2014) holistic approach. This learning path encourages self-awareness, ethics, and (self)leadership, connecting with the focus group feedback from alumni in 2023, which emphasized these themes for a successful career in product development.

Together, these three initiatives illustrate a multi-faceted approach to design education, incorporating personal development, values exploration, and self-reflection to create a collaborative and innovative learning environment. By embracing these elements, educators can foster well-rounded, socially conscious

designers equipped to address the complex challenges of the contemporary world. We believe this initiative will deepen the close connections we have with our students in the Department of Product Development. We anticipate that it will enhance their confidence, encourage greater boldness, foster a visionary mindset, and promote ownership in their design processes. This initiative should also support the transdisciplinary bridge-building role our graduates play in the job market. Most importantly, we believe it will contribute to their overall well-being.

2. Initiatives

2.1 SkillsLab

2.1.1 Setup

Commencing in 2020, the Department of Product Development within the Faculty of Design Sciences at the University of Antwerp made a strategic decision to intensify its emphasis on cultivating supporting soft skills and to proactively engage students in their personal development and growth trajectory. This initiative involves affording students the opportunity to choose, acquire, and apply various supporting skills, thereby augmenting the richness of their educational journey, elevating their academic outcomes, and bolstering their employability prospects.

Within the first year, the SkillsLab sessions are structured as concise, hands-on modules scheduled during the lunch break. Each session has a duration of 90 minutes, comprising a 20-minute introduction followed by interactive and practical exercises. The session's format is tailored to meet its specific objectives. Typically, 6 to 8 students gather around a table, forming a group that encourages peer learning dynamics among individuals from both similar and diverse academic cohorts.

Illustratively, the interactive session centered around 'giving and receiving feedback' adopted a speed date format. In this configuration, each participant engaged in giving and receiving feedback on a design project within the allotted timeframe. The initial 20-minute introduction clarified the guidelines and best practices for effective feedback exchange.

Notably, one weekly session has the capacity to engage an audience of approximately 400 students, spanning three Bachelor and two Master years. The workshop accommodates a maximum of 25 students per session, ensuring an optimal balance between interactive engagement and effective facilitation.

2.1.2 First Observations and Evaluation

Within the academic year 2021-2022, we conducted a voluntarily survey among our students. The participating students (N=87) exhibited high enthusiasm and regarded SkillsLab as a valuable resource providing practical insights and skills for their personal development. The workshops received positive evaluations for being clear and tailored to participants' needs, maintaining a well-balanced mix of theory and practice. The average score, based on a ten-point scale, was 9,05 (Van Dyck, Mestdagh, Vaes, & Jacoby, Van Dyck, H. Mestdagh, E., Vaes, K., & Jacoby, A.2022). Starting in 2022, we rescheduled all courses for all students, allocating free time to enable participation in SkillsLab on Tuesday afternoons. For 2nd and 3rd-year Bachelor students, we we introduced a requirement for three mandatory SkillsLabs to actively engage more students and enhance awareness across all students. By applying a pass rate based on their attendance, we uphold a safe and conducive trial and learning environment within the SkillsLab format.

Figure 2, 3. A SkillsLab about the basics of brainstorming. Figure 2 shows random stimulation technique. Figure 3 shows an energizer.

The inception of the SkillsLab program involved a meticulous delineation by the faculty, seeking advanced themes aligning with one of the five foundational pillars: teamwork & leadership, creativity, self-management & well-being, communication, and the application of supporting tools & techniques.
A pertinent topic for inclusion in the program is one that is extracurricular and amenable to introduction within the interactive context of a 'SkillsLab setting,' affording students the opportunity to experiment and swiftly assimilate knowledge following a brief introduction. In instances where relevance dictates, a supplementary SkillsLab session may be devised to build upon preceding sessions, enabling a more profound exploration of a specific topic. The overarching objective is to facilitate the internalization of these specific learnings by students during their routine curricular project work.

2.2 My Designers' Values Project

2.3.1 Setup

To commence our designers' values project, we sought to implement a modest experiment within a design exercise. This approach ensured the experiment's manageability and immediate applicability, avoiding unnecessary complexity. During the academic term of 2023-2024, specifically in the Sustainable Design course (3 ECTS, spanning 6 weeks) of the 2nd year (2Ba), we embarked on our first exploration of the question: 'Which designer do I want to be(come)?'.

Aligned with the theme of sustainable design for the year 2023-2024, focusing on climate action, students were tasked to select a small-scale, targeted climate action in everyday life. Their objective was to design a product facilitating this chosen climate action.

Upon receiving the design brief, we introduced the concept of “my designers’ values”. We prompted students to reflect on their aspirations as designers and emphasized the significance of contemplating this aspect early

in their academic journey. We showcased exemplary and suboptimal designs, manifestos, and instances illustrating the driving forces behind a designer's work, highlighting the enduring impact on their identity, whether consciously acknowledged or not.

Following this introduction, students were provided with a set of values (Brown, 2020). They were tasked with selecting values that resonated with them and then organizing these values based on their interconnections. This mapping process facilitated the identification of core motivating values, providing a foundation for their design principles. Students were encouraged to delve deeper, selecting 1 to 7 values—considered 2nd tier values—and ultimately narrowing down to 2 primary drivers shaping their designer identity.

2.3.2 First Observations and Evaluation

Three weeks after the unveiling of my designers’ values, students were invited to voluntarily participate in a questionnaire. Out of the 90 students, 56 engaged in the questionnaire. Analysis of the responses revealed that 60.7% of the participating 56 students perceived the introduction of my designers’ values as an added value, with 21.4% expressing a desire for adjustments (table 1). Notably, 76.8% successfully identified personal values through the value exercise (table 2), and 30.4% referenced these values while working on the sustainable design assignment (table 3). An insightful observation emerged, as one student acknowledged that the questionnaire served as a reminder to revisit her listed values.

The open-ended query addressing potential areas for improvement unveiled recurring suggestions related to the physical setting. A notable proposal was to relocate the exercise to a more "open" space or an outdoor environment, emphasizing the significance of the exercise's context. Multiple respondents highlighted the spatial aspect, reinforcing the idea of enhancing the exercise's effectiveness through a different and more conducive location.

Table 1. Did the introduction of the designers' compass during the introductory days add value to you?

Answer	#	%
Yes	22	39,3
Yes, subject to adjustments	12	21,4
No	22	39,3
Total	56	

Table 2. Were you able to determine some values for yourself during the values exercise?

Answer	#	%
Yes	43	76,8
No	13	23,2
Total	56	

Table 3. Did you refer to the values or designers' compass while working on your sustainable design assignment?

Answer	#	%
Yes	17	30,4
No	39	69,6
Total	56	

2.3 Professionalization Learning Path

2.3.1 Setup

Within the Product Development program at the University of Antwerp, a comprehensive framework for Personal Development is established through the incorporation of six distinct learning paths spanning five academic years. These learning paths include:

- Design
- Research
- Economic sciences
- Human sciences
- Technological sciences
- Professionalization

A learning path, also referred to as a learning journey or educational pathway, is meticulously designed to provide learners with a structured and sequenced series of educational experiences. These paths guide students from initial points of knowledge acquisition to the mastery of specific competencies. They serve as a systematic approach to enhance the cohesiveness and purposefulness of the educational experience, ultimately optimizing the learning process.

Over the past five years, a dedicated curriculum committee and working groups for each learning path have collaborated to refine and optimize these learning experiences. Initially, the professionalization learning path was perceived as a collection of residual components that did not neatly align with other paths. Courses such as Portfolio & Orientation, Minors, and Professionalization in 3Ba, along with the International Design Workshop Week in 1Ma, were the primary components. From 2016 we added a 10-week internship in 1Ma. However, there was a limited presence of activities within this learning path for 1Ba, 2Ba, and 2Ma, apart from portfolio development. This was not considered problematic, given the primary focus on training designers for their professional careers.

To address this, the learning path was rebranded as the self-development path and underwent expansion to become a more comprehensive and mature learning journey. The refined structure includes:

- **1Ba**: Introduction of the 16personalities.com test to form diverse groups for the Product & Analysis design assignment. This test is closely linked to The Myers-Briggs Personality Type Indicator (Briggs, 1995) and serves to categorize individuals into 16 distinct personality types.
- **2Ba**: Introduction of the designers' values within sustainable design, fostering personal and professional growth.
- **3Ba**: Introduction of a new merged course called Portfolio & Professionalization (6ECTS), encompassing portfolio creation, self-exploration, and the development of the first version of ‘my design compass’. Additionally, students educate each other on themes such as ethics, self-

awareness, ownership, agility, and resilience, … while exploring the three minors offered in the master's program: Interactive, strategic and technology-driven design, in order to make a choice that suits the student best.

- **1Ma**: Through a group Product Service System (PSS) design assignment, students explore their group dynamics and preferred roles. Reflections are facilitated using Aalto's reflection cards, and a 10-week internship emphasizes reflective reports.
- **2Ma**: The master thesis becomes the focal point for second-year masters, preparing them for the professional environment. An innovation week and a portfolio course further encourage students to update their portfolios.

2.3.2 First Observations and Evaluation

The introduction of the 16personalities test in 1Ba helps the students to get to know themselves better and form groups based on their different profiles. This approach enables them to appreciate their differences right from the beginning when collaborating. The self-development learning path is still evolving, and the first edition of the Portfolio & Professionalization course is scheduled for the upcoming semester, starting February 2024.

The incorporation of the 16personalities test during the 1Ba design assignment facilitates a deeper understanding of oneself among students, enabling them to form groups characterized by diverse personality profiles. This intentional grouping strategy fosters an early appreciation for individual differences, laying the foundation for collaborative efforts within the cohort.

The self-development learning path is currently in a developmental phase, marked by ongoing refinement and expansion. An inaugural iteration of the Portfolio & Professionalization course is slated to commence in the upcoming semester, commencing in February 2024. This course represents a significant stride in the maturation of the self-development path, emphasizing the integration of portfolio creation and professionalization components into the educational framework.

In addition to these structured components, design educators are encouraged to incorporate reflection into their deliverables. Students are motivated to engage with SkillsLab and attend Inspirational Sessions (InsPO's), where alumni share insights into their professional experiences, offering a realistic view of the possibilities post-graduation. This comprehensive approach ensures that the educational experience extends beyond traditional boundaries, nurturing holistic development and lifelong learning skills.

3. Conclusions

3.1 SkillsLab

Although SkillsLab is a tremendous success, continuous improvement is essential. Therefore, conducting surveys on a regular base is relevant to identify needs and opportunities.

Encouraging active participation in SkillsLab poses a challenge for first-year undergraduate students who are navigating the initial stages of their academic journey within the faculty. The demands of mandatory coursework can be overwhelming for these newcomers, making it challenging for them to prioritize additional sessions. Establishing heightened awareness among other students within the academic community may, over time, positively influence the engagement of first-year students, fostering a more inclusive and supportive environment. Awareness of SkillsLab among practicum teachers can acts as a catalyst to alert first-year students, of a specific SkillsLab that might be relevant to them, which results in an increase of 1Ba participants.

Similarly, students in the second year of the master's program, immersed in the demands of their master's thesis, display a tendency to be less involved in SkillsLab sessions. A thorough examination is required to discern strategies that could motivate their participation in the future, as their involvement is perceived as integral to the peer learning process. Identifying the factors influencing their engagement and tailoring interventions accordingly will be instrumental in enhancing the overall effectiveness of SkillsLab sessions for students at different stages of their academic journey. Since 2022, we have established some SkillsLabs exclusively for 2Ma students, focusing on subjects relevant in time and subject to their master thesis which has resulted in filled sessions. For example, topics include "How to facilitate a brainstorm with your target audience or stakeholders?" and "Systemic design deep dive: how do I move from systemic analysis to the design phase?".

SkillsLab significantly enhances the establishment of a cross-year community among students in the department. In conjunction with various initiatives led by both students and staff, this project uniquely fosters connections among students in a relatively novel learning environment. Moreover, it introduces additional avenues for cross-year collaboration within the framework of design projects.

We are actively pursuing fresh collaborations with our student and alumni association to elevate this project in the upcoming academic year. Simultaneously, we are exploring the possibility of extending session accessibility to alumni. Recognizing the increasing demand for specialized skill development in the professional arena, particularly in addressing larger, more intricate, and frequently intangible tasks within the future landscape of design (Swanson, 2020), we aim to tailor certain SkillsLab sessions to accommodate broader applications across various departments or faculties. This endeavor involves investigating opportunities to forge connections and collaborations with other educational programs.

3.2 My Designers' Values

The integration of my designers' values will be a recurring element in the Sustainable Design course for 2nd-year students specializing in product development at the University of Antwerp in the upcoming academic year. To enhance the effectiveness of this exercise, there is a deliberate decision to allocate more physical space and time.

Building upon this initial exposure, students will delve deeper during their 3rd year (3Ba) in the Portfolio and Professionalization course, crafting the first version of their individual design compass. As they embark on the search for a suitable internship in their 1st master's year (1Ma), my design compass (version 1.0) will serve as a guiding tool. It will aid them in choosing and reflecting upon their internship experiences, acting as a North Star aligned with their evolving design aspirations.

As the current 2nd-year students progress into their 2nd master's year (2Ma) in the academic year 2026-2027, they will be invited to revisit and update their portfolio. This process will involve the creation of my design compass 2.0 within a similar portfolio-focused course.

The overarching objective is to seamlessly integrate this exercise into their educational journey, encouraging regular engagement. By maintaining this connection throughout their academic endeavors, we hope that students will continue to reference and derive value from their design compass in their professional work, providing a consistent guiding framework for their ongoing development.

The conceptualization of 'My Design Compass' as an instrument for aiding personal development, evolving in tandem with a designer, will be subject to further research.

3.3 Professionalization Learning Path

To reinforce the self-development and growth dimension of SkillsLab, we aim to investigate (software) tools that both students and coaches can utilize for tracking individual competence development. The selected tool should empower students to take charge of their growth process, fostering essential self-reflection and self-understanding to discern a personalized direction. This capability will be a valuable asset in structuring and advancing the SkillsLab workshop program and enabling a student to create their own design compass to navigate the future.

3.4 The Evolving Role of the Educator

The evolving role of educators involves acknowledging personal development and values exploration as integral components of design education. Educators are called upon to guide students in self-discovery, helping them identify their values, aspirations, and ethical frameworks that will shape their design philosophies.

The holistic approach in design education aligns with the broader societal shift towards sustainability and inclusivity. Educators play a pivotal role in instilling in students a sense of social responsibility, empathy, and an understanding of the environmental impact of their designs that is no longer optional.

The Educator's Evolving Role:

- **Facilitator of Holistic Learning:** Educators are transitioning from traditional instructors to facilitators of holistic learning experiences. They guide students in integrating technical skills with personal development, fostering an environment that nurtures creativity and self-discovery.
- **Mentorship in Values Exploration:** Educators serve as mentors in values exploration, encouraging students to critically examine their beliefs, ethical considerations, and the societal implications of their designs. This mentorship extends beyond the studio to prepare students for their roles as socially responsible designers.
- **Navigating Interdisciplinary Collaborations:** The evolving role involves navigating interdisciplinary collaborations to expose students to diverse perspectives. Educators facilitate collaborative projects that challenge students to consider the broader societal and cultural contexts of their designs.

More than ever, it is imperative that educators step out of their silos and consult and align sufficiently as a team to create the ideal climate in which students can discover and flourish. Continuing education and even retraining of educators, lifelong learning is key.

Day (2000) and Domik (2011) both stress the importance of investing in teachers' intellectual and emotional well-being, with Domik specifically highlighting the need for transdisciplinary collaboration and the development of lifelong learning skills.

Learning can no longer be dichotomized into a specific place and time designated for acquiring knowledge, such as school, and another place and time solely for applying that knowledge, typically the workplace. In the contemporary educational landscape, it is imperative to recognize that educating students extends beyond this traditional demarcation. To truly prepare students for the challenges of the future, we must go beyond imparting information; we must equip them with opportunities and essential soft skills that cultivate the mindset of lifelong learners.

In this context, educators must continue investigating how to evolve the learning experience. This entails creating dynamic educational environments that transcend the boundaries between academic settings and professional contexts. By integrating opportunities for continuous learning and emphasizing the

development of soft skills, we empower students to adapt and thrive in a world where knowledge acquisition and application are seamlessly intertwined. The goal is not just to provide them with knowledge but to instil the capacity for ongoing self-directed learning, fostering a commitment to knowledge acquisition and application throughout their personal and professional lives, aligned with their values and desires.

In forthcoming research endeavors, our aim is to continuously advance awareness, foster soft skills, and actively involve students in their journey of personal development and growth by empowering them. Through student agency, we provide them with significant autonomy to determine what and how they learn.

In the upcoming academic year, we will plan a study day to disseminate the insights gleaned from Portfolio & Professionalization, and to collaborate with educators and researchers in co-creating initiatives for other courses. This approach seeks to enable students to assume control of their developmental process, fostering vital self-reflection and self-awareness to chart their individual paths.

KEYWORDS | TACIT KNOWLEDGE, DESIGN RESEARCH, INTROSPECTION, DEMONSTRATORS, INACCESSIBLE RESEARCH

ABSTRACT | Design research is developing swiftly, adopting a lot from the scientific approach. However, rationalistic methods tend to limit their discoveries to ungeneralizable situated knowledge and lead to the separation of practice and theory, leaving unaddressed the tacit knowledge that design massively relies on. In this paper, an experimental tool is developed and tested that allows using design skills to explore their design decisions inward. During the design process, designers tend to adopt multiple perspectives of, for example, a client, a user, and a producer, and quickly switch between them looking for the best solution that suits everyone. We believe introspective methods are important for design researchers as they provide a better understanding of tacit principles guiding these shifts. The Internal Family Systems (IFS) approach suggests that as human beings, designers also have a set of personal perspectives, which might interfere with their design decisions and cause frustration. To reach them, an experimental card-sorting workshop was held with a designer who was still disturbed by one of the demonstrators he designed despite the time passed. Preliminary data was collected by interviewing the stakeholders and used to prepare the topics guiding the discussion. The workshop, guided by IFS techniques, revealed conflicts in the roles the designer plays as an executor, a company owner, and a private individual, which seem to be common in design practice. Further development of the tool might unfold a promising direction in design research towards bridging the gap between theory and practice, as well as design and research skills.

1. Introduction

Design research is developing swiftly, adopting a lot from the scientific approach. However, rationalistic methods tend to limit design research discoveries to ungeneralizable situated knowledge. This, in turn, leads to the separation of practice that is rapidly expanding into new domains and theory that is unable to follow it. Moreover, it leaves unaddressed tacit knowledge of design practice, that is often inseparable from the personality of a designer.

During the design process, decisions are often made by designers intuitively, even if they are based on solid ground of experience (Albers and Wiedner, 2011). Chow and Jonas noticed that keeping a distance from the studied object will never let the researcher fully comprehend the relationship between the designer and the design system (2008). Designers, however, have the necessary skills to position themselves inside it and obtain knowledge through practice. Furthermore, this perspective identifies a missing piece of design research — studying a finished project after being a part of it, or research AS design (or inward or inaccessible research) (
Figure 1).

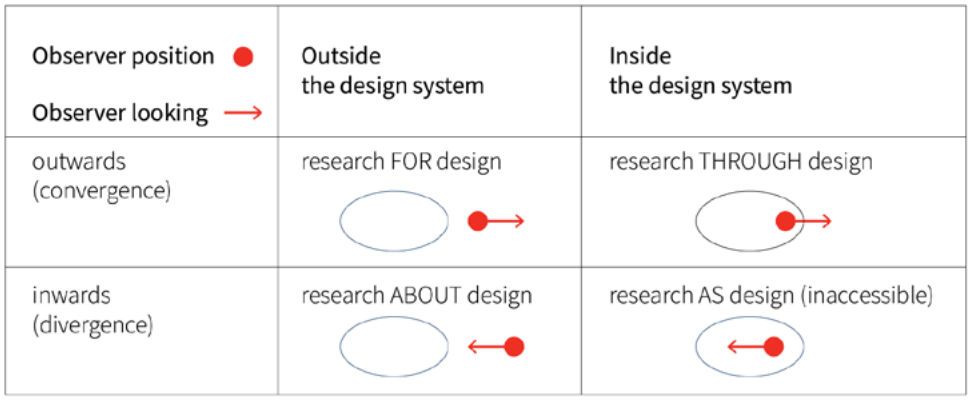

Figure 1. The concepts of research in design according to the observer position (see Chow and Jonas, 2008).

Moreover, the complexity and abstractness of design solutions are rapidly increasing. As opposed to the scientific approach that aims to reduce this complexity, design research thrives on it (Grand and Jonas, 2012). Therefore, to enhance the quality of the research skills of intuition and empathy inherent in designers should be mastered. Inaccessible otherwise, tacit bodies of knowledge can be accessed with the assistance of tools based on those skills. As a starting point of our study, we choose a demonstrator that has a richer soil for conducting such research (Sviridova *et al.*, 2022a).

In this paper, we develop and test an experimental tool allowing a designer to examine, report, and appraise their thoughts and experiences. The study is based on a case of a demonstrator, whose author claims to feel frustrated with it and still does not know why it was designed this way. To uncover usually tacit guiding principles, a series of interviews with all parties involved in the project-creating process were conducted. Based on the obtained knowledge, an experimental card-sorting workshop was held with the designer. According to the working hypothesis, during the design process, designers tend to adopt multiple perspectives of, for example, a client, a user, and a producer, and quickly switch between them looking for the best solution that fits everyone. To reach these perspectives of a completed process a combination of guided introspection methods with the Internal Family Systems approach elements was used. The researchers prepared cards with words that represented categories of possible reasoning based on the analysis of the interviews to guide the designer's inner conversations. The workshop revealed conflicts in the roles the designer plays as an executor, a company owner, and a private individual. These conflicts seem to be common in design practice and studying them might unfold a promising direction in design research towards bridging the between theory and practice. Moreover, a further development of the tool might help design research uncover guiding principles that are normally tacit such as designers' value

systems, enablers, drivers, or limitations.

2. Background

The ideal tool for conducting inwards research should be suitable to be used by designers in their practice, helping them identify and locate design rationale and strategic reasoning. However, as it deals with extremely vague matters, developed skills of reflection and introspection are required. As this study only describes the first attempt at developing such a tool, it was designed to be used with a researcher as an assistant. Otherwise, the data obtained might have been too unreliable for the rigor analysis. To acquire the necessary skills, researchers are suggested to use methods of guided introspection and the Internal Family Systems (IFS) approach. As domains of sociology and psychology have great experience in studying how people think and behave, the adaption of their practices seems to be promising for helping designers reconnect with their work.

2.1 Guided Introspection

The skill of reflection allows experienced designers to form a dialogue with the design process of constantly growing complexity and take the potential unintended consequences of their actions into consideration (Schön, 1984). It helps guide the process toward the best possible result, however, it does not aim to investigate subjective experiences for insights or knowledge generation. Introspection, however, involves deeper examination with an intention to explore 'what' and 'why' of one's own thoughts. Although, the literature suggests seeing introspection as a process (Gould, 1995), in this study we mainly focus on its efficiency in studying a project that was made a long time ago.

Reflection is used to adjust rational decision-making steps on the way to the result (reflection-on-action and even more responsive reflection-in-action according to Schön), while introspection addresses individual experiences when the result is achieved (Figure 2). In addition, reflection works with memory that fades with time, while introspection addresses the mental images, feelings, and sensations that can be recreated vividly if using appropriate tools. Therefore, methods of introspection suit better if the question aims to uncover the reasons for made actions.

Xue and Desmet differentiate between two scopes of the conception: the researcher's self-introspection, characterized by the unity of the researcher and their subject, and guided introspection, when the researcher only guides the subject to introspect. The last method focuses on assisting the subject in examining and reporting their experience and does not involve the researcher's introspection (2019). In this study, we choose to assist the designer so that he would not need additional training and could focus better on the process of reconnecting with their work.

Figure 2. The difference between reflective and introspective approaches when studying the decisions made during the design process.

2.2 Application of Internal Family Systems (IFS) in Design

During the design process, a designer intuitively shifts between several roles to get a better perspective of each of the stakeholders. These roles can be simply a client, a user, or a manufacturer of the product, however, with the increasing complexity of challenges, they are becoming more complex. Marmo points out how contemporary designers communicating on contextual, communal, and organizational levels become more of 'translators' between making, researching, and facilitating modes (2017). Meehan notices the tension caused by the confusion between having different functions within specific roles and the growing expectations to fulfill them. Depending on which mode and in what context they are in, roles

define what tasks they need to perform, while functions are about the responsibility they take on a general level (Figure 3). The interplay between these entities demands constant adaptation, making designers flexible and quick learners (Meehan, 2018). However, the process of switching between the modes as well as choosing the current most relevant one remains unclear. We believe that if designers could consciously reconnect with these modes, they could discover a lot about their own design process.

To try to address them methods of Internal Family Systems (IFS) were used during the study. IFS is an integrative approach to individual psychotherapy developed in the 1980s by Richard Schwarz. The basic assumption of this transformative evidence-based model is that the human mind is subdivided into indeterminate inner parts that are united and led by Self. In balance, this 'family' develops a complex relationship, where each part adds something positive for the individual. However, as a reaction to stress, they might try to draw attention to the problem by destructive and counterproductive actions. For example, as a reaction to a childhood trauma, a part can turn into an exile and take over Self in a similar situation, causing the feeling of vulnerability and fragility to protect the individual's consciousness from pain. In practice, it might look like avoidance or denial, and even lead to self-harm (Schwartz, 1995). The goal of IFS is to reconnect with the parts and 'unburden' them, restoring the cooperative and trusting relationship. It is important to notice, that parts are not created by experiences but can be affected by them. There are no 'bad' parts and thus, no need to eliminate them, but instead help them return to their non-extreme roles (IFS Institute, n.d.). The approach is relatively new and not applied much in domains other than psychology, therefore its adaptation to the design research purposes happened intuitively and was not supported by the literature.

2.3 Case Selection: Of Instruments and Archetypes

Demonstrators can be described as tangible objects, combining engineering, design, and art to communicate a certain, usually abstract and complex, message to their audience (Sviridova *et al.*, 2021). Although the process of designing them has received some attention in the literature, it is mostly focused on scientific demonstrators intended to bring research from the laboratory to the market (Moultrie, 2015; Stelvaga and Fortin, 2022). This study focuses on a demonstrator made in a small design studio: it manifests the result of the research personal to the designers without the influence of a client, a manufacturer, or a customer (Sviridova *et al.*, 2022b). Therefore, we believe the approach we propose should be fruitful in this case as most of the decisions were made intuitively and could not be articulated by the designers or reached with analytical research methods.

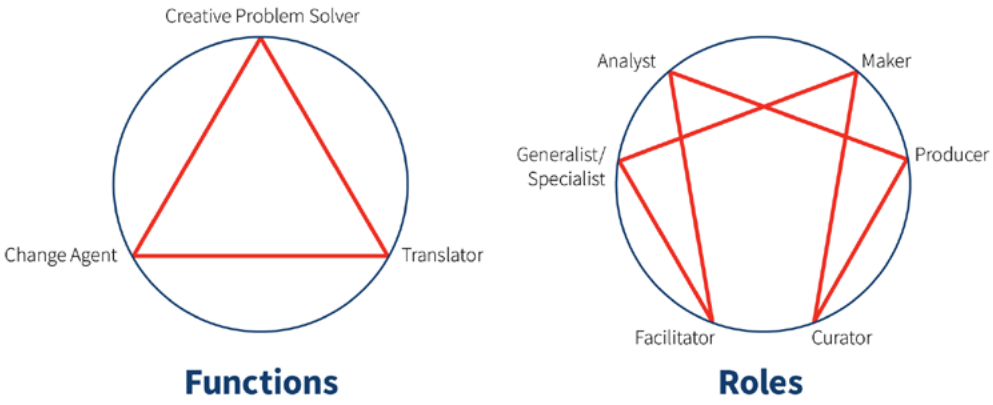

Figure 3. Visualization of probable functions and roles of a modern designer based on the visualization of an enneagram (see Meehan, 2018).

The selected project, 'Of Instruments and Archetypes' explores the relationship between physical and digital user interfaces by uniting measuring and making. It consists of a set of measuring tools and a screen displaying a 3D model. The user does the measurements and it immediately affects the parameters of the 3D model. When they are done the result can be printed. The project brings the making back to the maker, in the form of a physical embodiment of parametric CAD modeling (Figure 4). According to the designers,

the appearance of the tools is intentionally archaic to provoke people who are too used to digital interfaces (Unfold Design Studio, 2014).

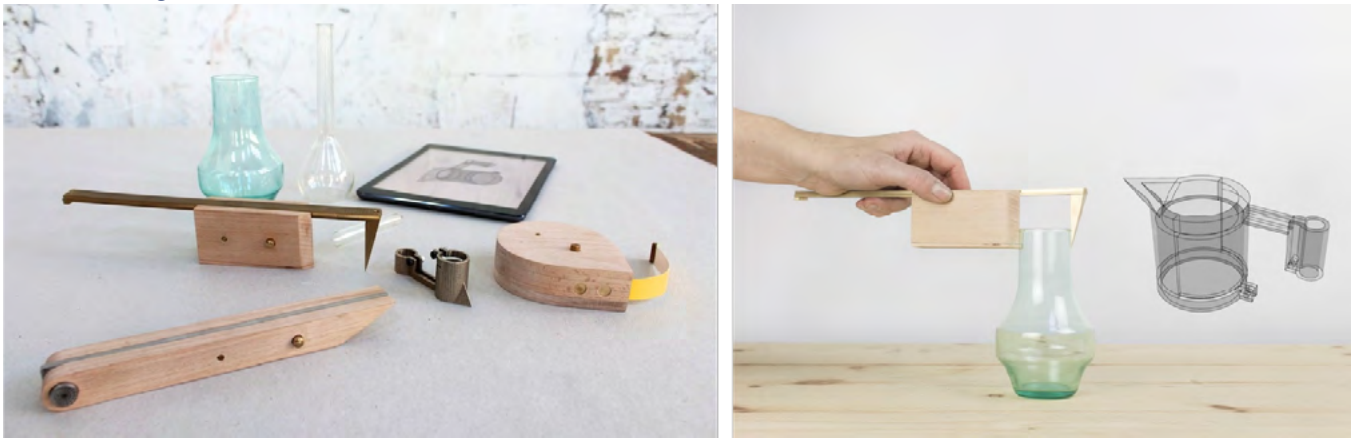

Figure 4. Of Instruments and Archetypes by Studio Unfold (Unfold Design Studio, 2014).

This project was chosen for the study as it still causes frustration to one of its creators almost ten years later after it was built. The designer claims that this project is the most unusual in his practice because he still does not know why they did the project the way they did it and why they decided to do it in the first place. In the interview, he clearly states their intention to bring the digital functions of the 3D-modeling tools back to the physical world, however, the frustration stays. Thus, it correlates with our statement that the problem that initiated the design was so implicit to grasp, that the path to the solution was guided purely by the designer's intuition and hence, needs a special tool to be unraveled.

3. Method

To help the designer answer the question of why he did the project 'Of Instruments and Archetypes', a special tool was developed first. It was designed to help him locate the relevant tacit knowledge zones and introspect them looking for the reason for frustration. To identify these zones, methods of Internal Family Systems were used. The algorithm for guiding the discussion was provided by a psychologist with experience in using this technique. In a nutshell, it consists of preliminary focusing and work with unwanted behavior. First, inner parts need to be identified and described, then asked how they feel in general and regarding the project. The number of parts can be established by asking direct questions or noticing which words the person uses when talking about the problem. The introspection process was supported by the conceptual card-sorting technique as guidance for the participant during the sensitizing process (Sanders and Stappers, 2012).

To pinpoint the key concepts for the cards, the researchers interviewed the people involved in the design process. Additionally, the context of the project in the studio history was framed using the materials from their website. The concepts represented categories of possible reasoning derived from the analysis of the interviews and researchers' assumptions. They were supposed to act like anchors and guide the participant busy with interacting with his inner Self about abstract problems. IFS was used to help the participant identify his inner actors, while cards helped him describe them and their needs while exploring the structure of their relationship.

4. Results

4.1 Interviews

Three people worked on “Of Instruments and Archetypes”: the designer, the second founder of the studio, and the intern. At the moment there was also the second intern, but all the parties agreed, that her contribution was mostly the details, as the core decisions about the idea, concept, software, and funding were made by the aforementioned people. Thus, the study consists of three interviews with them, an analysis of the project in the context of the studio history, and the results of a workshop with the designer.

The interviews were semi-structured and took around an hour. Two of them were held online, the one with the designer — in person. Questions focused on the timeline of working on the project and on the reasons for making it. The main parts of the project were elicited from the transcripts of the interviews’ recordings and explained the distribution of work (Figure 5). To find out what caused the designer’s frustration about the project, decisions that were made during the process and reasons for making them were coded and analyzed. Cards for the card sorting part of the workshop were made based on this data. The further analysis focused on contradictions in the participants’ words.

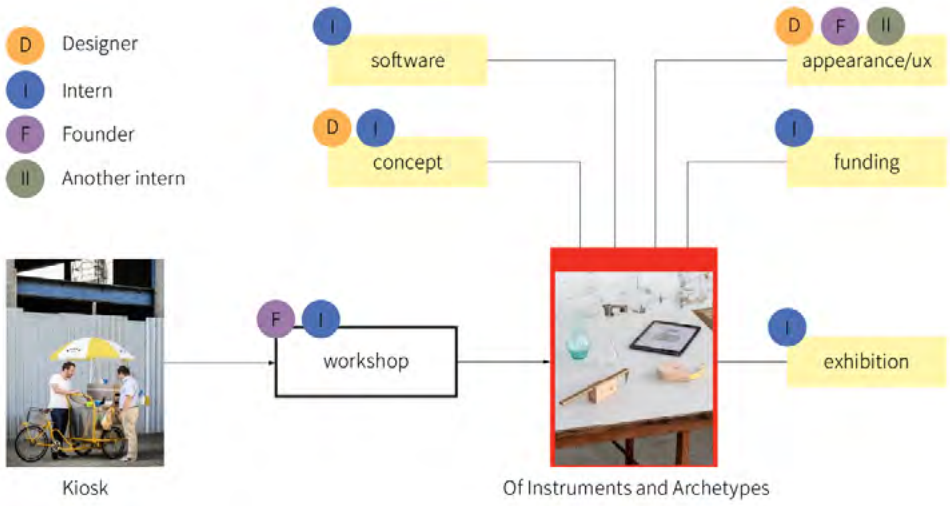

Figure 5. Roles on the project according to the interviews.

All three participants corroborated the roles they (together with another intern) played during the work on the project. The founder and the intern came up with the initial idea while conducting a workshop related to their previously done project, Kiosk — a mobile stall where people could print a custom detail. During the workshop, a discussion started with the participants about digital copying, and the idea of a tool that could take measurements directly on the screen arose. The intern was the main driver of the idea, and eventually, he obtained a grant that allowed finalizing the work after the concept development. He also organized the exhibiting of the project.

The founder said she did not feel any frustration regarding ‘Of Instruments and Archetypes’ and that according to her vision, the project showed well what the studio does. She explained that especially in the earlier days they liked to envision scenarios of the near future and illustrate them with tangible interactive objects. They were never interested in bringing them to the market and, therefore, she never felt any frustration about this project, nor questioned why they did it in the first place. However, two other participants still feel it and we believe, the reason lies in the aspect of commercialization.

The intern said during his interview that he started this project as a development of democratic design ideas.

By that, he understands the approach when designers provide customers with the possibility to make a product instead of the product itself. According to this, 'Of Instruments and Archetypes' should have become part of the easily accessible production facility, and the tools should be able to be bought in a hardware store or found on the street and used to create a chair, a table, or anything. Soon he realized, that this idea was impossible to materialize and he could only reach the demonstrator stage. However, he believed that the designer pushed the project to become a real product, something that could be produced and sold.

On the contrary, according to the designer's interview, the problem was that "if you want to make an impact, you have to complete the project instead of making it a kind of inspirational thing". He claimed that during his studies he was taught to work with concepts and museum installations, never considering the potential business model or the way how to commercialize his design. To him, 'Of Instruments and Archetypes' was more of a reflection point of what it was supposed to be and what it should be, where lies the fine line between a materialization of a concept to inspire others and a prototype for potential production.

Therefore, we concluded that the reason for the designer's frustration lies in his attempts to define what he as a designer should do: pursue commercialization like what a product designer is supposed to do or stop at the conceptual phase like he was taught at the design academy and what he prefers better. This version seems even more plausible if look at the studio projects' timeline: before 'Of Instruments and Archetypes' their work looked like prototypes of products that only needed one more step to be brought to the market, while afterward, they switched to demonstrators illustrating their ideas and research, and later, even to movies as a medium that communicates their stories more clear (Figure 6).

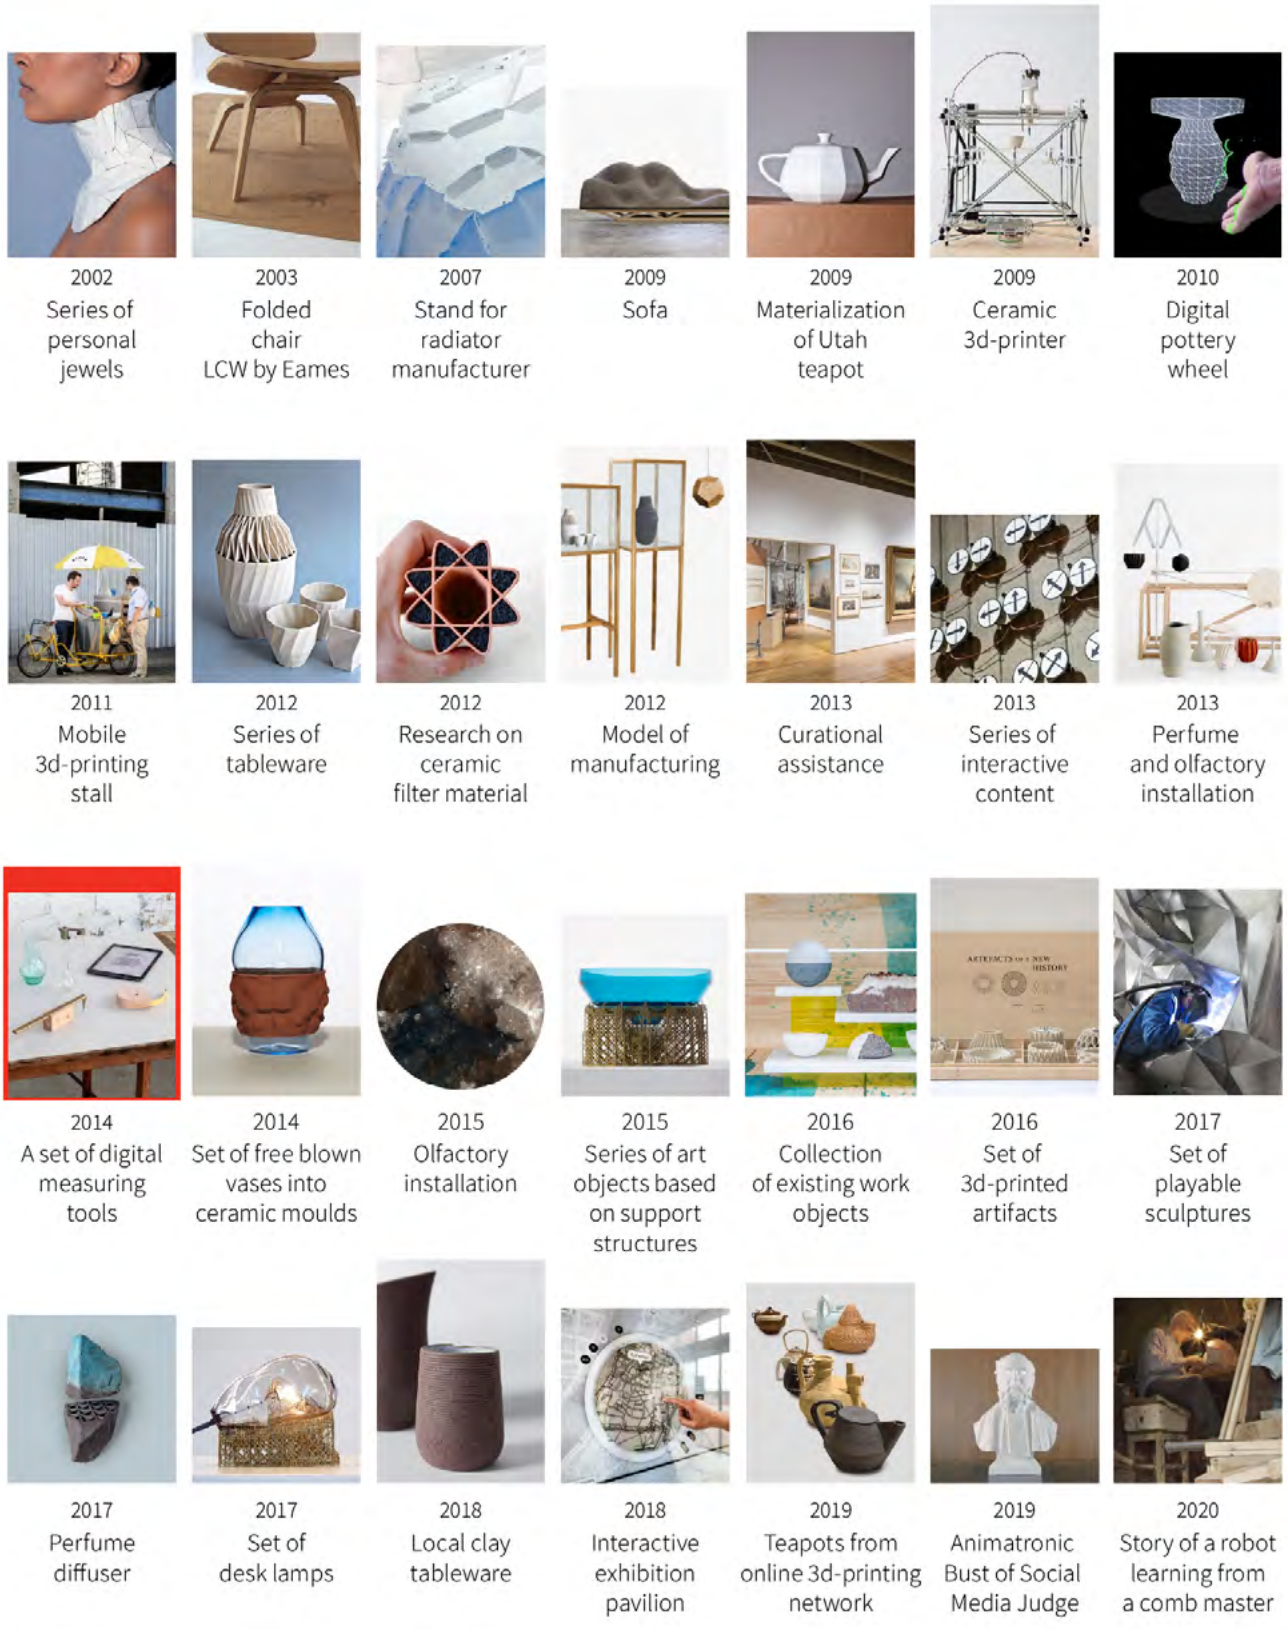

Figure 6. Timeline of all the projects done by the studio so far. In the top part, projects have the potential to be brought to the market, in the bottom — the focus is switched to the stories that the objects represent or even the videos.

4.2 Workshop

To test the hypothesis about the conflict between a concept-maker and a commercial product designer, and to see if there were other conflicts, a workshop with the designer was conducted. It was held in person and took around 90 minutes. The participant was briefly introduced to the procedure, the timeline, and the concepts written on the cards. The first half was based on techniques of IFS, while the second was the work with two sets of cards. The concepts written in the first one are meant to guide the discussion and help the participant describe his inner parts together with some blank pages left to add something if needed. The second set had potential frustration reasons based on the analysis of the interviews and the researchers' assumptions (Figure 7, left). During the first half, two main inner parts of the participant were identified: a curios challenge-seeking part enjoying problem-solving and making things, and a sustainable business-oriented part, who seems to have a conflict regarding earning money/sustaining the studio and exploration of design/envisioning the future. We assume that the discussed project was the one where the conflict took place for the first time.

To guide the discussion, questions from a list provided by the IFS expert were asked in an appropriate order (Table 1). The parts were directly asked what makes them happy or frustrated (Table 2). Then they were asked to focus on the 'Of Instruments and Archetypes' project and describe how they feel. Surprisingly, the sustainable part was happy about the project because "that story works". Being pragmatic, it enjoyed developing the concept of how consumers work together with designers in the future. At the same time, these aspects caused the frustration of the curios part — it did not have "a lot of plays" as the concept was quite specific. However, if the curious part gets its freedom, the sustainable one faces eternal questions of how to fit the project into their studio's strategic evolution. The designer notices that "the desirable situation would be that companies pay you to be the curious hacker and the future envisioning", yet he admits that it is a dreamland, and other studios he knows have the same struggles balancing between the need to produce things that can be sold and aspirations to research and explore.

Table 1. Questions to identify the inner parts and work with specific ones adapted from the IFS approach.

Focusing Self on one of the inner parts:
• At which part would you like to first pay attention? Which part would you like to talk to first? What does it look like? • What thoughts can you notice when focusing on this part? What feelings do you have towards this part? • Are there other parts? What other parts can you notice/observe/hear?
Work with a specific part:
• What story does this part want to tell us about itself? What is important for this part to tell us? When did it appear for the first time? How old is it? • What does this part do for you? What does it take care of? What are its intentions towards you? • When did it start doing it? • What did it feel when it started taking care of it? Does it like this job and the way it does it? • If it did not need to do it, could it give this job to Self? What would it prefer to do instead? • What is the attitude of Self towards this part? What does <another part> think about this part?
Changing focus to a specific part:
• Do I understand it right that one of the parts is now reacting to this? Who is talking right now? • Could you please ask it to step aside for a bit? Does it agree? If not, what reasons does it have? What can we do for it to step aside for a moment? • When you hear the voice of//observe this part, what else do you notice? • Could I please speak to <another part>?

These perspectives are quite contradicting, nevertheless, the designer believes the parts understand that they are “two sides of the same coin” and that having the sustainable one is “a necessary evil” for the curious one. It is confirmed by the card-sorting exercise: the participant arranged the concepts so that they better represent these parts, however, with time they blended (Figure 7, right). He admits that although each of the parts finds much fun in the other’s activities (for example, the curious part is interested in learning how business works), it is the sustainable one that bears the most frustration as it has “to think about efficiency and the bank account” when the curious part does not worry about these things and can cut the frustration loose. Meaning, that keeping one part happy causes the frustration of another:

> “They are mutual. You can switch them because without one there's no other and without the other, there is no one. So you cannot pinpoint which of the two is frustrating you. … But the frustration is universal. That is a lack of having the means to do what you like to do or having a lot of means to do something that's different than what you want to do”.

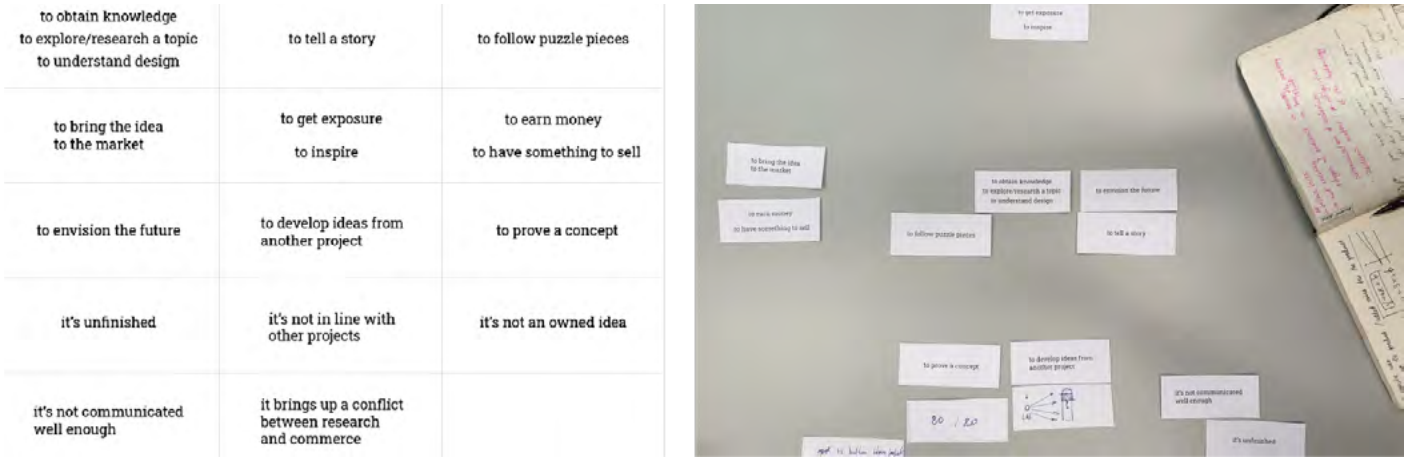

Figure 7. Premade concept and possible frustration reasons cards (left) and the results of card-sorting exercise supported by methods of guiding introspection clustering the concepts as more inherent to one or another inner parts (right).

The two inner parts of the designer were in constant conflict as they also represent his rational studio owner part opposing his irrational designerly one. Although he admitted the reasons for his frustration became clearer, the designer could not find a connection to why this particular project caused this emotion. The analysis, however, showed that ‘Of Instrument and Archetypes’ was the key project that changed the direction of the studio from potentially producible products to demonstrators, significantly shifting the emphasis to the research part, and later even abandoning the presentation of its results in a tangible form. The frustration arose as the intern who initiated this project represented the opposing views, in other words, the process of working on this project coincided with the designer’s inner conflicts. The designer did not come up with this interpretation during the discussion, however, he did not contradict it either. Although the participant denied the reason for doing the project came clear to him during the study, he agreed with the researchers’ version brought to his evaluation at the end of the workshop:

> “Honestly, I think I understand very well, but I'm just not comfortable, really. So maybe … that's also why I brought this project up, because I know that it's kind of … the end of something and the start of something else”.

The proposed tools worked as planned, however, the efficiency could be better: the participant could not always distinguish between the parts, and sometimes the guidance from the researcher was more confusing than helpful. Additionally, they focused on personal inner parts and could not locate the designerly inner parts. However, they might be tightly connected, especially in small independent design studios where designers have more authorship of their work. The collected data can be useful to refine the tool but it also highlights the potential direction of further research, which is a conflict of inner parts of a designer. The potency of it is proved by the participant claiming that many of his peers are experiencing the same.

Table 2. Reasons when two parts identified by the designer are feeling frustrated or happy.

	Curious challenge seeker/ creative problem solver/ explorer and maker of new things	Strategic future thinker/ business-oriented/ sustainable
Frustrated	- The longer you have your own studio, the more you involve people, the less you can get involved in that fun part (making things) - It's frustrating that I'm teaching here, while people in the studio are playing with stuff and making things - If you only try to be efficient and solve the problem, then you stop at the point where you start to be curious. - I think the core frustration where you feel like (the other part) is really happy - (this part) wonders how can I earn a sustainable income without having to make this vision as a startup	- The frustration is that it doesn't know what it can be or what is the format of that - It worries about how to get resources - from the outside it looks like (other studios) can finance kind of the curious, inquisitive meta story design work. But then later you talk to them, … and there is no magical solution - How can such activity sustain itself? How does it make an impact?
Happy	- I like to understand things - Two parts … are not meant to go together, but let's see what happens when we put that together. I think that's the fun of creating hacking	- It would want that he can fund the work properly: from a client, or public or private funding, or from limited edition objects

5. Limitations

It was the first time when the researchers used the Internal Family Systems technique and the lack of experience led to sometimes redundant guidance that, in turn, caused the participant to go in circles. Nonetheless, the result can be considered positive based on the participant's reactions: he managed to distinguish and switch between the parts and referred to them separately when answering questions. Sometimes, unwanted parts joined the conversation, it was clear as the participant's voice and even mimics changed. With guidance, however, they were properly addressed and asked to wait, while giving the space to the parts that were of the study's interest. Additionally, this approach deals with one individual, and no matter how complex one human being could be, a designer might have several personalities intertwined, such as user, client, or manufacturer whose opinion they take into consideration. It might decrease the accuracy of the tool; however, we believe it can be mitigated with the level of its development.

As both methods used in the study are based on subjective experiences, the tool might be limited to projects where the researchers have access to the involved parties. Meaning, that it could be less effective to use with secondary data. Although the tool is capable of being used for projects designed decades ago, and the feelings and emotions can be recovered almost as vividly as they are, the memory fade might still be a reason for concern.

6. Discussion and Conclusions

An experimental workshop was designed as a first attempt to develop a tool to reach tacit knowledge that designers produce when working on demonstrators. To identify and reconnect with his designerly inner parts, a designer who claimed he still does not know why he did one of his projects ten years ago was asked to introspect on his experience while sorting cards. The process was guided by questions based on the

Internal Family Systems (IFS) approach when the concepts on the cards were based on the analysis of the interviews of all involved parties together with the context in which the project was carried out. The direction of the tool design has proved to be successful as it allowed the participant to reconnect with the project he worked on more than ten years ago. Two inner parts of the designer were elicited: a curious problem-solver and a sustainable strategic future thinker. In a conversation with them the designer identified what aspects of his work make them happy or frustrated and realized that they contradict each other: if one inner part is happy, the other one is frustrated. The 'Of Instruments and Archetypes' project apparently coincided with the designer's realization of the fact that he will always have to invent new ways how to sustain his studio if he wants to work only with conceptual design. It means prioritizing the well-being of one inner part at the expense of another.

As the use of IFS is expanding to other domains such as marketing and branding, the proposed tool can be potentially adapted for multidisciplinary use. The method to locate the inner parts was based on the one that therapists use in their practice so it was not pre-adapted to the design context. However, if a person with no prior experience managed to use it (it could be seen by changes of voice and vocabulary selection of the participant when an inner part that did not want to talk interfered with the conversation), the efficiency of the method can be enhanced in the future. It might be used in research of design rationale and strategic reasoning of designers given the necessary modifications (that are also to be discovered).

In his essay 'The Author as Producer', Benjamin discusses the necessary changes in the political and economic environment that can grant the author the freedom to write what he pleases (2018). The social situation, however, is not inclined to give him such autonomy and will inevitably force him "to decide in whose service he wishes to place his activity". Benjamin talks about the potential impact of technological advancements and their ability to redefine both authorship and labor and gives an example of Brecht's theatre, where he alters "the functional relationship between stage and audience, text and production, producer and actor". Almost a hundred years later we witness his predictions come true. Today it is barely possible for intellectual workers to not be involved in their actual production process: designers must learn how to design, develop, and market their content to be sustainable. The Author has become much more multidimensional — yet, this advancement has also brought conflicts. The increasing number of roles and functions designers have to perform today might result in a lack of *design* in their practice and cause psychological frustration. For design research, it means that studying design is inseparable from the personality of the designer and to advance they also need to expand their palette of tools, functions, and roles.

About the Authors:

Aleksandra Sviridova has an extensive track record and network in the field of digital design, 3D printing, and prototyping. In her working life of more than 5 years of industry, her interest in the overlap between the arts and technology grew, as well as a passion to learn more, after which she followed the training for integrated design with summa cum laude in Dessau. She is currently pursuing her PhD at the Antwerp Design Factory, part of the research group of Product Development, University of Antwerp. Promotor is Prof. Jouke Verlinden.

Jouke Verlinden is the spokesperson of the research group of Product Development at the Faculty of Design Sciences. His research focuses on Augmented Fabrication: cyber-physical manufacturing and mixed reality and digital fabrication for improving (augmenting) human-centred design. He has published >120 scientific articles and several patents. He is editor-inchief of the Journal of Design Research (JDR). Furthermore, he acted as guest editor for CAD journal, International Journal of Interactive Design, Engineering, and Manufacturing, International Journal on Automation Technology, while he co-founded a magazine series on Augmented Reality and Art. Recently, one of his co-authored works received the European Heritage Award for the Scanning for Syria project (2020), the best paper award at the ASME DETC conference (2017), while he received the 2016 Purmundus Award for the 3D printed bicycle.

Acknowledgements: we thank Dmitri Pechkeen (independent psychologist and psychotherapist) for the immense inspiration and helpful guidance to the world of Internal Family Systems, and Dries Verbruggen (studio Unfold) for his time and courage.

KEYWORDS | PERFORMATIVE DESIGN, CRITICAL THINKING, PEDAGOGICAL PRACTICES, DESIGN, PARTICIPATORY

ABSTRACT | In the expanded field of design science, performative practices emerged in the 1960s with the "experiential turn" concept to instrumentalize space and the body, trigger experiments with the public, explore the language of design, and invoke the various concepts that today are scientific instruments in design and elevate design to a multidisciplinary dimension. Performative Design (PD) transcends conventional boundaries by integrating experiential elements into the design process, emphasizing the importance of audience experience, human interaction, and the emotional resonance of a design. PD is a transformative act, where the designer becomes a curator of their methodology as an experience rather than just creating a product. There is a sociological impact that PD introduces into the scientific frontiers of design, especially when combined with other processes, such as participatory design, co-design, critical design, fictional design, and speculative design. This process involves a dynamic interaction between the physical and digital domains, challenging designers to consider the entire lifecycle of a design – from conception to fruition. This article proposes a teaching model based on the instrumentalization of design methodology as a medium to establish the interaction between: (a) the mediator - signifier, igniter, and activist; (b) with space - private space, public space, and nonspace, and (c) the Public - audience, participatory and observer. The authors applied this model in a Curricular Unit in the third year of a Communication Design degree in Portugal. In this article, they share the first results of this CU, where the student reflects on the design process as an exploratory means that continues after a functional consequence of a commercial product.

1. Introduction

This paper aims, first and foremost, to explore different approaches to design practice, with a profound recognition that the expanded field of design brings to the discussion the opportunity to explore new borders. In the expanded field of design science, performative practices emerge to instrumentalize space and the body, trigger experiments with the public, explore the language of design, and invoke the various concepts that today are scientific instruments in design and elevate design to a multidisciplinary dimension. Performing arts enunciated an artistic transformation in the 1960s with the "experiential turn" concept, which introduced experience as a complementary element to the different dimensions of creative practice, with the performative bringing contingency and illusion to situationism through a space and a discursive context, establishing a relation with the public. Designers have also appropriated these dimensions, bringing to the design context: (a) a transformation in practice through the power of event intervention and (b) the aesthetics of experience and construction through the creative narrative approach. Correlating embodiment, enactment, and staging with private space, public space, and nonspace, and the different types of audience, participatory and observer, PD projects emerge, which even transform the borders for domains already characterized as performative language and performative artifacts.

Nowadays, PD transcends conventional boundaries by integrating experiential elements into the design process, emphasizing the importance of audience experience, human interaction, and the emotional resonance of a design. At its core, PD is a transformative act, where the designer becomes a curator of their methodology as an experience rather than just creating a product. Designers such as Tereza Ruller - The Rodina (2021), Amandine Alessandra (2021), Benjamin Santiago, Hella Jongerius, and Louise Schouwenberg (2017), among others, have outlined through their work the sociological impact that PD introduces into the scientific frontiers of design, especially as other concepts can be enunciated in this practice as participatory design, co-design, critical design, fictional design, speculative design, among others. PD thrives on embodying ideas, where concepts are translated into experiences. This process involves a dynamic interaction between the physical and digital domains, challenging designers to consider the entire lifecycle of a design – from conception to fruition. The Designer "The Rodina" has demonstrated through its work that the physical and digital dimensions through immersion in augmented reality open new ways of experiencing, bringing the design closer to fruition.

Methodologically, the goal is to contribute to the PD statement and definition through intensive research focusing on a literature review and an academic understanding of reference designers working in this field, analyzing, and characterizing their methodologies and contexts. What we found most prevalent in the extended field is the structuring element of their practices or the instrumentalization of design methodology to establish the interaction between their work, the space, the public, and the anticipated outcomes. Based on this conceptual framework, the authors created a teaching model - Performative Design Experiments Generator Model (see figure 1), to facilitate the design process students used to develop the design challenge pedagogically supported by a project-based learning approach in a Curricular Unit in the third year of a Communication Design degree in Portugal.

This reflection presents and discusses the first results of this CU, where the student looked at the designer as an exploratory means that continues after a functional consequence of a commercial product. Thus, it also allows young future designers to understand design knowledge and intervention through interdisciplinary collaboration, bringing together experts from different areas to converge PD and design science in a fertile ground for innovative and holistic design solutions.

2. Performative vs Performance

It is essential, first, to identify the difference between the terms "performance" and "performativity," which are ambiguous and have varied meanings and implications in various situations and fields. As a result, opinions about how performative reenactment differ significantly among practitioners and in depictions of it in academic and media contexts. (Johnson, 2019)

Performativity, which means "the quality of being performative," has been employed in various contexts and occasionally in specific ways. The most well-known usage of the term was in Judith Butler's (1988) argument that gender is produced through the verbal and physical acts that impose social norms. Associated with this definition is also the performative language, defined by Austin (1962), which is the capacity of some forms of language to act - not only to describe but also to effect social action by accomplishing a statement.

The clarification in the arts field, specifically with the distinction of performative arts, allows us to characterize the difference and application in the context of PD. The distinction happens genetically; "theater" and performance usually refer to scripted works centered around (verbal) dialogue, story, and a character or characters in theater, performance studies, and the cultural industries. On the other hand, performative refers to a change in focus from the effects and sensations a piece generates to what it shows and represents—or, in a simple understanding, from what it "says" to what it "does." (von Hantelmann, 2014)

The performative, in theory, causes a methodological shift in our perception of any creative work and the meaning-making process. When interpreted in this light, it does provide a fascinating and thought-provoking change of viewpoint. (von Hantelmann, 2014) The performative idea puts into perspective the illusive and contingent world of impact and effect that creativity produces, both relationally—concerning a viewer or public—and situationally—that is, in a particular spatial and discursive environment. (von Hantelmann, 2014)

Von Hantelmann (2014) applied this change with *experiential turn.* This term changed the creative environment, especially in the arts, when in the 60s, with the expanded field (Krauss, 1979) turned toward the production of experiences, creating and molding experiences became a crucial component of the idea behind the artwork. The potential of art to elicit this experimental self-relation is what has an aesthetic influence that communicates not with the artist's sensitivity or subjectivity, as we could when we consider other works of art, like drawings, but with ourselves and other people who share our experience. (von Hantelmann, 2014) In this perspective, the author focuses on a purpose for the performative definition, where the object, traditionally the protagonist of meaning production, becomes a device for engaging in an experimental relationship with oneself and others. (von Hantelmann, 2014)

PD incorporates concepts into the design process in various fields, including interactive media, architecture, and design. It includes research on how people, situations, and surroundings can be actively interacting and shaped by design mediation. Functionality, economy, sustainability, user experience, social impact, and more are the criteria for creating designed artifacts, environments, and experiences. But mainly the commitment to the active engagement of participants, the exploration of liveness and presence, and the potential for transformative encounters between creators, audience engagement, and the world around them. The concept of the performative puts into perspective the illusive and uncertain domain of effect and impact that brings about both situationally — that is, in a given spatial and discursive context — and relationally, about a viewer or a public. (von Hantelmann, 2014)

According to Smith, G. (2006), Ervin Goffman defines that not only an actor or a performance artist, but every individual in his day-to-day interactions with others, is using a surface, and they must deliver a performance to influence the other. It transforms this perception into a continuous framework for interaction; that is, performativity is no longer made possible by framing the social scene. (Rullerova, 2015)

Performative Experience Design is a proposal defined by Spence, J. (2013, 2016) as a methodology, a field, and a paradigm for comprehending technology-mediated encounters where the system, gadget, or circumstance presents a chance for the "user" to perform for others. In the author's definition, Performative Experience Design draws our focus away from a technological tool or even the user's interaction with it and instead highlights the significant psychological and social shifts in perception that result from showing others how we interact with technology and from making ourselves appear to others as social beings using it.

In this paper, we intend to characterize the purpose of this (PD) proposal as a more expanded scope that is not defined by the technology or techniques but by the potential of the PD as a field for the public to interact in and with design, applying the fundaments in ephemeral practices, with flexible structures, instrumentalized by the narrative developed and embodying the designer as a mediator and with emphasis on the public participation as being part or as observers of the performative context. It is based on this conceptual extension connected to performative art that we develop the model and apply it in the teaching context to explore the expanded field of design, where nowadays it allows this dialogue with the viewer in areas such as critical design, speculative design, transformation design, among others.

3. Literature Review

This literature review researches the perspectives of performative designers within design theory and practice, being the timeline between Bauhaus and the Fluxus to Contemporary. While primarily based on scholarly journals, our focus is on understanding the viewpoints, methodologies, and contributions of designers who prioritize the performative aspect of their work. Through a comprehensive analysis of existing literature, this study aims to provide insights into the evolving landscape of PD and its implications for design theory and practice. The methodology employed in this literature review involved a systematic search and analysis of relevant scholarly journals within the design field. Keywords such as “performative design,” “embodied interaction,” and “design theory” were utilized to identify pertinent literature. After identifying relevant articles, a thorough examination was conducted to extract insights related to PD perspectives.

Revisiting the principles of the Bauhaus, one of their many concerns was to create fresh, cutting-edge teaching strategies that allude to the movement's past but are also pertinent to the discussion about design and design education. In this ambition of Bauhaus, Brejzek & Mayer (2019), identity articulation in objects and buildings, as much as in performances, choreographies, textiles, and paintings, texts, and manifestos, seemed to us to lie distinct links to today's concerns about design education and the role of the designer in society. Performative activities, like the well-known Bauhaus performances by Oskar Schlemmer (1924), were seen as a social and pedagogical aspect of the Bauhaus philosophy, further encouraging masters and students to interact, with invitations frequently extended to the general public. Costumes were based on order, law, and precise structures, incorporating new materials and technologies, fusing technology and human creativity to create futuristic-looking, sculptural figurines that interacted with the public—Applied Bauhaus pedagogies by design principles, methods, and social organization and activities. The preparation for each performance followed a similar pattern, beginning with the abstract symbols, designs, geometric formations, and predetermined linear pathways produced as paintings. These ideal abstract conceptions were practised in real life by collaborating with the dancers performing on stage (Nechvatal, J., 2017).

After Bauhaus, the Fluxus is the movement that embraces and brings to light this convergent approach to breaking boundaries. Emerge in the 1960s started with an interdisciplinary and experimental approach to the creative process, blending different media and breaking down traditional dogmatic views on the creative field for a more open mind, creating controversial work, converging disciplines for the same context, and engaging audiences in interactive experiences. From composers and poets to artists, architects, and designers: John Cage, George Brecht, Dick Higgins, Allan Kaprow, George Maciunas, and others define the need to conduct experiments using different disciplines in the learning process inside de classroom (Higgins, 2003).

From the book "*Information and Experience*", van der Bijl-Brouwer & Malcolm (2020) stated that it is possible to identify different approaches operating with diverse experiential frameworks characterized by the dissolution of boundaries, beneficial cross-fertilization, experience of context, and learning for a rethinking of wither education. Another recent change is using design methodologies, such as systemic design, to address societal issues through transdisciplinary collaborations. Academic and societal stakeholders must work together to fully understand and address the complexity of major societal concerns like digitalization, rising inequality, and climate change (Tejedor et al., 2017). Transdisciplinary collaboration holds the potential to integrate academic and contextual information, enabling the creation of treatments by leveraging diverse viewpoints (Lang et al., 2012).

Design is frequently promoted as a viable method of collaborating that may unite various parties and professions. However, sometimes, how it accomplishes this needs to be clarified. This research aims to elucidate design's role in transdisciplinary settings by challenging and expanding on this viewpoint. How can and ought design to position itself, we wonder? Is "the solution in itself" design? (cf. Dorst, 2019) or is its contribution more nuanced and humbler than often claimed? The most well-known design aspect is its generative powers, which enable it to produce aesthetically pleasing goods and seamless services. Nevertheless, there has been a greater focus on the ethical, political, and societal ramifications of design in recent years. Approaches such as speculative design (Dunny & Raby, 2013), adversarial design (DiSalvo, 2012), and value-sensitive design (Friedman et al., 2002; 2017) highlight these developments. In the meantime, there is a rising number of inter- and transdisciplinary collaborations due to the growing complexity of scientific and societal concerns. Issues like global migration, climate change, and digitization are examples of "wicked problems." Buchanan (1992) encompasses a broad spectrum of professional fields, scientific specialities, and cultural settings, necessitating a comprehensive strategy to handle the complexity and multidimensionality of the situation effectively. Such an all-encompassing strategy is the goal of transdisciplinary collaboration. According to Lang et al. (2012), transdisciplinarity is "a reflexive, integrative, method-driven scientific principle aiming at the solution or transition of societal problems and concurrently of related scientific problems by differentiating and integrating knowledge from various scientific and societal bodies of knowledge." (Lang et al., 2012). There is an understanding of the rationale for the perception of design as a prospective ally in transdisciplinary cooperation. The intricate, unrestricted, unclear, and interconnected character of contemporary issues provides opportunities for design and its innovative drive to use its proficiency in comprehending many disciplinary frameworks and stakeholder viewpoints (Buchanan, 1992; Dorst, 2015; Meija et al., 2018). Furthermore, tolerance for ambiguity, solution-driven attitudes, and comfort in framing and reframing the problem—all fundamental characteristics of design—are required due to the complexity of societal concerns (Dorst, 2015; Meija et al., 2018).

According to Minder, B. & Lassen, A. H. (2019), the designers have increased their capability through methodologies of user-center design, co-participatory or co-design, instrumentalizing multidisciplinary in a more flexible and experimental dimension, assuming the role of facilitator or mediator, and allowing the designer for develop skills that have interventions and the transformative power of a creative narrative approach.

3.1 Learning from Performative Designers

An example of this multidisciplinary acting is the work developed by Tereza Ruller, "The Rodina", in which she proposes the PD as a practice to effect social change. The design is a practice that carries out an action, signifies the happening of an event, integrates time and space, and has a connection to both an audience and a performing group. Rullerova, T. (2015) also states, "I understand performativity also as a concept and method of performance." The designer argues that the performance is unique; it takes place through the designer's action, the interaction with the public, and the experience and relation established in that moment. In her, performativity is also a concept and method of performance, and she complements it by reinforcing that, on the contrary, to performative art, the process can create an artifact or a "fetishized" material memory. Expanding this theoretical perspective, Rullerova, T. (2015) defines *artifacts* as a medium

of the intent to instrumentalize the relationship and information for the user. An example of this vision is her exhibition *Keep Smile*, performing the role of designer, Banská Stanica, 2014. “The Rodina” takes her vision to a different level, using the expression of surface as a border between objects and outside, which, with technology, enhances the relation with surroundings and simultaneous presentation of information. She exemplifies with the work of speculative design studio Metahaven that as the capacity to transform values, it is defined as a place where the material properties of its material do not have their properties. The PD *Accidental Geopoetics* (2019) is an intervention embracing the complexity of revealing rather than hiding. To visually support such a narrative, Rodina designed geo-ponchos – costumes for roleplay – through which human bodies connect to the planetary one. Performers were carrying 'geoglyphs'– a system of signs inspired by mining infrastructures as a unique navigation system guiding the museum visitors. *Elements of Style* (2020) is a performance that exposes the paths used by editors, curators, designers, artists, and producers to create publications. The completion of the magazine is achieved through the application of immaterial, intangible labor procedures. These are etched into the big map, which turns into a curtain that never goes away (Rodina, 2019).

Another Performative Designer, Lauren Grusenmeyer, is interested in creating graphic design, performance, illustration, and design exhibitions with a discourse involving staging, dialogues, costumes, and graphic identities. To the designer, "performance is a complete design in which both the intention as the character, attributes, and gestures are designed in the format of a university" (Stone, 2017).

Looking at Stefan Sagmeister's most well-known works, *The Happy Show*, is the outcome of a study on happiness that lasted more than ten years. The show transports us inside Sagmeister's head and his inventive yet approachable ideas about happiness through a combination of comedy, provocation, and interactivity, together with video, infographics, sculptures, and interactive installations. It also suggests that, like our bodies, happiness may be trained; thus, a more active role in pursuing it is called for. Sagmeister ignites the limits between design and art or between science and popular culture, breaking down all barriers by using incredibly emotive graphic design to connect with people (Sagmeister, 2018).

Amandine Alessandra is a graphic designer and researcher who developed through collaborative remote workshops offered in academic contexts, primary and secondary schools, and cultural institutions, but also diasporas looking at reconnecting through a punctual, creative participatory event; she creates typographic performances exploring togetherness in a post-Covid 19 world within the TAO lab. Her study also explores fun ways to write instruction centered on performance and group practices, working with trainee teachers and Didactics students. In between Raphael's cartoons, the Victoria & Albert Museum hosted this public multimedia typographic performance in 2014 and 2015. The liminal area of interaction that results from people constantly switching between virtual and real locations is examined in *One Word At A Tim.* With the proposal *Typographic performance: Message as Flux,* only by capturing screenshots of the photos from a public webcam—which shows the famous Abbey Road crossing—onto a computer was this typographic performance captured on film. A fraction of a second appears to be added to the CCTV's 4-second real-time image display every 4 seconds to accommodate the image refresh time. It is interesting to note that using a public camera to broadcast a message significantly increases its reach. This public performance aims to make people feel the weight of time passing by, symbolically stopping traffic, and using ephemeral typography to achieve this (Alessandra, 2015).

For Benjamin Santiago (2019), the performance *Spaundou*, is a constructed language of his design, based on recreating the experiences of being half-Filipino and half-Puerto Rican but without speaking either language. Santiago takes the form of semi-participatory musical performances, pamphlets, installations, and karaoke-style videos.

The Studio Åbäke is a collective where visitors are welcomed by hired performers and storytellers. Exhibited ephemera and other printed graphic items catalyzed personalized narratives. The studio is a transdisciplinary designer collective that focuses its work on the social aspects of graphic design and strives to make room for multiple perspectives by integrating curating, teaching, and publishing activists that use the participatory space as an instrument for experimentation within a framework of social practice, "*...play with instructions, taking turns, participation, and interaction.*"

A further example is Studio Moniker, which used various media to investigate the social implications of technology and how our everyday lives are impacted by it. They fostered works that unfolded and blossomed like plants, exposing their internal organizational mechanisms, and they actively involved the public in their efforts. The studio focused on print, video, interactive, performance, and physical installations. The Red Follows Yellow Follows Blue Follows Red, is a participatory performance. Here, each participant was given a

red, blue, or yellow cape with headphones and instructed to follow the directions. Those wearing red were instructed to "follow yellow but avoid blue," and those wearing blue capes were instructed to "follow red but avoid yellow." Even though there is no computer involved, the project shows how crowd behavior and what structures do to us—it is like social programming with instructions that work like an algorithm (Boddington, 2020).

Analyzing different contexts in areas of critical design, speculative or design futures, it is possible to identify a mediation with and through design artifacts that, for example, the work of Kristina Niedderer, performative objects, that function does not equal form, nor is it entirely observable in the form, even though the material form is one way that function becomes obvious. When it is in use, the second mode of an object is when its function is most clearly evident. The concept strongly emphasizes function as an immaterial attribute tied to an object's dynamic use (Niedderer, 2004).

With all these examples of PD, the emergence of "performative curation" offers an area where experimental approaches to meeting design concepts are being attempted instead of displaying completed works or artifacts. In this case, the curator's job is to establish a shared space of encounter with audiences rather than to act as a "custodian" or "expert" (Watson, 2021).

4. Performative Design Model

Based on the analysis and synthesis of the research information, the authors created the Performative Design Experiments Generator Model. The model aimed to be a classroom methodology to be implemented in a curricular unit, "Performative Design," in a Communication Design degree. The purpose of this approach was to bring to the students an expanded perspective on Design action and intervention, especially with a focus on the participatory aspect, where the dimension of the public as a participant can be instrumentalized through the conception of the design process itself. By exploring different dimensions of the performing arts and different ways of exploring interaction through the discipline of design, students will understand and apply critical concepts for the conceptualization and design of a project, which, through different means, has its primary objective of involving the passive viewer or active to achieve a specific goal. Interaction and experience are some of the models used by multidisciplinary artists; the field of PD makes room for the construction of another way of communicating, reaching audiences, and creating memorable experiences and sensations, being an exploratory field for multidisciplinary designers.

Through the teaching methodology, the student is intended to develop projects that promote the instrumentalization of all the knowledge acquired throughout the course. This experimentalist exploratory unit raises the student's rationale to a dimension of expanded design practice. The student will be able to explore different fields in a self-reflection on the different design domains and their area of expertise in the professional field. As an area in development, the exploratory factor will be pedagogically an opportunity for students to structure critical thinking about the design discipline. Identify areas of intersection and

convergence/divergence that demonstrate this space of interaction and dialogue between the agent and audience, changing their position from observer to participant. Students were challenged to create their models of PD, guided by the exploration of pre-existing concepts, but above all, to identify different areas of action in which design is the mediator of this relationship between participation and experience—observing, research, understanding, critical thinking and building a proposal.

The students must define the topic through a problem-based learning approach, which the students could define during the research. After contextualizing the performing arts and the main concepts that this context brings to design, students should understand through the analysis of PD projects to complement the research. After comprehension of the model, the student can combine the information, mainly define the project's purpose for engaging with the audience, and design the interaction and the experience.

The starting point is the model developed is the intersections between 3 axes:

- SPACE (a sense that can be private, public, and nonspace);
- PUBLIC (audience, participatory, and observer);
- MEDIATOR (that can be a signifier, igniter our activist).

In the crossing of these three axes, we have a result:

- Between SPACE and PUBLIC, the construction of a PERCEPTION;
- Between PUBLIC and MEDIATOR, the ARTIFACT that can be an object, word, or media, among others;
- Between a MEDIATOR and SPACE, the SITUATION.

The crossing results are the EXPERIMENTS concepts:

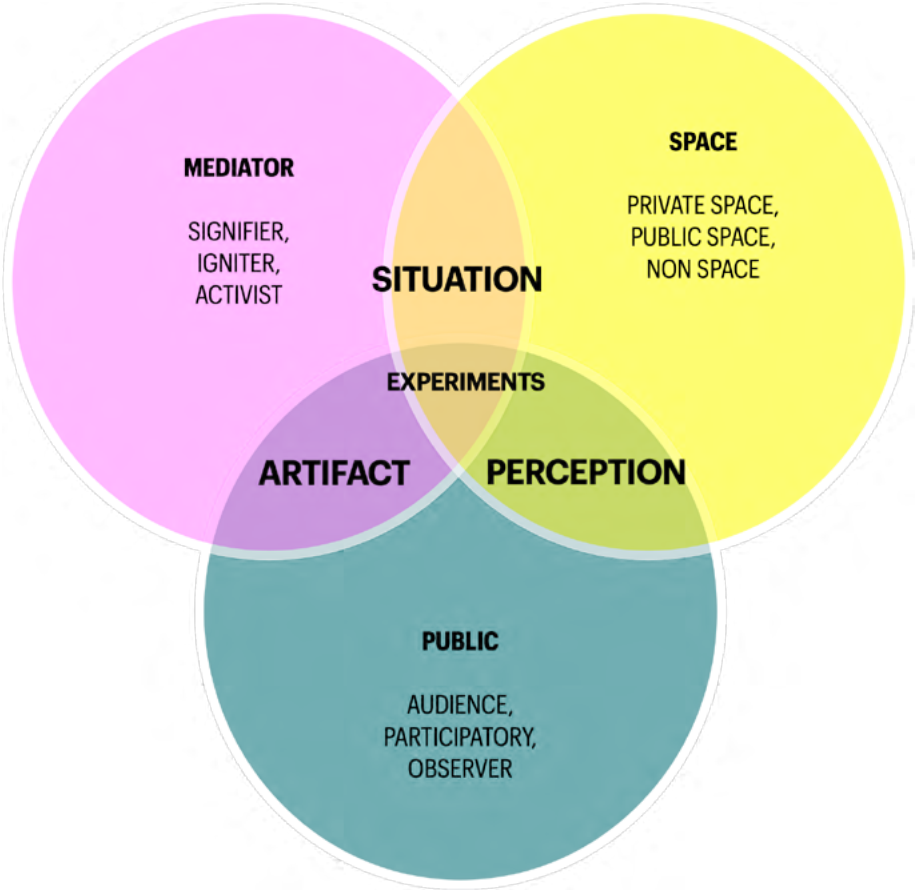

Figure 1. Performative Design Experiments Generator Model.

This experience allowed students to develop other dimensions, especially personal interest, and critical thinking about societal, environmental, political, or complex contexts. The projects presented in this article are a small sample of the results obtained, with the curricular unit being in existence for three years. There has been a constant update of the pedagogical approach and the model itself over these three years, as this area of PD has evolved as it has been appropriated by more Designers, even established designers as we presented in the literature review.

Three student projects were selected, representing the diversity of applied contexts:

Project 1: Focusing the Consumer Consciousness

"*Mind the Food*"
The project aims to raise awareness of the importance of sustainability in the context of food and reflect on the impact of our choices, "*Mind the Food*" looking for conscious and creative alternatives in the territory (Algarve). In a public space, the performance begins with each person taking out a card, where they can find a drawing of a typical food from the Algarve region or the village of Burgau and a word from a group of topics about endogenous, traditional and problematic issues from the region. Then, as a group, they will prepare a creative recipe where dialogue and debate will be promoted, raising questions like the lack of water in the south of the country, gentrification due to tourism, or excess fish consumption in the region.

Figure 2. PD work developed by the students Palma, Agostinho, Silva, Freitas, and Ferreira.

Figure 3. PD Title: *Mind the Food*, developed by the students Palma, Agostinho, Silva, Freitas, and Ferreira.

Project 2 and 3: Focusing the Political Consciousness

"*DemoDrama*"
The project aims to raise awareness of the importance of political consciousness in Portugal, considering informed critical thinking about politics and the role of citizens when making decisions and elections. "DemoDrama" is an experience through gamification on the concepts of Democracy and Citizenship in a dramatized way. According to Salvador Sandoval, political consciousness consists of understanding the eleven interrelationships between the psychosocial dimensions of meanings and information that allow individuals to decide how to act in political contexts and specific situations. Starting from the question: "Is democracy a regime of trust?" the participant takes a route that validates or invalidates their conviction, with a complex system of questions designed to interact with the visitors until a final moment of characterizing the visitor's mindset.

Figure 4. PD Tittle: *DEMO DRAMA*, developed by the student Crisostomo.

"*Ensaio sobre a verdade*"

"Ensaio sobre a verdade" another student defined the essay on truth, in which throughout the exhibition, the visitor would be confronted with questions about national politics so that the interaction with the pieces designed by the designer, with one intention to be part of a collective experiment and which will result in a sense of awareness of the truth or lie about the topics questioned. The images at the end will illustrate this controversy, inquiring about the level of belief in national political parties.

Figure 5. PD Tittle: *Ensaio sobre a verdade*, develop by the student Cordeiro.

Figure 5. PD Tittle: Ensaio sobre a verdade, develop by the student Cordeiro.

4.1 Results Discussion

Ultimately, we apply a group dynamic of self-assessment and evaluation between peers to understand the forces and weaknesses and breeding suggestions to understand students' training for this practice and a more expanded design field. Compared to design challenges with project-based learning methodologies, i.e., presentation of a challenge in this area of PD, the introduction of this pedagogical model is effective in

understanding the project SCOPE and this practice because it brings specific axes of Research and searches for solutions through the expanded field of design. Thus, the results indicated:

Forces:

1. Students indicate that the model leads the sequence of straightforward actions that allows guidance in all phases of the project, in an area that is more complex for them because it brings many languages and codes different from their essence, theory, and practice of learning in the design that is used to;
2. It allowed learning of complementary areas to design, such as performance arts, facilitating applicability of this knowledge and practices to the field of design based on the model axes;
3. The perception of students that PD allows them to bring themself and their statements to a more direct dialogue with people.

Weaknesses:

1. Students have indicated that they still have some difficulty integrating some of the concepts;
2. In the final solutions, it is not easy to get out of traditional models and results, i.e., the tangibility of design in an innovative way with new assumptions.

Improvement suggestions:

1. Students suggest the creation of more sub-phases of the model that allow them a deeper exploration of the PD;
2. Suggest that the model indicate some experimental fields for project implementation to leave traditional models.

5. Conclusion

Our literature review demonstrated that we are still at the beginning of the theoretical and methodological modeling of the integration of Performative into the models, processes, and tools of design science. This field is still very connected with production and a design orientation toward Art. Therefore, we resorted to analyzing authorial works to better understand how this fertilization between art and design occurs.

The conceptual model present intended to consistently bring the performative to the classroom in a design degree to systemize the process, integrating the aspect of pure creative and performative exploration with the rationale of design processes. The authors sought to integrate the performative aspect with the essence of research, focus, and objectification in creating artifacts by harmonizing the subjective and experimental with the materialization and concretization inherent to the design project that directs its production to something or someone. Therefore, this article contributes to the construction of scientific knowledge for this expanded field of design action, both in its foundations and the possibilities of new outcomes.

This exploratory approach and medium are fundamental to the design scene, between the dimension for exploring the new conceptual artifacts that question different contexts and social drivers that bring further questions for communication. The projects developed over the last three years provide the opportunity to reflect on several issues, namely the continued loss of culture and critical thinking on the part of young people, where their convictions and practices remain at the level of pragmatism and the function of design. The PD model crosses three axes that do not constantly interact directly with the designer. Therefore, future design professionals must understand that we all have roles, and their work intersects all these axes, whether in an experimental or practical field. The discomfort of mediating or creating artifacts that intercept the space and the public is disinhibiting the construction of new opportunities for experiments and, in turn, future ideas for design.

Fundamentally, the aim was to develop design skills in our design students, focusing on a more experimental process with an expanded intervention vision. We found that to obtain the desired learning results, it was essential to use a model that allowed students to explore other design dimensions, more interrogative, introverted, and activist. This elevated the intervention of Design beyond the dimensions of form, function, aesthetics, or even marketing. The results presented in this article, through student work, demonstrate this.

The PD model allows the students to learn complementary areas of design, such as performance arts, facilitating the applicability of this knowledge and practice to the field of design and allowing them to bring themselves and their statements into a more direct dialogue with people. Further model development needs to integrate more profound concepts and get the student out of the standard design field, mainly to segment and narrow the model for a more guidance structure.

Finally, we will say that we also need more significant discussion among peers about how to build and develop these fundamentals and practice, essentially by modeling, systematizing interventions, and sharing tools and results.

KEYWORDS | DESIGN EDUCATION, EQUALITY DIVERSITY INCLUSION, DESIGN CULTURE, TEACHING AND LEARNING, SOFT SKILLS

ABSTRACT | The need to align teaching and learning practices to concepts that are conformed to the evolution of contemporary society, so that students can gain higher confidence in addressing the instances of future markets, requires Design universities to review their curricula. Equipping future designers with updated cultural and design frameworks is an imperative and strategic mission. Among innovative concepts that can advance Design Education and the development of soft skills in learners, 'Equality, Diversity, and Inclusion' (EDI) is today considered paramount to reorienting teaching and learning practices toward holistic educational patterns. This would allow students to gain more confidence in designing enabling products and services for all consumers, including vulnerable ones. However, EDI is an evolving and complex concept, sometimes hard to grasp. Moreover, potentially biased contents could limit its correct adoption. This work explores the concept of EDI in Design Education; it provides an overview of principal concepts and shows promising trajectories for Design studies. It follows a four-step process comprising a literature review, case study analysis, data synthesis and classification, and a discussion on promising research trajectories.

1. Introduction

The contribution of Design to the progression of global markets is today apparent (Boztepe, 2007). Only in the European territory, the Design industry significantly contributes to economic development by generating an annual turnover of circa 35 billion Euros (over 5,5% of the European business service sector) and the number of designers working in the creative industry exceeds 500.000 units (BEDA, 2018). Several authors (e.g., Cross, 2001; Lyon, 2011; Herrington et al., 2014; Noel, 2022) stated that the contribution of undergraduate and postgraduate Design programmes is paramount to empowering future generations of designers to gain novel soft skills needed to interpret present societal phenomena so that final consumers can adopt more sustainable and inclusive ways of living (Amrita & Aaron, 2021; Rieger & Rolfe, 2021). Accordingly, the Design discipline operates beyond styles and aesthetics interweaving strong ties between societal stakeholders, consumers, and economic actors (Meyer & Norman, 2020).

In recent years the raising of societal issues influenced the cultural and technical components of Design Education (Zimmerman et al., 2011). Along with sustainability, which contributed to improving the field since the '90s, issues related to the way people experience everyday life have become a grassroot from which to think about prosperity, fairness, and justice (UN, 2015; 2019). However, this culture was not only driven by theoretical speculations, but it mirrors clear market trends (e.g., Fondazione Symbola, 2023). Overall, the social dimension of the design practice is an aspect that all designers, including students, are asked to confront with because their actions determine some forms of social effects.

Among innovative social concepts that foster progressions in the body of knowledge used for skills development, 'Equality, Diversity, and Inclusion' (EDI) is today strategic to orient teaching and learning practices toward novel patterns enabling the design of products, services, and systems of solutions for all potential consumers, including vulnerable ones (Garay-Rondero et al., 2020; Amrita & Aaron, 2021). As the world becomes increasingly diverse and interconnected, the concept of EDI gains significant traction in various design fields, such as product design, service design, graphic and digital design. Accordingly, spreading the EDI concept in Design Education is vital to produce consistent and effective impacts on economies (Donovan, 2020), and this concept will be much more relevant in the future. Consistent with the vision of the Design Council in the UK (202-), to be inclusive, the Design discipline must reflect society's rich diversity and enable people from diverse backgrounds and worldviews to thrive, including people of various ages, disabilities, ethnic, social, life experiences, or cultural backgrounds.

In relation to Design Education, EDI is hinged around three relevant and clear concepts that are approached holistically regarding design practices. 'Equality' involves the conditions of fairness as well as the opportunity for groups of people to access enabling solutions that don't produce harmful conditions, or that such artifacts don't produce any disadvantageous conditions during and after their daily use (Garay-Rondero et al., 2020). Therefore, an imperative for any designer is the design of solutions that, regardless of their nature, are accessible in terms of purchasing power but also that individuals who may be disadvantaged have the resources they require to have the same, equitable possibilities as their peers. The concept of 'Diversity' strongly implies confronting with psychophysical, cultural, social, and economic differences of users that will access solutions to design (Lorentzen et al., 2018). This also accounts for the environment where actions are performed due to an 'inclusive' effect being experienced in a living context. In terms of designs, this requires designers to promote design processes by considering consumers' background, mindsets, and cultural habits to empower, even when liaising with manufacturing companies, an empowered culture of creativity and invention that recognized diversities as a value. Finally, 'Inclusion' entails setting up environments in which people feel fully appreciated, and therefore creating solutions that produce an engaging and inclusive atmosphere with solutions designed for them, regardless of their race, age, gender, psychophysical abilities, or disabilities (Holmes, 2018).

The value of promoting EDI in Design Education lies in its ability to foster inclusivity and celebrate diversity, which is an asset that expresses great potential in terms of curricula enhancement by enabling students to reduce market gaps and improve attainment. Universities can play a key role in training, facilitation, and

guidance. Hockings (2010) defines inclusive educational design as the design, planning and evaluation of programmes, courses, and modules in terms of learning outcomes, content, pedagogy, and assessment, and how they engage and include the needs, interests, and aspirations of all students. It becomes a pivotal concept through which future designers can shape prosperity for all by design (Garay-Rondero et al., 2020). By modeling inclusive behavior and instilling empathy values of EDI in students, design educators are asked to contribute to the creation of a more socially conscious society (Cho et al., 2013). This can be done at the product, service, and system level.

2. Aims and Methodology

In Design Education, EDI can produce significant progressions in terms of teaching practices and learning curves at all levels. This means that adequate programmes and contents on how to properly deal with EDI-related notions must enable learners to get higher confidence in a variety of subjects that the market is now demanding. Moreover, educational pathways on Design studies have the power to situate students into controlled experimentations that may produce first-hand experiences for learners (Hitch et al., 2016; Rieger & Rolfe, 2021); they can simulate real-life projects by working with first-hand data depicting societal outlooks. However, EDI involves complexity, due to its multidimensional nature that links technical, social, and economic spheres. Proper explorations on the ties between Design Education and the concept of EDI would help design practitioners in getting higher confidence in this complex cultural context.

This work aims at describing the main features of the concept of EDI in Design Education, to provide a disciplinary overview of concepts and to trace promising cultural directions to invest on.

In terms of methodology, this work is structured into four phases:

1. Literature review of topics linking EDI concept and Design Education, to provide a framework for phenomenological discussion within Design studies.
2. Case study analysis on examples developed within educational environments, to discuss how the inclusion of EDI into Design curricula enhances the attainment of students' soft skills.
3. Data synthesis and empirical classifications, to articulate taxonomies and to describe how the concept of EDI is holistically merged in Design Education.
4. Discussions and recommendations for promising educational models suggesting ways to correctly include EDI into Design curricula.

3. Literature Review

A literature review process (Cardoso Ermel et al., 2021) was used to develop the analysis of contributions matching EDI and Design Education. The analysis led toward the creation of three discussions: a) EDI culture in Design, b) Teamwork practices, and c) Empowerment of soft skills. Overall, these indicate that EDI is considered as necessary not only to promote a fair and more inclusive cultural environment, but also to create original projects whilst improving learners' relational skills.

3.1 EDI Culture in Design

In Design Education, several authors debated on the value that a design culture is fundamental to inspire students in shaping a better world. Indirectly, these echoed EDI. For example, cultural intersections between design, human ecology, and social change are proposed by Victor Papanek (1971) when he challenges that conventional design practices need to foster responsible approaches and impacts into society; Victor Margolin (2005) argues on how an effective design culture can trigger strategic forces needed to produce an opening toward the ethical sides, as a reaction to consumerism and exclusivity; in terms of enabling scenarios, Ezio Manzini (2016) discusses the concept of 'emerging design' as a design-led cultural

reaction that leads toward responsive designs; finally, an approach for "doing design otherwise" is offered by Carl DiSalvo (2022) who recommends that designers must supply novel contributions to local democracy by drawing together theories and practices.

Examples developed in academic contexts provide a better phenomenological understanding of how the EDI culture can enrich the teaching and learning practices. For example, Asojo (2001) discusses the need to introduce students and educators to different cultural settings to promote transformational approaches to EDI that raise awareness and strengthen abilities. Sohoni (2009) advocates the need to enhance the EDI culture by drawing on the experience of diverse cultures as part of the learning processes. On the other hand, O'Sullivan & Hakaraia (2018) prioritize the need to develop a culture of diversity as a pedagogical component that invites students to overcome cultural barriers, so that an enrichment is made through the appreciation of student cultural acumen. About educational settings, Lee et al. (2021) argue for the need to improve teaching and learning environments in terms of cultural perception, so that diverse student cohorts can be included. Finally, Albert et al. (2023) reflect on the need to generate an EDI culture by linking design practices to emotions, skills, and intercultural intelligence to engage students in active learning experiences related to a variety of issues.

3.2 Teamwork Practices

In an educational environment like the one promoted by Design studies, the term 'teamwork' immediately depicts the studio environments where both students and teaching staff are involved in developing projects and real-life simulations. However, several studies have discussed the value that a cooperation environment shows in terms of improvement of effective pedagogies on EDI (e.g., teaching and learning curves). Working in a group is an essential practice and provides momentum for the simulation of a professional environment. Within an EDI framework, this practice is essential and defines the daily basis around which to ask learners to confront, negotiate design decisions, and generate new knowledge.

Friis (2015a) describes how to impart the value of variety in innovative teamwork practices; given the rising prevalence of diverse teams in professional design work, diversity is a critical component of Design Education. In another work (2015b), she also provides an interesting analysis of dichotomous aspects of diversity in Design Education that evokes both creativity and conflicts among peers; the author finally states that despite inherent contradictions, diversity is capable of producing transformation at three levels: individual reflection and practice, the relationships and ways of working in the team. Mateus-Berr et al. (2020) provides an interesting analysis of dominant models of ability and (dis)ability, made with international teams of scholars and students; they claim that education for the future is made when professionals and people with disabilities work together. Fathallah (2021) reflects on the students' inherent competitiveness within Design studies, which often lend toward individualism and lack of collaboration; she advocates that projects must be organized by design educators to encourage inclusive group dynamics and democratic team engagement. Finally, Nae and Smith (2023) affirm that an inclusive foundation in Design Education is essential to engage mixed cohorts of students, and this can trigger modalities for social and professional cohesion among peers that ultimately instill cohesion and will to achieve outstanding results.

3.3 Empowerment of Soft Skills

Studies reveal that the EDI produces significant impacts on Design Education. Therefore, the empowerment of soft skills such as decision-making, higher awareness of EDI-related topics, confidence in the use of digital skills, and improved knowledge of methods and tools is a direct consequence of exposure to complex topics. Often, synergies between sustainability and inclusivity are seen as powerful drivers to expand the value of design practices toward holistic teaching and learning models that provide momentum to reflective creative practices.

Studies included in the literature review depict a multifaceted set of topics that are considered relevant to better reinforce the understanding of the contribution of EDI to Design Education and the empowerment of skills. For example, Tan (2019) affirms that creative investigations increase designers' skills to deal with interdisciplinary projects. The contribution of external bodies and people, as well as the direct exposure to on-site experiences, is discussed by Mensing-De Jong et al. (2021) as critical elements to promote inclusivity. Amaral et al. (2023) affirms that the ability to think beyond barriers is an essential quality of future designers in order to tackle difficult problems and have an influence. Different authors (Dias et al., 2015; Mateus-Berr et al., 2020; Oleson et al., 2023) encourage the combination of different disciplinary and interdisciplinary approaches to produce consistent progressions in skills development. Overall, there is consensus that the use of participatory design and research approach as well as collaborative design practices enables learners to get higher confidence with novel skills (Thieme & Van Boeijen, 2011); and this later produces progressions in the creation of a multidisciplinary inclusive educational framework (Kee & Lai, 2022).

4. Case Study Analysis

In the landscape of Design Education, the principles guiding EDI have emerged. This case study analysis (Yin, 2009) delves into the intersection of EDI and Design Education and explores challenges, strategies, and transformative potential inherent in the creation of inclusive learning environments. The aim is to unpack the multifaceted dimensions of topics to provide a synthetic examination of experiences found in the literature. Specifically, the case study analysis is developed around four domains: a) Cultural diversity, b) Empathic design, c) Authentic learning, and d) Human Factors and Ergonomics (HFE). The following sections contain an analysis of an emblematic case study representing each pre-identified domain.

4.1 Cultural Diversity

The relevance of cultural diversity in Design Education, as a fundamental aspect inherently driving EDI, is discussed in several studies (e.g., Sohoni, 2009; Lee et al., 2021; Georgiadou, 2021). However, the one presented by Hassin (2013) provides interesting discussions. The study aims to explore various perspectives on how Design Education can provide enriching experiences to cultivate designers capable of navigating the dynamic interplays between social change and human-environment interaction.

Design Education is claimed to demand inventive talents, social responsibility, and an awareness of human behaviors in both two- and three-dimensional contexts. The emphasis is on blending formal design components with socio-behavioral issues, as well as developing students' cognitive capacities to do successful design research. However, traditional Design Education, based on historical models, is mostly concentrated on formal characteristics that show little regard for cultural and social factors. The growth of cultural variety and socio-physical changes in modern cities needs a paradigm shift in Design Education that incorporates cultural components into teaching. Innovative design pedagogy methods, such as participatory design, have been put forth to solve these challenges. In the design process, this method places a strong emphasis on user involvement, cultural sensitivity, and cooperative problem-solving. This study finally concludes that Design Education must evolve to meet the demands of a rapidly changing society by embracing participatory approaches that promote social and ethical responsibility. Designers may successfully respond to social objectives and human needs by incorporating consumers in the design process and interacting with a variety of cultural views.

4.2 Empathic Design

Empathy is commonly recognized as one of the driving forces to empower dynamic connections with a culture on EDI and it can be found in different works (e.g., Joyce et al., 2011, Altay et al., 2016; Altay, 2017; Cordan et al., 2020). Enabling designers in shaping environments for diverse user groups is crucial for enhancing the quality of life and social participation, and this can properly be done by using empathy, though constraints often limit participatory practices. However, the work of Altay & Demirkan (2014)

provides a fundamental example on the use of empathy in Design Education. Specifically, the study analyzes activities conducted in an academic course focusing on inclusive design and highlights the importance of empathic understanding in Design Education through empathic modeling.

The project intends to provide relevant analyses on improving students' cognitive abilities, from simple to complex creation, as well as the hierarchical development of emotional behaviors and values. Thus, students engaged in a variety of activities, such as evaluating how accessible their homes were, acting out users with varying abilities, and creating posters to reflect on their experiences. Posters were intended as tools for critical reflection on technical and design issues; these later were evaluated in relation to changing attitudes toward inclusive design. Discussions included in the study are useful to highlight the need for empathetic modeling in advancing inclusive Design Education. Inclusive Design is discussed to improve students' understanding of strategic challenges faced by diverse users and to foster empathy.

4.3 Authentic Learning

Authentic learning is an educational practice often used in design modules due to the opportunity to experiment with real-life situations in a studio environment (Rossi, 2021). It emphasizes real-world relevance, complex problems, collaboration, and student reflection, which are key elements to promote active student engagement. Accordingly, early works demonstrate that authentic learning can promote deeper explorations and empathic understanding of issues related to EDI. In terms of case studies, two works are interesting for the aim of this paper.

The work of Rieger & Rolfe (2021) investigates the efficacy of authentic learning in Design Education, particularly in fostering inclusive design practices by engaging students with real clients with varying abilities. Traditional design education often relies on stereotypes or fabricated personas in studio projects, hindering students' understanding of inclusive design principles. Therefore, the authors employ authentic learning frameworks with a cohort of second-year architecture and interior design students in Australia, over a year-long period. The work concludes that integrating authentic learning frameworks into design education can empower students to become empathic and socially conscious designers, contributing to a more inclusive and equitable built environment.

The work Miceli & Zeeng (2017) propose IAES, a four-stage engagement process for students (Investigate, Apply, Explain, and Share) to overcome inherent biases found in design practices, such as lack of research, academic rigor, and stylistic imitation. The authors also remark the need to shift from a product-centric design culture to a process-led one.

4.4. Human Factors and Ergonomics

Several authors (i.e., Tosi, 2020; Attaianese et al., 2021) are considering Human Factors and Ergonomics (HFE) as a strategic research field to progress the value of EDI as well as the development of teaching and learning and design methodologies useful to design enabling solutions for all. However, the novelty and the complexity of this research angle produces a fragmented knowledge framework that results in an extremely little number of case studies. Among these, the work proposed by Dias et al. (2015) seems to be relevant for the aim of this paper.

The study examines the integration of HFE into Design Education, and emphasizes its significance in creating inclusive and usable products and spaces, particularly on shifting towards a new industrial model focused on social and ecological restoration. The work highlights the role of Design Education in imparting knowledge about human limitations and capacities in design practice, and the need to optimize human well-being and system performance through accessibility principles. Specifically, authors discuss the contribution of HFE in a Portuguese higher education institution. Discussion and results provide recommendations to integrate HFE modules earlier in the academic curriculum, or to teach concurrently with design studio courses to enhance students' application of HFE principles to produce socially

sustainable solutions. Authors ultimately recommend to include HFE principles into Design Education to enhance the inclusivity of products.

5. Data Synthesis and Classification

Sections 3 and 4 provide a description of main available sources discussing thematic foci of EDI in Design Education and examples made in a university context in relation to four knowledge areas. However, a holistic overview of what these sources suggest can provide better understanding to explore inherent dynamics within teaching and learning practices, and generally to evaluate students' skills development.

A process of data synthesis is operated to develop knowledge clusters depicting main influences of EDI in Design Education (Table 1). Conceptually, this classification follows and interprets the structure proposed by the Winterhouse Institute's Social Design Pathways (2015) that puts in place ranges of expertise, cultures, skills needed to address complex problems at various levels and scales, design methods, etc.

Table 1. Influence of EDI in Design Education: Knowledge clusters.

EDI	Design Education		
	Design Culture	Design Methods and Approaches	Teaching and Learning Practices
Equality	Commitment to breaking down systemic barriers. Improved ethics and awareness. Higher knowledge on sociological conditions of users. Focus on accessibility and rights. Ability to assess users (design, and T&L practices). Better use of open philosophies. Improved skills on social research. Autonomy in decision making.	Better use of social Design Methods to understand contextual features and users. Improved skills in translating sociological aspects into design practices. Improved skills in translating market data into design practices.	Introduction of new design topics from society. Compliance with emerging trends in Design studies. Consistent learning curves. Involvement of real users and/or stakeholders in T&L practices. Better adherence to real life situations.
Diversity	Commitment to breaking down systemic barriers (user level). Improved ethics and awareness. Use of unbiased contents in Design. Higher knowledge on psychophysical conditions of users. Focus on the quality of human-artifact interactions. Ability to engage with different user groups (design, and T&L practices). Ability to deal with multiculturalism and internationalization. Improved leadership for product and service innovation.	Higher use of goal-oriented design strategies. Better use of HFE methods to assess the quality and performance of products and services. Confidence in the use of tests with final users. Improved skills in opening toward diversity-oriented markets. Use of specific research methods for social investigations. (required) One-to-one design approach. Improved skills for design and innovation (product level).	Introduction of new core knowledge and design topics from society. Compliance with emerging trends in Design studies. Consistent learning curves. Involvement of real users and/or stakeholders in T&L practices. Better adherence to real life situations. Professionalization and improved marker readiness. Improved autonomy (i.e., students as knowledge producers).

Inclusion	Commitment to breaking down systemic barriers (group and society levels). Improved ethics and awareness. Use of unbiased contents in Design. Higher knowledge on the economic, social, and relational conditions of users. Focus on the social impacts. Ability to involve different groups (design and T&L practices). Higher awareness about nondeterministic design processes. Improved leadership for system innovation for social change.	Higher use of goal-oriented design strategies. Better use of Co-Design to involve final users into processes. Improved analytical methods for inquiry. Confidence in the use of tests with relevant stakeholders. Use of a goal-oriented mindset (from product-centric to EDI-driven approach). (desired) One-to-many design approach. Improved skills for design and innovation (system level).	Introduction of new core knowledge and design topics from society. Compliance with emerging trends in Design studies. Consistent learning curves. Involvement of real users and/or stakeholders in T&L practices. Better adherence to real life situations. Professionalization and improved marker readiness. Improved autonomy (i.e., students as knowledge producers). Research-through-design, or other immersive practices.

Previous studies discussed in sections 3 (literature review) and 4 (case study analysis) provide a phenomenological representation of the EDI concept in Design Education, and articulate the different aspects composing it in different teaching and learning areas. However, in these sections, only factual discussions have been reported, and most of them were presented at the phenomenological level due to sources used for the analysis; accordingly, these provide consistent descriptions of thematic analytical lenses used but do not show a qualitative emphasis on relevant aspects like impacts into teaching and learning.

Essentially, impacts are considered as qualitative or quantitative metrics to assess the results of an action within a setting. In the cases considered, impacts produced by EDI concept in Design Education can only be evinced at the level of cultural speculations. However, the quantification, or the qualification, of impacts produced by novel teaching and learning practices is strongly recommended by standard frameworks – see for example Advance HE (2023; 202-a); particularly, see Advance HE (202-b) for EDI-related topics. Therefore, to provide a contribution to the debate around the impact of EDI in Design Education, Table 2 proposes a detailed list of elements that are considered as promising in terms of impacts into teaching and learning practices. This contribution is provided at the learner, staff, and module and programme level.

Table 2. Impacts of EDI in Design Education.

Learner Level	Teaching Staff Level	Module and Programme Level
Develop reflective creative practices.	Improving the effectiveness and the consistency of T&L strategies.	Opportunity to develop new modules and programmes.
Develop critical thinking, autonomy, and decision-making skills.	Use of new design methodologies.	Modernization of T&L practices.
Improved marker readiness.	Opportunity to deliver updated contents.	Better reputation and promotion.
Better engagement and understanding of real-world problems.	Opportunity to adopt holistic and interdisciplinary contents and topics.	Active involvement of companies and organizations in T&L activities.
Opportunity to develop student-led projects.	Opportunity to move from content-based to goal-oriented and opportunity-driven T&L practices.	Introduction of a transformation culture (e.g., system design).
Better confidence in dealing with complex data/situations.	Fostered cooperation with other modules and disciplines.	Enabling teaching and learning environments (physical, digital, blended).
Better individual and teamwork skills.	Improved innovation-based culture (e.g., product and service design).	Increased enrollment and mitigation of drop out (long-term goal).

6. Discussion

Previous sections portrayed the complexity of the EDI concept in relation to the Design Education domain. The variety of data extracted from different sources provided relevant information in terms of cultural theories, themed discussions, and examples developed within educational contexts. This part of the work introduces discussions and recommendations for promising educational models and suggests ways to include EDI into Design curricula. It also tries to propose future trajectories to progress the debate in the area of Design studies. Accordingly, four discussion topics are proposed: a) Improving current educational models; b) Connecting student's soft skills with relational attitudes; c) Introducing inclusive criteria in curricula development; and d) Holistic trajectories for future studies. Brief notes on converging bodies of knowledge and the revaluation of values are discussed at the end.

6.1 Improving Current Educational Models

It has been said that higher education institutions can significantly benefit from the introduction of EDI concepts into undergraduate and postgraduate modules. In Design Education, wide improvements can be made in various aspects, such as novel contents, design challenges, studio practices, and live activities with real users. The use of immersive and empathic modalities to engage with students and stakeholders can benefit the overall learning curves so that a higher awareness on EDI-related topics can be produced (Rossi, 2021). The introduction of novel tools is also crucial to overcome biased notions (Rossi, 2023). However, EDI also triggers students' cultural progressions and enhancement of confidence about social components, which ultimately can reduce gaps in training while increasing students' readiness to enter in professional markets.

The improvement of current educational models can be promoted and supported by:

- Exposing students to real-world challenges and engaging with diverse communities. Real-life problems stimulate students' empathy and inclusivity in design practices. Authentic learning modalities are therefore favored.

- Encouraging collaborative projects that reflect the diversity of society. Teams of students from varied backgrounds can lead to innovative solutions and foster a deeper understanding of different perspectives.
- Developing curriculum components that aim at enhancing students' empathy towards diverse user groups. Empathic modeling and participatory design practices are favored.
- Consistent use of HCD principles and practices ensure that students are more capable to design accessible, usable, and inclusive solutions that emphasize the well-being of all potential users.

6.2 Connecting Student's Soft Skills with Relational Attitudes

Students' soft skills are at the core of educational models and require institutions to comply accordingly. In Design Education, soft skills are defined as the set of interpersonal, social, and emotional skills used in a design practice (De Freitas & Almendra, 2021). However, it has been shown that the EDI concept stimulates students to overcome traditional teaching and learning models based on the development of hierarchical soft skills (i.e., full confidence with problem solving, systematic thinking, teamwork, etc.) (Dong, 2010) by embracing longitudinal patterns more tied with relational attitudes.

The connection of student's soft skills with relational attitudes can be supported and promoted by:

- Engaging with diverse communities of users, even marginalized ones, and focusing on inclusive design practices to cultivate empathy and a deeper cultural sensitivity.
- Fostering team-based projects so that diverse cohorts of students can benefit from enhanced communication, negotiation, and collaboration skills. This ultimately can prepare learners to address multifaceted dynamics of the professional world.
- Addressing real-world challenges through reflective creative practices. This eventually encourages critical thinking and complex problem-solving skills when considering various factors and stakeholders.

6.3 Introducing Inclusive Criteria in Curricula Development

EDI stimulates significant shifts in the design and delivery of modules (Dong, 2010), and improvements can involve a wide range of topics such as contents, topics to discuss in seminars and tutorials, groups of users to involve, design methods, etc. This means that EDI directly impacts the inclusion aspects of curricula since the beginning of their conception. Eventually, this may produce reflections on different aspects that entail daily

routines with students. Interesting dynamics can be observed when incorporating inclusive criteria into teaching and learning practices, and these can produce benefits to actors, instructional components, and studio settings. Improvements in branding and the design of themed programmes can also be the result of a systemic change when properly supported by a shared culture on EDI.

The introduction of inclusive criteria in curricula development can be supported and promoted by:

- Embedding EDI principles across all aspects of Design curricula, including the creation of theoretical modules delivering unbiased notions on EDI and the creation of studio projects hinged around EDI-led authentic learning. Ensuring a holistic approach to inclusivity reflects inadequate training of staff.

- Ensuring that Design curricula reflect a wide range of cultures, identities, and perspectives. This can prepare students to design for a global audience and instill confidence into positive perspectives and actors.
- Prioritizing accessibility and usability in all aspects of Design Education. This promotes flourish environments where students are enabled to create products and services that are inclusive for all users.

6.4 Holistic Trajectories for Future Studies

Alongside educational features of EDI in Design Education, studies considered in this work provided rooms for considerations on the value of research in the field. It is essential to recall that research experimentations are essential to advance Design Education and its body of knowledge. Therefore, investing in holistic research and novel studies on EDI is paramount to advance the whole sector of Design Education. Constant sharing of knowledge flows is the basis for a consistent improvement.

Holistic trajectories for future studies are essential in Design Education, particularly when it comes to EDI. These can lead toward:

- Longitudinal studies on outcomes produced by informed EDI teaching and research practices. The attention is on the investigation of long-term impacts of EDI-centered curricula on students' outcomes, their professional practices, and potential societal contributions in the long run.
- Cross-disciplinary approaches to Design and EDI. The attention is on the exploration and the integration of EDI principles with other disciplines, such as technological, digital, and engineering ones, but also economic and social, that ultimately foster innovation in design solutions as a whole.
- Global perspectives on Design and EDI. Conducting comparative studies on the implementation and outcomes of EDI-based issues in Design Education across different cultural and educational contexts is essential to identify best practices and areas for improvement. Therefore, sharing of knowledge can be the consequence of a collective learning process involving both students and institutions.

6.5 Brief Notes on Converging Bodies of Knowledge and the Revaluation of Values

In Design studies, EDI calls for an in-depth examination and revising of established references, challenging the body of traditional cultural standards that are frequently associated with reflective creative practices – Who do designers design for? How can teaching staff equip future generations of designers in addressing present and future challenges? How can designers enable people to live sustainably and inclusively? etc. It is well established that Design, as a profession firmly rooted in societal structures and cultural settings, has the ability to impact perceptions, behaviors, and interactions. Thus, reevaluating design ideals becomes critical in resolving issues of inequity, lack of diversity, and exclusion. At the same time, notions like those mentioned by EDI-wider conception allow creative thinkers to consider good possibilities that are fully inclusive of all individuals. This indeed stipulates critical reflections on the values commonly passed on by staff to learners and promotes stronger convergences among knowledge areas.

At the level of design ethic of scholars involved in the progression of the body of knowledge, EDI can trigger reflections on the following aspects:

- On the concept of 'Equality', design researchers can shed light on gaps in representation, recognition, and access to resources within design education, practice, and discourse. By questioning established conventions and pushing for more inclusive design practices, researchers help to revalue values in the area of Design studies, resulting in more fair and just design ecosystems.
- On the concept of 'Diversity', design researchers can emphasize the contributions of marginalized groups, question monocultural design norms, and push for greater inclusion in design education and practice. By challenging prevailing design narratives, prejudices, and exclusionary practices, researchers pave the path for a more varied and culturally rich design environment, furthering the revaluation of values in Design studies.
- On the concept of 'Inclusion', design researchers can emphasize the importance of creating with, rather than for, marginalized or underrepresented populations, allowing people to construct their own settings and narratives. By questioning conventional concepts of authorship, competence, and authority in Design studies, researchers contribute to more inclusive and democratic design processes, supporting a revaluation of values that prioritize equality, diversity, and inclusion in design research.

7. Conclusions

This work discussed the complex explicit and hidden dynamics that subtended the integration of EDI in Design Education. Studies and examples discussed, as well as novel classifications inferred via qualitative interpretations of findings highlight the need for a significant change in academic methods and cultures to fulfill the progression of teaching and learning apparatus needed to address the issues of present society.

The literature review provides important insights about the symbiotic relationships between EDI and Design Education. From this, three critical conversations can be proposed: the growing of an EDI culture in design; the value of teamwork modalities; and the empowerment of novel sets of soft skills into learners. Altogether these dialogues highlight the need to incorporate EDI at a higher level; these do not only foster equitable and inclusive cultural environments, but also the improvement of students' ability to put creativity whilst enhancing their abilities to address social issues.

The value of a culture on EDI imposes the need of accepting different viewpoints that reflect into multimodal design processes. Various scholars advocate that infusing design culture with a sense of responsibility when addressing societal issues is a strong plus. They suggest that direct exposure to various social contexts elevates students' awareness while reinforcing their capabilities to meaningfully navigate into different subjects and environments. About teamwork, Design Education acts as a microcosm within which cooperation is extremely important. Studies highlight the transformative power of varied groups to cultivate creative thinking and social and collective development. Teaching staff are advised to develop inclusive dynamics by promoting equitable participation and democratic engagement. The empowerment of soft abilities arises from direct exposure to EDI-related subjects. Improved decision-making, digital literacy, as well as a deeper understanding of interdisciplinary approaches are mentioned as a result of such immersive pedagogical environments. Additionally, synergies between sustainability and inclusivity fuel holistic teaching and learning models, moving into innovative reflective creative practices.

On the other hand, the analysis of case studies portrays an interesting set of topics dealing with both rhetorical and operative levels. Scholars rely on participatory design methods and interdisciplinary cooperation to nurture students' self-confidence, skills, and abilities. Educators use multidisciplinary frameworks as grassroots to produce inclusive academic settings that promote innovation, enable to address modern challenges, and increase confidence with design practices.

The inclusion of EDI principles in Design Education at the teaching and learning levels generates a sense of inclusive culture across many fields. Growing with an inclusive culture, cultivating cooperative skills, and encouraging students in taking controlled risks while getting confidence with novel soft skills, are longitudinal assets that produce benefits at the module, course, and programme level. These also improve students' market readiness and inherent social aspirations. Accordingly, educators can prepare future designers to navigate the complexities of a varied and rapidly evolving world. This holistic approach not only enhances the academic experience, but also equips students with the right operative and cultural attitude required to establish favorable modifications within their communities and beyond. The value of cultural diversity, empathic design, authentic learning, and the use of HFE in shaping inclusive design practices are widely recognized as a plus to shape designers with a social consciousness. Synthetically, inclusive cultural components promote combinations of formal design aspects with socio-behavioral factors that ultimately reinforce students' cognitive abilities in addressing social complexities; empathy stimulates alternative viewpoints and social engagement, whilst enabling the design of inclusive solutions; experiential discovers operated by promoting empathic understanding of topics provide consistency to authentic learning methodologies and drives into the enhancement of intrinsic predispositions to be later translated into engaging design practices; finally, HFE enhances holistic understanding of human well-being, system efficiency, and diversity.

Overall, EDI produces arrays of benefits in Design Education, and this can be found at different levels such as the progression in the design culture, the improvement of design methods and approaches, and the consistency of teaching and learning practices. This leads to discussing beneficial impacts, which are clearly observable at the learner, staff and organizational level. Around impacts, some relevant research lines can be proposed to reinforce the convergence of initial topics found within studies that can be considered as promising working lines for future explorations.

In a strategic sense, EDI concept also aligns with sustainability; and this aspect is directly evinced from both the literature review and the case study analysis. Particularly, strong links can be found when comparing EDI to the Sustainable Development Goal (SDG) No 4 – 'Quality Education' – since it states the commitment to ensure inclusive and equitable quality education and promote lifelong learning opportunities for all (UN, 2015). Therefore, it can be affirmed that EDI is a foundational concept for any educational framework, the studio culture related to it is a key successful driver to generate long-lasting sustainable behaviors into learners (Dong, 2010; UN, 2015). To conclude, this work depicts the complexity of a fast-growing cultural driver capable of generating cascade impacts into many educational fields. EDI nurtures curiosity while promoting the advancement of novel theoretical and procedural apparatus that are considered relevant today in Design Education.

About the Authors:

Emilio Rossi is a Tenure Track Assistant Professor in Design. His studies include Design for Social Inclusion and Design for Sustainability, with a focus on the methodological innovations for inclusive product-service systems (I-PSSs). He has international experience in teaching and research and currently coordinates the EDIDesK project (Erasmus+ KA220-HED).

Sarah Jane Cipressi is a PhD student (PhD programme in 'Design for Made in Italy: Identity, Innovation and Sustainability') and her research involves Inclusive Service Design and Sustainable Mobility. She graduated in Architecture in 2022 with a dissertation on the design of a modular ferry boat.

Alessio D'Onofrio is an Assistant Professor in Design. He carries out teaching and research activities in the field of Service Design for Sustainability and Social Inclusion. Specifically, his work involves the creation of smart services for mobility, ecotourism, and bicycle tourism.

Raffaella Massacesi is an Assistant Professor in Design. She carries out research activities in the field of communication and digital design. She also took part in national projects granted by the Italian Ministry of Universities and Research. She is the director of SOS-Habitat, an academic spin-off.

Giulia Panadisi is an Adjunct Professor in Design. Her research work investigates the relationship between communication design, social inclusion and education. Alongside the research and teaching commitment, she works as a freelance art-director and motion designer.

Rossana Gaddi is an Associate Professor in Design. She carries out studies in Communication Design with a focus on the strategic enhancement of resources, the synergies between local resources, and innovative promotion modalities local and international scales by using human-centered and inclusion-oriented strategies.

Antonio Marano is a Full Professor in Design. He carries out studies in the field of Product Innovation and Design for Sustainability. He authored over 100 research and design outputs including publications, patents, and commercial products.

KEYWORDS | FUTURE THINKING, ART SCHOOL, COLLABORATION, COLLECTIVE, RADICAL PEDAGOGIES

ABSTRACT | Scenarios for envisioning future thinking in arts education are typically constrained by perceptions of contemporary circumstances as immutable, despite political fluctuations across the Global North: determined by culture 'wars,' socio-economic, and ecological crises. While the future of art and design education cannot be predicted, we can help shape it by joining forces across/beyond borders (disciplinary, institutional, geopolitical) to create more horizontal hierarchies of knowledge tested through participatory discovery and discursive research methods. Drawing on the Learning Platform of ELIA: FAST45 (Futures Art School Trends 2045), FAST UK is introduced as an emergent nexus of British educators, student collectives, and third-sector partners. We actively embrace diverse stakeholders in the public domain as a socio-conceptual space for formulating an equivalent Pedagogic Futures Research Lab in the UK. This experiment in future thinking is devised as a catalyst for more robust multimodal bodies of knowledge employing discursive and empathic approaches to co-construct pragmatic and theoretical new methodologies, more porous academic boundaries, and future visions for the (British) art schools of tomorrow. Art school traditions, models, and methods are unpicked as a part of this process to sift best practices from habits/norms and familiar formulae through the lens of the possible, probable, potential, plausible, preferable, or even utopian futures for the sector. New forms of art practice, generative AI, radical pedagogies, performative practices, and hybrid technologies are synthesised in a convergence of knowledge. FAST UK is conceived of as a means of anticipating and shaping our collective futures by utilising the inherently imaginative, intellectual, and creative resources (human, strategic, methodological) nurtured and developed in our art schools at a local, regional, inter/national, and global scale.

1. Introduction

Shaped by the cultural and socio-economic climate of our time, the art school is situated in an uncertain position as a state-funded institution producing creative innovations and new knowledge, contributing significantly to economic growth in the UK. Its popular (historical) status as an emancipatory site for creative and intellectual freedom, innovation and imagination, radical thought and action, integrated with a pragmatic preparation for professional practice in the service of industry, has led to fluctuating socio-cultural values and industrial allegiances. Over a century since the official opening of the Bauhaus in Germany (1919 – 1933), UK-based foundation arts education programmes remain significantly influenced by historical modernist principles of progress and production, achieved through a synthesis of form and function in the pursuit of a better tomorrow. In addition to the modernist pursuit of a new lived environment through art, architecture, and design, future-thinking has developed as a core characteristic of HE arts institutes that challenge students to shape their future through new cultural resources, anticipating future techno-social worlds. Academic course and module descriptors frame the future of creative work as full of possibilities but also uncertainty, as evidenced by the common refrain that many jobs in the future do not yet exist (it is students that will create them). Yet, what was imagined as an invocation to revolutionise the future of design work and fine art practices has become constrained by the immediacy of urgent climate and energy crises, socio-economic inequalities, funding cuts to the arts, cultural sector, and education in the context of political short-term thinking and turbulence. At a time when local councils in the UK have made 100% cuts to support for the arts and creative subjects have been systematically underfunded and diminished in their academic, social-cultural, and economic value from school to Higher Education levels, radical collaborative proposals are needed to reposition art and design pedagogy, research and practice at the forefront of socio-political action.

Arts education is framed in this paper not as a 'reflex' of the labour market or the knowledge economy but as an act of critical agency and transformation through the collective actions (Giroux, 1985: xi) of a transdisciplinary group of British arts educators, students, and local community groups. Following in the footsteps of the cultural legacy and educational significance strategically built by Bauhaus tutors and students in a collective act of self-actualisation through published manifestoes, pamphlets, exhibitions and catalogues, lectures, and media campaigns, FAST 45 calls on arts and design academics to be at the forefront of envisioning future scenarios for the art school. Walter Gropius' radical pedagogic vision for the Bauhaus converged theory and practice and unified the applied and fine arts within an interdisciplinary programme facilitated by the architectural site of the art school as a 'home' for future thinking and making. The *gesamtkunstwerk* (synthesis of diverse art forms) was characterised by an absence of ornamentation in an embrace of objectivity and rational design on the one hand and post-war optimism and radical experimentation on the other.

Future Art School Trends (UK) or FAST UK is introduced as a nascent collaborative arts education futures project instigated and co-constructed by a collaborative team of interdisciplinary educators from Kingston School of Art (London) and Nottingham Trent University in the UK. The critical context of UK-based arts and design Higher Education provides the focus and context for FAST UK, but this is not intended to delimit its research findings on a more global scale, nor is it framed as an exclusive internally facing project. On the contrary, its generative nature, collaborative structure, and porous edges are symbolically and practically designed to form discursive intersections with diverse partners and contributors. As such, this paper is presented as an open invitation for creative input and exchange, adaptability, and mutability, framed by the conference theme of converging pedagogic knowledge. The initial inspiration and catalyst for creating FAST UK was the FAST 45: Futures (Un)Known conference in Brussels (6 – 7 December 2023), at which participants (predominantly arts and design educators from Europe and the USA) were invited to join forces to "imagine and promote a future in which the arts and arts education plays an integral role in a world radically reshaped by the 4th industrial revolution, globalisation, and climate change" (FAST45, 2023, *np*.). We met at the conference as strangers, discovering a common passion for collaborative discourse around arts and design education. The conference call to collaboratively reflect on and reimagine art's role in envisioning and shaping our collective academic and professional futures represented a productive

provocation for a more expansive and generative thought experiment in future thinking. As the website states, Future Art School Trends 45 (FAST 45) aims "to imagine, map, and shape a higher arts education landscape where participation, research, and education in the arts play a crucial and integrated role within the sector and society as a whole" (ELIA: FAST 45, 2024, *np*). The convenors of the FAST 45: Futures (Un)Known conference made it clear to attendees that the learning tools (Learning Platform) co-created by the research participants could be used and adapted by all arts/educational institutions who are seeking to anticipate unknown futures and actively shape them. With this collegiate spirit in mind, we left the conference having agreed to form a distinct but aligned future art school research group.

FAST UK is presented to the Cumulus community as a statement of intent and an invitation for collaborations across borders and disciplinary boundaries to join and enrich this discursive convergence of knowledge through tangential insights, oppositions, and synergies. The FAST UK pedagogic research group aims to empower arts educators through a spirit of convivial exchange rather than competition to not only anticipate possible futures for the arts but also to be co-leaders of future thinking.

2. A Reflective Overview of FAST 45

Launched in 2022, Future Art School Trends (FAST 45) takes a futures-thinking approach to imagine the educational landscape of 2045 as the year when those born in 2022 might apply to study a degree-level arts discipline. What socio-cultural, strategic, pragmatic, or symbolic role might the art school institution of the future offer prospective students? The Futures (Un)Known conference formed part of a programme launched in 2022 across several European arts institutions from Belgium, Estonia, Switzerland, the Republic of Ireland, Germany, Spain, and the Netherlands, as well as non-academic partners such as the School of Commons. FAST UK was conceived as a direct consequence of in-person attendance at the Futures (Un)Known conference: its aims are closely aligned but distinct due to the socio-economic and political circumstances of contemporary Higher Education in the arts in the UK. We have identified a need to place UK educators at the heart of discourse to actively shape the future of our institutions in a pedagogic exchange. The FAST 45: Futures (Un)Known (ELIA, 2023, *np*.) home page presents participants and audiences with a challenge:

> "Close your eyes. Picture the arts in higher education in 2045. Imagine multiple futures and how working practices will change while dealing with global uncertainty. Is it possible to map unknown futures today? What structures do we need to create the sustainable and desirable futures our art students deserve?" (FAST 45, 2023, *np.)*

A research-in-action and knowing-in-action approach that draws on Donald Schön's (1987) conscious engagement with mutual dialogue as a method of developing new forms of understanding and action lends a more reflective evaluation of the research process in future thinking. For Schön, the alert participant in dialogic future research consolidates the methods of discovery and knowing as a part of the active process of thinking about the research while actively engaged in it. The FAST 45 workshop techniques and methods employed during the conference to explore certain aspects of future arts education are thus incorporated and adapted into FAST UK as core methods of exploring future pedagogies and practice research. For example, four scenarios have been developed by FAST 45 to act as adaptable "tools that will empower arts institutions to not only anticipate an unknown future but to actively shape it" (FAST 45, 2022, *np.*). They include:

- Scenario 1: Open Spaces: hubs of artistic ingenuity, encouraging creativity and collaboration, addressing the complex problems of society and the planet.
- Scenario 2: Slow Eco-life: Slowness and degrowth are seen as catalysts for creativity, while resource scarcity is integral to artistic growth.
- Scenario 3: Phygital Frontiers: fresh perspectives and legislation are needed to navigate the ethical challenges of technology-driven art.

- Scenario 4: Profitable Endeavours: To thrive, artists and institutions must adapt, forge alliances, and embrace alternative networks that foster inclusivity, artistic freedom, and diverse perspectives.

FAST UK seeks to triangulate future thinking, the Learning Platform tools of FAST45, and a diverse coalition of art and design school stakeholders in a new synthesis of theory and practice, media and methods, community and academia, co-created by those currently studying and teaching in the UK. FAST UK will also embrace and develop the spirit of convivial participation designed for participants of the Futures (Un)Known conference as a human-centred method of collaboration, incorporating interactive media, prompt cards, speed dating, Q&A sessions, data gathering, analysis, mapping, and knowledge creation in multimodal discourse. Experimental modes of research and engagement, including performance poetry and sound works, will also be adapted from FAST 45 as alternative future-thinking approaches to workshop construction and deployment. FAST UK is, thus, framed in this paper as an emergent nexus of educators, students, and third-sector partners co-constructing strategies for a radical reappraisal of arts education and new configurations of the art school itself within urban, suburban, and rural locations. This experiment in future thinking is devised as a collective rather than competitive approach to innovation – joining forces across disciplines and institutions to make new networks of shared knowledge for, with, about, and through art and design education. The FAST UK collective is conceived of as a means of anticipating and shaping our collective futures by utilising the inherently imaginative, intellectual, and creative resources nurtured and developed in our art schools at local, regional, national, and European levels.

3. UK Art school visions of the future past

Art school myths persist as institutional prospectuses and promotional platforms attest by claiming that art school teaches you to rethink and reshape the world in a crucible for original thinking, risk-taking, and critical thinking (Tickle, 2013). Within the duration of three-year (BA) or one-year (MA) programmes, art students are tasked with addressing urgent (vast and complex) global challenges, from climate and energy crises to health and well-being, to ethnic and gender equality, in the form of cutting-edge designs and inspirational art forms that will simultaneously contribute to economic growth. These achievements are sought while simultaneously succeeding at the highest level (there is no alternative level) of attainment (assessment grades), leading to a lucrative position in one of the ‘creative industries’ (to pay off student loans and concurrent debts), winning design awards, being selected for exclusive exhibitions and building a significant following on social media.

Corporate branding and design agencies promote visions of art education as a force for social good but also individual self-actualisation in a competitive global market. That art schools have the strategic and structural capacity to fulfil these obligations is not in question, but in current and future visions of academia, what needs to be addressed is the role of the art school itself as an idea, place, and community of practice which is instrumental in the conception and construction of future visions. This paper seeks to go beyond the current UK Education policies, which, even in 2013 (when fees were increased to £9000 per year), were “driven by an overarching political view of how the world should work. A sense that [the] government sees every aspect of cultural life purely in terms of its economic utility” (Guardian, 2013, *np.*). While the images and nomenclature employed by art schools in their designed visions and mission statements have adapted to new challenges (e.g., decolonising the curriculum, increased equality, diversity, and inclusivity in curricula) and labour markets, this paper argues that a new collective convergence of knowledge is urgently required from students and tutors, technicians, librarians, and researchers within Higher Education (HE) to reimagine art school futures. In the age of AI and machine-led knowledge production, social and ecological crises, and global conflict, there is more urgency than ever to rethink our models of education, drawing on diverse voices.

Beyond the neoliberal affordances of the UK's vibrant arts education sector, future thinking is inherent to art and design practices, giving form and credibility to new ways of living, working, and being in the world. As Ramia Mazé (2019) argues, in the process of conceiving and producing visions of the future, artists, educators, students, and designers give form to possible, plausible, or preferable scenarios, visualised by Voros (2015) in Figure 01 below. Futurists use the plural of 'futures' because the master concept of the futures field is that of the existence of many potential alternative futures rather than simply a single future (Voros, 2022). Futures studies are the systematic study of possible, probable, and preferable futures, including the worldviews and myths that underlie each future vision – alert to the methodologies or mechanisms that don't change as well as those elements that do differ. What is considered an advancement, a progressive vision? And who for? Who benefits from the future vision for the arts and arts education? Dominated by technological determinism, such visions often fail to make explicit the shifts in the social imaginary, labour, and policy required to instigate critical shifts to "gender norms, socio-ecological practices, and power structures" (Mazé, 2019, p.23).

Future visions of art school education are thus approached as a fundamentally social discourse embracing diverse positions to strategically and productively coalesce new models and methods drawn from a wide range of re/sources and stakeholders. As discussed with attendees at the conference, future curriculum planning needs to consider the urban and suburban creative practices of local communities as a divergent embrace of DIY coding, graffiti, and music production, the theatre of the street, and performative communication.

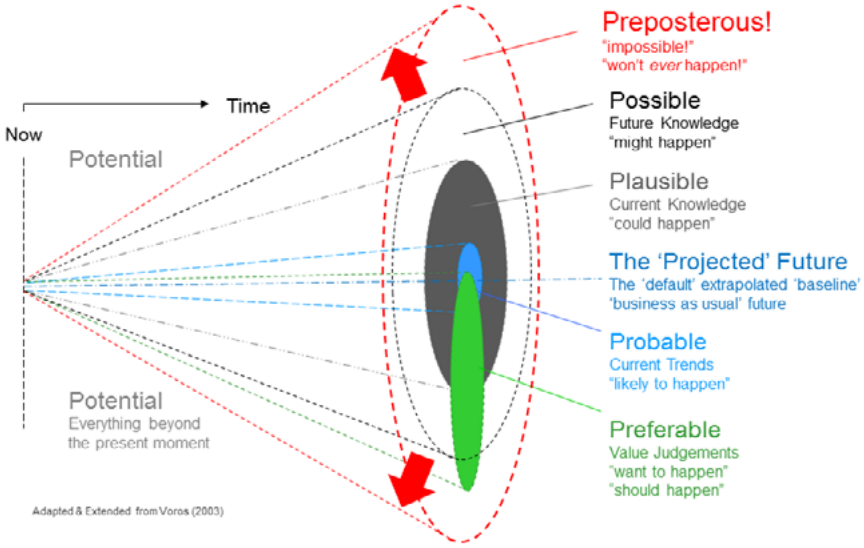

Figure 1: The Futures Cone, adapted and extended from Voros (2015).

'Art school' is employed as an overarching umbrella term coalescing broad concepts of art and design education to purposefully invoke examples of symbolic art institutions of the past (Bauhaus, Ulm, Black Mountain College). Art school is often framed as a crucible for such future thinking in action, although as the queer, intersectional, feminist platform Futuress (2024, *np.*) argues, "common design practice, its history, pedagogy, and institutions remain predominantly Western, white, privileged, cisgender, and able-bodied." The mythical concept of art school may have survived as a backdrop to contemporary arts education in the UK, but the internal power structures and neoliberal ideologies of competitive individualism are at odds with the traditional values of collaboration, transformation, creative discovery, and freedom. Decades of underfunding in the UK threaten to undermine the learning experience offered to students as the often reductive nature of how art and design education is described by government ministers and media alike is determined by market forces and a recent rise in media references to 'culture wars.' Arts educators are thus consistently asked to do more with less or to paraphrase the British BBC TV comedy series WC1A (BBC, 2014 – 2017) 'More of Less Initiative' described by one character in this way: "The fact is, this is about identifying what we do best and finding more ways of doing less of it better"

(Wollaston, 2017, *np*.).
Historically, British art schools, such as St. Martin's School of Art (UAL) or Hornsey College of Art (founded in 1880), have accumulated an image of counter-cultural rebellion (Tickle, 2013), a transformative discovery of the self and the world. However, the plethora of free schools, alternative universities, self-organised collectives, and courses that have expanded in recent years in the UK as well as in Europe suggests that the current state-sanctioned provision is not meeting the needs and ambitions of young people (Kosmaoglou, 2017). What the expansion of newly formed alternative art schools reveals is the need for ownership and engagement in the form of arts education, which eschews the hierarchical structures of modules, fixed curriculum, assessment, standardisation, and constant measurement. The conventional teacher-student power relationship (derived from the historical master-apprentice model) of the classroom/studio is disrupted in a more collective embrace of learning and experiencing arts education for all. These alternative art schools feature collective strategies for engaging students in the possibilities of their own learning experiences beyond the neoliberal framework of more established validated institutional systems. Indeed, as more collective arts, architecture, and design collectives emerge from the transdisciplinary social opportunities of studio-based art school study, perhaps the first change in the future art school model must be in a collective alternative to the predominantly individualistic assessment criteria. The impulse to collaborate rather than compete in contemporary arts education programs and practices suggests a transitional moment is at hand for course leaders, teachers, students, and external partners.

With the rapid and increasing emergence and availability of AI software as an embedded tool for the creation of artworks and artefacts, the traditional certainties of knowledge transference between experienced teacher and pupil are called further into question. When a student, born in 2022, can produce, direct, change, merge, and edit their creation alone in their bedroom through machine intelligence, what role does the art institution play in teaching those nuanced skills? The creation of an artwork (in collaboration with AI) necessitates the questioning of values - what is the value of this work beyond Walter Benjamin's notion of aura (Benjamin, 1936)? What is the intent of the student? What do they understand about the context of the composite ideas and images and the nature of the collaboration? What does this say about being human?

4. Future Studies Futures Thinking

In his essay, 'A primer on Futures Studies, foresight and the use of scenarios ' Joseph Voros (2022) highlights the broad field of future thinking which goes by a variety of names, including: "'futures research,' 'futures studies', sometimes 'futures analysis,' 'futurism,' 'futuristics', or even 'futurology'" (Voros, 2022). Many have negative connotations. As such, a research framework for future thinking within academic contexts may suffer from the ambiguity or topicality of its nomenclature. Voros adapts three 'laws' of futures from Roy Amara (1981) to establish a conceptual foundation for the futures field:

- the future is not predetermined
- the future is not predictable
- future outcomes can be influenced by our choices in the present

Higher Education might be framed as a programme of preparation for future practices in which curricula are designed to meet the challenges of today and anticipate the needs of tomorrow, responding to real-world problems in a hopeful projection of art and design's power to have an impact on the world. As educators, we help students give tangible form to speculative future scenarios as a means of better understanding the link between action and impact – social, ecological, economic, political, and cultural – on a local and global scale. Future skills (Kingston University, 2022) such as adaptability, collaboration, collective resilience, relationship building, and critical thinking are identified by businesses as necessary thinking tools to meet the challenges of tomorrow in civic and corporate contexts. To this list, we might add future thinking as a means of reconfiguring the reactive approach to contemporary local and global crises and adopting a more proactive position for the arts, culture, and education in future thinking. Art

school is (or has represented) an ideal environment for such skills to be developed and in a process of transformation through learning, for innovative modes of creative thinking and problem-solving to be applied and integrated into everyday experiences. As Ramia Mazé argues, "designed visions of the future, along with their preferences, norms, and ideals, shape policy planning, market economies and cultural imaginaries" (Mazé, 2019, p.24). But how can we approach a future unknown with heuristics to create change when the parameters for creative practice are so ill-defined?

On MA Graphic Design (Kingston School of Art), responsible approaches to visualising future scenarios are applied to future thinking in a reflective process of analysing historical images of our future lives. In these scenarios or tableaux, the (male) workers may be observed flying on jet packs to the sleek shiny office, while the domestic sphere remains depressingly familiar in its division of labour and gender bias. The shapers of our cultural horizons must be fully conscious of what we allow to change (travel, climate, work) and what remains the same (social, ethnic, and economic inequality) in our future imaginings. Critical reflection is therefore essential to underpin the principles and methodologies of imaging our future world through 'Futures thinking,' 'speculative' and 'critical design,' and 'design fiction' if we are to avoid reinforcing the stereotypes and inequalities of contemporary life and work.

> "Speculative design asks questions about the future and offers some alternatives that are essential for the world of today, but more importantly, the world of tomorrow… the speculative design approach expands the critical practice towards imagination and diverse visions of possible future scenarios." (Mitrović, 2016, p.69).

Who gets to decide what the future looks like? Or how connected we are through social and or technological networks? How much of our cultural heritage do we bring to our future selves? Art and design's (modernist) claims for a universal language, the globalisation of the arts, cultural capital, and the enfolding of commerce and common culture arguably frame 'the future' itself as a design problem (Mazé, 2019; Reeves, Goulden, & Dingwall, 2016). And it is often a singular future that is sought, following time's chronological arrow in a logical progression from *the* past through the murky waters of the present to *a* future. Designing for a future art school education is a political act. Indeed, despite the initial intellectual and critical opportunities for design practice enabled by speculative research, its 'flaws' were soon exposed, as Francisco Laranjo argues, as 'critical design' became interchangeable with speculative as an ambiguous and unaccountable doctrine "synonymous with a vague 'what if' mode of design predominantly practised by white, middle-class Europeans" (Laranjo, 2024). The aphorism-cum-heuristic of "the purpose of a system is what it does" from the cybernetician Stafford Beer (2002) still provides a useful beginning frame from which to proceed. What does the art school *do* currently, and what do 'we,' as participants, labourers, co-constructors, and stakeholders, want it to do? How can Futures Thinking be used as a method for opening-up visions around this while taking on board such criticisms as those posed by Laranjo and Futuress?

As a crucible for the possible, art schools are ideal environments in which to problematise future thinking and to instigate alternative mindsets and methodologies through scenario-building. Scenarios can provide focused frameworks for research and thought experiments as an exercise in critically identifying an ideal socio-political location for an art school demonstrated at the design educators' conference in the UK (GDEN, Ideas of Revolt, 2017). In this context, alternative socio-political scenarios (utopia, dictatorship, monarchy, communism) were examined in an action-based workshop on the speculative possibilities of art school – as a concept and place of revolt. Scenarios were devised, deconstructed, and critically interrogated on a sliding scale from the speculative to the pragmatic (Ellis, 2017) as a means of thinking beyond the parameters of the now. Voros' (2022) Futures Cone enhances scenario building through the lens of future thinking in an embrace of the possible and impossible in a more pluralistic mode of critical thinking. Through four scenarios, described next, FAST UK's critical and speculative approach to envisioning future art schools thus seeks to harness inspirational thinking and radical pedagogies. Underpinned by criticality and convivial collaboration, the scenarios seek to decolonise academic conventions and expand the boundaries of the academy to embrace local communities in a more proactive and collective exchange of ideas and interests to provoke socially engaged art practices and action.

5. FAST UK – a new convergence of knowledge

Some of these questions have been tackled by organisations such as AdvanceHE, a member-led charity which aims to 'shape the future of HE' by addressing "systemic inequalities and advance education to meet the evolving needs of students and society" (AdvanceHE, 2024). Other national networks for arts education in the UK, such as the Group for Learning in Art and Design in Higher Education (GLAD) established in 1988, work towards pragmatic discussion about 'best practice in developing the student experience' with a focus on teaching, learning, and assessment "in the context of increasing student numbers and reductions in staffing" (GLAD, 2024, *np*.). More discipline-focused groups such as the Graphic Design Educators' Network (GDEN),

Illustration Educators, National Association for Fine Art Education (NAFAE), or EDI (equality, diversity, and inclusion) networks such as Fashion Academics Creating Equality (FACE) seek to re-establish the purpose and value of a given subject of study or field of the arts and to challenge the lack of Black, Brown, and POC academics in the HE system, for instance. No equivalent future-focused multi-disciplinary arts pedagogy research group such as FAST 45 currently exists in the UK.

In response, as coordinators of FAST UK, we propose a parallel set of scenarios to those established by FAST 45, which seek to identify and celebrate best practices drawn from British HE arts institutions while creating intellectual and discursive spaces for new knowledge methods and configurations of arts education to be interrogated. FAST UK has strategically expanded in its scope, incorporating third-sector groups such as The Community Brain (Community Brain, 2024a), student-led autonomous art schools such as the Offshore Art School, and self-organised alternative art schools such as Open School East. By integrating a broader spectrum of stakeholders in the arts and art and design education, FAST UK seeks to cement the core qualities and values of the arts into everyday discourse beyond the academy and within the social imaginary (Castoriadis, 1975). The social imaginary is framed as a social network negotiated between members of an (academic) arts community which anticipates a synthesis of the real (today) and the future-possible (tomorrow).

FAST UK is presented as an expansive forum for debate, an open invitation for participation at this conference, which is ideally placed to exploit the community of art and design educators and researchers drawn from 730 member institutions across 69 countries. Cumulus thus provides a unique itinerant context for and means of exchanging/converging knowledge to elevate "the positive role of designers and artists in creating sustainable and humane futures for all" (Cumulus, 2024). The collective context of the Cumulus forum "represents a dynamic ecosystem for internationalization and global mobility, knowledge exchange, and collaboration in art and design pedagogy, research, and practice" (Cumulus, 2024). The wealth of pedagogic experiences, diverse epistemologies, and methodologies brought to Cumulus conferences is sought to strengthen the emergent research model of FAST UK. The four research scenarios proposed by FAST UK include:

- Student Voice & Alternative Art Schools
- Art School: the role of the institution
- Decolonising the Curriculum
- Civic/social responsibility: third places / third spaces / third sector.

Student voice & alternative art schools — Those studying art and design are rarely asked for their visions of the futures of their practice, or when asked, their visions are diluted or overwhelmed by the avalanche of competing interests and economic forces within arts institutions. This Pedagogic Futures Forum is proposed as a student-led, inter-disciplinary, and inter-institutional space in which current students can meet to discuss the future directions, modes, spaces, and aims of art school/HE in the UK. It builds on previous Alternative Art School collectives (Gale, 2017) and current student-led groups such as the Offshore Art School at Kingston School of Art. As a mode of research-in-action, tests in gallery foyers, publications,

talks, and workshops (Festival of Futures, June 17 – 20, Kingston-upon-Thames, UK), these autonomous student forums are connected and sustained through Instagram and accessible digital platforms enabling diverse voices and suggestions to be added to the mix. The members of the itinerant art school model collaboratively conceive and configure their own new power structures to facilitate accessional interventions, provocations, and contexts (for a more expanded historical or global sphere of possibilities).

The Anti University, *Blueprint for Counter Education* (Stein & Miller, 2016), and Black Mountain College provide a backdrop to the emergence of free or collective self-managed arts schools such as the School of the Damned, the Islington Mill, Open School East, and The Margate School in the UK, and the Parallel School or Maumaus in mainland Europe. Representatives from these schools and intra-institutional schools-within-schools such as the Alternative Art School (Gale, 2017), Offshore Art School (Gale, 2014), Department 21, and Splinter will be invited to speak to the concept of art school from beyond academic boundaries, module systems, curricula, and assessment processes. These self-organised (co-operative and collective) schools are cited here as examples of previous or alternative models that can be analysed and evaluated as spaces from which to learn or to build other practices. Such models face challenges in terms of resources and financial capital but are gaining in popularity due to the high degree of collective ownership amongst the participants, the freedom of pedagogic processes, and a focus on the core value of art practices. They can be susceptible to the aforementioned hierarchies, privilege, and structural challenges that formal institutions battle but offer another position.

Art School: the role of the institution — Art school has a heritage of rebellion, a healthy counter-cultural critique of societal norms and political positions expressed through the visual and performative tools of the arts. Alternative Art Schools, as listed above, are examples of additional and parallel spaces through which students can channel creative activity and thinking, and we can usefully draw on these examples through a contemporary lens to imagine models for the future. Students who are undertaking a formal education in a formal setting are still able to continue discourse and conversation in a variety of spaces outside of the

A formal institutional framework but a less measured, less assessed, and more convivial context for such dialogic practice is made possible. With the impact of generative AI working collaboratively with students (robot and human) and the advancement of computational practice and machine-led making and learning, where does this leave the institution? If what students need to learn is ‘intent’ and to understand bias, AI references, and context, perhaps the institution itself becomes the hub of human-centred learning. We propose that this necessitates an urgent need to reframe the institution as the mediator of these, thinking through this history of Art Education in order to position ourselves in a future space of critical relevance.

Decolonising the Curriculum — From reading lists to interrogating and dismantling hierarchies of power in contemporary institutions, decolonising the curriculum represents a shift in motion within UK art schools. Whether systemic changes rather than superficial name changes are a result may depend on the leadership and inclination of each institution, but good examples can be found in several colleges and current courses. Understanding history from the position of now and learning from the recent proliferation of curatorial platforms and biennales celebrating non-Eurocentric practices and voices that would once have been silenced offers reassurance. But there is still a long way to go. Sustainability, not as popular rhetoric for a poster campaign but rather an integral philosophical agenda, is a key component in establishing a balance between human and non-human cultures. The Western art world (as just one part of a broader network of consumption) has not held sustainability as a core value until relatively recently, with organisations like Julies Bicycle helping arts institutions to work better (or to help make things ‘less worse’). It is the responsibility of art schools and institutions to help shape a community of practitioners and makers who consider the future and the origins of the materials they use.

Civic/social responsibility / third places / third spaces / third sector — Reconfiguring and relocating the art school beyond the ‘bubble’ or ivory tower of the art school/academy FAST UK seeks to integrate discourse and knowledge with the local communities in (their) third spaces (neutral community spaces such as cafes, bars, village halls, libraries). By repositioning the forum for debate and action from the academic institution to the spaces that belong to the community, opportunities to meet new audiences on

their terms are enabled. Such collaborative discussions and joint activities have already been established with The Community Brain (2024a) in the Kingston/Surbiton area of southwest London. Such partnerships and Knowledge Exchange collaborative projects provide opportunities to test the value of arts education methods and social interventions in context. Collaboration and communication with charities / third-sector organisations are featured as a means of grounding ideas in relation to local environments and meeting the needs of local people in the civic sphere. Including and empowering local people through a convivial exchange of creative transferable skills extends the edges of the art school itself to encompass a new dialogue of collective potential.

6. Summary

While we can agree with the Erasmus+ funded FAST 45's claim that the world of 2045 – or indeed tomorrow – might look very different and that the future is unknown, the coalition of contributors from arts education and business propose that we take a more proactive role in shaping the future landscape of higher education. In a participatory approach to mapping, imagining, and interrogating future scenarios for the arts and culture sectors, FAST 45 has built a substantial body of research material which they have sought to share within the wider arts and design educational community. The invitation to participate in the project of empowering arts institutions through the diverse stakeholders engaged directly or tangentially with its production and delivery struck a chord with us, the instigators of FAST UK. As a small group of UK-based educators from graphic design, fine art, and film, we were inspired by the inclusive approach of the conference leaders and the inclusive nature of problem-finding and debate. Inspired by the optimistic attitude of those attending the event, FAST UK was conceived of as a means of anticipating and shaping our collective futures by utilising the inherently imaginative, intellectual, and creative resources (human, strategic, methodological) nurtured and developed in all art schools, whether at a local, regional, inter/national, and global scale.

The urgent need to remind arts and design educators of their inherent yet overlooked and undervalued ability to explore ideas and visions of the possible as part of an interdisciplinary and international coalition of creative thinkers comes at a time of crisis in the UK. The need for new ideas and methods in and for the arts, culture, and education sectors in the UK and more globally is laid bare in this paper, as the political climate in post-Brexit Britain has seen the value of arts education dramatically decline in recent years. What FAST UK aims to instigate is a UK-wide collective research community of inter-connected stakeholders in arts and design education futures thinking for and with arts educators, students, and (local) communities. Research collaborations have already been established within the neighbourhood surrounding Kingston School of Art (The Community Brain, 2024b) facilitated by Dr. Gale's membership and role as Professor of Ludic heterotopias in the semi-fictional Free University of Seething. Drawing on the transdisciplinary skills and experiences of the current FAST UK team, each member is reaching out to connect with communities of practice to build scenarios for testing radical pedagogies and expanded notions of practice in the arts and Higher Education.

The small team (collective) of UK-based educators who present this paper were inspired by the rigour and creativity of the FAST 45 initiative and resolved to create an aligned but distinct thought experiment in arts education futures for the UK, as no such group currently exists. FAST UK draws on areas of local expertise and academic progress made in recent years, such as in embedding EDI (Equality, Diversity, and Inclusion) into curricula and establishing respectful forums for Students' Voices. FAST UK is envisioned as an agile research project that speaks to the common concerns and proposals emerging from the FAST 45 Learning Resources and extends threads of enquiry to incorporate unexpected insights and future unknowns. The FAST UK team is seeking a community of practice through the Cumulus conference in Budapest this year as an opportunity to converge the rich knowledge resources available at this global meeting of educators, students, and researchers. We have the ambition, with your support, to anticipate and shape our collective futures by utilising the inherently imaginative, intellectual, and creative resources nurtured and developed in our art schools at a local, regional, national, and global scale.

About the Authors:

Dr. Cathy Gale (MA: RCA / SFHEA) is Course Leader MA Graphic Design at Kingston School of Art (London), a research-led educator and graphic artist specialising in critical performative approaches to design as a (collective) social praxis with diverse communities of practice.

Max Ryan Max Ryan is a designer, developer, researcher, and educator. His practice explores techno-social systems through the use of tools, workshops, and digital mediums. He operates an independent practice working with organisations such as Common Knowledge, Novara Media, and Ecological Citizens.

Annie Watson has been the Deputy Head of Department for Design and Digital Arts since November 2022, a role that includes strategic vision as well as operational expertise. Prior to this role, Annie worked as a film editor, fiction film writer/director, and director of pop videos, where she won international awards.

Dr. Emily Strange is the Course Leader of BA Fine Art at Nottingham Trent University. Her PhD explored drawing as a vehicle for utopian design and proposition. The research project was practice-led, and drawing was treated as a channeling tool for Ernst Bloch's original theories of utopia, by testing, editing, and appropriating paper architecture.

Acknowledgements: Dr. Cathy Gale and Max Ryan are grateful for the support of Kingston School of Art (Kingston University, London) in funding the in-person presentation of this paper

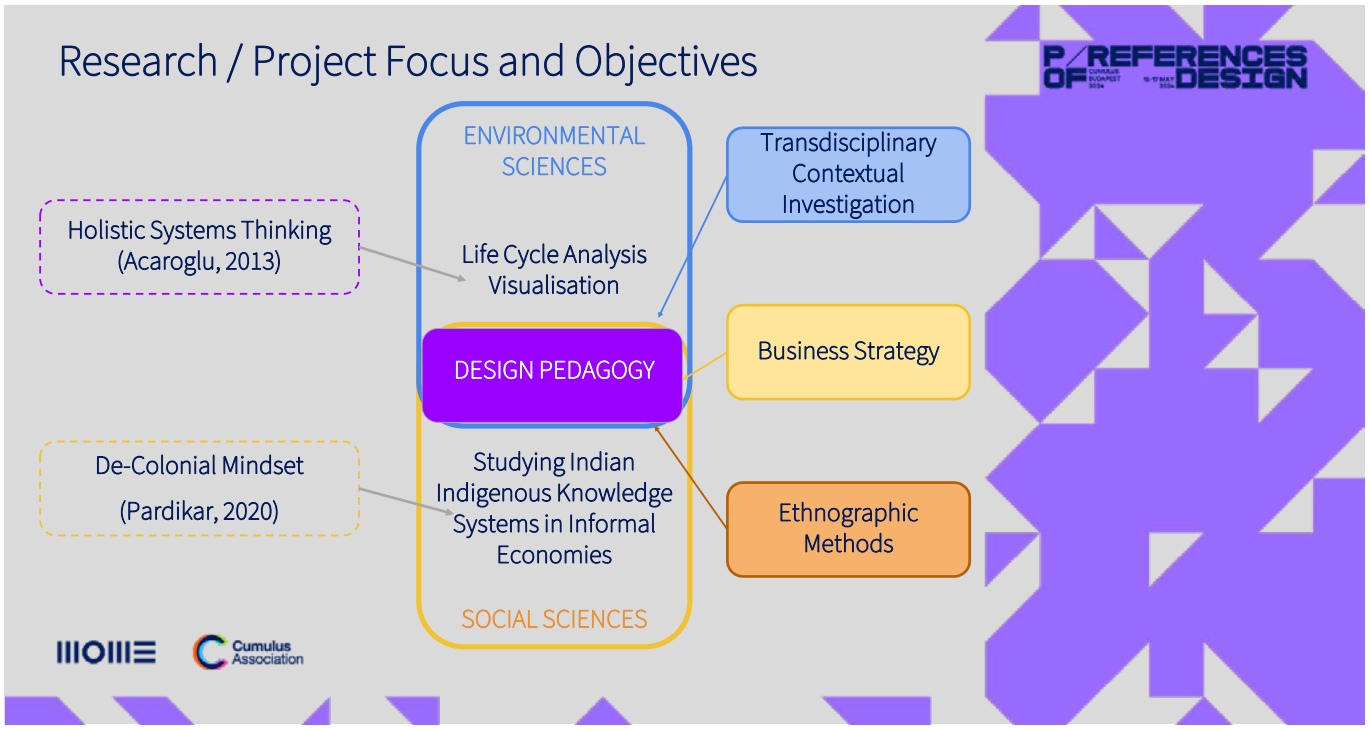
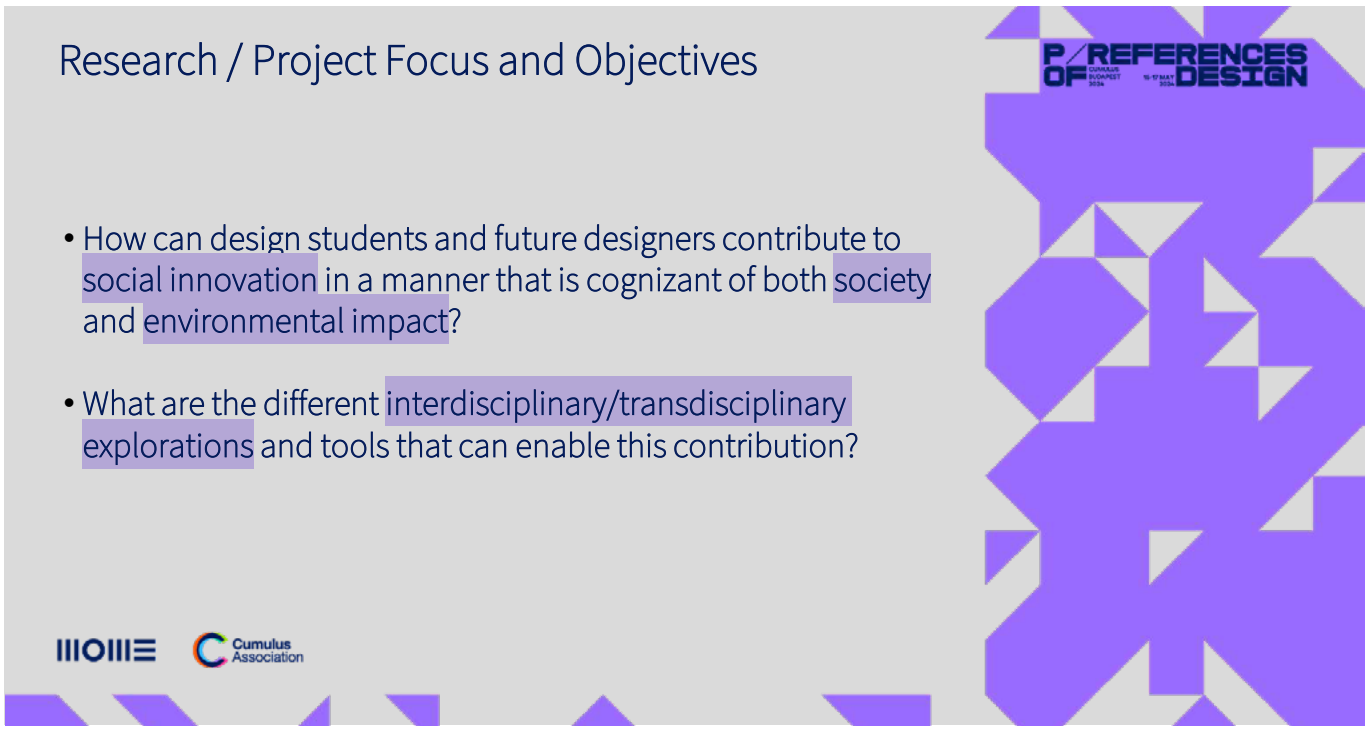
KEYWORDS | TRANSDISCIPLINARY, DESIGN EDUCATION, PEDAGOGY, SOCIAL INNOVATION, CLIMATE CHANGE

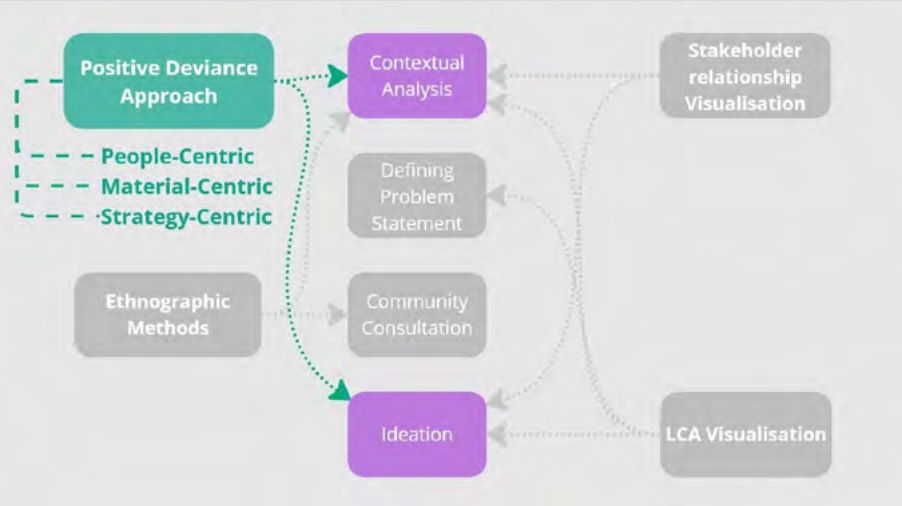


ABSTRACT | With exponentially growing global concerns about climate change, the responsibility of mitigating climate change is an emergent focus area in design studies. Thus, there is a growing critique of hyper-specialization and disciplinary education in design (Bremner & Rodgers, 2013). Acaroglu (2013) highlights the dangers of this silo-sized, disciplinary design thinking without understanding holistic systems, which can lead to a huge environmental impact. Additionally, while countries in the Global South are most impacted environmentally and socially by climate change, they are underrepresented in mainstream literature (Pardikar, 2020). Research on the nascent wisdom and extensive knowledge within informal economies of countries like India are also under-represented (Ohnsorge & Yu, 2022). This paper proposes a pedagogy that departs from these norms and advocates a radical reframing of design pedagogy by integrating systems thinking transdisciplinary, and social consciousness for sustainable social innovations. In line with the track "Converging Bodies of Knowledge," it positions design education as a bridge between Life-Cycle Assessments (LCA) from environmental sciences and the study of social networks and community well-being, situated in social sciences and sociology. It answers the following important questions:



1. How can design students and future designers contribute to social innovation in a manner that is cognizant of both society and environmental impact?
2. What are the different interdisciplinary explorations and tools that can enable this contribution?

The pedagogy presented here is a composite framework comprising methods from two studios facilitated by the authors, namely "Managing Waste" and "Making That Matters" at Srishti Manipal Institute of Art, Design & Technology, MAHE, Bengaluru. It employs a four-pronged strategy to achieve its objective.



1. LCA Visualisation - Tools for visualizing LCA research papers as diagrams that can be used to easily identify opportunities for design contribution and intervention. This also promotes interdisciplinary collaboration and understanding.
2. Stakeholder relationship visualization - Existing models of stakeholder diagrams do not sufficiently visualize stakeholder networks, power relationships, and stakeholder-to-process relationships. An extensively detailed methodology to cover these gaps is introduced.
3. Interviews and ethnographic methods - Methods such as photo elicitation and interviews are encouraged to understand relationships and social networks. The importance of social networks, especially in informal economies for which they serve as an important driving force, is primarily recognized in sociological studies (Lomnitz & Sheinbaum, 2004). This perspective is brought into the design studio.
4. Positive-Deviance Approach or Ideation Through Observation - As appreciative inquiry (Cooperrider & Whitney, 2005), students are encouraged to identify positive outliers and build or scale them up (Baxter & Lawton, 2022). These positive deviances are categorized into three groups - people-centric, material-centric, and strategy-centric.

The paper presents student work from the two studios to demonstrate the strengths of this pedagogy. This resultant pedagogy can be applied in interdisciplinary design research studios at different levels of education. Additionally, one of the studios rooted in real-world issues and the physical context of Bengaluru, India, offers two more directions for this research, namely the decolonization of social innovation studies in the Global South and the possibilities for applications of this pedagogy by system designers in their practice. The paper also provides tools for applications of this pedagogy.

LCA Visualisation as a Tool to Identify Opportunities for Design Intervention

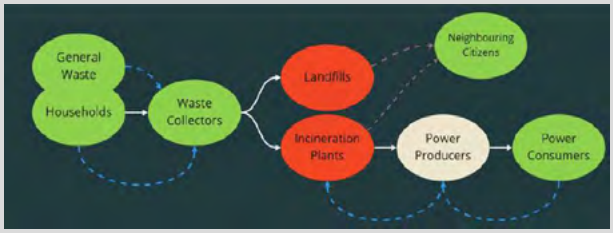
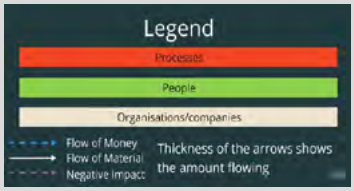
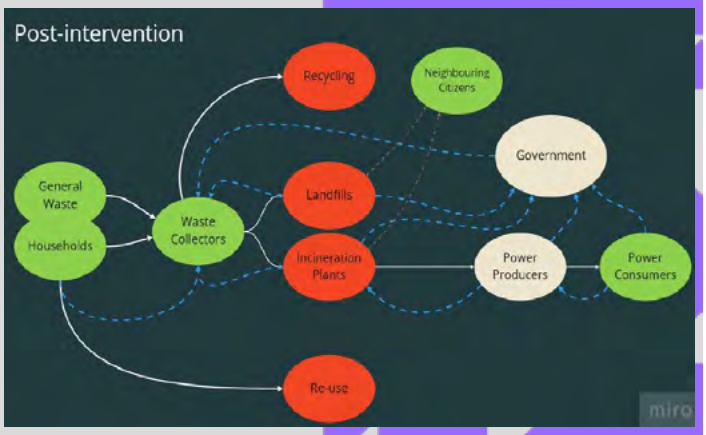
By Aditya Murudeshwar and Suhrud Shringarputale, Srishti Institute of Art, Design & Technology

Aditya Murudeshwar and Suhrud Shringarputale's LCA understanding clearly depict the harmful effects of various parts of the product's lifecycle (such as thermoforming, disposal etc.) on the environment through visualisation of "impact categories" such as climate change and Photochemical Ozone Formation.



LCA Visualisation as a Tool to Identify Opportunities for Design Intervention





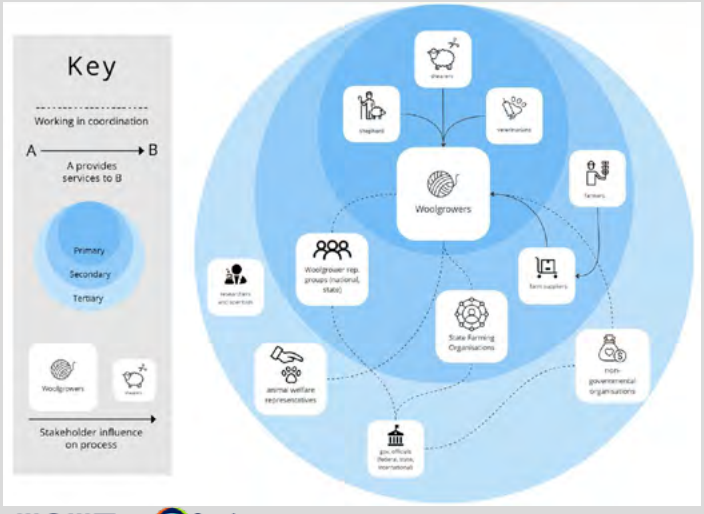
Student Work by Aditya Murudeshwar and Suhrud Shringarputale, Srishti Institute of Art, Design & Technology

Aditya Murudeshwar and Suhrud Shringarputale's then analysed the environmental impact of alternative material "NOTPLA" to demonstrate how it did away with harmful processes such as thermoforming and incorporated biodegradation as a end of life process.

LCA Visualisation as a Tool to Identify Opportunities for Design Intervention

Student Work by Aditya Murudeshwar and Suhrud Shringarputale, Srishti Institute of Art, Design & Technology featured above highlights how government taxation changed the whole system of waste disposal surrounding PLA cups

Evolution of Stakeholder Visualisation Techniques



Existing models of stakeholder diagrams do not sufficiently visualize stakeholder networks, power relationships and stakeholder-to-process relationships. An extensively detailed methodology to cover these gaps is introduced.

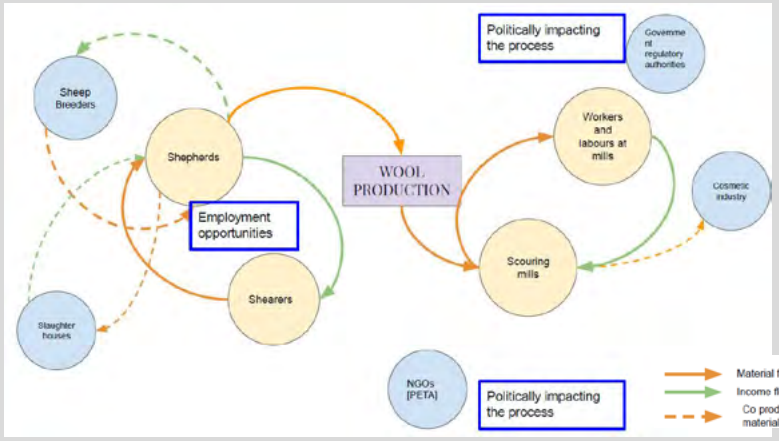
	Primary/Secondary /Tertiary	Processes?	Relationship to Process	Stakeholder Impact on Process	Process Impact on Stakeholder
Stakeholder 1					
Stakeholder 2					
Stakeholder 3					
Stakeholder 4					

	Stakeholder 2	Stakeholder 3	Stakeholder 4	Stakeholder 5
Stakeholder 1				
Stakeholder 2	X			
Stakeholder 3	X	X		
Stakeholder 4	X	X	X	

Stakeholder mapping framework by Lakshmi Srinivasan

Evolution of Stakeholder Visualisation Techniques

The woolgrowers (sheep farmers) are the most influential stakeholders at the material sourcing stage of the life cycle. They interact with almost every other stakeholders in the process - employ some of them, hire some for their services and their activities are governed by some unions and organisations. They are the prime decision-makers in this process.



The labourers interacting directly with the sheep, like shearers and shepherds are stakeholders having a high interest in the process, because it is their primary source of livelihood. However, they have little influence on the process because they do not have the power to make decisions.

Trader unions and labor unions are functional in outlining the wages for labourers and safeguarding their rights. They have quite a critical role to play because primary workers are exposed to a number of disases, especially at the material sourcing stage.

Company directors and the government have a high influence in the process because they define the policies that the system runs along. However, they have lesser interest as compared to the primary labourers since their livelihood does not entirely depend on one industry.

By Kasturi Pathak, Srishti Manipal Institute of Art, Design &Technology

Evolution of Stakeholder Visualisation Techniques

Meghal Grover's work synthesises the tabulated data to identify the impact of stakeholders on other stakeholders and how product/income flows through the product life cycle.

By Meghal Grover, Srishti Manipal Institute of Art, Design & Technology

Future Directions

Expansion to Global South contexts:
Further investigation and adaptation of the pedagogical framework to address environmental and socioeconomic concerns specific to Global South countries, taking into account their distinct circumstances, informal economies, and various cultural landscapes.

Decolonization of Design Education:
Learn more about decolonization efforts in design education, particularly in the Global South, by focusing on indigenous knowledge, views, and practices for addressing sustainability and social innovation challenges.

Integration of Indigenous Wisdom:
Indigenous wisdom and traditional ecological knowledge are incorporated into the pedagogical framework, acknowledging the importance of local traditions in supporting sustainable solutions and community resilience.

Enhanced Community Engagement:
Improving community engagement tactics within the educational approach, encouraging closer collaboration with local stakeholders, grassroots groups, and marginalized populations to co-create solutions that address their particular needs.

Scaling and Dissemination:
Investigate strategies for expanding and disseminating the pedagogical framework beyond academic institutions, such as collaborations with government agencies, non-governmental organizations (NGOs), and industry stakeholders, to apply the approach in real-world contexts and amplify its impact on long-term social innovation.

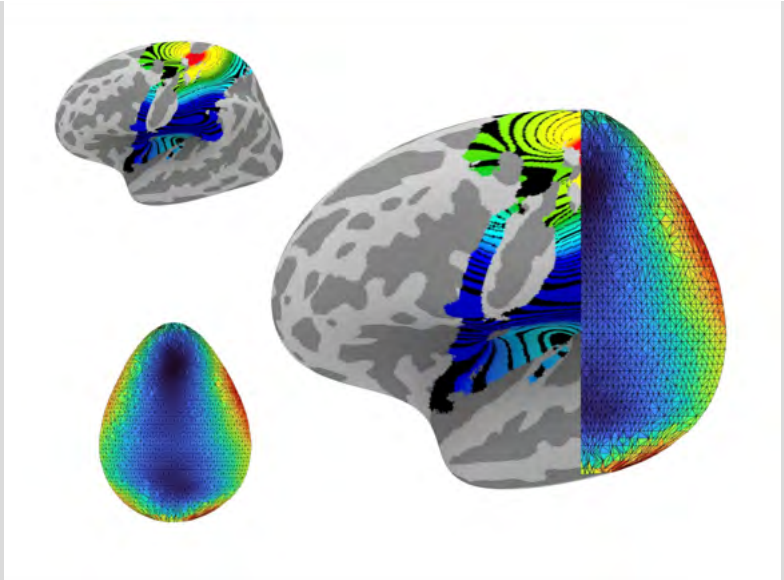
KEYWORDS | DESIGN, COMPUTATIONAL ARCHAEOLOGY, BRAIN SCIENCES, TOOLS, DATA SETS

ABSTRACT | Conceptual Design practice case studies use design to bridge and rethink research tools in the fields of Brain Sciences and Computational Archaeology. Tools are central to the design discipline, they both allow for the realization of work, are expressions of design in themselves, and they tell the story of the people who made/use them. Tools are far from exclusive to Design. However, their fundamental standing in the discipline allows them to make a convenient and intimate point of entry into many scientific fields.

The showcased projects (Slide deck) are currently on show at the Hebrew University of Jerusalem's Brain Sciences art gallery and display the outcomes of the author's distinctive design interactions with the said gallery faculty as well as that of the Computational Archaeology lab at HUJI's Institute of Archaeology.

Both the fields of Archaeology and Brain Sciences create tools to study who we are/were. Increasingly, those tools are computational, processing data sets with outputs "translated" into visuals for easier human comprehension. An outsider's view of the scientific processes allows for spotting common ground, such as between methods used in these fields, e.g., convergence of individual instances into a more general digital model. Or, for instance, the realization that archaeologists creating digital tools for the study of prehistoric stone tools have inadvertently placed themselves into the hominin evolutionary lineage for having themselves created new tools. Tools, whether lithic or digital, are vehicles for studying the people who made them, understanding their interests, their technologies, their social organization/interactions, etc.

Dr. Gadi Herzlinger and Prof. Leore Grosman (Herzlinger, G. et al., 2018) developed software that analyses an assemblage of prehistoric hand axes (a popular "teardrop" shaped stone tool typology used by hominins for some 1.4 million years) found on an excavation, defining a typical average form, and identifying the extent of deviation from that average form. One series of design works subverts the computer program, using it as a creative tool and not for its anticipated analytics. For example, the use of a data set consisting of 10 hand-axes knapped by the designer and 10 Neanderthal hand-axes found in France. Based on his ancestry, the designer has 2-4% Neanderthal DNA, but through the creation of this new hand-axe form, the interspecies mix has been upped to 50/50. Or by questioning the assumption that a data set should include several (ideally many) artifacts to work properly instead of placing and flipping the same single artifact into the program twice, creating an overt self-symmetry assessment.



A parallel dialog with Prof. Yonatan Lowenstein's lab at the Faculty of Brian Sciences on fMRI-based research looking at selectivity in the brain cortex led to the design of shoes for the creation of brain analytics patterns as well as 3D printed brain infographics as a novel research dissemination tool. The design was used to bridge these two scientific fields by highlighting shared methods and interests, at the same time offering an alternative and subjective point of view through recontextualizing.

50% Neanderthal / 50% Human, Stratasys full-color 3D polyjet print, 2023

It is not by chance that many of the tools developed to study ourselves, whether through artifacts we created in the past or of our anatomical workings, rely on and output visual data. Both the fields of Archaeology and Brain Sciences make use of and develop such tools.

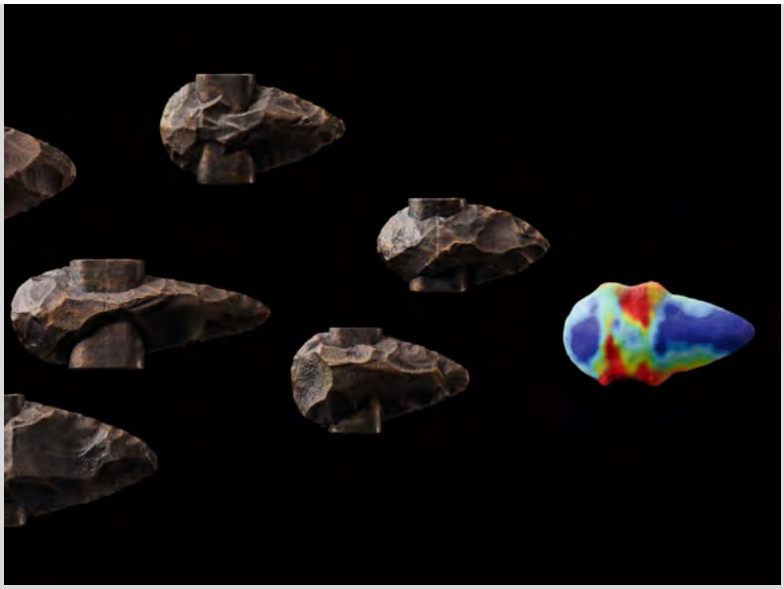
The detailed project herein focuses on these tools and what they signify to rethink them and leverage them for the creation of novel designs.

A 'mean output' visual comparison from computed data sets in the fields of Brain Science, and Archaeology

The project required identifying common research approaches shared by the fields of Brain Sciences and Computational Archaeology and later highlighting this through their property - developed digital research tools. Tools that require data sets, and hence propose the altering of results (i.e., *design*) based on control over the input data, in essence transforming analytical tools into creative tools.

Digital tools used included CAD and visualization software, Artifact GeoMorph Toolbox 3D, fsaverage, 3D scanning, 3D printing in PLA/Stratasys's polyjet/quartz sand, as well as bronze casing and flint knapping.

Creative process included physical-to-digital-to-physical workflows: sourcing flint, knapping stone tools, 3D scanning, CAD manipulation, 3D printing



Dialogues were upkept with researchers in the discussed scientific fields, including visits to archaeological dig sites, material archives, digitized artifact repositories, sourcing raw flint from the desert, and academic conference workshops.

The creative process consciously constructed narratives or context beyond the objective geometry/neurological activity being observed by researchers. This included the creation of new objects that, for example, point to the evolutionary link between the researchers/designer and a prehistoric artifact maker. Or the extraction of actions taken as part of a controlled lab study utilizing fMRI and recreating them in life by means of streetwear.

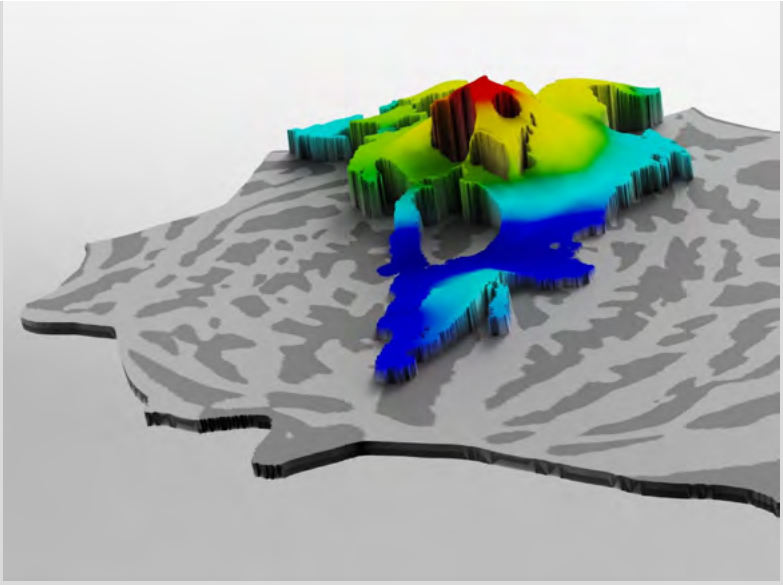
The Whole Earth Hand-axe, Stratasys full-color 3D polyjet print, 2023.

The Whole Earth Hand-axe is a gesture to *unity* combining evolutionary backgrounds, our own, as well as those of parallel hominins, through a geographically dispersed common tool - the hand-axe. This work was created using property computational archaeology software to process a large group of Paleolithic hand axes originating from Africa, Europe, Central Asia, China, and the Levant.

Data Set, cast bronze, and Stratasys full-color 3D polyjet print, 2022

Six hand axes knapped from flint nodules were 3D scanned and then digitally manipulated, enabling them to be easily hafted to a shaft that could run through the artifacts as though they were forged metal axe heads. They were then cast in bronze – in accordance with the (pre)historic shift from the Stone Age to the Bronze Age. These new fictional artifacts were then fed as a data set to the AGMT3-D software, which produced a single multi-colored 'mean' artifact. A color scheme familiar from scientific and engineering analytic visualizations, the colormap here indicates deviation from the mean form, with red representing areas with the most form variability and dark blue representing areas where the artifacts were most similar.

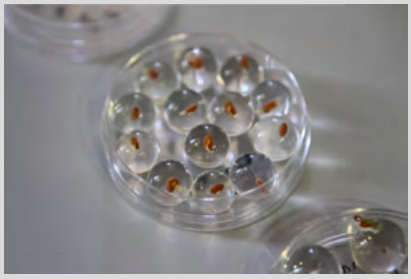
Perpetual, 3D photopolymer and elastomer prints, 2D digital prints, synthetic hair, 2023



Brian selectivity levels correlating to the brushing of subject's limbs were displayed on an "inflated" brain model. The resulting analytics visualization was then "unwrapped" as a two-dimensional pattern. For the *Perpetual* shoes design, leg stimulation information was isolated from the overall data. The obtained two-dimensional color pattern was treated as though an animal hid and used to make the shoes upper, with the left hemisphere map applied to the correlated right shoe and vice versa.

The brushes incorporated in the shoe design pay homage to the way the scientific study was conducted and, at the same time, brush the wearer's legs when walking, thus stimulating the brain and producing color cortex maps, which can then be used in the creation of shoes…

Design works and scientific workflow illustrations incorporated in the exhibit *"Looking at Ourselves"* at the ELSC Martine De Souza-Dassault Brain Art Gallery, at the Hebrew University of Jerusalem



Mapping of the neural level of response in the brain to somatosensory stimulation, its *selectivity*, indicates the large-scale organization of hierarchies in the somatosensory domain. Degree of change is represented here by color as well as height.

An unanticipated outcome of the project was the development of a technique of showing brain activity data in a novel fashion; to date, the lab has used virtual 3D models with applied heatmaps (color correlated with degree of selectivity) to illustrate their findings.

Through 3D printing, researchers now have physical 3D brain activity models that can be handled and observed. Additionally, they regularly "flatten" the brain models to fully view the information on the folded brain surface. Taking those flat mappings and assigning a physical height value to the heatmap results in "mountains" materializing on the flat brain map, allowing for the intuitive reading of how rapidly the selectivity changes from one area to another simply by looking at the degree of incline.

MDes student projects in collaboration with HUJI's Physics, Chemistry, and Earth Sciences Department labs

The references and framing of this project rests, in part, on the backdrop of an academic collaboration I co-tutor with Maya Ben David held within the framework of an MDes course between design students and "hard science" labs at the Hebrew University of Jerusalem. The students are introduced to content – research topics in Physics, Chemistry, and Earth Sciences labs, and from there, embark on a hopefully collaborative 'response' through design. Projects at times propose applications, communicate science, speculate through alternative futures on implications, latch onto poetics identified in the lab environment, or otherwise give a subjective context to purposely objective research.

DOI: 10.63442/GPMR9128

KEYWORDS | VISUAL PROGRAMMING, ARDUINO, DISABILITY

ABSTRACT | In the „Stage of Impossibilities" project, I created a puppet moving mechanism for children with multiple disabilities. In this structure, the marionette is not manually controlled but can be moved by a robotic arm through tracking head movements. This technology has been used in a special needs school in Budapest as part of movement therapy and art classes.

A working prototype has been created in a few days using Arduino and visual programming languages. In my artistic research, I am exploring my role, primarily how a person with a background in arts education can take on a creative role in areas traditionally associated with engineering, particularly the creation of prototypes that require programming skills. The project led me to explore the origins of the tools I use, the ambition behind their creation, and their validity in today's world.

A key element of my research is the study of development environments that have been created to democratize programming and make it accessible to artists and designers. John Maeda's "Design by Numbers" project and its continuation with Processing and Arduino significantly contributed to making programming-based art an integral part of the cultural discourse, and many development environments - used in interactive and visual artworks - derive from them. These are certain types of development environments that I call the "build-your-own-tool" software. They approach the relationship between humans and machines from a different perspective. The „build-your-own-tool'" software allows artists to create complex digital works without having deep programming skills.

It was the pioneers of computer art who gave directions for making this software, while they couldn't rely on anything similar and had to write the algorithms themselves. The „build-your-own-tool" software gives the illusion that we create every part of the creative process ourselves, but at the same time, we are bound by the characteristics of the software itself. With these development environments, it is possible to make rapid progress, and they provide insight into the operation of the computer, but only a mediated and thus superficial knowledge.

The recognition of the boundaries recalls the Manifesto of Computer Art written by the Hungarian computer artist Tamás Waliczky in 1989, in which he stated, "Programmers develop software for us, the users, to use. Unless we know the capacities of the computer, we cannot sufficiently formulate our needs. Unless we sufficiently formulate our needs, we will receive nothing but traditional replies, programs that mimic the usual logic." How relevant is the manifesto in today's era when computers have become intricately more sophisticated? In my opinion, we have drifted from this statement just as much as computers have become more complex. In this context, even greater significance can be attributed to the Arduino and microcontrollers when creating programming-based art or design, as their complexity is comparable to that of early computers, and understanding them is much more approachable.

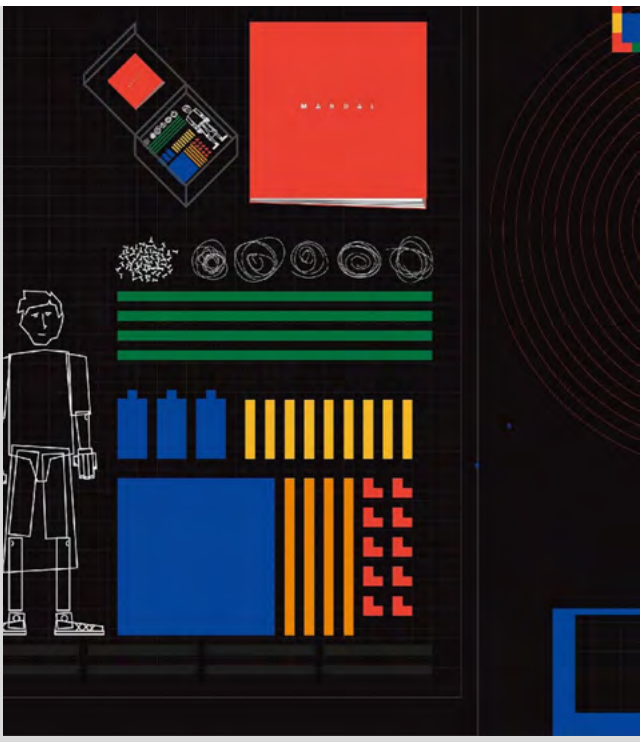
The Manifesto of Computer Art, 1989

Let's establish a much better relationship with programmers. Because they become our co-authors even when we buy programs ready-made, and our work will bear their mark as well.

Programmers develop software for us, the users, to use. Unless we know the capacities of the computer, we cannot sufficiently formulate our needs. Unless we sufficiently formulate our needs, we will receive nothing but traditional replies, programs that mimic the usual logic.



Limitations

- footprint
- prototyping versus product
- good for all, master of nothing
- cross-platform problems
- visual abstraction of written code
- licencing
- promise of easiness

Conclusion

- From democratisation to mainstream
- New directions: market segment of software
- Straightforward solutions - less ‘build your own tool”
- Insight into the operation of the computer
- Effective tools in education and fast prototyping
- Software is leaving its mark on creations
- Preservation difficulties

IS THIS PRINT TALKING TO ME? MATERIAL AGENCY IN DESIGN.

Elena Bartomeu*[a], Lluc Massaguer [a]

a Faculty of Information and Communication Sciences, UOC, Spain
* ebartomeum@uoc.edu

DOI: 10.63442/REMH6225

KEYWORDS | MATERIAL AGENCY, SENSORY DESIGN, EXPERIENCE DESIGN, PERCEPTION, INTERACTION

ABSTRACT | The workshop “Is this print talking to me?” is a relational practice in which we shift the perspective to the object. Human participants will be chosen by one of the participating objects, and the research team will observe the level of agency of the objects. On the other hand, participants will reflect on and define the qualities of the relationship they have established with their objects based on a questionnaire that will be provided.

1. Theme and Objectives

The theoretical model that governs the workshop is framed within Lambros Malafouris' Material Engagement theory (2013). It rethinks the agency of objects as a shared feature, within the framework of the new materialism movement (Harman, 2010). Subjects and objects are understood as part of the socio-material assemblage of design (Bill et al., 2015, p.10). Design is defined as the process of characterizing an artifact, encompassing its essence through to the elicited sensations, experiences, values, and imaginary signs it activates in the user (Calvera, 2007).

During the workshop, we will observe how prints activate sensory processes (Bedolla, 2005), how they have their own agency, and how they address participants in the personal, social, and practical spheres (Walker, 2015). Participants will also share the lived experience with the print, and we will use the collected data to validate the main hypothesis of the research, according to which end objects have an agency capable of addressing users in the most personal sphere.

Both the theoretical model and the questionnaire (research instrument) have been improved and validated with feedback obtained in previous editions of the workshop. With the edition we are presenting, our goal is to compare the experience of material agency across the cultural contexts of Barcelona-Lisbon-Hungary.

2. Schedule

Workshop schedule will last 90 minutes, with the following agenda:

1. Introduction (10 min):
   - Introduce the topic and the research context;
   - Sign permissions for collecting data (only research purposes).

2. Objectives (5 min):
   - Outline the specific objectives of the workshop and encourage active participation.

3. Time for Person-Object Interaction (15 min):
   - Choose an object and interact with it;
   - Objects can be shared, but responses are individual.

4. Questionnaire Response (20 min):
   - Written activity for participants to reflect on what they feel // data gathering for research.

5. Sharing Session (25 min):
   - Group discussion to share responses and reflections from the questionnaire;
   - Debate and exchange of ideas among participants.

6. Time for Person-Object Interaction (10 min):
   - A second connection to consolidate knowledge.

7. Conclusion (5 min):
   - Summarize key points and highlights of the workshop;
   - Stay connected

3.Questionnaire

The questionnaire is structured in four phases:

1. Level of agency (Malafouris, 2013; Harman, 2010, Bill et al., 2015)
   - Origin

2. Material experience (Desmet, 2012; Dezcallar, 2012; Morales, 2015; Bedolla, 2020)
   - Sensory
   - Emotional
   - Meaningful

3. Interaction (Rognoli, 2018; Lefteri, 2005; Maldonado, 1993)
   - Physical
   - Emotional
   - Mixed

4. Spheres of meaning (Walker, 2012)
   - Personal
   - Social
   - Practical

4. Audience

The targeted audience is people from art, architecture, design and/or research areas.

It is recommended that participants attend our paper presentation in order to familiarize themselves with the concepts that we will work with before the workshop begins.

Expected number of participants: Between 15 and 20 persons.

5. Equipment needed

20 chairs, 2-3 tables for object exhibition and to fulfill questionnaires, computer and projector, 20 pens, 20 printed copies of the questionnaire.

KEYWORDS | PARTICIPATORY DESIGN, LEARNING SPACES, LEARNING ENVIRONMENT EDUCATION, SPATIAL LEARNING, OUTDOOR LEARNING

ABSTRACT | To look at spatial perception and creation as learning processes and the connection between learning spaces and pedagogical methodologies. The workshop is rooted in two physical exercises from the introduction phase of Basalt School, an educational program to create outdoor learning spaces in elementary schools through participatory design. CAN Architects' Basalt School program has provided Hungarian schools with 22 outdoor classrooms in 2021-2023 and, in 2024, is planned to grow with 100 more, already on an international level too. Building as a learning process provides an ideal environment for experience-based education due to its seemingly elementary yet multi-sensory and multi-layered activities, which raise the curiosity and awareness of participants effortlessly. Due to the 1:1 scale conscious transformation of the environment, teamwork becomes natural, and the spatial vocabulary is introduced through the perception and use of the natural and built environment. The use of real-scale tools to create real-scale spaces is a key element in the process, based on the Inner 3D (CSEH 2015) spatial learning method and also following spatial education methods from the Bauhaus Vorkurs and its Total Theatre (WILCOX 1998) as well as the experimental architecture courses of Juhani Pallasmaa (WALL 2013).

Figure 1. The Ladder - Building trust through cooperation in 1:1 scale spatial exercises.

At the start of participatory design processes, the workshop's building and reflection tools are used as an introduction to spatial consciousness, possibilities and responsibilities towards the natural and built environment, representation roles in the process, and target levels on the ladders of citizen participation (ARNSTEIN 1969) and children participation (HART 1992).

These tools - the sticks and ladders - are not just spatial elements to create with but also representations of the possibilities/abilities and difficulties/disabilities of participating groups and individuals. Their presence creates burdens and opportunities to be handled. Inclusion comes through the investigation of the shared tasks, the reflective role assignment of the members of the group, and the building process itself.

Figure 2. Sticks – Spatial teamwork about the possibilities and responsibilities towards our natural and built environment.

The evaluation starts with the objective and measurable attributes, looking at the data of the result objects. The process assessment follows with a self-reflective evaluation of the learning curve and the possible applications of these build-and-learn spatial learning methods.

About the Authors:

András Cseh is a graduate in architecture from the Budapest University of Technology and Economics. In 2008, he started working at CZITA Architects and in teaching architectural design at Széchenyi István University. Pre Architecture - Learning Through Space, his doctoral research at Moholy-Nagy University of Art and Design investigated the connections between spatial perception and creation as learning processes. In 2017, he co-founded CAN Architects, an architectural studio with a strong focus on learning spaces and built environment education. Based on their multidisciplinary research with pedagogic and psychological experts, the studio developed spatial learning innovations such as the Alcoved Classroom and the Turning Classroom. Currently, he is lecturing on learning spaces, school architecture, and spatial awareness in education for students of pedagogy at the University of Pannonia and students of psychology at Eötvös Loránd University. He promotes outdoor learning and 21st-century learning design at the Basalt School, his office's education program.

Szilárd Köninger graduated in architecture in 2012 from Széchenyi István University, where he founded and organized villageBUILDING, a series of social design and build workshops to enhance the spatial possibilities of rural life. After having worked at Promontorio (Lisbon, Portugal), DGT Architects (Paris, France), and CZITA Architects in 2017, he co-founded CAN Architects, an architectural studio with a strong focus on learning spaces and built environment education. Based on their multidisciplinary research with pedagogic and psychological experts, the studio developed spatial learning innovations as the Alcoved Classroom and the Turning Classroom. Currently, he is running Basalt School, CAN Architects' education program to promote and integrate outdoor learning and 21st-century learning design into the national school curricula of Hungary.

ABSTRACT | While the essence of social design varies between cultures and local contexts, two of its key features are working with and for local communities and partnering with stakeholders other than the industry. While many design researchers, practitioners, and educators work with NGOs, be they local and small-scale or structured global entities, working with NGOs is hard to define. Indeed, reflecting on the key writings of classic social design (Papanek, 1971 and Margolin, 2002, to name just two), we find key attributes that are debated at length, but the importance of working with NGOs in this sphere of design practice is far from ideal. Tromp and Vial (2022) offer several components revolving around adding to a broad and rather flexible ethical common good. First, care-driven activities for the well-being of underprivileged people. This component accentuates an active role in starting with empathy and care while aiming at communities that truly need the additional knowledge of design professionals. Second, responsiveness-driven activities for good governance. This approach is especially important during collaborations with civil servants, NGOs, and nonprofits in better addressing the needs of their beneficiaries. Third, political progress-driven activities for empowered citizens.

Social justice, design ethics, participatory strategies, and politics-in-action are especially important when conducting joint projects with NGOs and local communities. NGO as a key partner differs immensely from other typical stakeholders. Due to its ideological nature, as well as its reliance on volunteers and pro-bono contribution, as well as its complex relation to industry and commercial venues, this all imbues working with an NGO with a unique layer.

The workshop is aimed towards design researchers and educators working with NGOs in higher educational contexts. During the workshop, participants in a group setting familiarise themselves with two collaborative scenarios: 1) a student project with an established long-term partnership with a community center, and 2) a design research project with a new collaboration with a local NGO. After choosing one scenario, participants dive into planning the community engagement by thinking through a framework that is currently under development by the authors: the level of participation, the necessary context analysis, trust-building exercises, care-driven activities, emerging conflicting themes, as well as collaborative strategies and suggestions. The creation of the framework is also supported by a probe kit that encourages participants to create a three-dimensional model of participation for discussing responsiveness.

This creative planning exercise helps design researchers and educators carefully consider all elements prior to setting up a collaboration with an NGO. The proposed framework as a workshop could be organized among team members within relevant HEIs, design students, or with local NGOs. The reflective questions developed by the authors during the Change Agents, an EU-funded project, can enhance future partnerships by creating fairer collaborative processes.

20 participants (3-4 on each team)

Timeline (90 minutes):

- 5 min - introduction and icebreaker
- 10 min - presentation of the context and frameworks
- 60 min - facilitated group work (5 groups)
- 15 min - shareback and conclusion

About the Authors:

Ruth-Helene Melioranski is the Dean of Design at the Estonian Academy of Arts. She has a background in design research, practice, and education, focussing on exploring how design can tackle societal challenges. She conceptualises new and emerging design practices in higher educational and professional contexts through her research-through-design projects. Her research focuses on relational design and its qualities.

Dr. Bori Fehér, an associate researcher at MOME Innovation Center, leads the Social Design Hub, guiding practice-based research projects for over a decade. Her focus lies in social, eco, and humanitarian design, particularly addressing the climate crisis and its impact on social resilience, particularly in rural areas. She co-founded and co-chairs the Social Design Network and is currently leading the Erasmus+ Cooperation Partnership Change Agents project. Bori has been a visiting researcher at the Maryland Institute College of Art Center for Social Design since 2014. She earned her degrees in architecture and design management from MOME, where she also obtained her doctorate summa cum laude. With prior experience in architecture in Budapest and New York, USA, she now teaches R&D&I courses and supervises at the MOME Doctoral School.

Associate Professor Jonathan Ventura (PhD) is a design researcher teaching at the Department of Inclusive Design at Hadassah Academic College, Jerusalem, and is Chair of The Unit for History and Philosophy of Art, Design, and Technology at Shenkar: Engineering. Design. Art. Jonathan is also a Research Fellow at the Helen Hamlyn Centre for Design, Royal College of Art, London, and a fellow at the PhD School at MOME University in Budapest. He specializes in design theory, design anthropology, and social and medical design. Jonathan is also the co-founder and co-director of the international Social Design Network. His latest book, titled Introduction to Design Theory, was co-authored with Prof. Michelle Gal and published by Routledge in 2023.

Eva Liisa Kubinyi is a design educator and researcher at the Design Faculty of the Estonian Academy of Arts, currently pursuing her PhD on the topic of youth mental health. Her design practice focuses mainly on children's roles within society, resulting in creative workshops or service concepts. She holds an MFA in Child Culture Design from HDK-Valand (SE) and previously worked as a designer at VIVISTOP Telliskivi (EST), a creative accelerator for kids and youths.

In the evolving landscape of technology and design, traditional notions of data are being challenged and reimagined. Data are no longer confined to quantitative measurements but have been actively shaping creative processes, design outcomes and human-non-human interactions. The track Redefining Data Boundaries explored the transformative potential of data which involved recognizing data's agency and its capacity to influence outcomes autonomously. This transition requires a re-examination of our understanding of the roles of technology and humans in the design process. There is an increasing recognition of the emergent agency of digital technologies, rather than perceiving them solely as instruments controlled by humans. This viewpoint considers technology and people as collaborators in a symbiotic relationship, wherein both possess agency that converges in practice.

One aspect of this transformation is the integration of aesthetic computing in design. Using computational methods to simulate human aesthetic decision-making allows designers to enhance creativity and efficiency. Systems that generate visual content based on specific inputs, such as mood boards, demonstrate how data can bridge the gap between quantitative metrics and qualitative experiences. These systems extend designers' creative possibilities by automating tedious tasks, prompting inspiration and extending the scope of ideation. Close to that, in some cases also the materiality data can acquire present a unique balance between numbers and live experiences. When data are embedded into the physical world, this raises the need for ethical

considerations in data representation that span beyond the digital. Thus, in those cases, data are transformed into a tangible experience that challenges the definition of data. Moreover, physicalizing data may facilitate profound relationships between individuals and the information conveyed through reflection. Physical data underscores the capacity of data to foster empathy, contest prevailing perceptions, and enhance informed and compassionate decision-making processes.

In addition, the redefinition of data boundaries necessitates an extensive examination of the interaction between machines and human agency. Understanding that technology can operate independently and affect events requires the development of new frameworks for assessing and designing these interactions. By evaluating the agentic capabilities of technology, designers may foresee future impacts, align human and non-human agency, and develop more equitable and ethical systems. This approach transcends conventional human-centric or techno-centric approaches, promoting a more integrated vision that recognizes the reciprocal nature of humans and technology.

The redefinition of data boundaries highlights the emergent, contextual, and distributed characteristics of agency. Agency is perceived not as a binary characteristic but as a spectrum of dependent phenomena that vary across circumstances. This understanding encourages designers to evaluate the different levels of autonomy and impact that technologies exhibit, and how these attributes might be used or regulated within design methodologies.

Moreover, the increase of data's significance in design and interaction underlines the ethical implications of technology use. As data integration increases and technology acquires greater autonomy, providing transparency, accountability, and responsibility is essential. Designers are required to build systems that are both functional and visually appealing while also contemplating the ethical and societal implications of their work. By adopting innovative frameworks of agency, incorporating aesthetic computing, and promoting empathetic interactions with data, we can create new methodologies that enhance human experiences and tackle intricate difficulties. This redefinition promotes an extensive perspective that values the interaction among humans, technology, and data, hence fostering more considerate, innovative, and ethical actions in the digital era.

KEYWORDS | MOOD BOARD, IMAGE GENERATION, AESTHETIC COMPUTING, DEEP LEARNING

ABSTRACT | In the design process, manually constructing mood boards is a difficult, multi-step task requiring significant time and effort to gather and select images. To improve the efficiency of mood board creation, we introduce AesMood, an intelligent mood board generation system based on image generation and aesthetic computing. AesMood utilises the Stable Diffusion 2 image generation algorithm, which enhances the diffusion model by introducing a cross-attention layer into the model architecture and substantially improves visual fidelity. To mitigate the issue of inconsistent aesthetic quality among generated images, AesMood integrates the Style-specific Art Assessment Network (SAAN). SAAN efficiently extracts both style-specific and generic aesthetic features to evaluate and ensure the high aesthetic quality of the images for mood boards. In the preliminary phase of designing the system, interviews were conducted, which yielded three design requirements: meet user needs, editability, and simplicity of use. Three important functionalities are encoded in the AesMood system, including intelligent mood board generation, aesthetic scoring, and mood board editing. We invited 20 designers to employ our system, and its performance was assessed across four dimensions—usefulness, ease of use, learnability, and satisfaction—using the Likert scale in conjunction with semi-structured interviews. The results demonstrate high satisfaction levels, with participants noting the system's ability to broaden inspiration, stimulate creativity and imagination among designers, and enhance the efficiency of the ideation capture phase.

1. Introduction

Mood boards are an important tool for designers in the design process and are a source of inspiration. The construction of mood boards is a complex, multi-step task requiring designers to spend a lot of time and effort gathering and selecting images. Additionally, this process is confronted with the challenge of accessibility to high-quality image resources. Consequently, designing an automated system capable of generating high-quality mood boards is important for optimising the design workflow. Such a system could reduce designers' cognitive load and time demands by adjusting the resource acquisition phase and ensuring a consistent supply of premium visual materials.

In an era where data is not merely a collection of numbers but a rich canvas of human experience, aesthetic computing is redefining the boundaries of data interpretation and representation. Aesthetic computing enables designers and artists to experiment with different identities and forms of expression, exploring how data can shape and reshape design expression and self-perception. Aesthetic computing refers to the application of computational methods by computers to simulate human aesthetic decision-making (Xu, et al, 2022), and it represents a quantitative study of the aesthetic attributes of artistic forms such as images. Aesthetics assessment, as one of the primary research directions in aesthetic computing, principally involves extracting aesthetic perceptual features to assess the aesthetic quality of visual inputs. Prior research has applied aesthetic computing to the domain of photography recommendation (Wu, 2022). However, studies focusing on utilising aesthetic computing for mood board construction assistance are currently absent. Integrating aesthetic computing into an intelligent mood board generation system is anticipated to alleviate the issue of inconsistent aesthetic quality among generated images. The most employed datasets for aesthetics assessment include AVA (Murray, et al, 2012), AADB (Kong, et al, 2016), and CUHK-PQ (Tang, et al, 2013). Given that mood boards are a crucial referential component in the design process for designers and are often characterised by their aesthetic and abstract nature, we have incorporated the Style-specific Art Assessment Network (SAAN) (Yi, et al, 2023), trained on Boldbrush Art Image Dataset (BAID), into our intelligent mood board generation system as an auxiliary tool for designers. The SAAN algorithm effectively extracts specific styles and general aesthetic features to evaluate and ensure the high aesthetic quality of mood board images.

This paper proposes ***AesMood***, an intelligent mood board generation system based on image generation and aesthetic computing. The primary objective of AesMood is to enhance the efficiency of mood board creation by automatically generating images corresponding to specific keywords input by designers and conducting an aesthetics assessment of these images. The image generation algorithm used by AesMood is stable diffusion 2 (Rombach, et al, 2022), which improves visual fidelity significantly by incorporating cross-attention layers into the model structure. Through a series of user studies, we have evaluated AesMood's performance in assisting designers, overall user satisfaction with the system, and the effectiveness of its various functions. The contributions of this work are as follows:

- The mood board intelligent generation system, named AesMood, has been developed, which generates images corresponding to specific keywords input by designers to construct mood boards. The intelligently generated mood boards feature a fixed layout and are endowed with editable capabilities.

- We have creatively integrated an aesthetics assessment algorithm into the AesMood system, referencing public aesthetics during the mood board construction process and assisting designers in their decision-making.

- Experimental results indicate that AesMood performs well in assisting designers with mood board generation, enhancing design efficiency, providing a broader source of inspiration, and stimulating designers' creativity and imagination.

2. Related Work

2.1 Mood Board

The mood board is a collection of visual images arranged to express the emotional response to a design brief (Garner, et al, 2001). Lucero (2012), through empirical research, identified five main functions that mood boards can serve in the early stages of the design process: framing, aligning, paradoxing, abstracting, and directing. Current research on mood boards primarily focuses on innovation in the form of mood boards. Koch et al. (2020) investigated the innovative use of digital mood boards to enrich designers' creative process by attaching semantic labels to images. Their study introduced SemanticCollage, a digital tool that employs advanced semantic labelling algorithms to assist designers in transforming vague visual concepts into searchable terms, thereby enhancing the understanding and communication of design ideas without disrupting their creative thinking. Zabotto et al. (2019) explored how to use Kansei engineering to connect users and designers, employing automated mood boards to convey emotions and aid clients in analysing ideas for product development. Their paper examined the potential of a Kansei engineering system based on rough set probability statistics, which could link customers' affective words with sustainably collected images online. They proposed a new Kansei engineering process comprising five cycles that capture user opinions at all stages of the design process. Ivanov et al. (2022) introduced the MoodCubes system, a system for rapidly creating and manipulating multimedia content to address the challenges of gathering and combining inspirational materials in the early stages of the creative process. MoodCubes supports designers by deconstructing objects (such as extracting colour palettes), suggesting new materials (such as 3D models, images, and lighting effects), and providing filters to alter the aesthetic of a scene. These studies have expanded creative research on constructing mood boards by incorporating new elements such as text and 3D models, yet they still utilise existing collected materials. Wan et al. (2023) proposed a digital mood board, GANCollage, driven by StyleGAN and supported by a pretrained anime image classifier, which aids designers in organising and understanding these generated ideas in the form of “sticky notes” on the mood board canvas, with a primary application in character design. Our research, however, attempts to explore the automatic generation of mood boards using the stable diffusion 2 image generation algorithm by generating a diverse range of mood board images to support designers in various design fields (e.g., product design and vehicle design).

2.2 Image Generation

Image generation algorithms are an artificial intelligence technology that typically relies on sophisticated mathematical models to produce images that appear authentic by emulating the characteristics of real-world imagery. These algorithms have utility across various applications, including artistic creation, game development, film special effects, and aiding designers in conceptualising new product designs. Currently, the mainstream algorithms for image generation include GANs (Generative Adversarial Networks) (Goodfellow, et al, 2020), VAEs (Variational Auto-encoders) (Kingma, et al, 2019), and diffusion models (Ho, et al, 2020). Due to their superior image quality, diffusion models have gradually replaced GANs and have become the most popular image generation models. Among the research based on diffusion models, Avrahami et al. (2022) proposed an innovative method for the local editing of natural images using natural language descriptions and region of interest (ROI) masks. This method combines a pretrained language-image model (CLIP) with a Denoising Diffusion Probabilistic Model (DDPM) to guide the editing process toward the textual prompts provided by the user, ensuring seamless integration of the edited area with the rest of the image. Kim et al. (2022) introduced DiffusionCLIP, a powerful method for text-guided image manipulation using diffusion models, addressing the limitations of GAN inversion methods in diverse real-world image applications. Their work highlighted the full inversion capability of diffusion models, enabling zero-shot image manipulation across unseen domains and diverse content. They introduced a novel noise composition method to facilitate direct multi-attribute manipulation. Additionally, Gu et al. (2022) proposed the vector quantised diffusion (VQ-Diffusion) model for text-to-image generation, which combines vector quantised variational autoencoder (VQ-VAE) with the recently developed conditional

variant of DDPM. Their approach aims to overcome unidirectional bias and error accumulation in existing methods, demonstrating significant improvements in text-to-image generation tasks. The VQ-Diffusion model handles more complex scenes and significantly enhances the quality of the synthesised images. Our research employs the stable diffusion 2 algorithm, which enhances the diffusion model by incorporating cross-attention layers into the model structure, thereby significantly improving visual fidelity.

2.3 Aesthetics Assessment

Research on aesthetics assessment currently focuses on two main areas: Image Aesthetics Assessment (IAA) and Personalized Image Aesthetics Assessment (PIAA). In Image Aesthetics Assessment, Ke et al. (2023) proposed a novel method to learn image aesthetics from user comments, employing vision-language pre-training to develop multimodal aesthetic representations. He et al. (2022) conducted a comprehensive study on image aesthetics assessment, introducing the TAD66K dataset containing 66K images across 47 themes. They also developed a Theme and Aesthetics Network (TANet), a model that adapts to the image assessment rules of different themes, achieving state-of-the-art results on several datasets. Furthermore, He et al. (2023) proposed An Enhancer for Aesthetics-Oriented Transformers (EAT) to improve the performance of transformers in IAA tasks. EAT utilises a deformable, sparse, and data-dependent attention mechanism, refining attention through offsets to balance foreground and background, thus outperforming previous methods on various datasets.
In the domain of Personalized Image Aesthetics Assessment, Li et al. (2022) addressed the challenges of PIAA by proposing a meta-learning-based algorithm—Transductive Aesthetic Preference Propagation (TAPP-PIAA), which avoids the need for fine-tuning personal data, thereby reducing training costs and preventing underfitting/overfitting. Yang et al. (2022) tackled the challenges of PIAA by introducing a new personalised image aesthetic database—Personalized image Aesthetics database with Rich Attributes (PARA). They presented a conditional PIAA model that uses thematic information as a prior condition, surpassing existing methods and offering insights into the complex interplay of image aesthetics and personal characteristics that generate personalised aesthetic preferences. Considering mood boards' aesthetic and abstract attributes, our research has incorporated the Aesthetics Assessment Algorithm SAAN, trained on the Boldbrush Art Image Dataset (BAID) with 60,337 art images, into our intelligent mood board generation system. This provides designers with a quantified reference to public aesthetics.

3. Design of a Mood board Generation System

3.1 Pre-study Interview

To comprehensively understand the significance of mood boards to designers, their challenges in creating mood boards, and their needs for an automated mood board generation system, we interviewed seven designers (aged 26-30, with professional experience ranging from six months to six years). The positions of the participants were as follows: interior designer (3), game designer (1), spatial designer (1), fashion designer (1), and CMF designer (1). As the participants were in various cities, the interviews were conducted online and audio-recorded for subsequent analysis. We designed a survey questionnaire comprising eleven questions that covered basic information, the importance of mood boards, experiences and challenges with using mood boards, and the needs related to an automated mood board generation system. The synthesised feedback from the interviews is summarised as follows:

Importance of Mood Boards. All designers concurred on the paramount importance of mood boards in the design process, describing them as perpetually essential. One designer stated, *"You cannot leap from an idea in your head directly to a sketch or a model. There is a chasm in between."* Designers regard mood boards as a source of inspiration, an intuitive guide, and a visual summary. Regarding communicating with clients, a spatial designer mentioned, *"Mood boards can better help users grasp the general feel of a proposal before any concrete design is in place."*

Difficulty in Finding Images. All designers identified the most significant challenge in constructing mood boards as difficulty in sourcing images. They often spend considerable time searching online for images that meet their requirements but fail to find suitable ones. "*No matter how you search, you cannot find what you want,*" one designer illustrated, "*For instance, if you have a creative idea that might not exist in the market currently, you actually cannot find corresponding images. I think finding images is a significant challenge, especially when making creative-type mood boards.*" Another fashion designer said, "*The images found may not match the needed tone, requiring modifications to the images, such as removing certain elements, which is time-consuming.*"

Automated Generation of Mood Boards. All designers strongly desired a system that could automatically generate mood boards, saving time seeking out and editing images. One designer stated, *"If it could automatically generate mood boards based on the textual information we have researched, that would significantly reduce our workload."* Regarding the functionality of the automated mood board generation system, one designer believed, *"The simpler the system, the better, focusing on the core function of generating mood boards."* Most designers hoped that the layout of the final mood board could be flexible enough, with added editing capabilities. One designer had specific requirements for the precision of generated images, hoping for a more accurate match of suitable images to the input keywords.

3.2 AesMood System Design

Informed by interview feedback, we developed AesMood, an intelligent mood board generation system designed to create mood boards that align with designers' needs. This system encompasses three primary functions: automatic mood board generation, aesthetic scoring, and mood board editing. The entire system was developed using Python. The operational workflow and system framework of the AesMood system are shown in Figure 1.

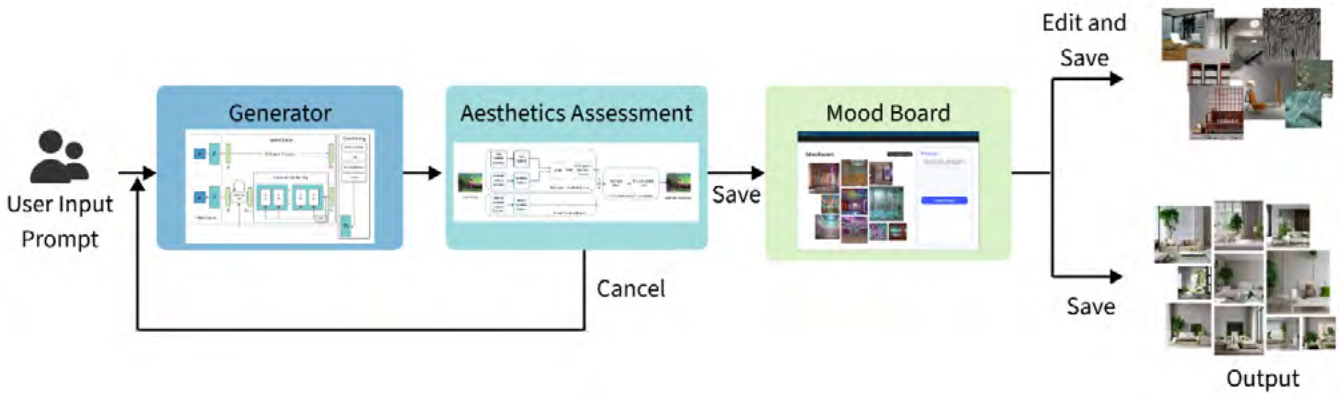

Figure 1. Operational workflow and system framework of AesMood.

Based on the interview feedback, we developed the AesMood to address three core requirements of designers, as shown in Table 1. Beyond following these requirements, to address the issue of inconsistent image quality commonly associated with current image generation algorithms, we incorporated an aesthetic scoring feature into the AesMood system. This feature is intended to assist designers in building mood boards by providing aesthetic evaluations.

Table 1. Design Requirements for Constructing an Intelligent Mood Board Generation System.

	Design Requirements
1)	Develop a system capable of automatically generating mood boards that more accurately align with the requirements of designers, thus conserving the time they spend searching for images.
2)	Create an intelligent mood board generation system with image editing capabilities, enabling designers to utilise this system to complete the construction of mood boards directly.
3)	Design an intelligent mood board generation system with a simple interface and precise interactions, facilitating ease of learning and use for designers.

Figure 2 presents the main interface of the AesMood system. The left side is a blank space as the Mood Board display area, where designers can modify the size and position of selected images after saving them. On the right is the prompt input area, where designers can enter keywords related to the images they wish to generate into the text box, separating each term with a comma. Upon entering the desired keywords, click the “Generate Image” button to initiate the image generation process. As depicted in Figure 2, we entered a set of keywords “future interior design, renaissance painting installation, digital visual, cyberspace” as an example of usage.

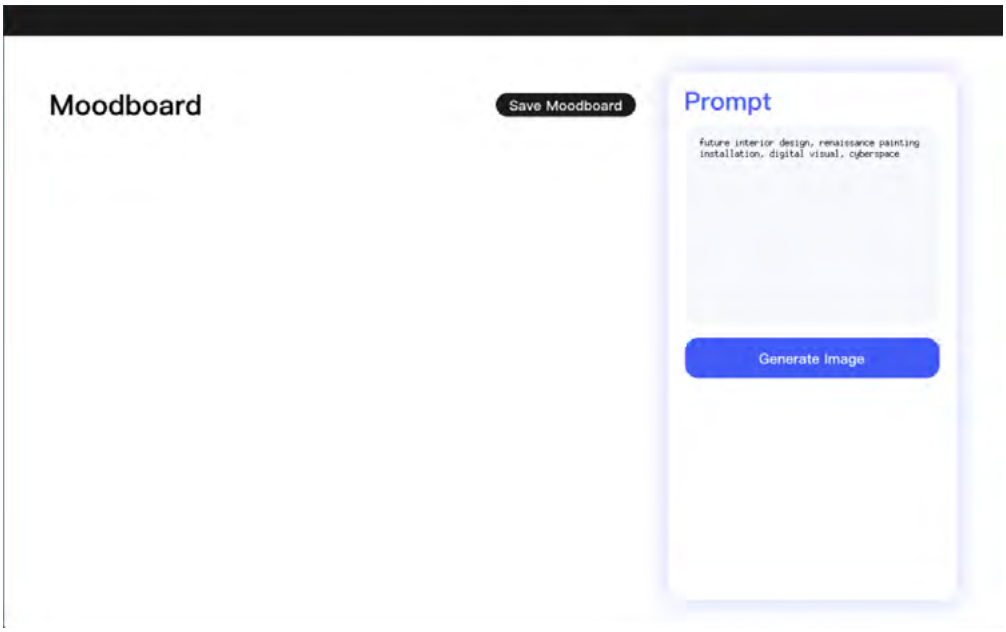

Figure 2. The main interface of the AesMood system.

The interface for image generation using the prompt is depicted in Figure 3. The current image's prompt is displayed at the top of the interface, with the generated image showcased in the centre. Concurrent with the image generation, an aesthetics assessment algorithm calculates an aesthetic score for each image displayed below the image. This aesthetic score offers a quantified evaluation of public aesthetic appeal, serving as a reference for designers when deciding whether to incorporate an image into the mood board. If the designer opts to include the image in the mood board, they select the “Save” button; if not, they choose the “Cancel” button.

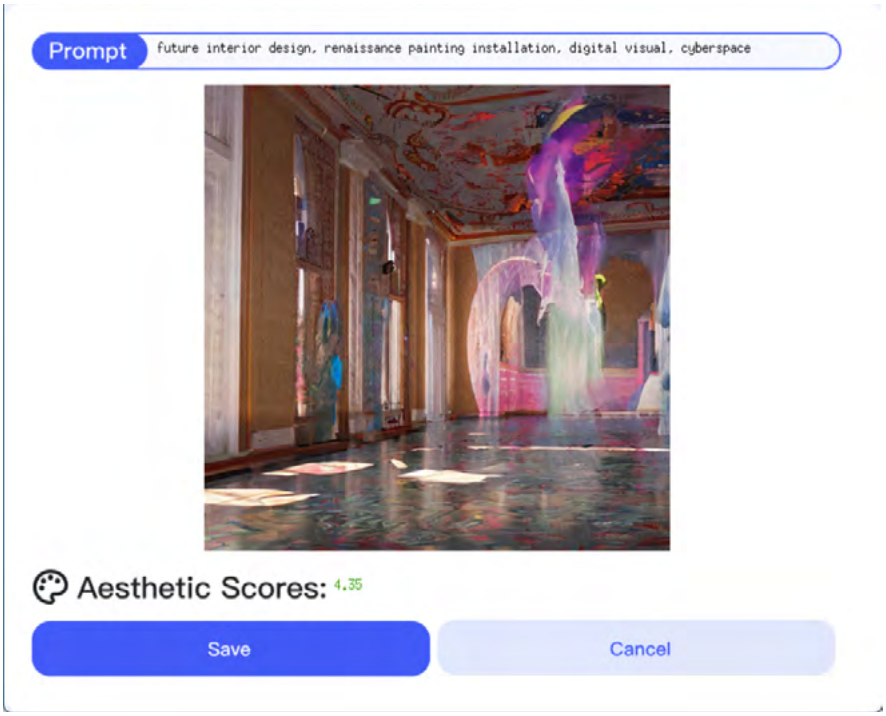

Figure 3. Image generation interface.

As seen in Figure 4, after saving an image, it is directly displayed on the mood board and arranged in a preset sequence with a fixed layout, with a maximum of ten images for the designer's reference in layout planning. If the designers are satisfied with the fixed layout, they can choose to save the mood board directly. If the designers feel adjustments are necessary, the AesMood system also supports editing functionality. The specific operations are as follows: images can be moved using a drag-and-drop action with the mouse's left button, and the size of the images can be adjusted by placing the cursor over the image, holding down the control key, and scrolling the mouse wheel. The designer can flexibly adjust the position and size of the images on the mood board while adding images that meet their requirements until the final composition is determined. The designer can select the “Save Moodboard” button to save the mood board. Additionally, the images generated during the construction of the mood board are saved on the computer, allowing the designer to edit them further using other specialised design software if needed.

3.3 Algorithm of AesMood

The image generation algorithm AesMood uses is Stable Diffusion 2, as illustrated in Figure 5. It enhances the diffusion model by incorporating cross-attention layers into the model structure, thereby significantly improving visual fidelity. The differential model learns data distribution by denoising standard distribution variables, effectively reverse-engineering a fixed-length Markov chain. In image synthesis, these models are trained through a series of denoising autoencoders to predict the denoised version of the input. The algorithm's perceptual compression model allows access to a lower-dimensional latent space that is more suitable for likelihood-based generative models. This algorithm uses image-specific inductive biases and 2D convolutional layers to construct a UNet, focusing on the perceptually most relevant parts. Additionally, by incorporating a cross-attention mechanism, the algorithm transforms the differential model into a more flexible conditional image generator capable of handling inputs across various modalities, preprocessing these inputs through domain-specific encoders.

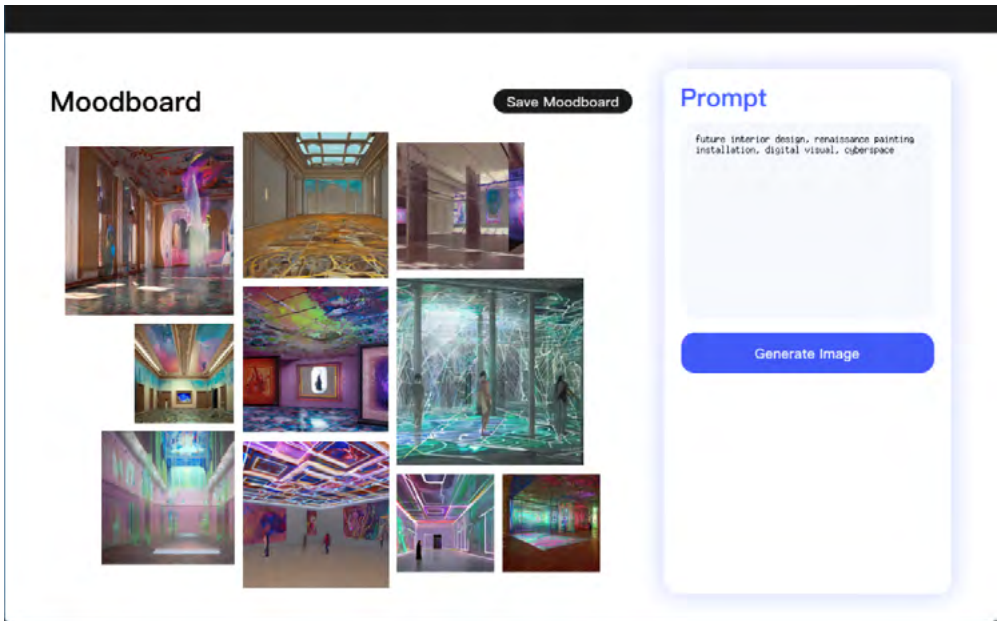

Figure 4. Fixed layout of the mood board generated by AesMood.

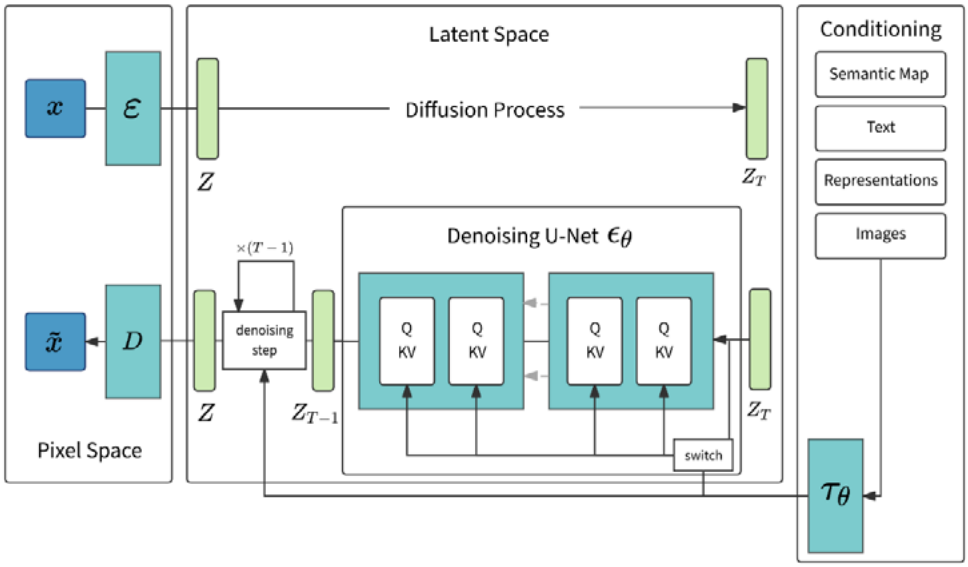

Figure 5. Network structure of the image generation algorithm.

AesMood also introduces an aesthetics assessment algorithm, the Style-specific Art Assessment Network (SAAN), trained on the Boldbrush Artistic Image Dataset (BAID), which comprises 60,337 artistic images. As shown in Figure 6, the SAAN algorithm contains three modules: (1) Style-specific Aesthetic Branch (SAB): This extracts aesthetic features related to artistic style, using a pre-trained VGG-19 to extract style features and a pre-trained ResNet-50 to extract aesthetically relevant features. The AdaIN layer integrates style features into aesthetic features while preserving the spatial structure of style features. (2) Generic Aesthetic Branch (GAB): This branch extracts general aesthetic features based on self-supervised learning, such as the integrity of prominent parts and frame layout. It uses ResNet-50 as the backbone network and applies self-supervised learning methods for pretraining. (3) Spatial-information Fusion Module: This module uses non-local blocks to fuse spatial information and incorporates the composition of artworks into the assessment. It merges the features extracted by SAB and GAB and then uses non-local blocks to fuse spatial information.

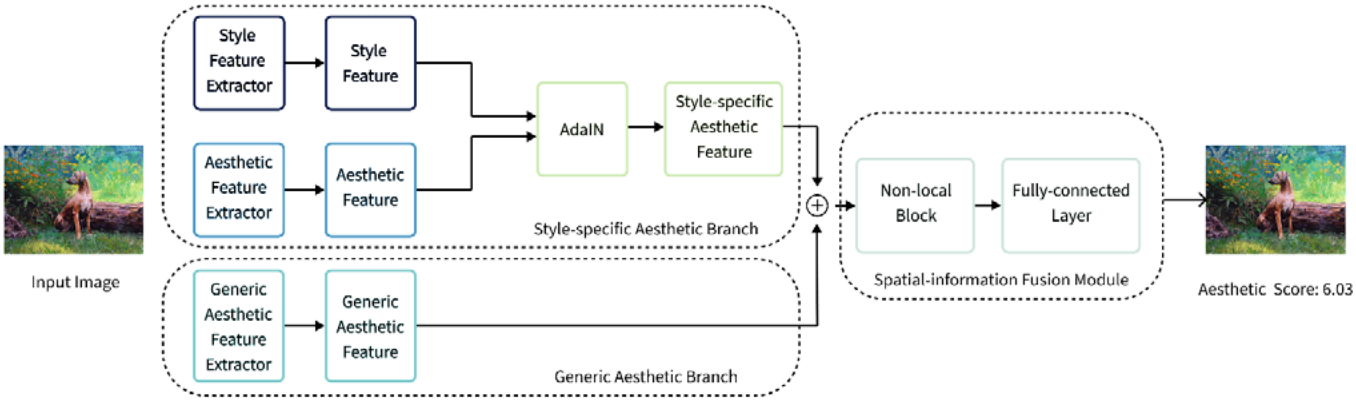

Figure 6. Network structure of the aesthetics assessment algorithm.

4. Evaluation

4.1 Experimental Setup

To evaluate the performance of the AesMood system in assisting designers and to assess overall user satisfaction and the effectiveness of each system function, we conducted a series of user studies. We recruited 20 participants (age 22-30, M=25, SD=5.94) as the human subjects in this study. All of them were designers (average of 6 years of design experience), specialising in product design, landscape design, interior design, etc. The experiment involved asking designers to conceive designs based on the fixed theme of "smart home" and to create mood boards using the AesMood system. The experiment included three main parts: (1) pre-experiment, (2) creation of mood boards, and (3) post-test.

1. Pre-experiment: Designers initially familiarised themselves with the AesMood system by trying out its main functions and operating procedures. After several adjustments, they preliminary determined the prompts to be used in creating mood boards to minimise the impact of prompt adjustments during the subsequent experimental process.

2. Creation of mood boards: In the formal experimental phase, we set up four control experiments to verify the effectiveness of the functions in the AesMood system and their impact on designers during the mood board creation process. We asked designers to create mood boards using four different versions of the system, each with varying functionalities: AesMood, which includes the full functionalities of image generation, aesthetic scoring, and image editing capabilities (dragging and resizing); AesMood-edit, which provides for only image generation and aesthetic scoring; AesMood-score, which includes only image generation and image editing; and AesMood-edit-score, which provides for only image generation. Designers used these four systems in a random order to create complete mood boards to prevent the order of the experiments from affecting the results.

3. Post-test: We designed a user questionnaire based on a 7-point Likert scale across four dimensions—usefulness, ease of use, learnability, and satisfaction (Lund, 2001)—and asked designers to rate their agreement after each experimental group (1: strongly disagree, 7: strongly agree). Designers were also asked to score the final mood boards they created (on a 10-point scale). Finally, we conducted a semi-structured interview to gain more specific feedback from designers about the AesMood system.

4.2 Results

The normality of the Likert scale data was assessed using the Shapiro-Wilk test, which yielded significant results ($p < 0.01$), indicating that the data did not follow a normal distribution. Consequently, we employed the Kruskal-Wallis non-parametric test to determine if there were significant differences between the various systems across the four dimensions of usefulness, ease of use, learnability, and satisfaction. Dunn's post hoc analysis was conducted to further discern specific differences between pairs of systems. The mood boards created by designers using the AesMood system are shown in Figure 7.

Figure 7. The mood boards created by designers using AesMood.

1. Usefulness

As shown in Figure 8, significant variances were detected through the Kruskal-Wallis test in the areas of usefulness ($H=14.89$, $p<0.01$), efficiency ($H=9.00$, $p<0.05$), and requirement satisfaction ($H=23.70$, $p<0.001$). Pairwise comparisons revealed that AesMood significantly outperformed the other three systems in terms of usefulness, with p-values less than 0.01 when compared to AesMood-edit, less than 0.05 when compared to AesMood-score, and less than 0.001 when compared to AesMood-edit-score. This indicates that the functionalities for aesthetic scoring and mood board editing substantially impact the enhancement of system usefulness.

Regarding the fulfilment of needs, AesMood was significantly superior to both AesMood-edit and AesMood-edit-score ($p<0.001$), and AesMood-score also significantly outstripped AesMood-edit and AesMood-edit-score ($p<0.01$), indicating that the capability to edit mood boards is of paramount importance to designers

from the perspective of meeting their needs. Concerning the enhancement of mood board creation efficiency, the evaluation (M=5.60, SD=0.50) indicates that designers generally perceive the AesMood system as having improved the efficiency of mood board creation. Furthermore, from the assessment results concerning the acquisition of design inspiration (M=5.85, SD=0.59), it can be inferred that the image generation capabilities of the AesMood system have aided designers in obtaining more design inspiration.

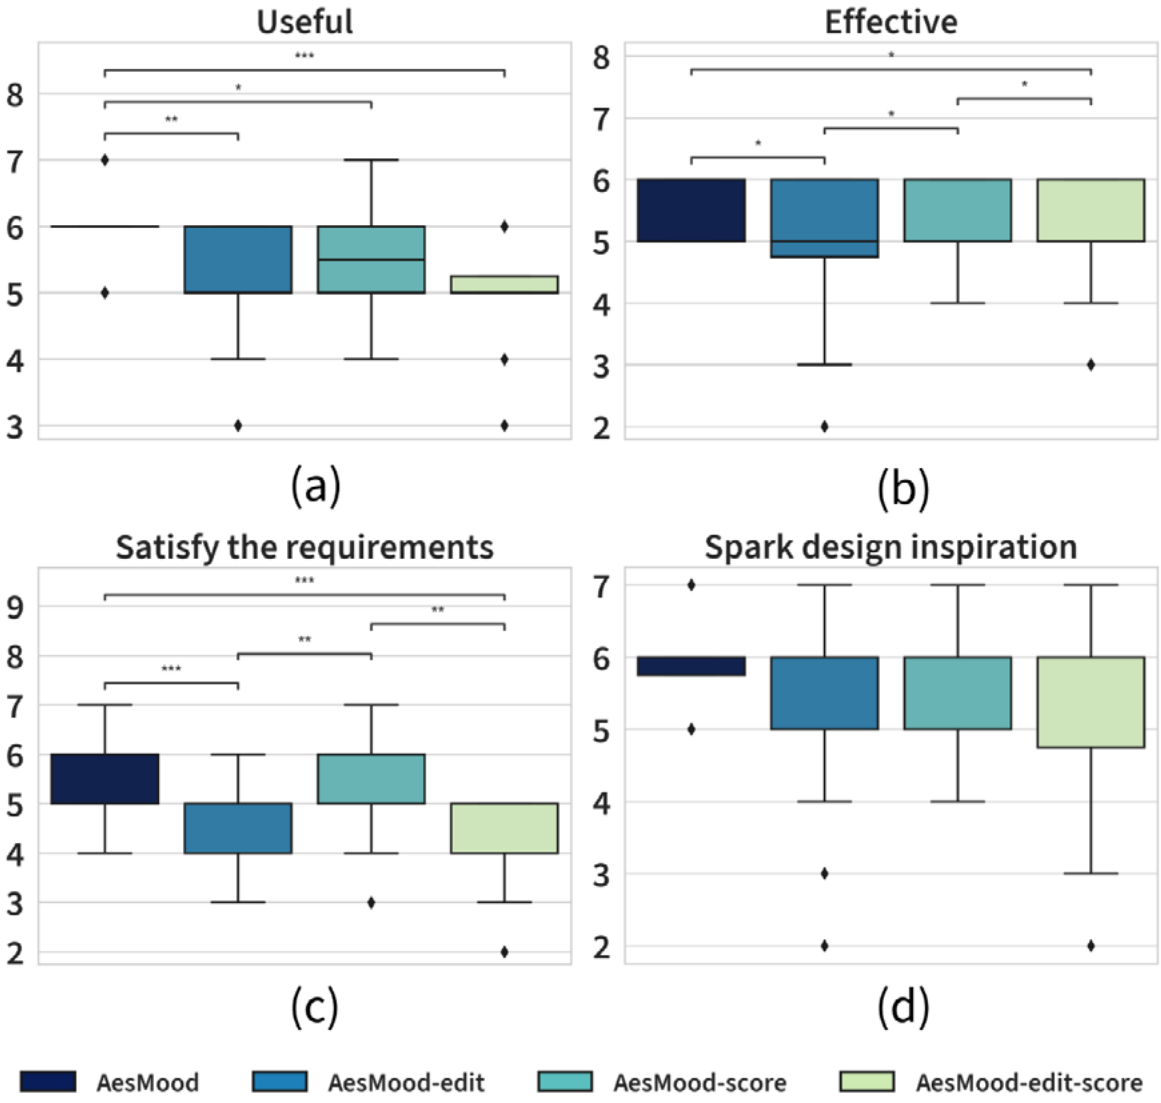

Figure 8. The evaluation results for system usefulness (*: 0.01 < p < 0.05, **: 0.001 < p < 0.01, and ***: p < 0.001). (a) the system's usefulness in facilitating the creation of mood boards; (b) the improvement in efficiency for creating mood boards compared to usual practices; (c) the system's fulfilment of needs concerning the creation of mood boards; and (d) the system's role in augmenting design inspiration.

2. Ease of use

As depicted in Figure 9, there is a statistically significant variance in user-friendliness among different systems (H=8.09, p<0.05), with pairwise comparisons revealing that systems without an editing feature are rated lower in user-friendliness. The AesMood system scores favourably in ease of use (M=6.20, SD=0.62), indicating that it is relatively easy to use, and it also receives a positive rating for user-friendliness (M=6.05, SD=0.83).

3. Learnability

Figure 10 indicates no significant difference in learnability among the various systems. The AesMood system demonstrates commendable learnability in the overall assessment (M=6.40, SD=0.60), and designers can achieve proficiency in utilising the AesMood system with relative swiftness (M=6.55, SD=0.61).

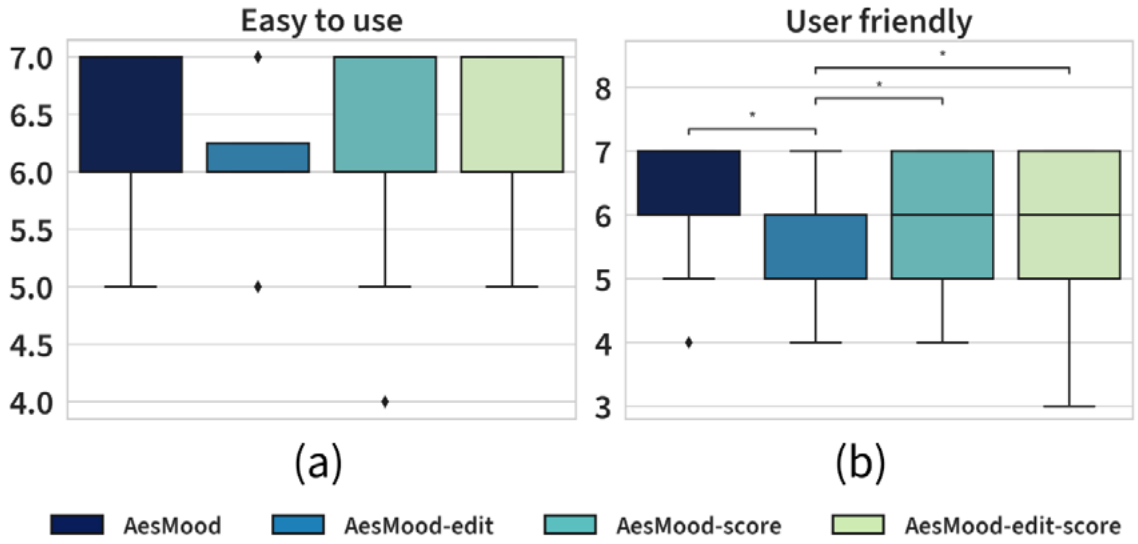

Figure 9: The evaluation results for system ease of use (*: 0.01 < p < 0.05, **: 0.001 < p < 0.01, and ***: p < 0.001). (a) This system is very simple to use. (b) This system is user-friendly.

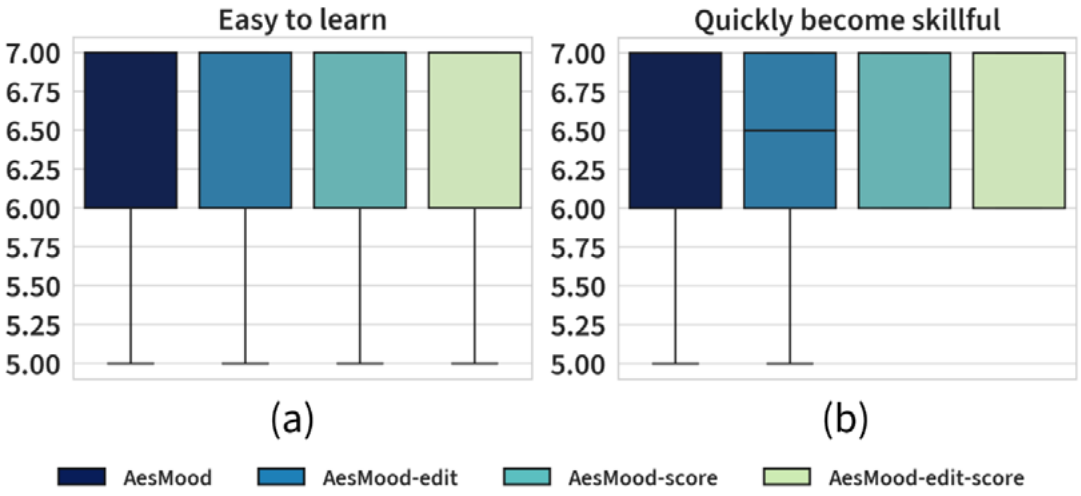

Figure 10. The evaluation results for system learnability. (a) It is easy to learn how to use this system. (b) I was able to become proficient in operating this system quickly.

4. Satisfaction

Figure 11 reveals that there are significant differences in the system satisfaction assessment, specifically in the domains of user enjoyment (H=13.20, P<0.01), overall system satisfaction (H=8.92, P<0.05), willingness to recommend the system to other designer friends (H=10.16, P<0.05), and satisfaction with the mood board (H=12.04, P<0.01). Through pairwise comparisons, it was found that AesMood significantly outperformed both AesMood-edit and AesMood-edit-score in terms of user enjoyment (P<0.05), and AesMood-score was significantly superior to AesMood-edit and AesMood-edit-score (P<0.01), indicating that the addition of mood board editing features can enhance designers' pleasure when using the AesMood system. Regarding the willingness to recommend the system to other designer friends, AesMood was

significantly preferred over AesMood-edit (P<0.05) and AesMood-edit-score (P<0.01), suggesting that designers are more inclined to recommend a system with a more diverse and comprehensive set of features to their peers.

The overall satisfaction with the AesMood system was evaluated from two perspectives: satisfaction with the system and the generated Mood board. The results showed that systems with editing capabilities, AesMood and AesMood-score, were evaluated significantly higher than those without editing features in both system and Mood board satisfaction assessments. Analysing the AesMood evaluation scores, it is noted that AesMood received high ratings in terms of system satisfaction (M=5.65, SD=0.67) and Mood board satisfaction (M=5.30, SD=0.66), indicating that, overall, designers have a favourable satisfaction rating for the AesMood system.

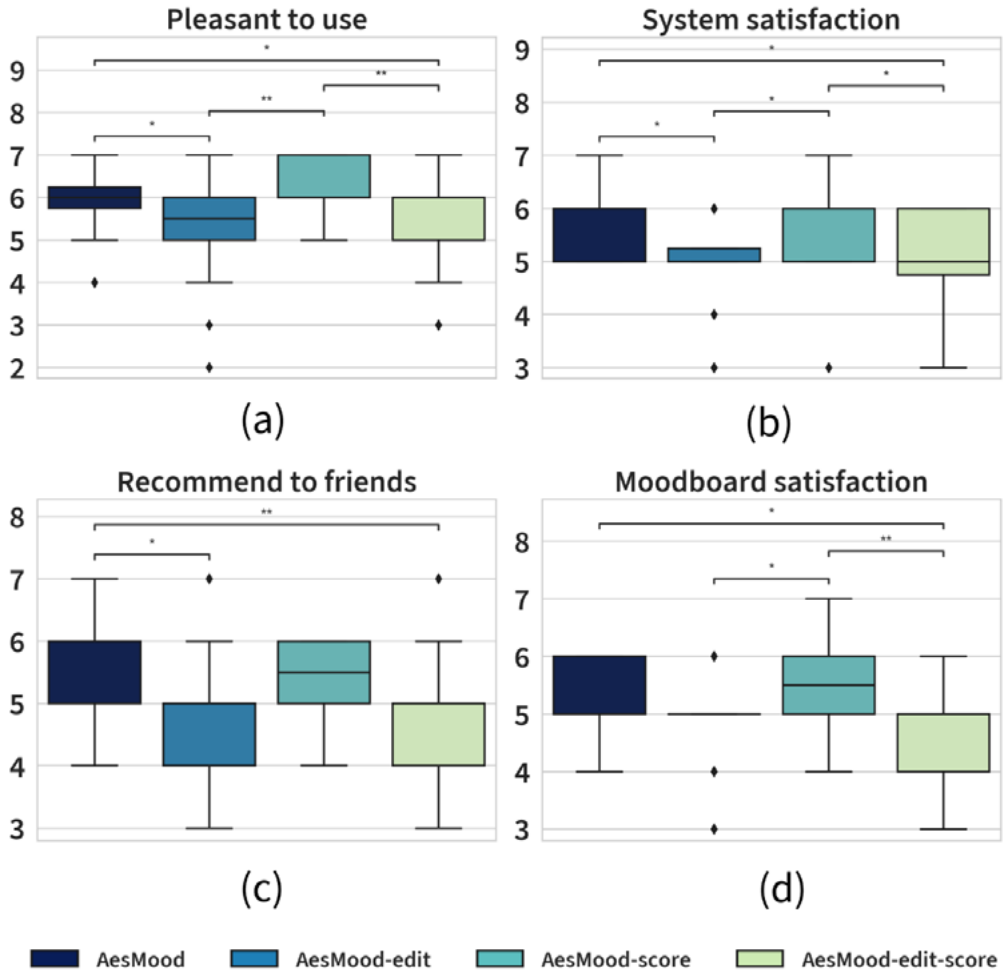

Figure 11. The evaluation results for system satisfaction (*: 0.01 < p < 0.05, **: 0.001 < p < 0.01, and ***: p < 0.001). (a) Utilising this system is a pleasant experience for me. (b) I am satisfied with this system. (c) I am willing to recommend this system to other designer friends. (d) I am content with the Mood board generated by using this system.

We also collected designers' scores for the final mood boards, as shown in Figure 12, which indicated significant differences between systems (H=20.48, P<0.001). Pairwise comparisons revealed that the mood board scores for AesMood were significantly higher than those for AesMood-edit and AesMood-edit-score (P<0.001), and AesMood-score was also considerably higher than AesMood-edit and AesMood-edit-score (P<0.01). This suggests that the mood board editing feature is critical to the designers' evaluation of the final generated mood boards. The AesMood mood board generation system, which has editing capabilities, better responds to the needs of designers and helps them create more satisfactory mood boards. Additionally, the size of the P-values and a comparative analysis of the scores for AesMood (M=7.70, SD=1.03) and AesMood-score (M=7.40, SD=1.00) suggest that the aesthetic scoring can enhance the mood board scores to a certain extent.

Furthermore, we used the Mann-Whitney test to analyse whether the use of other AI image generation tools affected satisfaction and found no significant differences in satisfaction with the system (U=710.50, P>0.05), satisfaction with the mood board (U=742.50, P>0.05), and mood board scores (U=801.00, P>0.05). This indicates that designers who have used other AI image generation tools are also delighted with our designed AesMood system.

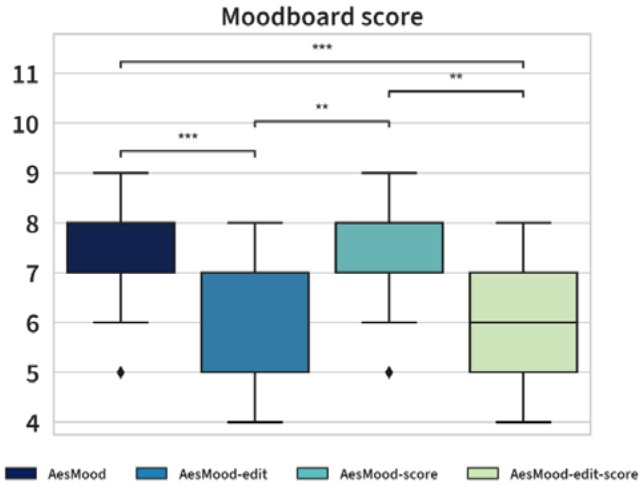

Figure 12. Mood board score (Ten-point scale) (*: 0.01 < p < 0.05, **: 0.001 < p < 0.01, and ***: p < 0.001).

In the semi-structured interviews, we posed some open-ended questions to understand designers' more specific opinions about the AesMood system. Regarding which system they liked the most, 80% of the participants chose AesMood. At the same time, 75% of the participants least liked the AesMood-edit-score system, indicating that most designers prefer a mood board generation system with more diverse functionalities. We have also compiled some representative responses in Table 2. Most designers considered the aesthetic scoring feature to be of certain assistance in creating mood boards. They believe that "*Aesthetic scoring plays a role in assisting decision-making.*" "*With a high aesthetic score, I feel more confident about the mood board I create.*" Some designers noted no significant impression when first using a system with aesthetic scoring. However, the difference became quite pronounced compared to systems lacking this feature, leading them to favour mood board creation systems with aesthetic scoring. The designers expressed satisfaction with the functionality and interface of AesMood, noting that "*The innovation in generating mood boards is stronger and more aligned with my needs.*" and "*The user interface is simple, and I am quite satisfied overall.*" One designer highlighted that "*The generated images exhibit proficient style integration.*" demonstrating one of the prominent advantages of applying an image generation algorithm to mood board creation. Additionally, the randomness of the image generation algorithm provides designers with a broader source of inspiration, as one designer mentioned, "*The randomness in the generated images is quite interesting and helps to inspire creativity.*"

Designers have offered several suggestions to address the shortcomings of AesMood. Regarding aesthetic scoring, they propose that "*Aesthetic scoring based on the client's preferences is more referential.*" This means that in the design process, by allowing the aesthetics assessment algorithm to learn the client's aesthetic preferences in advance, the system's aesthetic scoring suggestions would align more closely with the client's tastes, thereby better fulfilling the client's needs. Regarding system functionality improvements, designers have indicated a desire for "*some help available when entering prompts.*" During our experiments, we observed that designers with more experience could easily conceive the keywords for their prompts, quickly obtaining the desired mood board images. In contrast, other designers required more time to consider or search for relevant keywords using search engines. Therefore, incorporating prompt suggestions into AesMood would significantly enhance user-friendliness.

Table 2. Examples of User Responses from Semi-Structured Interviews.

Cluster	Notes
Aesthetic Scoring	"Aesthetic scoring plays a role in assisting decision-making." "With a high aesthetic score, I feel more confident about the mood board I create."
System Functionality	"The innovation in generating mood boards is stronger and more aligned with my needs." "Once I have the images for the mood board, I can layout directly, which is very convenient." "The generated images exhibit proficient style integration."
System Interface	"The user interface is simple, and I am quite satisfied overall."
Inspiration Stimulation	"The randomness in the generated images is quite interesting and helps to inspire creativity."
Improvements in Aesthetic Scoring	"Aesthetic scoring based on the client's preferences is more referential."
Improvements in System Functionality	"I hope there could be some help available when entering prompts."

5. Discussion

We designed the AesMood intelligent mood board generation system based on user needs derived from preliminary interviews. This system enhances the efficiency of mood board creation by automatically generating images corresponding to specific keywords input by designers. Integrating an aesthetics assessment algorithm into the AesMood system allows designers to reference public aesthetics during the mood board construction process. Feedback from designers indicates that AesMood increases the efficiency of mood board creation, a development that saves time and introduces new dynamic elements into the creative process. Overall, our proposed AesMood system can allow designers to reference public aesthetics, increase creative efficiency, and provide a broader range of inspiration. Additionally, the AesMood system excels at integrating styles, which can stimulate designers' imagination and creativity.

From both quantitative analysis and qualitative feedback, we observe that designers perceive aesthetic scoring as a supportive tool for decision-making, which can enhance their confidence while creating mood boards. Furthermore, including the aesthetic scoring feature can, to some extent, elevate the designers' final appraisal of their mood boards. However, aesthetic scoring also presents an issue of insufficient interpretability. As Wu (2020) has indicated, the issue of insufficient interpretability accompanies aesthetic scoring, which more closely resembles a black box that directly maps inputs to aesthetic scores. In practical application, designers may be more concerned with understanding how aesthetic scores are calculated and how to obtain higher aesthetic scores. Future work could consider incorporating suggestions on enhancing aesthetic scores and guiding designers to input more appropriate prompts to improve the aesthetic quality of the generated images.

Our experiments show that AI-based image generation algorithms possess an element of randomness. This randomness can aid designers by expanding their creative boundaries and offering a broader source of inspiration. However, it can also lead to issues of excessive divergence. Such divergence may prevent designers from constructing mood boards within a more defined scope. The algorithms perform notably well in aesthetic-related directions but exhibit certain limitations in displaying design products and specific product functions. Future work could contemplate fine-tuning the image generation algorithms on datasets related to design products and specific product functions to compensate for the current deficiencies.

Designers' unfamiliarity with prompt writing can affect their use of the AesMood system, necessitating additional tools to help designers better translate their requirements into suitable and accurate prompts.

In this context, the SemanticCollage digital tool (Koch, et al, 2020) serves as a pertinent example, employing advanced semantic tagging algorithms to aid designers in converting vague visual concepts into searchable terms. Future work could integrate prompt suggestions into the AesMood system to facilitate more precise prompt descriptions by designers, ensuring that the generated images align more closely with their needs.

In exploring the development of automated design assistance tools, it is essential to reflect deeply on their ethical implications for design practice. The design process is not merely an output of functionality but also an integral part of a designer's personal expression and experience, characterised by exploratory, intuitive, and emotional investment. Although automated design tools can significantly enhance efficiency, they may also deprive designers of intuitive responses and emotional experiences during the creative process, potentially leading to a reduced depth of understanding of design materials and elements. Zhang et al. have determined in their research that using artificial intelligence in the design process can induce an illusion of success in human designers, contributing to their complacency. The study states, "*Once human designers follow AI suggestions, they give up the opportunity to explore the design space by themselves.*" (Zhang, et al, 2021, p.20) Therefore, in the development of automated design assistance tools, consideration should be given to how to preserve the designer's creative involvement while increasing efficiency. Future work could enhance interactivity by learning the personal aesthetics of designers and catering to their individualised customisation needs.

Our work also has limitations: The aesthetics assessment algorithm we selected is somewhat limited, as it was trained on a limited artistic image dataset and may provide lower scores for complex design products and other types of images. Furthermore, due to constraints in model size and computational resources, we chose the Stable Diffusion 2 algorithm for image generation. However, if computational resources permit, selecting algorithms like Stable Diffusion XL could generate images of higher quality and clarity.

In future work, the AesMood system is anticipated to incorporate many innovative features, such as multimodal creation capabilities. Beyond images, it aims to automatically generate text, 3D models, sound, video, and other components constituting novel mood board forms (Ivanov, et al, 2022). Additionally, we plan to introduce real-time collaboration tools for use by multiple designers simultaneously, which is expected to enhance their workflow and creative expression. It is also worth considering training the aesthetics assessment algorithm on different aesthetic evaluation datasets to see if this leads to higher satisfaction with the aesthetic scoring feature among designers. Future research could further explore how to refine the algorithms to accommodate a broader range of design contexts and personal preferences. Additionally, considering AI algorithms cannot understand overly abstract design descriptions, future work could focus on developing a design corpus and optimising image generation algorithms to meet specific design needs more accurately.

6. Conclusion

In this paper, we design, construct, and evaluate AesMood, an intelligent mood board generation system based on image generation and aesthetic computing. Utilising the Stable Diffusion 2 image generation algorithm and the SAAN aesthetics assessment algorithm, AesMood automatically generates images corresponding to specific prompts by designers and references public aesthetics to assist designers in constructing mood boards and facilitating their judgment. User studies indicate that AesMood performs commendably in aiding designers with creating mood boards, enhancing design efficiency, broadening the scope of inspiration, and stimulating the designers' creativity and imagination. We aspire for our work to contribute to AI-assisted design, and future work will aim to refine the system further to accommodate the increasingly diverse needs of designers.

About the Authors:

Rong Rong is a PhD student in Design at Hunan University. Her research interests are focused on human-computer interaction and artificial intelligence, with a current emphasis on aesthetic computing.

Shuyi Liu is a master's student in Design at Hunan University. She holds a bachelor's degree in Industrial Design from the same institution. Her research interests are in human-computer interaction and emotional regulation.

Hanling Zhang is a professor at Hunan University. He has led over ten national and provincial projects and published over 60 papers in international conferences and journals, including TIP, CVPR, and ECCV. His research interests include human-computer interaction, user experience intelligence evaluation, and the analysis of human factors data.

KEYWORDS | ANTHROPOLOGY OF DATA, EVERYDAY DATA CULTURES, DATA JUSTICE, DESIGN JUSTICE

ABSTRACT | We live in datafied societies where data is collected and used to shape even the most intimate spheres. The last decade has seen the emergence of new and critical data practices as well as approaches to the study of data that have had little applications and impact on design so far. With increasing demands on designers to work with and use data in their practice, more reflection is needed to frame the relationship between design and data, and to expand the boundaries of how design should and could understand and use data. The paper begins by exploring the key changes from within design as a result of increased engagement with data (and specifically big data). Drawing on reflections from two practical design research cases, the paper then offers an invitation to rethink the boundaries of data and explore alternative approaches that focus on everyday data cultures. As a more nuanced understanding and use of data develops (including within design), a more nuanced knowledge of alternative data practices and critical ways of framing and exploring data is required. By tracing the new boundaries of emerging alternative data practices, this paper aims to make a contribution in this direction.

1. Introduction

Data are everywhere. Through digitalization and the proliferation of devices that can capture, measure, collect, store and compare data about most of our social (digital) actions and interactions, we have come to produce an incredible amount of data that we now need to understand and make use of. Increasingly, data is being collected by governments, companies and by us (e.g. by self-tracking) through a variety of tools and during most of our social interactions, whether we know it or not. When we buy tickets for a concert with our credit card, when we watch a film on one of the many movie platforms, when we go to the doctor, or simply when we switch on or off the lights in our smart homes or walk through the train station in a smart city, different actors are collecting, storing and trading our data at different times.

Scholars have dubbed this phenomenon *datafication,* as we increasingly live in *datafied* societies (Hintz et al., 2018). What this label attempts to capture – I believe – are at least four fundamental shifts that have occurred in our relationship with data, namely: i) that data is now collected continuously through and during most of our social interactions; ii) that data is increasingly used to make sense of our societies, including by shaping what is knowable and valuable; iii) that for most of us, collecting data is a largely *passive* activity, done *to* people who are represented and treated differently as a result of data collection; and iv) that data is collected and used interchangeably in different parts of the world and according to a universalizing approach, as context does not matter.

This paper aims to build an argument for design to become more attentive, take a stance and define its roles in relation to data, seeing itself not only as a practice that uses data to improve services and products, but increasingly as a practice that is critically engaged throughout the data lifecycle (including the planning, storing and reuse of data). Drawing on two practical cases, the paper presents alternative data practices as an invitation to rethink the boundaries of data in design, including dealing with the politics of datafication, and to reflect critically about new forms of inequality and injustice that can result from data-driven decision-making and profiling. The case studies present two different pieces of research, one in the field of mental health (Pierri, 2020) and one in the field of smart cities (Pierri and Wiltshire, 2021). As the presentation of the findings and methods of both research projects is the focus of the papers just referenced, this paper will mainly draw on the findings to share reflections and extrapolate some general concepts about data that might be useful for design.

As design is increasingly asked to engage, learn and produce things and meanings through data, more nuanced knowledge from within the discipline of alternative data practices and critical ways of framing and exploring data is needed. By tracing the new boundaries of emerging alternative data practices, this paper aims to make a contribution in this direction.

2. Who Is Talking About Data and Why?

The last decade has seen the emergence of new and critical approaches to the study of data at the intersections of anthropology of technology, critical and internet studies, science and technology studies, and increasingly in design and HCI, which seek to complexify and counter alternative views of data to those that are more dominant.

In an attempt to make sense of the increasing amount of data we face today, scholars (Kitchin, 2014) have started to differentiate between so-called '*captured data'*, which is intentionally collected to produce specific datasets and knowledge, and '*exhaust data',* which is the type of data that is unintentionally produced in large quantities by electronic devices and digital systems, and which is mostly a *by-product* of other activities. This typology of data, sometimes also known as *'big data'*, is considered to be the most promising for advancing science and supporting business objectives.

Since the emergence of big data, scholars have warned of a quasi-religious process and new forms of *faith* in data, referred to as *dataism* (van Dijck, 2014) or *data fundamentalism* (Crawford, 2013). Both terms point to a pervasive and unwavering belief in data as the primary and only source of knowledge: if we have the right data, there is nothing we cannot do, know or decide. Early questioners of this mantra of *'big data'* as the solution to all problems have also emerged (Boyd & Crawford, 2011), who questioned the objectivity and accuracy of this type of data. Thanks to these critical stances, big data has been framed as not neutral and as deeply political instead (Coté et al., 2016), and therefore a site of struggle over meaning, power, interpretation, inclusion and exclusion in the production and use of data.

What most of these narratives have in common is a set of assumptions about data: What is it? Why is it useful and valuable? What is its power? As the field of critical data studies has developed, it has been pointed out that "[a] potentially serious problem with some of these forms of critique is that they risk echoing, mirroring or amplifying – rather than debunking – the dominant myths about the power of technology" (Burgess et al., 2022, p. 12). Indeed, some of these critical approaches lack engagement with the lived experience of those affected by new data practices and risk becoming as abstract and universalist as the theories and practices they seek to critique. As an alternative to these framings, "everyday data cultures" approaches (Burgess et al., 2022) have been put forward, reminding us that people are not only and always *passive* subjects of data (or data objects). These approaches underpin the research presented in this paper.

'Everyday data cultures' is an emerging framework for studying the impact of data and digitalization, paying attention to the datafication of everyday life, the ways in which people develop intimate relationships with and through data and digital tools, as well as the mechanisms they develop to cope with, resist and better control the digital technologies used in their lives. These research methodologies – so-called "from below" (Miller et al., 2021) – focus on how ordinary people live with technology (and data) and develop their own creative and ingenious ways of using the data to address issues they face (e.g. from ageing to health care or maintaining social relationships). Through an everyday lens, people's experiences in the use of technology (for instance, in everyday routines in the home) become central as sites for demystifying technological determinism, that sees technology as being introduced and used in the same way everywhere.

3. Design and Data: What Are the Boundaries?

Design research and practice are increasingly paying attention to the ways in which they can capture and understand data, particularly in the cases where design deals with digital platforms and services as well as machine learning. In the following pages, the paper attempts to provide a brief overview of the main literature on the topic. In the last 10 years the number of articles on the topic has been gradually increasing, also due to the influence of conferences and special tracks dedicated to this issue. Overall, from the literature analyzed it emerges that design seems to follow the path that other disciplines have also taken, showing an increasingly critical view on the topic of data.

Unsurprisingly, many studies in design still fall into the mainstream field of *'big data'*, which focuses primarily on the role of data in innovation and in corporate settings (Urbinati et al., 2019), highlighting the challenges and opportunities that big data offers to companies, and mostly focusing on the tools and methods that are needed in order to create and fully capture the value of *'big data'*.[1] Other studies (Mortati et al., 2023) question the value of (big) data used in design projects and explore how big data can be combined with the qualitative 'thick data' that design also produces, or for creative purposes (Quiñones-Gómez, 2021).

[1] Mortati et al. (2023) provide a good review of the literature on data and innovation, where data is used at different stages of innovation to generate new knowledge to support business processes and develop products and services.

A useful definition for capturing how designers work with data and how data is used differently to support their practice, distinguishes three types of value associated with data in design (Speed and Oberlander, 2016): i) raw measurements; ii) commercial and social; and iii) moral and ethical (which mostly relate to the management of personal data). Looking at changes in computing and communication technologies, Chris Speed and Jon Oberlander have provided a robust reflection of the key developments in design as data moves from being a source to design '*from'* to something more complex and fluid that designers need to design '*with',* if not to a state where design is produced '*by*' data (2016). In the first mode of design '*from',* data is collected and used in more classical ways, for instance to allow design to improve its services and products and enhance innovation. Designing '*with'* data includes the possibility of designing with the live streams of data generated through digital interactions and captured live. In this case, data operates as a *flow* rather than an object, which raises new challenges for design to use it and requires new knowledge and tools. Design *by* data illustrates the case where design happens autonomously, as systems design other systems. At the time of writing their article (2016), the latter mode was generating a lot of interest as well as anxiety about the "[…] emerging prospect that data itself, supported by an algorithm, will become a designer" (p. 9).

While the last scenario has not materialized (at least not yet), we could say that there is still a risk that design will lose its roles if designers (especially those working on digital platforms and services) do not expand their boundaries for how they look at and consider data in their work. While many approaches, especially in corporate design practice, still reproduce an understanding of data (and specifically *big* data) as "the new oil" (Porciuncula & de La Chapelle, 2021) that needs to be accumulated and used to gain business and scientific advantages, interesting research is emerging within the design field, that aims to expand the boundaries of data and of what design could do for shaping the data infrastructures.

These attempts include for instance new reflections around the role of designers in the process of *data transformation* (Prendiville et al., 2017), as a key moment where design can contribute practically to make data available, accessible and comprehensible to communities and the general public. Other studies have put forward innovative models for rethinking data visualization (as another key area for design), either to put people's senses and experience of data at the center (Hogan, 2018) or to expand new data imaginaries (Benabdallah et al., 2023) through participatory engagement with different actors and as a way to increase people's data literacy. Tools and methods have also been identified for designers to make the most of *open data* that is accessible in new and generative ways for research (Kun et al., 2018).

Within HCI studies, nuanced ways of reflecting and using data have also been proposed, where data is clearly no longer a simple input or output of design activities, but is more fully understood as an *object* of design (Feinberg, 2017). Melanie Feinberg draws on Redström's concept of "design after design" to frame digital processes as those in which the product of one design activity becomes the material for subsequent design activities. In doing so, she foregrounds new roles for digital designers in dealing with data, including the design of data infrastructures, collection and aggregation. From within HCI we can therefore observe alternative narratives emerging where the nature and essence of data are questioned, and data is no longer a simple means to an end, but a material that can be shaped by design to create a diverse range of experiences (Lee-Smith et al., 2023).

This brief overview of the modes of interaction between design and data illustrates a growing and moving field, where we are shifting away from acritical practices fueled by big data enthusiasm (still mostly happening in corporate design), towards building the right tools and methods to sharpen design understanding and use of data, as well as questioning the role and essence of data overall.

In the next section of this paper, two alternative approaches to the understanding of data will be discussed, drawing on reflections from two projects. These aim to put forward practical ways in which the boundaries of data could be extended within design, namely by extending *data as plural* as well as by introducing questions of *justice* in relation to data.

4. Alternative Framing of Data

The previous sessions aimed to present the context in which alternative framing of data in design could (and should) happen, as well as to highlight the reasons why this is an important issue for design to address. Summarizing, the paper presented the following arguments: i) that data is becoming a complex and central new object for design in *datafied* societies; ii) that critical data studies are increasingly complemented by new and interesting approaches that pay attention to everyday data practices; iii) that current reflections within design on its mode of use and relationship with data are still taking place within narrow boundaries; and iv) that design could benefit from expanding its boundaries and understanding of data through alternative data practices.

These alternative approaches draw on principles of "data feminism" (D'Ignazio & Klein, 2023), which pay particular attention to the political and power dynamics in the collection, use and reuse of data, and (most importantly) question whether and how the *'datasets'* compare with the lived experience of those who are the object of the data collection. Following these accounts, when attempting to design a digital service or product, designers should critically explore what data is available, what the data means from the everyday point of view of the lived experience of those represented by the data, its politics and meaning as well as paying attention to the data that is *not* there. This last point was perfectly illustrated during the COVID-19 pandemic, where data were used to define the problem, design solutions and prioritize groups or areas for care interventions. In these number-based policies and narratives, certain groups – whose data was *not* collected – were deliberately made to disappear by design. Scholars who paid attention to what was not in the data during the pandemic were able to identify what they called instances of "data poverty" (Milan & Treré, 2020), which constitutes a new form of invisibility that perpetuates and creates new forms of inequality. Interestingly, these scholars also mapped the ways in which these so-called *'marginalised communities'* still succeeded in creating forms of solidarity from below to mitigate the negative effects of their (data) invisibility.

Through these accounts, data is not simply something that is *done to* people, as we can see how people become *subjects* of their data, or how data itself becomes the terrain for new struggles and the object of new forms of action that aim to produce new narratives (not captured by data), through alternative ways of documenting and making visible.

This next session draws on two design research projects I was involved in that aimed to explore data not as a neutral or objective thing, but as something produced through social relations and in context. Both projects had a clear stance on valuing and eliciting the *'lived experience'* of data in order to focus on the concerns and priorities of those most affected, their views, fears or wishes for how data could be used differently by design.

4.1 Data as Plural

Data is usually used as a singular noun (we say that data *is*, or that data *does,* etc.). The idea of data as singular has profound consequences in shaping the unspoken ways in which we understand data. Data as singular evokes the idea that data is one thing, that it has no differences, and no relationships. Data used as singular reinforces universalizing conceptions of data (Chan, 2014; Douglas-Jones et al., 2021) that seem to imply that data is the same everywhere and has the same meaning that cannot be questioned or contextualized.

In the first case study presented in this paper (Pierri and Calderón Lüning, 2023 and Pierri and Wiltshire, 2021), participatory design research aimed to engage citizens in four European cities to reflect and learn more about digital technologies and data collection at the city level. The whole project was based on the premise of understanding data (and the digital technologies used to collect it) as *contextual*. General data on the impact of digitalization in smart cities or local data from the four participating cities were already

collected and available through national and local statistical portals. However, by adopting a more contextual understanding of data, the project did not start by simply using the data that already existed, even if it was presented as objective and reliable data. Instead, the team was interested in capturing the local understanding of data, the data that was not being collected, as well as how different people in different parts of the city were affected by and used the data differently. Therefore, at the beginning of the project, the team brought together local residents and digital rights experts to map the local context and provide insights into the local priorities around data and digital technologies. The local maps of data and digital knowledge that were collectively created in each city immediately revealed a more diverse data landscape. Each city then took a bespoke approach to designing engagement around the data, and several workshops were held with citizens, all of which were tailored and varied in terms of topics and focus. All workshops and events were conducted in the local language and facilitated by local researchers and professional facilitators.

This approach assumed data (from now on in the plural) and allowed them to emerge as deeply local objects. Which data were collected during the project and to which data citizens paid attention to, depended on the different local sensitivities and approaches to data and digitalization more broadly. This mode of engaging with data draws on recent studies in anthropology and design (Douglas-Jones et al., 2021; Loukissas, 2019) that frame data as cultural and locally embedded objects and practices. In these accounts, data *settings* (rather than data*sets*) are most relevant for describing data that make sense and produce knowledge in context. The *'settings'* of the first case study were the different maps and priorities that were identified locally, that spoke the local language (problematizing the use of English as the most common language in mainstream and universalized narratives of *'smart cities'*), and that framed data as being used and understood differently in each of the cities. These contextualized and different approaches gave cultural flavor to our *data conversations,* as the tone and content changed, sometimes significantly, in different cities. We learned through contextual research that data are no agnostic to places (Loukissas, 2019) and additionally we learned how data can have histories as well. In fact, even before digitalization data have for long time been collected and used and may evoke different emotions and attitudes in different places based on their histories. As one of the cities involved in the project was part of a former communist country, questions about local sensitivities to data collection and use based on past history could not be ignored. In this way, data start to be framed beyond the universal data of machine-readable information, but through the cultural, historical and lived experiences of those who produce and make sense of data locally through their practices.

4.2 Data and Justice

Linnet Taylor (2017) is the scholar who originally introduced the concept of data justice, understood as the ambition to achieve "fairness in the way people are made visible, represented and treated as a result of their production of digital data […]" (p. 1). Particularly when used in public services (as well as for political purposes), data effectively become the way in which citizens are grouped according to identity traits or behaviors and are made visible, represented and treated differently as a result of their digital profiles.

As data tracking and automated decision-making through data are currently being designed into most of our public services, with the aim of increasing efficiency and evidence-based decisions, issues of social justice come to the fore for all those designing these platforms. This is particularly true in what Virginia Eubanks calls "low rights environments" (2018, p. 12), which are the social and health service sectors:

> "Those designing AI systems in general, as well as those focused on the welfare state are overwhelmingly white, male, well-off, and from the Global North. No matter how committed they might be to certain values, the assumptions and choices made in shaping the digital welfare state will reflect certain perspectives and life experiences." (Alston 2019, p.4)

The second example this paper is putting forward is based on research into community mental health in the UK (Pierri, 2020), where digitalization of public services was introduced on a massive scale (and to the

enthusiasm of many) in the early 2000 (HM Government 2012). Community mental health includes health care services (not just medical ones) that are designed to be delivered closer to the people who need them, and that involve local communities in various ways, with the aims of both: building joint collaborations to provide a caring local environment for those in need, as well helping to raise awareness of mental health issues and thereby reduce stigma for those affected by poor mental health.

In practice, the digitalization of mental health services in the UK meant that services were de-materialized as health and social care assessments were increasingly carried out online using purpose-built platforms. According to the government narrative, these digital platforms were designed to be *'neutral'* as they operated in a data-driven mode, collecting and using all available data to make the best decisions in each individual case. The aims were to drive cost savings and provide the best support based on the data available. The data points in these cases were generated by triangulating a wide range of data: including people's biographies, their work experiences, previous episodes and encounters with the National Health Service (NHS), and *potentially* other available datasets about the neighborhood in which people lived, the schools they attended and the behavior and interactions of the extended network of friends and family members. This is a *potential* list (albeit a very realistic one) because at the time of their introduction – and in some cases this is still true today – it was neither transparent, nor even understood as problematic, what data these platforms were fed and how the algorithm processed them to learn and adapt (Alston 2019).

Data in this project were revealed as a terrain of power struggles over visibility and justice: what data were being collected and *not* collected, what knowledge the data were supposed to hold about people's fluctuating mental health and how the data were being used was not clear to anyone involved in the process. Using what we now refer to as *design justice* (Costanza-Chock, 2020), the project engaged advocacy and campaigning mental health organizations to call for more participation of those involved and affected (especially those potentially harmed) in deciding what data should be collected and how the practice of data collection should be designed in advance to create more transparent, alternative and inclusive data infrastructures. If faced with similar design briefs, designers asked to design digital platforms for public services might even consider the option of not designing with the available data, as this can be opaque and biased.

5. Pushing the Boundaries: What Are the Implications for Design?

In the preceding pages, this paper has explored the current ways in which design practice engages with data, both as an input to the design process and as an output or object of design. Drawing on practical cases, the paper has developed alternative understandings of data (as plural and as a terrain of struggles for justice). The aims are to trace new boundaries for what data are and what design can do with/for/by data and to make a further contribution towards new approaches to design and data.

The main argument of the paper is for design – especially when used to design digital services or platforms, or increasingly in machine-learning – to take a stance and define its roles not just as a practice that uses data to improve services and products, but increasingly as a practice and mode of research that is critically engaged throughout the data lifecycles. This would include, for instance, rethinking the roles of design in the *planning*, *collection*, *storage* and *use* phases as well as in thinking creatively about opportunities for *data re*use (which, for example, should be fostered and facilitated by design and for the public good).

As Feinberg writes:

> "[…] the development of data infrastructure is not commonly considered as a design activity, perhaps because such decisions often seem banal and obvious, or because they seem more associated with subject-matter expertise and scientific methods than with a design perspective. The use of temperature to understand weather, and the means in which temperature is

> measured, seem a matter for meteorologists to specify, not for designers to interrogate or imagine differently." (2017, p.2954)

Echoing Feinberg, this paper asks designers to question whether and why this should actually be the case and suggests that re-imagining data infrastructure and data practices across the whole lifecycle is precisely a role for designers. As Crawford reminds us: "Data and datasets are not objective; they are creations of human design" (2013). And therefore attention from design to how these data infrastructures are currently made, or could be made differently, would be a fruitful question for design to address.

The main objective of this paper has been to raise the need for design to expand its boundaries and understanding of data. It has attempted to do this by drawing on recent critical literature on data and on two practical projects where design has been confronted with the complexities of dealing with data. While both projects foreground critical questions and ways of dealing with data, and perhaps even imagine cases where designers choose not to work with the available data, more work and cases are needed to expand the methods we have available to deal with data critically, as well as thinking of ways to bring these questions and alternative data practice straight into the design education for the future designers. Interesting examples that have been developed on the methodology level, include "data journeys" (Bates & Goodal, 2016) as qualitative ways of experiencing the geographical and temporal scale of data and capturing the 'life of data' from its initial phases to modes of reuse in different contexts; or "data walks" (Murray et al., 2015), which are creative ways of analyzing data and their meaning with different actors, including those affected by the shared data. Expanding tools and methods to engage with data differently, including in design education (de Götzen et al., 2018), is the next terrain for design to explore further. For while more design researchers are becoming aware of the complexities of engaging with data, I believe the discipline still suffers from what has been defined as a form of conceptual dissonance "[…] where one knows conceptually that data is interpretively fluid and yet acts as if it were, might be, or should be objective and universal […]" (Feinberg 2017, p. 2).

KEYWORDS | AUGMENTED REALITY, VERBATIM TESTIMONY, TRAUMA-INFORMED, HCI, CARE IDENTITY, POSTHUMANIST

ABSTRACT | This paper introduces a novel approach combining augmented reality (AR) and verbatim testimony to create sensory engagements with data as interactive digital artefacts. The project aims to supplement existing research by communicating how aspects of care feel from the perspective of young people with experience in the UK care system. Through a posthumanist lens, we explore trauma-sensitive considerations and material-discursive aspects of meaning-making. The project emerged from a collaboration with The Verbatim Formula, a participatory arts initiative. During playful workshops, care-experienced young people and theatre practitioners co-created AR artefacts using verbatim theatre and generative design techniques. These artefacts, comprising verbatim testimonies and physical expressions of lived experiences, were presented to policymakers at the Department for Education in London. Leveraging feminist scholarship, the study engages with new materialist concepts to analyse human-technology data interactions during the live performance. The paper foregrounds aesthetic and ethical considerations, examining the material-discursive dimensions of audience co-performativity with the AR artefacts. The insights contribute to dialogues on redefining data boundaries and conceptions of value in generative design research. The AR artefacts are spotlighted as active agents in creating and disseminating knowledge, offering a new trajectory for understanding and engaging with data and values. This approach positions listening and co-performativity as a mode of care and a sensory practice of knowing, challenging conventional perceptions of data and technology towards humanising policy and care services.

1. Introduction and Overview

“I think this form of listening is a very embodied mode of attentiveness.” Maggie Inchley of The Verbatim Formula (TVF) expresses how it feels to perform a verbatim recording.

This paper presents a novel approach to data visceralisation (Koterwas, 2023; Lee et al., 2020), blending verbatim testimony with augmented reality (AR). We discuss insights into the process and material practice of co-developing and presenting trauma-sensitive augmented reality (AR) artefacts to communicate an understanding of how navigating care services feels from the perspective of young people with lived experience. Care experience refers to individuals in or with a history of being in the care system. The traditional approach to policymaking for care services leans heavily on quantitative data for decision-making, which can lead to a disconnect between the lived experiences of people with care experience and those formulating policies.

This research, in collaboration with The Verbatim Formula (TVF), a participatory arts initiative, aims to enrich the knowledge base, supplementing statistics by highlighting novel trauma-informed and responsive approaches to communicate the lived experiences of individuals interacting with care services. It seeks to humanise policy and care services by providing textured and plural insights. It celebrates creative expression and encourages co-performative ways for policymakers to listen and engage somatically with the narratives of care-experienced individuals.

The paper draws on theoretical notions of more-than-human and emergent agency as conceptualised by feminist scholar Karen Barad (2007). We explore Barad's new materialist concepts by interpreting human-technology data interactions, particularly during a live verbatim performance made to policymakers at the Department for Education (DfE) in London. The paper foregrounds aesthetic and ethical considerations, analysing the material-discursive dimensions of audience co-performativity with the AR artefacts. We discuss how these entangled interactions can produce new forms of engagement and understanding with data, extending beyond human-centred narratives to include the agential capacities of digital artefacts and environments in shaping experiences. The insights are discussed in relation to the implications for affective data representation in transdisciplinary applications of generative design research.

The AR artefacts were co-created during trauma-informed workshops with young people who are care experienced and TVF theatre researchers and practitioners. These sessions enacted playful, performative inquiry, blurring disciplinary lines between human-computer interaction (HCI) and applied theatre to elicit novel, somatic experiences with participants and lens-based technologies. The resulting AR artefacts embody sensory information as data, comprising verbatim testimonies and physical expressions of lived experiences. These artefacts emerge from the entangled co-creative journey, where the interfaces between human and more-than-human assemblages shape the unfolding narrative. This situated and performative meaning-making process illustrates the co-constituted agential relations between data and personal value systems, resonating with Barad's (2007) ethico-onto-epistemo-logical principles that highlight the inseparability of emergent values, ways of being, and knowing.

The analysis spotlights the AR artefacts as active agents in creating and disseminating knowledge. They act as interfaces for audience interaction, inviting spatial, somatic, visual, and auditory engagement with the materialised data. This performative interface between human and non-human elements as a form of data visceralisation is exemplified in the interpretation of interaction with the AR prototype by Nadhim Zahawi, then Secretary of State for Education.

The conclusion summarises the research contributions to redefining data boundaries and conceptions of value by illustrating the role of material-discursive practices in data interaction and audience engagement. It underscores the potential of AR and verbatim testimony in creating interactive, emotionally engaging experiences, challenging conventional perceptions of data and technology. The paper concludes with a trajectory for future work that continues to develop an understanding of the generative dynamics for

engaging with data and values, where listening and co-performativity become a mode of care for the other and a sensory practice of knowing.

2. Care Experience

Care experience is a term used to describe a person currently in care or with a looked-after background. In the UK, the most common settings for care delivery are Foster, Kinship, and At Home. Foster care involves placing a child or young person with a foster family, Kinship care refers to care by relatives or friends, and At Home care involves providing support services to families in their own homes. The vast majority of people enter the care system due to a need for care and protection. However, media narratives and prevalence data presented as statistics on care identity can have dehumanising effects while perpetuating a stigmatising and fatalistic deficit discourse, which becomes embedded in the public's psyche (FrameWorks Institute, 2020). We argue that quantitative data on its own represents an incomplete picture of care identity, signifying probabilistic but not deterministic outcomes, which lack nuances of human experience or a causal understanding of how to make improvements to care systems.

The findings of the Scottish Independent Care Review (2020), which included qualitative research, unveiled critical insights into the care system, notably the need to minimise care placements, the importance of listening to care-experienced individuals, and the often dehumanising feel of the care system. These findings resonate with our research and, while perhaps not unexpected, underscore the urgency for approaches to understanding and reforming care systems and practices with and for those who access, design and deliver them.

In response, this project endeavours to embody and enact a process of attentive listening for building bridges between care experienced individuals and policy makers. Our research involves co-creating safe and brave spaces (Arao & Clemens, 2013) for creative expression, exploration and dialogue. From these experiences, the paper foregrounds epistemological and methodological contributions for new trauma-sensitive approaches to creative co-performative data presentation and interaction. The objective is to engage policymakers with an immersive, trauma-informed experience that conveys the emotional texture and experiential realities of those navigating the care system. By doing so, we hope to facilitate a deeper, more empathetic understanding of the lived experiences of those the care system is intended to serve towards policies that are informed by these insights and shaped by the compassion and understanding they engender.

3. Theoretical Background

This section outlines the theoretical framework guiding this study, which integrates transdisciplinary concepts to address our objectives within trauma-sensitive generative design research. The framework is structured into two main subsections: firstly, principles of empathy and trauma-informed design, which lay the ethical foundation for understanding and applying design practices that are sensitive to young people with care experience. Secondly, agential realism is explored, emphasising the relational dynamics in the co-creative processes of knowledge production. This theoretical bricolage scaffolds our approach to engaging complex ethical challenges of participation, representation, agency, and uncertainty. It also highlights more-than-human assemblages and co-performative nature of digital materiality for creative expression, underpinning our generative approach and methods for engaging with and through data.

3.1 Empathy and Trauma-Informed Design Research

By critically appraising the framing of empathy within design methods, this section aims to develop a more holistic conceptualisation of subjective lived experience in design research. As noted by (Brown, 2010), mainstream design thinking frequently positions empathy as a mechanism for designers to 'put themselves

in the users' shoes' with the intention of gaining a deeper insight into user needs and experiences. This perspective risks not adequately acknowledging power relationships and oversimplifying the complex dynamic nature of identity and empathetic engagement in posthumanist and transdisciplinary applications of design research with stigmatised communities.

Drawing upon our prior experience in community-based speculative design and participatory photography workshops with young people who have experience with care systems, we frame our understanding of empathy through Edith Stein's (2012) phenomenological framework. Stein emphasises empathy as a deeply embodied understanding, bridging the gap between observing and experiencing emotions. Her concept of empathy, where one is 'alongside the other but never one with them,' offers a more nuanced and respectful approach than the notion of putting ourselves in the other's shoes. It suggests that while experiential engagement can lead to a better understanding of another's experiences, complete identification with the other is neither possible nor desirable, as it risks erasing the individuality and subjectivity of the other person and may not be ethically cognisant of power relations (Stein, 2012). This distinction invites a mindful and ethical approach to empathise with participants, recognising the limits of our understanding alongside the importance of respecting participants' autonomy and individual lived experiences.

Given the tendency of individuals with care experience to have imposed framings, a key starting point for our generative workshops drew on queer theory for the co-creation of safe and brave spaces for dialogues and creative expression (Arao & Clemens, 2013). Fundamental to this endeavour is an emphasis on trauma-informed practice, recognising the self-efficacy of individuals in shaping their own narratives and representations throughout the data generation, analysis, interpretation, and representation processes.

Building on the framing of empathy in design research, this section provides an overview of the research's application of trauma-informed and responsive practice grounded in a UK policy context. The principles covered include a nuanced understanding of our fundamental ethical duty of care, including preventing re-traumatisation in the research activities and nurturing emancipatory and reparative practices. This discussion aims to bridge the theoretical insights on empathy with practical approaches in trauma-informed and responsive care.

Gabor Maté (2022) defines trauma as a psychologically distressing event outside the usual human experience, often involving intense fear, terror, and helplessness, with complex trauma persisting over time and being difficult to escape from. In the context of policy, trauma is frequently communicated through the related principle of Adverse Childhood Experiences (ACE), which tend to be higher for care-experienced individuals (Appleton & Stanley, 2010). Simkiss's (2019) research highlights that the transition into care itself, despite being a protective measure, can also be a traumatic experience, exacerbating the sense of insecurity and loss, making it more challenging for these children to form stable, trusting relationships, develop a sense of self-efficacy, and feel safe and loved.

Trauma-informed practice recognises the widespread impact of trauma and seeks to create environments that promote safety, trust, and self-efficacy for individuals who have experienced trauma (Fallot & Harris, 2009). Drawing on guidance from NHS (2017), we emphasised safety, trustworthiness, choice, collaboration, active involvement, and building opportunities for individuals to benefit from their participation. We focused on understanding factors such as play that shape environments conducive to co-creating safe and brave spaces, facilitating active participant engagement and mitigating activities that could inadvertently cause re-traumatisation. The project's emancipatory and reparative potential was demonstrated during the participant-led performative event at the Department of Education, which emotionally engaged attending policymakers and politicians.

3.2 Agential Realism

Traditionally, Human-Computer Interaction (HCI) has foregrounded human experience and agency, positioning technologies as auxiliary instruments in the process of knowledge production. However, this perspective may limit our understanding of agency in a more expansive sense. Drawing on the feminist scholarship of Karen Barad, we challenge the prevailing assumption that human intentionality or reflexivity are prerequisites for agency. Instead, we argue that lens-based technologies actively contribute to the unfolding of phenomena in their unique ways, manifesting their agential capacity within the dynamics of a more-than-human assemblage of actors. From this perspective, lens-based technologies such as augmented reality can influence how events are framed, perceived, and interpreted, co-shaping the practices of meaning-making they are involved in.

Agential realism is a philosophical concept proposed by Karen Barad (2003) that emphasises the emergent performative nature of mattering. This perspective highlights the entanglement of human and non-human actors in the ongoing production of knowledge and meaning. Agential realism challenges the notion of fixed boundaries between subjects and objects and recognises that meaning-making is a dynamic and relational process. Barad foregrounds the notion that agency does not pre-exist but rather emerges through the dynamic 'intra-actions' between different entities, including technologies and environments. Table 1 summarises the pivotal agential realist concepts important to our research.

Table 1. Fundamental agential realist principles.

Agential Realist Principles	Description
Intra-action	Unlike interaction, which presupposes the existence of separate, independent entities that come into contact, intra-action posits that entities do not pre-exist their relations; rather, they continuously materialise through their ongoing relational engagements reshaped within the ecologies of intra-actions (Barad, 2007).
Diffractive Methodology	This study's analysis and discussion on the experience of digital artefacts employ Barad's (2007) diffractive methodology. This diffractive perspective diverges from traditional evaluative methodologies such as triangulation by not seeking fixed data points for analysis. Instead, it acknowledges the mutable and entangled nature of the research constellation, recognising the interconnectedness of all elements—participants, researchers, environment, activities, and lens-based technologies. This approach highlights the role of multiple perspectives and the active participation of research apparatuses in the shaping of unfolding phenomena. It examines patterns of difference, interference, and entanglement that arise when entities intra-act, inviting the exploration of agential relationships and uncertainty.
Ethico-onto-epistemo-ology	Combines ethics, ontology, and epistemology to explore the interconnectedness of values, existence, reality, knowledge, and belief.

Developed on agential realist foundations, this study emphasises the co-constitution of tacit and latent knowledge that are central concerns of generative design research (Sanders & Stappers, 2012) emerging from agential relationships among research stakeholders, care-experienced communities, lens-based technologies and environments. The emergent nature and focus on care identity in this research necessitate a flexible and adaptive theoretical approach, which accommodates generative insights throughout the creative and participatory design process of interpretive understanding.

Incorporating principles of agential realism into applied theatre and design research offers fertile ground for innovative explorations. This perspective can open new avenues for understanding and designing interactive experiences responsive to the complex entanglements between humans, technologies, and

environments. Additionally, by recognising the co-constitutive nature of knowledge production, researchers can develop more inclusive and collaborative approaches that value the contributions of all actors involved in the research process.

The subsequent methodology section of the paper furthers this explanation and justification for these philosophical and theoretical principles with a focus on generative design research practice. It delineates how the posthumanist perspective, along with principles of empathy and trauma-informed design research, was operationalised in the study. The section also discusses the practical application of verbatim and image theatre techniques in the co-creation and presentation of the augmented reality (AR) artefacts.

4. Methodology

> "Play delights in uncertainty."
> Alex Dunedin

4.1 Generative Design Research

Our application of generative design research revolves around a playful and collaborative approach to navigating uncertainty. Generative techniques can be articulated in multiple dimensions of our creative research practice. Firstly, we work with and for communities through active and attentive listening, collectively generating topics for exploration rather than hypothesis testing. Secondly, we generate knowledge on tacit and latent aspects of social and technical phenomena by playfully and reflexively attending to what people make, improvise, and dream.

Drawing on Sanders and Stappers (2012), our generative process aims to co-develop insights that can be difficult to surface through other research approaches. By technique, we refer to the material-discursive activity - in this case, playful practice-led applications of ubiquitous technologies animated with participatory and emancipatory mindsets. These generative principles align well with the techniques of eliciting, encoding and performing verbatim testimony as practised by The Verbatim Formula.

4.2 The Verbatim Formula

The Verbatim Formula (TVF) is a participatory arts initiative based in London. TVF employs verbatim theatre techniques, using words identical to the original source, to attend to the voices of care-experienced young people. 'Verbatim' signifies a commitment to honouring fidelity in representing participants' testimonies through word-for-word performative delivery with care professionals and policymakers (Baker & Inchley, 2020). TVF emphasised reparative facets of verbatim techniques and performance, underpinned by activist and justice-orientated principles from applied theatre towards change and community cohesion.

The verbatim formula process, from the acquisition of testimonies to the headphone theatre performance, is characterised by its simplicity and accessibility, facilitated by low-fi technologies like iPods. In workshops, participants are considered co-researchers; they actively shape discussions about topics that matter to them, sharing their thoughts and experiences, which are recorded as verbatim testimonies. Subsequently, these recordings are transformed into headphone theatre performances, where audiences experience the testimonies directly, creating an intimate and impactful connection with the narratives.

This participatory method is a compelling approach to information design. It represents an affective form of data physicalisation through performance, preserving the essence of human connection through eye contact between the performer and the audience. From an ethical perspective, it respects the integrity of the co-researchers' testimonies while inviting audiences to engage with the lived experiences conveyed in the recordings in novel and immersive ways. Table 2 summarises ethical considerations aligned with trauma-informed design principles alongside our application of verbatim techniques with digital media.

Table 2. Ethical and trauma-informed design principles alongside verbatim techniques.

Ethical Consideration	Our Application of Verbatim Techniques
Duty of care, confidentiality, and privacy	Participants are not asked to repeat their story multiple times, reducing the risk of re-traumatisation or desensitisation.
Trauma-sensitive relational design	Verbatim techniques are integrated into a trauma-sensitive relational design approach, positioning participants at the centre rather than engaging in pseudo-consultation.
Active participation	Co-researchers have control over their own stories and representation throughout data collection, analysis, and communication.
Self-efficacy	Hearing their words voiced back to them can be a powerful means for young people to realise that their opinions and the things that matter to them are being heard, valued, and acted upon, supporting a sense of self-efficacy.
Attentive care	Verbatim techniques nurture a mode of attentive care through active, embodied listening for co-researchers and audiences.
Emotional engagement	Verbatim performances create emotionally affective engagement with audiences through the embodiment of what is being shared, inviting them to listen with their hearts.

4.3 Verbatim Audio with Augmented Reality Artefacts

Early in the collaboration, TVF expressed an interest in the narrative and audience engagement capabilities of immersive technologies such as augmented reality (AR), especially the notion of a 'digital trace'. We came to understand their position from an applied theatre perspective, in that the digital artefacts created would resonate with the audience after the live performance, involving a two-step rhetorical process:

- Firstly, evoking emotional echoes reminiscent of the live event — much like how certain songs, flavours, or scents can transport one back to a past emotional and sensory moment;
- Secondly, it is a means of reminding audiences of their promises to honour what they heard and experienced.

In addition to TVFs' expectations of digital technologies, we were keen to investigate how live audiences' experiences of digital artefacts might not only evoke but also provoke emotional responses on their own merit. This conceptualisation of the digital artefacts as material-discursive vessels of data positions them as a fundamental component of the live experience rather than an instantiation of a verbatim performance. This idea resonates with the enquiries posthumanist stance and Christopher Frayling's perspective of 'design as research', where he suggests that knowledge is embodied in design artefacts, which are not just an instantiation of an idea, it is the idea (Frayling, 1993).

5. Trauma-Informed Workshops

As an antecedent to the discussion section, accounts of workshop activities are communicated through critical 'reflection in action' (Schön, 1983). The augmented reality (AR) artefacts were co-created during trauma-informed workshops with the young people who are care experienced and The Verbatim Formula (TVF). These sessions enacted playful, performative research, blurring disciplinary lines between human-computer interaction (HCI) and applied theatre to elicit novel, somatic experiences with participants and lens-based technologies.

After engaging in applied theatre games as a playful way to establish a sense of safe and brave space, the care experienced co-researchers discussed what they would say if they could speak to the people in charge of the care system. They recorded verbatim audio testimonies on aspects of their lived experience, such as not being able to hug their social worker and the uncertainty of care placement moves. Key relational moments from these scenarios were then expressed in Image Theatre activities as tableaux for deeper analysis and discussion. A tableau is a theatrical technique where participants pose to create a freeze-frame with their bodies (Jackson & Boal, 2005). This creative participatory practice facilitated an embodied means of reflexivity among the participants, enabling the appreciation of multiple subjective perspectives on the same social phenomena.

Collaboratively 'making' rather than the researcher 'taking' images, various tableaux were recorded by co-researchers using a volumetric camera, resulting in 3D digital ethnographic artefacts for continued dialogue, meaning-making and reflexive practice. Figure 1 represents an image developed between the workshops in response to the testimony about not being able to hug a social worker. To preserve the confidentiality of the care experienced co-researchers in the border dissemination of media, the two figures are 'corporate parents' from Edinburgh Napier University, who willingly participated in an image theatre activity. In the UK, a corporate parent is the name given to an organisation or person who has special responsibilities to care experienced children and young people. In this improvised tableau, one participant embodied a foster carer, while the other represented a young person with care experience. Their enacted hug, depicted in the render, emerged intuitively in response to the emotional theme and timbre of the verbatim testimony.

These artefacts form spatiotemporal representations of the image theatre activity. The aesthetic decision to present the artefacts as point clouds and wireframes is congruent with the tableau workshop experience and research objectives. It preserves the fidelity of the original data while creating a layer of abstraction for addressing ethical challenges of representation and confidentiality.

Figure 1. 3D Scan of hug image statue.

To enrich the co-performative meaning-making process, we embraced the notion of prototypes as media for human interaction, presenting the co-researchers with digital prototypes of the artefacts in augmented reality (AR). The experience facilitated a reflexive process of coding and feedback. This approach underscored the importance of intersubjectivity and ongoing dialogue in the dynamic, iterative experience of creating meaning.

On one level, the prototype represents a digital echo of the initial image theatre experience, encapsulating data as a trauma-informed means of presentational knowing. At another level, the prototype is an invitation to engage with the sculptural piece actively and generatively. This material-discursive perspective aims to extend the actively participative process of the artefact's initial creation by opening up spaces for ongoing dialogue by exploring the affectual collaborative meaning-making potential of AR data artefacts with the co-researchers and audiences.

The sensory information codified in the AR artefacts from the workshops comprises data as verbatim testimony and physical expression of lived experience. The AR artefacts are framed as a potential interface for ongoing meaning-making, illustrating co-constituted agential relations between data and personal value systems. This positioning resonates with Barad's (2007) ethico-onto-epistemo-logical principles, highlighting the inseparability of emergent values, ways of being, and knowing.

6. Performance at the Department for Education

> “What’s your available agency to make a change?”
>
> Sylvan Baker TVF

The account of the audience engagement with the verbatim AR artefact was part of an event titled ‘My Story, My Words’ that took place at the Department for Education (DfE) in London. Pseudo-names are used to protect the confidentiality of the care experienced co-researchers. The room where the performance took place had four rows of seating and a capacity for around 50 people; most seats were occupied, with some people standing at the back. Audience members included the Head of Wandsworth Social Services, the Minister of State for Children, Nadhim Zahawi, and senior civil servants from the DfE. Our showcase of the AR artefacts was preceded by other performative activities delivered by the co-researchers.

When it was our turn, we continued the ethos of a prototype as a means of crafting interactions and dialogue with the audience and initiated a ‘show and ask’ communication to solicit comments and elicit feedback. A co-researcher, whom we will pseudonymously call Nathan, described to the attendees how our digital prototype draws from the testimonies of co-researchers who felt objectified by the care system, feeling reduced to mere files or numbers. Addressing this, our prototype featured the AR verbatim statue that functions via a barcode system. When scanned, it projects a 3D image, encapsulating the message: "I'm more than my barcode, I'm more than a statistic." Yet, discerning this message requires a distinct 'lens' or viewpoint (See Figure 2 by Paula Siqueira).

Figure 2. AR Artefact Demo.

Preceding to a live demonstration using an iPad, Nathan invited participants from the audience to experience our digital piece first-hand. He conveyed that the heartfelt testimony "A hug can change a lot" inspired the 3D imagery. As the participant explored the AR representation – two figures intertwined in an embrace – Nathan narrated the development journey, explaining the design choices and encouraging them to explore the 3D sculptural nature of the visual (See Figure 3 by Paula Siqueira). Upon activating the integrated verbatim audio testimony projected to the audience via a Bluetooth speaker, Nathan emphasised our intention: leveraging technology to communicate narratives of how the care system feels from the perspective of those with lived experience through and beyond live performances. The audience's response was positive, and the outcomes aligned with TVF's vision of a digital trace.

Figure 3. AR Artefact Demo 2.

Going beyond visualisation, it hints towards a form of data visceralisation (Koterwas, 2023; Lee et al., 2020), conveying multi-sensory information emotionally. In line with the utilisation of verbatim techniques, trauma sensitivity is elegantly integrated by creating distance between personal stories, the performer of these and the audience.

During the Minister of State for Children, Nadhim Zahawi's closing remarks, he contemplated the need for a more humane system, expressing his personal agency for change,

> "How can I get the whole system to hear you, to listen to the uncomfortable truth? We have to listen to you if we want to make the system respond and be better. I will take that away and think about how we can scale this up."

Following these reflections, he engaged with our AR prototype. Nathan assisted him in launching the application on the iPad. Zahawi then intuitively navigated around the 3D model in AR of the hugging figures, which remained anchored to the Zapcode on the lightbox (See figure 4).

From an agential realist perspective, by observing Zahawi engaging with the AR prototype, we became an integral part of the unfolding phenomena. He expressly shifted his stance to observe the model from different angles, gaining various perspectives on the figures embraced in a hug, evoking Stein's (2012) definition of empathy 'alongside the other'. Beyond passive observation, his active participation could be seen as a material-discursive mode of being, knowing and valuing. A meaning-making process involving engaging visual, auditory and somatic senses as a form of embodied cognition with digital data. In this dynamic, the actualisation of agencies within the constellation of phenomena is expressed through the interplay of several elements. These include the environment of the Department for Education (DfE), the AR 3D figures, the iPad, Zahawi and our role as observers. This entangled and contingent relationship underscores an emergent material-discursive view of reality, where both the observer and the observed co-constitute the reality being experienced.

During Zahawi's engagement with the AR prototype, the interplay between the digital and the physical realms became a focus of our attention. It was as if his movements weren't just physical adjustments; they symbolised a conceptual journey of understanding. He paused his spatial exploration to listen to the verbatim audio recording, focusing on the message that 'a hug can change a lot'. His interaction with the piece echoed a core objective and challenge of qualitative research—understanding complex social phenomena by empathetically identifying with others and attempting to grasp their subjective experiences. The extent to which this generative engagement stimulates cognitive empathy, as enabled through active participation in the narrative and connection with the stories being told, were themes we became curious to explore in future projects.

Figure 4. AR Zapcode on the lightbox. Follow the web link to see a video of the AR prototype in the DfE: https://youtube.com/shorts/JoNtBrJGkGg.

Zahawi was enthusiastic about his experience with the prototype and its potential for supporting his commitment to the co-researchers in exploring how to create a care system that values listening over bureaucratic protocols. He left us a card with his details requesting a version of the prototype and lightbox for his office. This was a positive affirmation of the concept and an opportunity to continue dialogues by sending him future AR testimonies as they develop.

Reflecting to what extent the digital prototype addressed TVF's interest in the narrative and audience engagement capabilities of immersive technologies, we returned to their notion of a 'digital trace'. The idea is that digital media can be positioned to evoke emotional echoes reminiscent of the live event, reminding audiences of promises they made to honour what they had heard and experienced. The interaction with Zahawi demonstrated the potential of the digital prototype to open new avenues for story presentation, ensuring that the co-researchers' narratives could continue to resonate and exert influence at both live and asynchronous events in and beyond the traditional practical and temporal limits of a live performance.

7. Discussions on Digital Artefacts as Data: Values, Being and Knowing

This section expands on the key insights gained from exploring the intersection of augmented reality (AR) technology and verbatim techniques, especially during the live Department for Education (DfE) event. Barad's (2007) diffractive methodology proved useful in analysing and interpreting how the means of investigating emergent values and phenomena interact and influence each other, communicated as critical 'reflection on and for action' (Schön, 1983).

Framing verbatim testimonies and AR artefacts as data based on ethico-onto-epistemo-logical principles that recognise the inseparable nature of emergent values from ways of being and knowing lays the groundwork for discussions on the intersections of values, data, and generative design methodologies. This discussion on digital artefacts as data and interfaces of emergent knowledge includes aesthetic and ethical discussions on the degrees to which they honour the fidelity and immediacy of lived experience and their potential for generative interaction with audiences. The focus is to illuminate the material-discursive interplay between the co-researchers' narratives, environments, audiences, and digital media materiality in contributing to understanding trauma-sensitive meaning-making and reparative practices with care experienced communities and policymakers.

Earlier descriptions characterised the digital artefacts from the co-creative workshops as active conveyors of meaning and knowledge. In exploring generative factors relating to the dialogical and socio-technically constructed values embedded within the AR prototypes, we characterise them as epistemic artefacts (Rheinberger, 1997). This perspective is extended through an agential realist worldview, recognising the intertwined nature of human and technological elements in the knowledge production process. In the context of generative design research, the AR epistemic artefact is explored in relation to co-performative extensions to our sensory perceptions. This includes material-discursive factors of how and what we come to know, who is represented and by whom. We discuss these ideas by reflecting on the AR epistemic artefact experience at the DfE performance and potential future iterations.

The positioning of the AR prototype as an epistemic artefact recognises its participative potential for codifying data that is a trauma-sensitive representation of the original image theatre activity and an ongoing co-performative experience in itself. This framing opens a perspective for exploring the blurring of spatiotemporal and conceptual boundaries between digital and physical realities towards novel and emergent material-discursive treatments of data. For instance, by actively involving the audience and the surrounding environment, the digital experience has a generative potential. While the verbatim audio remains consistent with each playback, the values and meaning derived are emergent, contingent on the audience's viewing perspective, interpretation, lived experience and ambient environment. In its 'not-yetness' (Ross & Collier, 2016), the material-discursive essence of the experience cultivates a dimension of uncertainty, one that is required to actualise agential relationships within the distinctive amalgamation of elements during each unique encounter.

The sensory information codified in the digital epistemic artefacts comprises data as verbatim testimony and physical expression of lived experience. The audience intra-acts with the artefacts through spatial, temporal, somatic, visual, and auditory means. This performative interface between human and technological entities could be seen in the conceptual journey of understanding described earlier in Zahawi's engagement with the AR prototype. In this configuration, AR offers novel, creative opportunities for representing subjective lived experiences distinct from other extended reality (XR) technologies.

Unlike virtual reality, which immerses you in a fully digital environment, AR allows for the layering of digital content onto the physical world. This layering creates a hybrid space that invites the audience to seek new perspectives alongside the image statue renders, connecting digital experiences, environments, and audiences. This blending of the physical and digital in AR enables a modality where the digital artefacts become part of the audience's immediate environment, positioning the environment and audience as characters in the unfolding narrative.

The experience of the AR prototype mimics aspects of a theatrical fourth wall break, a potentially self-revelatory experience where the lines between the audiences' physical and conceptual worlds become blurred with the digital scene. By blurring these boundaries, the audiences' intra-action implies a degree of agency to influence both the digital and physical world. The juxtaposition and interplay within the entanglement of the digital and the physical provide opportunities to study how constructing perceptually novel ways of experiencing narrative data can alter the audiences' attitudes and awareness of their own agency. The experience is intended to leave audiences with the implicit question: What is their available agency for making changes? Morrison and Kranicz's (2022) related research with extended reality (XR) technologies incorporates verbatim testimonies with the Microsoft HoloLens to explore the roles of interactive elements within mixed reality experiences.

This analysis of the epistemic artefacts as material-discursive experiences contributes to the discussion on the generative and interconnected nature of agential relations between values, design approaches, and data codified in digital artefacts. A similar conceptualisation of value alignment can be found in Barad's (2007) view of the intertwined nature of knowledge and materiality between humans and non-humans, grounded in their ethico-onto-epistemo-logical principles. This worldview underscores the reciprocal nature of the research endeavour, where lived experience, data, and values are inextricably intertwined. Such connections illustrate the entangled and reciprocal nature of material-discursive experiences, where the integration of digital media can reshape the ways we perceive and understand the world, influencing how we interact and respond to our environment and others.

The verbatim testimonies maintain the co-researchers' confidentiality while facilitating the audience's embodied listening, creating a trauma-sensitive interface between the audience and co-researchers' lived experiences. This aligns with Stein's (2012) phenomenological framework, which emphasises empathy as a deeply embodied understanding, bridging the gap between observing and experiencing emotions alongside the other. The application of applied theatre techniques with the iterative cycles of design prototypes provided introspective moments of reflexivity, enriching ethical strategies for qualitative rigour in the process and practice of digital experiences developed with and for communities as contributions to generative design research.

8. Conclusion

This research has explored the potential of augmented reality (AR) incorporating verbatim testimony in communicating and disseminating trauma-sensitive qualitative research to audiences while respecting the fidelity and emotional integrity of the original data and its source. Positioning the AR prototype as an epistemic artefact has opened new avenues for exploring interfaces between the digital and physical, introducing new pathways for appreciating the entanglement of the observer and the observed and creating opportunities for reconfiguring the audience's emotional and participatory engagement. The AR prototype's capability to involve audiences suggests a generative dimension to digital experiences. The dynamic nature of these epistemic artefacts, where values and meanings emerge contingent on individual perspectives and situated contexts, offers opportunities for developing perceptual insights into the potential affective and political possibilities of the technologies.

Positioning the epistemic artefacts as data prompts critical reflections about their impact on the ethics and politics of representation and potential value in policymaking. By disrupting conventional value structures, this experiential data unfolds a divergent counter-narrative. Beyond relying on impersonal statistics or pseudo consultations, the verbatim artefact approach signifies an opportunity for a potential relational and reparative representation of societal reality from the perspective of individuals with lived experience of the care system. Within the ethical boundaries of the research and the DfE event's political context, this enriched perspective supplements existing data and knowledge towards the potential to impact real-world conditions.

By grounding the findings in Stein's phenomenological framework and Barad's agential realism, this discussion illuminates the potential of AR and verbatim techniques in creating emotionally engaging, trauma-sensitive experiences. The insights contribute to dialogues on redefining data boundaries and conceptions of value in generative design research. The AR artefacts are spotlighted as active agents in creating and disseminating knowledge, offering a new trajectory for understanding and engaging with data. This approach positions listening and co-performativity as a mode of care and a sensory practice of knowing, challenging conventional perceptions of data and technology towards humanising policy and care services.

8.1 Future Work

> “Be ruthless with systems and kind with people.”
>
> Chanel Contos

Future research will focus on advancing the co-creation of digital epistemic artefacts, focusing on generative and speculative data imaginaries for education, advocacy, and a call to action by engaging audiences in the emotional dimensions of lived experiences. We aim to contribute further insights into the embodied co-performativity of somatic data, examining the potential of affective, collaborative approaches to meaning-making. While detailed discussions on applied findings are beyond the primary focus of this study, future applied research could strengthen the bridge between research understanding, theory development, methodological pluralism, and broader practical applications.

We will continue to explore the possibilities of immersive and affective experiences that engage audiences on a visceral level, investigating how design elements can be leveraged to provoke emotional responses and create a more embodied understanding of the experiences being represented. We are exploring how emergent extended reality (XR) technologies continue to blur the boundaries between the digital, physical, and conceptual realms, where the audience's intra-action implies a degree of agency to influence both the digital and physical worlds. The juxtaposition and interplay of forces within the entanglement of the digital and the physical provide opportunities to study how constructing perceptually novel ways of experiencing narrative data of lived experience can alter the audiences’ attitudes towards their available agency for change.

KEYWORDS | DATA DESIGN, DESIGN HERITAGE, MUSEUM

ABSTRACT | The integration of digital technologies in museums has instigated a transformative shift in various facets of museum practices, reshaping acquisition, preservation, communication, and exhibition processes. This evolution has given rise to a hybrid physical-digital nature within heritage institutions, where analog, surrogate, and digital dimensions coexist while retaining their distinct identities.

Within this dynamic context, digital data has emerged as a pivotal design material, fundamentally altering the operational landscape of museums. The field of "digital cultural heritage design" provides tools and processes to develop solutions that bridge preserved heritage with practices enhancing visitor experiences both on-site and online. This exploration of digital technologies and diverse media has led to three main types of intervention: datafication, representation, and narration.

Identifying design heritages as a field that due to its peculiarities can benefit manifold from these practices that open up new perspectives on the enhancement and understanding of collections, the paper investigates data-driven design approaches for design museums geared toward promoting innovative forms of heritage fruition and knowledge sharing.

The research identifies the designer's role, outlining objectives, target beneficiaries, competencies required, and associated deliverables for data-driven design approaches in museums. Envisioning a "process interface museum," the research suggests that data serves as a resource for study, research, exhibitions, and a foundation for a shared production of design history. It anticipates a future where museums seamlessly integrate physical and digital elements, leveraging data to enrich visitor experiences and contribute to the collaborative construction of cultural and design history.

1. The Museum's Digital Transformation

Museums encourage and stimulate the spread of knowledge by contributing to the preservation of a society's memory and the construction of its history through methods, processes and practices which characterise the social, cultural, and technological context in which it was conceived. Their Collections, presented in both temporary and permanent exhibitions through a specific didactic apparatus resulting from historians' and curators' in-depth studies, elaboration and interpretation, have been until recently the main instrument for the diffusion of cultural heritage. (Parry, Ortiz-Williams & Sawyer, 2007)

The introduction of digitalisation indeed marked a major departure from the consolidated practices of acquisition, conservation, filing, research, communication and exhibition of said heritage (ICOM, 2022) triggering an overall process of change that still today produces and requires epistemological, cultural and social reflections on the functions of the museum institution as well as on the hybrid physical-digital nature that increasingly characterises heritage. (Parry, 2007) Not only that, the refinement of renewed digital collection management systems demonstrates the intensification of opportunities for museums to interrogate, interconnect and share data. It basically amounts to two different forms of data, first made official in 2003 (UNESCO, 2003), namely *digital surrogates*, visual reproductions of analog artefacts created through standardised methods and techniques (Marras et al., 2020), and *digitally born*, artefacts existing merely in the digital format.[1]

The inclusion of digital surrogates and digitally born heritage by museums – e.g. by London's V&A, Washington's Smithsonian Institution and New York's MoMA – has made possible the broadening of the collections' boundaries with digital materials including digital texts; organisational and personal records of activity; transactions; correspondence; datasets collected to record or analyse scientific, geospatial, spatial, sociological, demographic, educational, health, environmental and other phenomena; learning objects; software tools such as databases; models; simulations and software applications; digitally-generated artworks and documentary photographs; scans, still and moving images; audio recordings; graphics; web sites; blog posts; social media pages in a wide and growing range of formats.

This increase in museum heritage has been accompanied by the expansion of digital-driven modes of fruition and specific personal devices and technological apparatuses (Lewi et al., 2019), enabling museums to offer plural narratives, conveyed by physical and digital devices, and to disseminate knowledge to a broader public that, when involved, relates directly to the artefacts. Digital data can in fact take on two functions: on the one hand, they convey the content of the narrative associated with the physical artefacts; on the other, they constitute the information carrier integrated with the artefacts and represent both the useful tool for conveying communication and part of the potentially communicable content.

Regardless from the will and possibilities of the various museums, this introduction to the digital dimension, in view of obvious benefits, has fuelled a broad debate on the planning and adoption of strategies to face this historic transformation, which has, with the *OpenGlam* movement (https://openglam.org) come to prefigure ethical open access to cultural heritage.

On the one hand, through an agenda promoted by dedicated international organisations, among which the International Council of Museums (ICOM, https://icom.museum/en), the International Committee for Audiovisual, New Technologies and Social Media (AVICOM – ICOM, https://avicom.mini.icom.museum/), and, in Italy, the *Commissione tematica Tecnologie digitali per i beni culturali* (https://www.icom-italia.org/commissione-tecnologie-digitali-beni-culturali-icom-italia/).[2]

[1] The former corresponds to the operations of digitalisation of historical documents, while the latter to the production of digital material.

[2] A body that, while taking care of AVICOM's work on a national level, develops initiatives for the activation of a dialogue between experts and institutions in the field of digital technologies for the conservation, documentation and communication of cultural heritage. Retrieved 2 August, 2024, from hjcjttps://avicom.mini.icom.museum/.

On the other hand, through activities by organisations/networks – among which the Museum Computer Network (MCN, https://mcn.edu/), the Museums Computer Group (MCG, https://museumscomputergroup.org.uk/), and the Network of European Museum Organisations (https://www.ne-mo.org/).

In the different occasions promoted in these contexts, since 2017 the discussion between professionals and institutions has covered multiple aspects: from the introduction of new forms of communication, fruition and participation, to the connection and relationship between institutions, from the accessibility of heritages and technologies to the development of an evaluation model for European museums, with a specific focus on the measurement of social impact (MOI - Museum of impact https://www.museumsofimpact.eu/en/museums-of-impact). Last but not least, the question of the relationship between the material essence of the artefact and the immateriality of the digital surrogate (Drucker, 2013). Indeed, the process of abstraction that characterises the acquisition of artefacts transforms the relationship between user and heritage, which, being more accessible and shared, nevertheless loses its qualitative-sensorial material dimension with the consequent reduction of values, at least from the point of view of perception. (Cameron, 2021, p. 105)

2. Data and Dataset in the Museum, from the Functional Role to the Social One

In a nutshell, the historiography of museum computing identifies in the 1960s in the United States the first initiatives of automated cataloguing of collections (Parry, 2007) that, by replacing paper instruments and the curators' memory with the primordial electronic documents provided the first systems of data search and retrieval (Sartori, 2016, p. 3). The continuation of catalogue automation processes goes in the following decade through the introduction of "new standards, a control of terminology and a systematisation of data entry" (Parry, 2007, p. 51), associated with the development of relational database management systems based on interconnected data tables (Sartori, 2016, p. 4). This production of information, at first only functional for the optimisation of the cataloguing and management of museum collections, becomes in the next phase one of the main goals and tasks of the museum, reconfiguring it as a repository and transmitter of information within society (Parry, 2010). George MacDonald and Stephen Alsford explain the influence of this transition in 1991:

> "Indeed, we must define "information" broadly. It may be intellectual, aesthetic, sensory, spiritual or emotional in nature or, more likely, an experience involving some combination of these elements. Culture is learned as a set of "messages", each of which includes various types of information. Culture is expressed not only through objects, but also through processes, ideas, feelings, personalities and so on." (MacDonald and Alsford, 1991, p. 308)

This idea of the museum as an "information utility", in which artefacts, didactic apparatus, audiovisual materials, databases, staff experiences, oral histories, re-enactments and live performances are understood as complementary, layered and overlapping communicative resources (MacDonald & Alsford, 1991), comes into being at the beginning of the Millennium with the spread of the World Wide Web, which allows for an enormous expansion of the relationships between multimedia, hypertexts, hypermedia and the Internet itself (Cameron, 2007). The discussion started even before the advent of the Internet era and the Graphic User Interface, and it focuses on shared/searchable databases; re-using research and data; visualising geographical and architectural contexts for museum objects; enhancing learning environments by adding multimedia capabilities; creating immersive galleries and virtual tours; and solving usability issues through interface design. (Farrelly, 2016, p. 172)

Underlying this transformation is the shift in the role of information technology from being a mere support for the internal management of collections to becoming an instrument of communication to the outside world, making information– and thus the collections themselves – accessible not only to the museum community but to the wider public. The structure of the museum is therefore assimilated to an indexed

collection of information, designed for archiving and retrieval, and identified through a reading of the objects systematised according to predefined and shared rules in a multi-layered information system and with the goal of clarity promoted by the desire to be informative.

Is the museum therefore a database? This provocative proposal by Mike Pepi (2014; 2019) picks up on Manovich's observation that “the database is the symbolic form of the post-industrial era” (1999, p. 2) and alludes to Parry's studies for which not only has the database become “the metonym of the museum” but, on the contrary, “the database itself [...] is endowed with the qualities traditionally associated with the museum”. (Parry, 2007, p. 51)

On the other hand, the overlapping of the term “museum” with “library”, "collection” or "archive” has now made the boundaries of these institutions increasingly blurred and sometimes ambiguous (Lupano, 2013), both in the structure they bring to mind and in the roles connected to it, all the more so when, moving out of the almost exclusively public dimension, they represent entire collections of materials that could be acquired by almost any Internet user in the more or less recent past (Schnapp, 2008).

Beyond definitional and terminological disputes that are beyond the scope of this paper, it is however clear that in just a few decades, as mentioned so far, the digital dimension has profoundly altered the structure and nature of the museum, highlighting both the possibility of considering different forms of expression and the connective properties of data as foundations on which to base museum practices and the need for interdisciplinary approaches and skills to govern the “new museum”. (Manoff, 2004; Clement, Hagenmaier & Knies, 2013)

3. The Case of the Design Museum

Between two traditional museological models, synthetically referring to the isolation of the art object or to the exhibition of the functionality of the technical object, the design museum constitutes a category of exhibition and research structures, sometimes elusive due to the history of the institutions that deal with it, the different types of artefacts it contains, or because the same artefacts are often kept in museums dedicated to something else. (Dalla Mura, 2010)

Even in this museum “category”, the debate, besides highlighting specificities and critical issues, has raised the question of its expansion through digital interactivity. (Farrelly & Weddell, 2016) In 2016 the scholar Liz Farrelly thus predicted: “An examination of some moments in the pairing of museums and ‘hypertextual connectivity’ reveals the digital online museum as a site for the production of meaning and points towards innovations that might push the ubiquitous website beyond the current paradigm” (2016, p. 171), and since then design museums have also experimented with digital modalities to avoid the risks of dispersion of materials, facilitate new perspectives of study and “animate” their collections.

As far as collections are concerned, the digital transition has had at least two significant effects.
Firstly, it has highlighted the importance of new types of heritages previously overlooked as media artefacts, pieces that can offer, among other things, a representation of new fields and professions in the field of design, and of modes of interaction between person and object. It is no coincidence that in 2012 Paola Antonelli, Senior Curator of the Department of Architecture and Design at MoMA, by acquiring 14 videogames stated that she “kicked off a new era for the collection”. (MoMA, 2012)

Exhibitions such as *Decode: Digital Design Sensations* in 2009 at the V&A in London, co-curated by Louise Shannon, curator of Contemporary Programmes, and Shane Walter, director of the digital media agency Onedotzero, or *Talk to Me: Design and the Communication between People and Objects* in 2011 also at the MoMA, where Antonelli, with Kate Carmody, Curatorial Assistant of the Department of Architecture and Design, “tested” the combination of the physical exhibition of pieces and its web version containing official and online materials, have indeed contributed to generate the current collections. For example, the online catalogue of the V&A currently shows a total of 302 pieces, of which 32 are in the “Design, Architecture and

Digital Collection" (https://www.vam.ac.uk/collections) under the heading "software", while MoMA and the Cooper Hewitt Smithsonian Design Museum include 88 and 60 artefacts respectively, dating from 1966 onwards and distributed among digital fonts, digital posters, smartphones, videogames, interactive visualisation and much more (https://www.moma.org/collection/; https://collection.cooperhewitt.org/search).

The second aspect concerns the possibilities offered by the combination of heritage digitisation and data interoperability, which, by allowing the analysis of masses of materials belonging to different conservators, from institutional to individual users, can, on the one hand, contribute to the reconstruction of processes by connecting the contents of different collections – i.e. by exploiting the potential of using Linked Open Data (LOD) technology in creating relationships inside and outside the archive (Listo, 2019) – and on the other hand extend and renew narratives. These enormous digital datasets open up new perspectives on the understanding and valorisation of design collections by prompting one to reason about quantitative parameters and metrics such as occurrences of formal patterns that can reveal stylistic trends and cultural influences, or chronological links that show the evolution of artefacts over time, or even semantic relationships between different elements of collections that allow conceptual and thematic connections to be identified.

It should also be considered that what closely links this category of museums to the opportunities offered by the digital transformation is one of its distinctive features with respect to other museum categories and an expression of one of the contemporary interpretations of design, namely the possibility of making its process dimension evident (Bulegato & Scotti, 2024): "The design museum – design being the whole process between project and product – cannot be a place where only the finished product can be observed, because this is 'only' the result and the point of arrival of a long journey. In order to be aware of this path, one must have knowledge of all the actors and all the actions necessary, and indispensable, for its completion". (Cecchi & Pirola, 2022, p. 336)

This historiographical and museological approach (Huppatz, 2020) has characterised the realisation of two recent structures, questioning, among other things, those historiographical readings and curatorial practices of acquisition, cataloguing and display that have by now been canonised and consolidated. The renovation of the Design Museum in London in 2016 in which the permanent collection, *Designers, makers and users*, explores the history of design through extensive materials documenting and explaining the interconnections between the three subjects: creator, producer and consumer. (Newson, Suggett & Sudjic, 2017)[3] Similarly, in 2021, the ADI Design Museum in Milan, the newest of the Italian design museums, exhibited its permanent collection, *Il cucchiaio e la città* (The spoon and the city), dedicated to the Compasso d'oro[4] awards using heterogeneous documents – sketches, drawings, models, prototypes, products, communication artefacts, photographs, documents, publicity and so on – generated by the various parties involved in the project-production-sales-consumption-disposal process – client, designer, model-maker, printer, entrepreneur, factory technician, graphic designer, copywriter, distributor, consumer and so on – with which the design process can be summarised.[5]

4. The Museum as an Interface

The elaboration by Petrina Foti, Professor in Museum Studies at the Rochester Institute of Technology, helps precisely to frame the role of data in the museum context. Reasoning about possible display modes for computer history collections, Foti (2022) questions the characteristics of data. In the proposed matrix (fig. 1), the data, an informational unit, is expressed in six different forms (bits, evidence, lens, tool, object,

[3] The digital catalogue is more or less non-existent and the printed one only partially includes the many exposed pieces.

[4] *In progress*, as the prize is still active.

[5] There still isn't an archive in which the exhibited materials are accessible, while a printed catalogue is currently in the works.

story subject) which correspond to contexts of use (discipline, objective analysis, contextualisation, historical preservation, professional practice, interpretation) represented within the museum by different outputs and practices of research and knowledge restitution. The datum as bit expresses the minimum unity of the scientific discipline being exhibited; the datum as evidence constitutes evidence and traces in a process of objective analysis; the datum as lens is a functional device for contextualisation; the datum as object is an artefact to be preserved; the datum as tool is the subject of multiple professional practices; and the datum as story subject is the protagonist of an interpretation. (Foti, 2022, p. 26)

Data is INFORMATION	*Due to DEFINITION*	*This is expressed in a variety of way, such as Bits; Evidence; a Lens; an Object; a Tool; a Story Subject.*

Table 1: The Synthesis Matrix

Figure 1. Petrina Foti, The Synthesis Matrix, 2022.

A further effect of the digital transition is the consideration of new skills and approaches for the orientation and management of a new living and adaptive museum. There is no uniquely defined digital heritage professional or scholar. The figures who come together in the renewed context are technologists, computer scientists, archivists, academics, historians, designers, curators who are called upon to be part of an interdisciplinary dialogue the effects of which also reverberate on each of their relevant communities. (Parry, 2010, p. 3) In the context of this dialogue, particular importance is assumed by professionals such as interaction designers, visual designers, exhibition designers and science communicators, as they are active in contexts that require cross-sectoral skills that facilitate the integration of tools and the mediation of contents. (Vane & Davis, 2020)

The design of the museum thus approaches that of an interface capable of integrating physical and digital dimensions “that delimits a cultural space within which a specific set of relationships can occur” (Hookway, 2014); an interface that conditions the production and circulation of information and meanings based on its spatial arrangement, connectivity, depth, responsiveness and reconfigurability. The museum understood as an interface for knowledge recalls the research hypotheses put forward by Kathleen Pirrie Adams (2018), Professor of New Media at Ryerson University, who clearly propose the connections between the physical and digital dimensions, the “enriched space” that, as theorised by Elisa Bonacini (2020, p. 55), is the paradigm on which the museum reframes its characters.

In particular, Adams' conceptual framework of the museum system is defined through a vocabulary that draws on the language of computer science and interface design where the terms “asset”, “platform” and “affordances” accompany and extend museum practices metonymically. Adams identifies “collection” with the term “asset”, with which she highlights the coexistence of a variety of quantitative and qualitative data: objects, texts, images, media and records of intangible culture. (Adams, 2018, p. 296)

The artefact, brought from a material dimension towards a more informational one (Adams, 2018, p. 294) and placed in a system of dynamic and plural connections, contributes to the production of an “exhibition” that defined as a “platform” brings associations with shared space, multimodality and multimedia to mind. Interpretation – historically a monopoly of the museum and its curators – is in turn renamed "affordance", recalling a term imported from the field of user experience design that frees it from subjectivism by bringing out objective and relational aspects.

5. “Digital Cultural Heritage Design” for Design

Starting from Foti's theoretical framework and Adams' metonymies, considering physical and digital data, whether surrogate or digital born, as plastic and adaptive resources, this paper investigates design-driven practices for design museums, aimed at promoting original forms of heritage fruition and knowledge sharing.

Even in the case of this category of museums, design practices for museums are based on the in-depth study of content that encourages dialogue with curators and cultural heritage professionals, and on the consideration of technologies, tools and languages with which to enhance the specificities of the heritage while taking into account issues related to infrastructure and economies available at the time of setting up and in later periods, when use and management make maintenance necessary.

Design for the enhancement of the museum heritage uses the potential of digital to highlight, superimpose and integrate the visitor’s experience also through the use of quantitative and qualitative data in its different expressions (Foti, 2022), according to different media. As claimed by Mason and Vavoula (2021), this is “digital cultural heritage design”, an

> “Activity system where a disciplinarily diverse team of staff and partners engages in the (co)creation of knowledge about how to design in ways that are specific to and appropriate for the museum and its audiences; in terms of the network of actions and actors that constitute the practice; in terms of the design methods and representations that catalyse the design activity system; and in terms of the design knowledge assets that grow out of and feed back into the system.” (pp. 406- 407)

Digital cultural heritage design is therefore the project serving digital cultural heritage, which in this research is applied to design museums. It is concerned with relating the specific preserved heritage to practices that enhance the visitor's experience of knowledge on site and online by exploring digital technologies and different media.

Applying the prefigurative vocation of design to the field of museum studies and orienting research toward the production, interpretation and fruition of cultural datasets, the authors identifies three main types of intervention: datafication, representation, narration.

For the sake of clarity and coherence, it was decided to formalise the framework of interest of each intervention according to predefined parameters. For each typology we choose to indicate the objective pursued, beneficiaries to whom the action is addressed, design solution, services and competences required of the designer, tangible or intangible deliverable to which forms of expression of the data and context of use with reference to the matrix elaborated by Foti (2022) are associated. In support of the proposed framework, exemplary cases of design museums that give concrete expression to its potential will follow.

Table 1. Data framework.

	Datification	Representation	Narration
Data expressive form	bit / object	evidence / lens / tool	story subject
Context of use	discipline, historical preservation	objective analysis, contextualization, professional practice	interpretation
Objective	to promote the queryability of the collection; move beyond the punctual research key; use of metadata as a means of aggregation, grouping, filtering and retrieval.	to organize the complexity of information by promoting its understanding; to share the complexity of an issue; to create public engagement; to highlight relationships; to reveal aggregations.	to offer adaptive content, personalized narratives, and systems that can combine and transmit knowledge and expertise, making explicit the narratives inherent in an artifact; to elicit emotion and involvement; to transfer individual and collective memories between generations; and to foster connections between institutions and heritage, individuals and communities.
Solutions	search and retrieval system; data-driven hub	reading and orientation system, lens for clustering content	interpretation system
Competences	product and service design strategy; user research; UX, UI, brand design, front back-end development, impact monitoring	analyzing, cleaning and formatting data; UI; UX	UX; UI; user research; content management; engagement strategy
Deliverables	websites, content archives, digital platforms, online exhibitions	static and dynamic data visualizations	integrated physical-digital systems and applications; digital platforms
Beneficiaries	researchers, students, online visitors, curators	researchers, students, on site e online visitors, non-specialistic public	researchers, students, on site e online visitors, non-specialistic public

5.1 Datification

With datafication interventions, the designer proposes the development of research/retrieval systems that are configured as data-driven hubs for research exploration and planning and are aimed at facilitating the queryability and usability of the collection.

The museum as interface emphasises the multifaceted identity of the artefact as a complex of information/attributes. The transformation of artefacts into data is not a mere transposition of the physical object/document into digital, nor is it its reproduction on another medium; it is a translation process that by standardising the heterogeneity of formats, through the production of metadata, facilitates the possibility of connection, interconnection making relationships between different artefacts, collections and digital environments, possible.

This lays the foundations for overcoming the punctual access to information traditionally guaranteed by the “search field” – which Mitchell Whitelaw (2015) defines as a “stingy interface” – in favour of a fruition in which the “generous interface” allows the user to have a contextualised view of the content searched in the archive-museum through aggregations and filtering.

Among the metadata associated with resources, tags “identify and classify” artefacts with non-specialist language. This opportunity bridges the “semantic gap” between cultural heritage professionals and the

public using less specialised terminology, laying the groundwork for reinventing ways and practices of using collections that stimulate different public use and understanding. (Whitelaw, 2015)

Interface and metadata constitute devices that can organize and manage complex cultural datasets by facilitating access to the data for an extended audience. If the focus shifts from access to analysis, the adoption of AI and in particular machine learning models, can function as a multiplier of data processing capacity, for example to perform recon on massive cultural datasets that with generous interfaces produce research on aggregated connected domains. Indeed, algorithms for mining, shaping, and representing large datasets play a key role in several stages of the so-called "data processing pipeline," for example, in operations involving digitization, transcription, pattern recognition, simulation and inferences, preservation, and curation. (Kaplan, 2015, p. 3)

Good examples are the Triennale di Milano Online Archive (https://archivi.triennale.org/archive/archivi) and the V&A Archive of Art and Design (https://www.vam.ac.uk/info/archive-of-art-and-design). Particularly interesting is also the online platform of the Cooper Hewitt Smithsonian Design Museum archive, which houses the collections of the different departments. The file of each artefact shows: tag (these tags connect diverse objects from across the collection: they represent themes that extend over time and across the different museum departments), timeline (year of production, year in which it was reproduced photographically, year of acquisition, exhibitions in which it was exhibited), metadata (type, producer, materials, production process, donors – connected to its collection), number of images available, the place where it is exhibited, other related artefacts selected by the curators from those present in the archive, size, colour palette. The use of the IIIF framework6 (Rodighiero et al., 2023) extends the queryable holdings to all objects held by the Smithsonian institutions.

[6] The International Image Interoperability Framework (IIIF), is an interoperable protocol for publishing high quality images on the web and sharing them. It was created for sharing images between digital libraries, is open source and has several levels of APIs (authentication, annotation, search, presentation) to be able to build and implement different services.

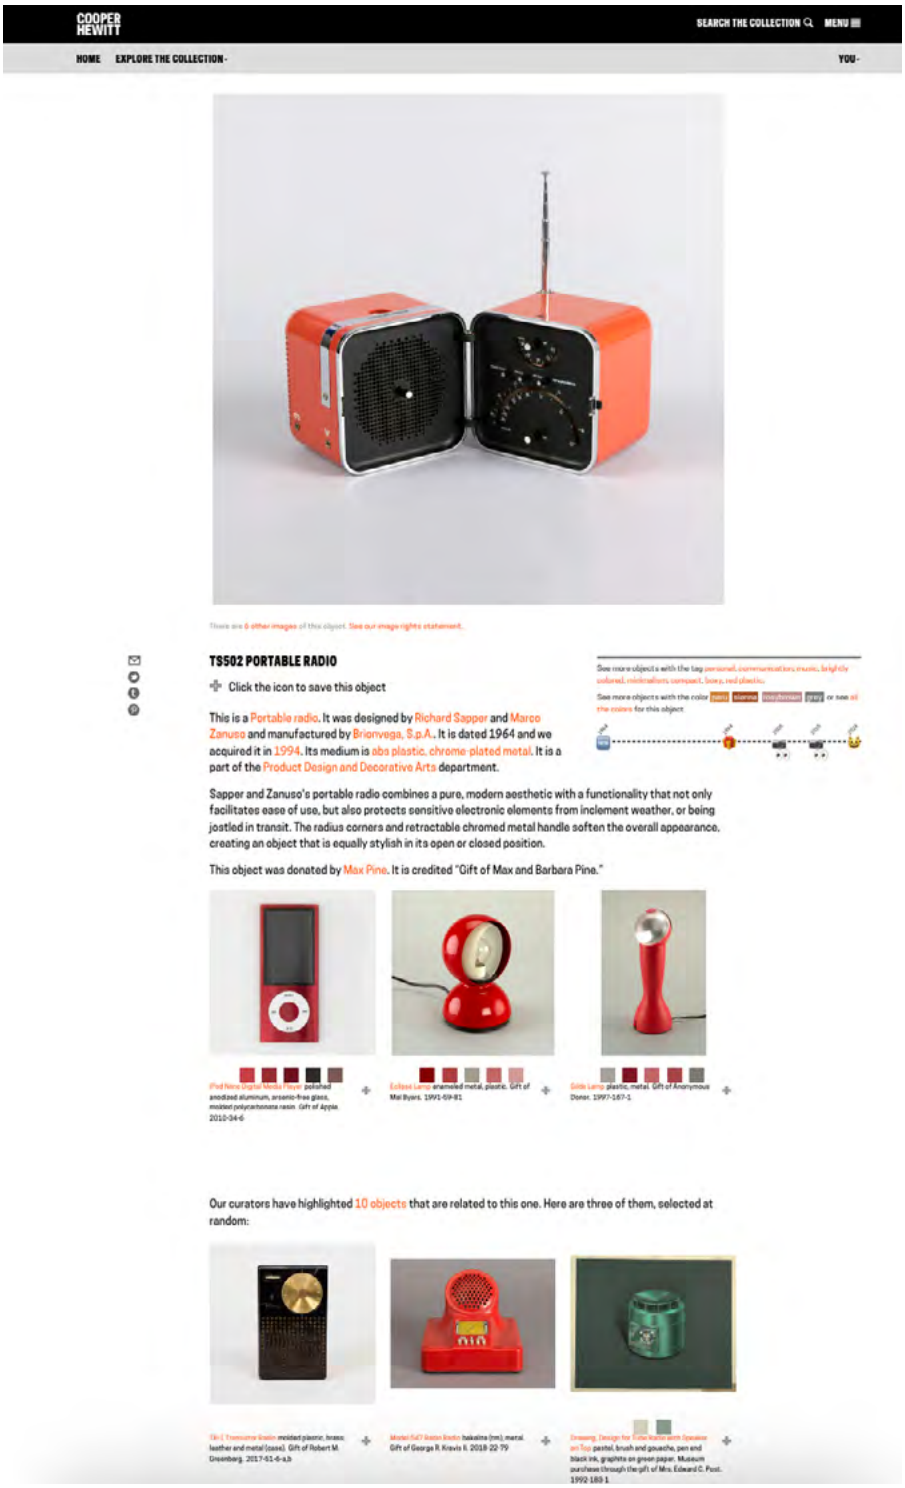

Figure 2. TS502 ts502 Portable Radio; Designed by Richard Sapper (German, 1932 - 2015), Marco Zanuso (Italian, 1916 – 2001); Manufactured by Brionvega, S.p.A. (Italy); Italy; abs plastic, chrome-plated metal; H x W x D (open): 13 x 33 x 16.5 cm (5 1/8 x 13 x 6 1/2 in.) H x W x D (closed): 13 x 22.5 x 13 cm (5 1/8 x 8 7/8 x 5 1/8 in.); Gift of Max and Barbara Pine; 1994-59-3. Retrieved 2 August, 2024, from https://collection.cooperhewitt.org/objects/18648915/.

5.2 Representation

With representational interventions, the designer, through practices of analysing, cleaning and formatting of extended datasets, proposes the development of orientation systems for the in-depth study, visualisation, sharing and dissemination of complex content in museum contexts.

Visualisation, a crucial intermediary between the digital archive and its big data, functions both within galleries and beyond their physical location as networked access (Kenderdine, 2021). The extent and heterogeneity of the preserved and digitised materials require the structuring of static and dynamic reading systems; interfaces to aggregate, filter and group the stored data that allow both “distant” and “close reading”. (Drucker, 2017; Kaplan, 2015; Kenderdine, 2010; Moretti, 2005)

Visualisations foster multi-level readings by highlighting relationships and revealing associations that, through interaction, can extend the experience from the screen to the physical setting (Windhager et al., 2019) opening up the museological heritage to exploration both within and beyond the institutional walls. This type of intervention sees designers and digital humanists working on the qualitative dimension of the data often in a parallel way, the former focused mainly on the design of physical and digital interfaces for expanded access to information – approach that finds in the use of AI driven tools the possibility of expanding, refining and updating research outcomes over time by reiterating the data query against the acquisitions made –, the latter rather more on analysis through visualisations as research tools and methodology.

The activity is aimed at diverse and broad audiences, involving experts as well as non-specialists. Three main approaches have been identified by Sarah Kenderdine (2021), professor of Digital Museology at the École polytechnique fédérale de Lausanne: collections visualisation, embodied visualisation and spatial and temporal visualisation.

An example of the most widespread practice, collection visualisation, is the work of Olivia Vane, researcher and data-visualisation designer (https://www.oliviavane.co.uk/cooper-hewitt-tags) who, wanting to narrate the breadth of the Cooper Hewitt Smithsonian Design Museum's collection, worked on the tagging system of artefacts by identifying in morphology and colour search attributes that multiplied by the numbers of artefacts in the collection highlight hidden narratives, surprising even museum staff. “Organising the data into timelines makes it possible to trace how a concept or idea has been visually expressed across time. Bringing objects from very different places together in these visualisations encourages serendipity and unexpected juxtapositions” (Vane & Davis, 2020, p. 29). In this case, the dynamic representation of specially designed digital data exploits and enhances the basic powers of human perception and supports the understanding of large-scale information (Card, 1999). In this way, user interaction highlights patterns and trends that are difficult to detect with point-in-time research.

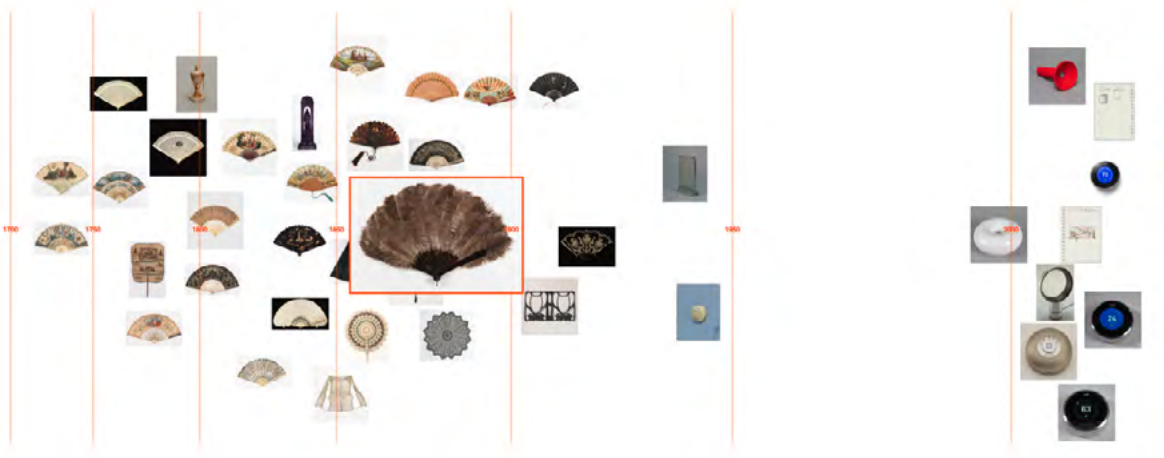

Figure 3. Personal environmental control timeline: a dry juxtaposition of these decorated fans against modern Nest thermostats. Olivia Vane, https://www.oliviavane.co.uk/cooper-hewitt-tags.

The *Surprise Machines* project (https://mlml.io/p/choreographic-interface/), developed in 2022 by metaLAB Harvard FU Berlin (https://mlml.io/) for the Harvard Art Museum is an example of embodied visualisation. Part of the temporary exhibition *Curatorial A(i)gents, Surprise Machines* is a data visualisation designed using AI algorithms that maps more than 200,000 digital images and shows them in an interactive installation enriched by "a choreographic interface" (Rodighiero et al., 2022) which allows visitors to understand the vastness of the collection by interacting through a camera that captures body gestures.

Figure 4. Surprising Machines, Harvard Art Museum, 2022 . Retrieved 2 August, 2024, from https://mlml.io/p/curatorial-aigents/.

Inscribed in the "spatial and temporal visualisation" typology, *The Room of Change* (https://accurat.it/work/broken-nature) is the environmental installation designed by the studio Accurat on the occasion of *Broken Nature: Design Takes on Human Survival* at the XXII Milan Triennale curated by Paola Antonelli. The room is empty and the walls are covered with a wallpaper that incorporates visual patterns derived from the processing of extensive datasets on global issues such as world population density, energy consumption and variation in average temperatures. These patterns represent environmental changes in the past, present and future. The wall is a device for conveying content through interaction with a mobile application that offers keys to interpreting the visual codes used. Following Giorgia Lupi's approach of "giving human life to data" (Lupi, 2014, p. 62), this project combines research and data design. The aim is to go beyond traditional data visualisation codes, incorporating cognitive studies on perception to make the project accessible to a wider audience, including non-specialists.

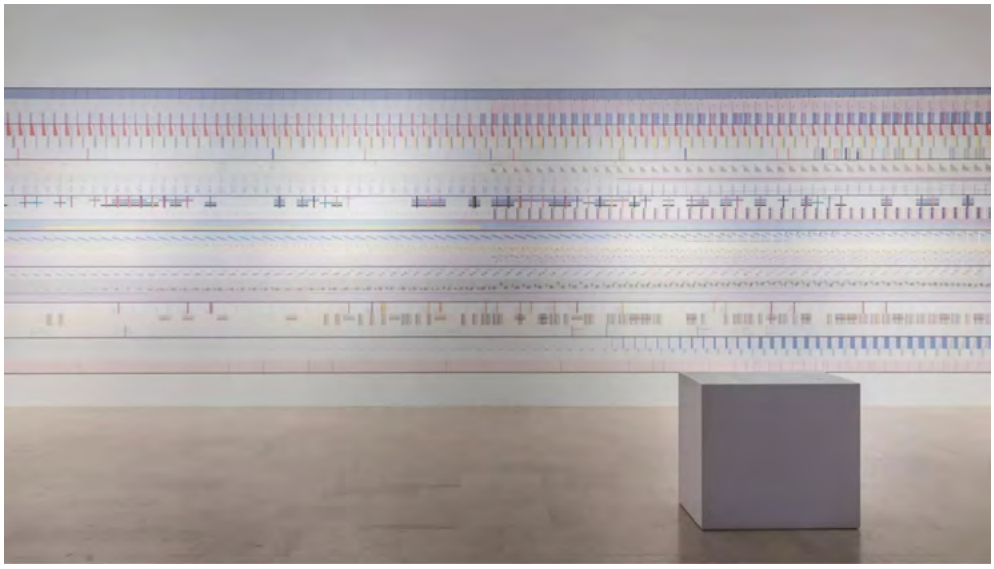

Figure 5. The Room of Change, Accurat, 2019. Retrieved 2 August, from https://accurat.it/work/broken-nature.

5.3 Narration

With storytelling interventions, the designer designs systems of multilevel interpretations aimed at combining and transmitting knowledge and expertise in order to: make the stories inherent in an artefact explicit; arouse emotion and engagement; transfer individual and collective memories between generations; and foster connections between institutions and heritage, individuals and communities (Bonacini, 2020). These systems include user customisation of content, the ability to offer adaptive content or customised narratives, and systems that can combine physical narratives with digital narratives (Poulopoulos & Wallace, 2022).

Variable, situated and dynamic interfaces are an expression of the expanded museum, a "living" organism with high complexity due to the variability of content aspects (Atzori et al., 2023, p. 38). Artefacts communicate themselves through their material properties but they also carry "other" and intangible stories concerning their contextualisation.

The contents that augment the artefact, whether created by museum professionals or ordinary people, or generated by AI give plasticity to the artefacts as they can be recalled on demand according to specific reading frames. These interventions also exploit the potential of hypertextuality and hypermediality as for the same content the narrative can take on different formats: text, audiovisual, images, links to collections or other.

The development of "augmented narration" systems requires the presence of a network infrastructure and connection systems for geo-localising information. Digital information is in fact made accessible through photographable two-dimensional codes (Qr Codes) or through various proximity devices (RfiD tags, NFC, Beacons), or directly through GPS positioning (Bonacini, 2021).

The aforementioned exhibition *Talk to Me: Design and the Communication between People and Objects*, curated by Paola Antonelli and Kate Carmody (MoMa, New York, 2011) integrates information on the contextualisation of the artefacts on display through the use of Qr-codes. The installation proposes a "connective and amplified narrative" (Trocchianesi, 2015, p. 101) in which the flow of information unites and connects internal and external visitors and exhibits. Each piece in the exhibition has a QRcode – this is the first time this device has been used in an exhibition context – that allows visitors to access in-depth information on the designer, project specifications, as well as tweets (according to a real-time data retrieval dynamic) posted by other visitors connected to the same piece. Products, installations and constituent systems of the contemporary communicative sphere are on display: interfaces, interactive multimedia systems, robots,

mobile devices, monitors, screens, and the use of the QRcode allows further links to other works linked by thematic affinity. In this case, the construction of the narrative in the exhibition stems from the object itself, a harbinger of new codes, which integrates them and injects them into the relationships between objects, visitors and the exhibition design that arise during the course of the event.

Although not directly related to a museum institution, but nevertheless interesting as an example of renewing relationships with artefacts, *Teaching with Things*, an experimental research project (2013) developed at Harvard's metaLab under the guidance of Jeffrey Schnapp (2018) and aimed at restoring three-dimensional objects in a multimedia catalogue, integrated augmented storytelling through the three-dimensional representation of the object. In this case, the three-dimensional modelling of the object becomes not only a digital surrogate informational node, but also an access point to a library of additional information capable of proposing relations with other documents and user comments. The digital surrogate, represented within a navigable system of spatial coordinates and queryable with regard to its physical information such as size and weight, is associated with acoustic properties, component attributes and other significant usage details. Information is conveyed through audio, video and photos. As the first experimental version of an "artefactual interface", the project proposes the transformation of an analogue object into an augmented version of it, where the integration of its attributes with those dictated by the users' annotations contribute to the "description of an object record, understood as an interpretative process that results in a multimedia composite". (Schnapp, 2018, p. 430)

Finally, the narrative of *Analogous city*, a multimedia installation proposed by researcher Dario Rodighiero (2021), clarifies the sources through the use of augmented reality. The work is an Archizoom initiative protracted in collaboration with Bonnefanten in Maastricht, EPFL in Lausanne, and GAMeC in Bergamo.[7] Placed within an exhibition context, Aldo Rossi's (1976) map of the *Città Analoga* takes the form of a collage that brings together drawings, images and extracts from artworks. Through a mobile application for tablets and smartphones, it is possible to frame parts of the work, which are recognised and give access to the respective augmented versions.

The augmented reality system graphically depicts touch points that, once selected, refer to bibliographic and iconographic references.

6. Conclusions

The study and analysis of datasets in a qualitative-quantitative key by the field of design supports processes of re-elaboration and signification of the heritage of design from the specificities of artefacts. This process, which is already in use in digital archives that go beyond the punctual search key through the use of metadata, favours the possibility of making the processual dimension of design evident as it makes the set of information supporting it explicit and more easily accessible.

As we have documented, existing data retrieval systems – for example those used at the Cooper Hewitt Smithsonian Design Museum – offer infrastructures and technologies capable of supporting the development of selection practices on which exhibitions can be based, capable of restoring the information content regarding the history of an artefact: the client's request, the conception, the choice of materials, the production technologies, the marketing strategies, communication and use, up to its obsolescence. The most recent design museums show some signs of openness towards this new approach but, although they interpret the logic of data (classifications, aggregations, filters, relations), they end up limiting themselves to the exhibition of analogue and digital artefacts and communication apparatuses, with limited bridges between the two.

[7] In addition to these museums, the Map of the Analogous City has been exhibited at the Triennale of Milan and MAXXI in Rome.

Even the most virtuous experiences and in line with the idea of a "museum as interface of the process" for design, the proposed "augmented narratives" related to artefacts – also by means of digital – remain in fact confined to the physical space of the museum for the duration of the exhibition for which they were conceived. The transience that characterises such "narratives" on the one hand limits their wider and shared access and on the other hand does not provide for their preservation.

Despite the resources available and the knowledge of the advantages that the digital dimension of data offers (hypertextuality, hypermediality, interaction with the digital object and with the information resources connected to it) what is still missing is the project of dialogue and connection between the exhibition dimension, often still limited to the finished product, and the digital dimension on which historical and curatorial studies could be expanded, favouring new reconstructions and interpretations based on an extended network.

The network of the new design museums based on the idea of a "museum as interface of the process" prefigures itself as a giant global and shared archive, implementable and queryable by each institution and by any user, where data constitute the project material at the service of study and research but also of temporary and permanent, physical and digital exhibitions. The data, an authoritative resource for the construction of memory and knowledge, thus becomes on the one hand the foundation for a shared production of the history of the project based on sources and documents, and on the other hand a support for the process of expansion of participatory and shared culture.

About the Authors:

Alssandra Bosco is an architect and PhD, is a Researcher at the Università Iuav di Venezia (Italy). She is the author of numerous contributions and publications and carries out research in the fields of Design for the enhancement of Cultural Heritage and Exhibit Design with a specific focus on collaborative approaches.

Fiorella Bulegato, PhD, is a design historian and Associate Professor at Università Iuav di Venezia. Her publications include "Michele De Lucchi: From Here to There and Beyond", with S. Polano (2005), "Il design degli architetti italiani 1920 –2000", with E. Dellapiana (2014).

Lucilla Calogero, PhD, is a Researcher at the Università Iuav di Venezia. She conducts research on the design of interactive digital systems in visual and multimodal communication, with a particular focus on data visualisation information design.

Author's Note: The contribution is the result of a common reflection of the three authors. Nevertheless, "1. The museum's digital transformation" was written by Alessandra Bosco. "2. Data and dataset in the museum, from the functional role to the social one" was written by Lucilla Calogero. "3. The case of the design museum" was written by Fiorella Bulegato. "4. The museum as an interface", "5. "Digital cultural heritage design" for design" and subchapters "5.1. Datafication", "5.2 Representation", "5.3 Narration" were written jointly by Alessandra Bosco and Lucilla Calogero. The Conclusions were jointly written by the three authors.
